UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, AND LITERATURE:

COMPREHENDING,

UNDER ONE GENERAL ALPHABETICAL ARRANGEMENT,

ALL THE WORDS AND SUBSTANCE OF

EVERY KIND OF DICTIONARY EXTANT IN THE ENGLISH LANGUAGE.

IN WHICH THE IMPROVED DEPARTMENTS OF

THE MECHANICAL ARTS, THE LIBERAL SCIENCES, THE HIGHER MATHEMATICS, AND THE SEVERAL
BRANCHES OF POLITE LITERATURE,

ARE SELECTED FROM THE

ACTS, MEMOIRS, AND TRANSACTIONS, OF THE MOST EMINENT LITERARY SOCIETIES

IN EUROPE, ASIA, AND AMERICA.

FORMING A COMPREHENSIVE VIEW OF THE RISE, PROGRESS, AND PRESENT STATE, OF HUMAN
LEARNING IN EVERY PART OF THE WORLD.

EMBELLISHED WITH A MOST

MAGNIFICENT SET OF COPPER-PLATE ENGRAVINGS,

ILLUSTRATING, AMONGST OTHER INTERESTING SUBJECTS,

THE MOST CURIOUS, RARE, AND ELEGANT, PRODUCTIONS OF NATURE, IN EVERY PART OF THE UNIVERSE;

AND ENRICHED WITH

PORTRAITS OF EMINENT AND LEARNED PERSONAGES, IN ALL AGES OF THE WORLD.

COMPILED, DIGESTED, AND ARRANGED,

BY JOHN WILKES, OF MILLAND HOUSE, IN THE COUNTY OF SUSSEX, ESQUIRE;

ASSISTED BY EMINENT SCHOLARS OF THE ENGLISH, SCOTCH, AND IRISH, UNIVERSITIES.

VOLUME XVIII.

CONTAINING

A comprehensive Treatise on PAINTING;

And a History of PARIS to the Death of NAPOLEON.

London:

PRINTED FOR THE PROPRIETOR, AT THE ENCYCLOPÆDIA OFFICE, 17, AVE-MARIA-LANE, ST. PAUL'S;
AND SOLD BY ALL THE BOOKSELLERS.

Non audiendi sunt homines imperiti, qui humano ingenio majorem, vel inutilem, et rebus gerendis adversum, πολυμαθειαν criminantur. Est scilicet quædam Scientiarum cognatio et conciliatio; unde et Εγκυκλοπαιδειαν vocant Græci; ut in unâ perfectus dici nequeat, qui cæteras non attigerit. Morhofi Polyhist. l. i. c. i. f. i.

Those inexperienced persons, who make it a charge of accusation against variety and extensive learning, that it exceeds the compass of human ability, or is useless, or that it is an impediment to transacting business, deserve no attention. For there is between the Sciences a degree of natural and close connexion; from which the Greeks use the term "Encyclopædia;" so that no one can be perfect in any one Science, who has not attained to some knowledge of the rest.

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, and LITERATURE.

O S I R I S.

OSI'RIS, a great deity of the Egyptians, son of Jupiter and Niobe. The ancients greatly differ in their opinions concerning this celebrated god; but they all agree that, as king of Egypt, he took particular care to civilize his subjects, to polish their morals, to give them good and salutary laws, and to teach them agriculture. After he had accomplished a reform at home, Osiris resolved to go and spread civilization in the other parts of the earth. He left his kingdom to the care of his wife Isis, and of her faithful minister Hermes or Mercury. The command of his troops at home was left to the trust of Hercules, a warlike officer. In his expedition, Osiris was accompanied by his brother Apollo, and by Anubis, Macedo, and Pan. His march was through Æthiopia, where his army was increased by the addition of the Satyrs, a hairy race of monsters, who made dancing and playing on musical instruments their chief study. He afterwards passed through Arabia, and visited the greatest part of the kingdoms of Asia and of Europe, where he enlightened the minds of men by introducing among them the worship of the gods, and a reverence for the wisdom of a Supreme Being. At his return home, Osiris found the minds of his subjects roused and agitated. His brother Typhon had raised seditions, and endeavoured to make himself popular. Osiris, whose sentiments were always of the most pacific nature, endeavoured to convince his brother of his ill conduct; but he fell a sacrifice to the attempt. Typhon murdered him in a secret apartment, and cut his body to pieces, which were divided among the associates of his guilt. Typhon, according to Plutarch, shut up his brother in a coffer, and threw him into the Nile. The enquiries of Isis discovered the body of her husband on the coasts of Phœnicia, where it had been conveyed by the waves; but Typhon stole it as it was carrying to Memphis, and he divided it among his companions, as was before observed. This cruelty incensed Isis: she revenged her husband's death; and, with her son ORUS, (see vol. xvii. p. 800.) defeated Typhon and the partisans of his conspiracy. She recovered the mangled pieces of her husband's body, (the genitals excepted, which the murderer had thrown into the sea;) and, to render him all the honour which his humanity deserved, she made as many statues of wax as there were mangled pieces of his body. Each statue contained a piece of the flesh of the dead monarch; and Isis, after she had summoned into her presence, one by one, the priests of all the different deities in her dominions, gave them each a statue, intimating that, in doing that, she had preferred them to all the other communities of Egypt; and she bound them by a solemn oath that they would keep secret that mark of her favour, and endeavour

to show their sense of it by establishing a form of worship, and paying divine honours to their prince. They were further directed to choose whatever animals they pleased, to represent the person and the divinity of Osiris; and they were enjoined to pay the greatest reverence to that representative of divinity, and to bury it, when dead, with the greatest solemnity. To render their establishment more popular, each sacerdotal body had a certain portion of land allotted to maintain them, and to defray the expenses which necessarily attended the sacrifices and ceremonial rites. As Osiris had particularly instructed his subjects in cultivating the ground, the priests chose the ox to represent him, and paid the most superstitious veneration to that animal. See APIS.

Osiris, according to the opinion of some mythologists, is the same as the Sun; and the adoration which is paid by different nations to Anubis, Bacchus, Dionysius, Jupiter, Pan, &c. is the same as that which Osiris received in the Egyptian temples. Isis also, after death, received divine honours as well as her husband; and, as the ox was the symbol of the sun, or Osiris, so the cow was the emblem of the moon, or Isis. Nothing can give a clearer idea of the power and greatness of Osiris than this inscription, which has been found on some ancient monuments: "Saturn, the youngest of all the gods, was my father. I am Osiris, who conducted a large and numerous army as far as the deserts of India, and travelled over the greatest part of the world, and visited the streams of the Ister, and the remote shores of the ocean, diffusing benevolence to all the inhabitants of the earth."

Some authors have alleged that Osiris was Joseph, and others maintain that he was Moses; whilst it is asserted by others, that this king of Egypt was more ancient than either, and that his worship was established in their time through all Egypt, since the Israelites imitated its ceremonies in the adoration of the golden calf. Bannier is of opinion, that Osiris is the same as Mizraim, the son of Ham, who peopled Egypt some time after the deluge, and who, after his death, was deified; and he is called by the ancients the son of Jupiter, because he was the son of Ham, or Hammon, whom he himself had acknowledged as a god. Marsham takes Osiris to have been Ham himself, known under the name of Menis, at the head of the dynasties which succeeded to the gods and demigods. Indeed, the learned in general allow, that Osiris was one of the first descendants of Noah by Ham, and that he governed Egypt, whither his father had repaired, and there founded a small kingdom, a few years after the dispersion which happened in the time of Peleg. Diodorus says, some think that Osiris is Serapis; others that he is Dionus;

nufus; others Pluto; many take him for Zeus, or Jupiter; and many for Pan. "This was an unnecessary embarrassment, (says Bryant;) for they were all titles of the same god."

Though the original Osiris was undoubtedly the sun, or the intelligence actuating the sun, yet there is reason to believe that there was a secondary Osiris, who at a very early period reigned in Egypt, and was deified after his death for the benefits he had rendered to his country. This is indeed so generally admitted, as to have occasioned great controversies among the learned respecting the time when he flourished, and whether he was the civilizer of rude barbarians, or the victorious sovereign of a polished nation. The illustrious Newton, it is well known, has adopted the latter opinion; and with much plausibility endeavoured to prove, that Osiris was the same with Sesostris, or Sefac: but it must be confessed, that his conclusion is contrary to all the most authentic records of antiquity; and that it would be easy, by the same mode of arguing, to give a show of identity to two persons universally known to have flourished in very distant ages. The annals of Egypt, as may be seen in the writings of Herodotus, Diodorus Siculus, Strabo, Plutarch, and others, who copied from those annals, expressly asserted the distinct personality of Osiris and Sesostris, and placed them in eras vastly distant from each other. Osiris, if any credit be due to those historians, was the founder of the Egyptian monarchy; and, as was customary in those days, having either received the name of the sun, or communicated his own to that luminary, was, after his death, deified, for the benefits which he had rendered to his country; and, being at first worshipped as a demigod, was, in process of time, advanced to full divinity, and con-founded with his heavenly godfather.

Since the above article was compiled, we have been favoured with an original communication on the same subject from another hand, with the drawings which appear on the annexed Engraving. Though it must necessarily cause some repetitions, perhaps some contradictions, yet we have thought it best to present it to our readers entire as we received it.

Clouds of obscurity and doubt hang so heavily over this Egyptian deity, that it is almost impossible to decide whether he was a god or a man, or whether he ever existed at all. Armies of ancient historians and mythographers, supported by their still more numerous auxiliaries, the commentators, with their lexicons and glossaries, muster very strong; but, as they, of course, never agree, the enquirers are sadly puzzled, and the subject becomes neutralized; that is to say, vanishes by degrees from their sight, and, like the diamond placed in the burning focus of concentrically-reflecting mirrors, loses all claim to substantiality. To reconcile them, and bring their various opinions to an indisputable thesis, would be a more than Herculean task, which we do not intend to undertake; but we shall endeavour to place in a clear point of view what has been said of Osiris, leaving each reader at liberty to adopt the explanation which best agrees with his respective taste.

1. According to Tacitus and others, Osiris was the most ancient divinity to whom the Egyptians paid the public and private honours of worship, (Tacit. Hist. lib. iv. c. 84.) and it appears that, by him, they understood in the abstract *Omne principium facultate humectandi præditum*; "all principle endowed with the faculty of creating moisture." This definition seems to blow our skiff far from the land of discovery; since we are soon to find Osiris identified with the sun. It seems that he was originally black, *Homo niger, μελαγχρους*; and this countenance the opinion of those who, from the name of Adam, (which in Hebrew means dark, brown, the colour of the earth out of which man was made by the plastic hand of the Almighty,) pretend that the first-created human being was a perfect Negro, and that the fair complexion of the

white is but an alteration from the original tint of the skin, occasioned by the sun having receded from the arctic pole, or having lost a great deal of its native heat.

Osiris was the husband, the brother, and the son, of Isis; a sort of enigma which the Egyptian priests had solved, in supposing that Isis was made pregnant by Osiris in the womb of their mother; an allegory which probably alluded to the heat of the sun operating upon the earth, and rendering it fit for agriculture. However Typhon, who is an emblem of excessive drought, killed Osiris, the principle of moisture, and cut his body into several pieces, which Isis, after long search, fortunately found, except the private parts, which she caused to be imitated and exposed to the veneration of the Egyptians, under the name of *Phallus*, and instituted the *Pamyia*, festivals in which was carried about this *simulacrum*, of a size three times as big as nature; *αἰδοῖον τετραπλασιον*. Plut. de Isid. and Osir. We must observe, that ancient writers assert that no sort of indecent idea was then attached to this *Agalma* or idol.

In an ancient medal described by Reusch, Osiris is represented with a long robe; in allusion to which, Tibullus, who relates his fate in a most elegant manner, says, *Fusa sed ad teneros lutea palla pedes*; and this deep-yellow gown was adopted to represent the golden blaze of the sun. (See the annexed Plate, fig. 1.) for Osiris was a symbol of the sun, according to other authors, while Isis was intended to represent the moon. Agreeable to this idea, we find him among ancient *Abraxæ*, under the disguise of a sparrow-hawk, or, at least, with the head of this bird upon a human body; (see fig. 2.) because the hawk was, on account of his fleetness through the air, and his excellent ken, dedicated to the god of day. But here we are puzzled again, on account of the crescent with which he is crested; but, to escape from this difficulty, commentators pretend that it is the *calathus*, or basket, a symbol of that fecundity which Osiris, as the sun, naturally causes. Osiris is also armed with a whip; some say, because he was entrusted with the government of departed souls; and, consequently, becomes Mercury, whose duty it was to conduct droves of "gibberish" ghosts (*Odyss.*) to the infernal regions; others, in allusion to his being the same as the great charioteer Apollo. Horus or Orus, and Harpocrates, have been often supposed to be the same as Osiris.

2. Thus far we have considered Osiris as an Egyptian god; and mythology has done her duty. But, in considering him as a man, history will not, we are afraid, assist us in any comfortable way. Tacitus, (Hist. v. 2.) who wrote a great deal of curious nonsense, in relating what was the opinion about the Jews in his time, roundly asserts that they left Egypt when Osiris and Isis were sitting on the throne of that kingdom. Osiris, therefore, must be the same as Pharaoh. The Romans hated the Egyptians, Chaldeans, and Jews, as we do gypsies and fortune-tellers; but they did also, as some of our contemporaries do, pay these soothsayers, and abuse them, as a sort of indemnification for the loss of their money. Lucan, lib. viii. v. 833. says:

Nos in templa tuam Romana accepimus Isin,
Semideosque canes, et Sistra jubentia luctus,
Et quem tu plangens hominem testaris Osirim.

"Your Isis we received into our Roman temples, with your demi-gods of canine breed, and your doleful Sistrum, and *Osiris*, whom, by mourning for him, you declare to be (not a god but) a man."

3. We are come now to the consideration of Osiris as being neither a god nor a man; and, indeed, he appears to have been but an hieroglyphic symbol of the Sun, according to Herodotus, Diodorus, and many others; whereas Plutarch takes him to be the image of the lunar orb. But this last opinion must be wrong, since we find him in contraposition with the Moon; and that, most indisputably, in a very curious and excellent bas-relief preserved in the Albani Villa at Rome. Our readers will be pleased with an exact description of this mystical piece of antiquity,

OSIRIS.

J. Chapman, Sculp.

1, Osiris from an Antique Gem. 2, Osiris Teracomorphos, Ant Gem. 3, A Bass-relief representing Osiris, Mithra, & Isis, from the Villa Albani at Rome. 4, Osiris as a mummy. 5, Osiris crowned with the lotus.

quity, represented at fig. 3. In this specimen of ancient sculpture, Mithra, with the Persian or Phrygian mitre on his head, presses with his right knee upon a subjugated bull, whose tail ends in an ear of corn; his flowing mantle seems violently agitated by the element of air, whilst the production of the earth and water seems to assail the ox. On one side, the head of Isis issues from a half-moon; on the other is the head of Osiris, or Apollo. A bird of the raven kind seems to peck at the principal figure in the group. The Bull certainly means Agriculture; but why, subdued by Mithra, who with one hand holds one of his ears and his mouth with the other, he should be teased by the assaults of a young lion's whelp, a serpent, a scorpion, and a crab, we must leave for others to guess. We thought at first, that these animals might allude, in a distant view, to the signs of the zodiac; but that view was so distant, that the objects became imperceptible. Is Mithra, the principal agent, a symbol of that life which pervades the whole of the universe; as Virgil says, *Spiritus intus alit*? Is the bull, then, an emblem of the teeming earth, which produces harvest under the influence of the sun and moon? Do the water-animals, the serpent, the scorpion, the crab, designate moisture in such an abundance as to injure the growth of corn? All these, we are afraid, will prove *un-solvable* questions. Here the thick veil of antiquity defeats the keenest and most eager curiosity of the man of knowledge and research, and lets him down upon the same form with the most ignorant of school-boys.

Whatever this curious bas-relievo may mean, it will not be uninteresting to compare it with one which has been lately published in the *Archæologia* of the Antiquarian Society. See vol. xix. Part I. It is supposed to represent the *fascinum*, or evil eye, mentioned by Theocritus and Virgil, (*Nescio quis teneros oculus mihi fascinat agnos. Ecl. iii. v. 103.*) and to have been sculptured in the time of Septimius Severus, when the worship of Mithra began to be widely diffused in the western parts of the Roman empire. The eye is properly set in the centre; Mithra is above, and his back is turned towards the spectator; on his right is a warrior, or *mirmillio*-gladiator, armed with a trident and a short sword; another figure was probably corresponding on the other side, but it is lost. Beneath the eye we find the snake, the raven, and the scorpion, a crane, and part of a lion, nearly in the same position as they are represented in our Engraving at fig. 3. This is supposed (by the Rev. Stephen Weston) to allude to the ceremonies observed at the initiation of candidates to the Mithraic society, a sort of Freemasonry of those times; and to indicate that the neophytes were to be transformed for a certain number of years into these animals before they could obtain the purity necessary for their admission. But probably the eye represents the sun, *oculus mundi*, the eye of the world; the figure called Mithra, at top, denotes Osiris, who is the same; and the supposed gladiator certainly indicates Typhon, who, having killed Osiris with his *sword*, throws his severed limbs in the sea, hinted at by the *trident* which he holds in his right hand: from which we may conclude, that this sculpture has the same intent as the Albani bas-relief, and does not refer to any sort of fascination, but merely to agricultural pursuits.

Fig. 4. is a half-length figure of Osiris as a mummy, holding in his right hand a whip, and in his left a crooked staff; on the chin is a beard, or an ornament resembling one, such as is found on a number of Egyptian figures. Fig. 5. Osiris standing naked; his head dressed in a kind of mitre, with the lotus; the right hand raised, the left holding his phallus. According to Plutarch, Osiris was often represented thus; and the Greek Cyllenian Mercury resembled him, according to Pausanias. Both these gems were in the superb cabinet of the late baron Philip de Stosch; but derived to us through the medium of Mr. Tassie's Museum, in Leicester-square, London.

OSITH, or OSYTH (St.) an island of England, at the mouth of the Blackwater-river, or Malden-water, in the

county of Essex, with a village. It is said to have changed its name from Chiche to that of St. Osith, who was a virgin murdered here by the Danes, and canonized. A monastery of black Augustine canons was founded here to her memory by Richard Beaver bishop of London, in the year 1120. St. Osith is eleven miles south-east of Colchester.

O'SIUS, Bishop of Cordova in Spain, was born in 257. He became the friend of Constantine, who, by his persuasions, convened, in 323, the council of Nice, where Osius presided. Under Constantius he was so much persecuted, that he turned Arian. It should however be mentioned, that he was then very aged, being almost 100 years old. Having made his recantation, he was permitted to return to his diocese, where he died soon after, extremely penitent, and in his last moments renounced the Arian heresy with great fervour.

O'SIUS (Felix), a learned Italian, was born at Milan in 1587, and became professor of rhetoric at Padua, where he died in 1631. His principal works are, 1. *Romano-Græcia*. 2. *Traçtatus de Sepulchris Epitaphiis Ethnicorum et Christianorum*. 3. *Elogia Scriptorum illustrium*; and several other works, in high estimation at the period in which he flourished.

OSKAWA', a river of Moravia, which runs into the March near Olmutz.

OSKIPA'RA, a town of Persian Armenia: thirty-six miles north-west of Kanja.

OS'KOL, a river of Russia, which runs into the Donetz near Iziun, in the government of Charkov.

OS'KOL, a town of Russia, in the government of Kurfk, on the river Oskol: sixty miles south-east of Kurfk. Lat. 50. 50. N. lon. 37. 14. E.

OSKO'VA, a mountain of Bosnia: twenty miles south-east of Serajo.

OSLAWA', a town of Moravia, in the circle of Brunn: twelve miles west of Brunn.

OSLAWA', a river of Moravia, which runs into the Iglau near Eybenschtz.

OSMA, a decayed town of Spain, in Old Castile, on the Duero, the see of a bishop: forty miles south-east of Burgos, and fifty-two north-north-east of Madrid. Lat. 41. 45. N. lon. 2. 58. W.

OS'MAN A'GA, a town of Walachia: twenty-two miles south-west of Galacz.

OS'MAN TOPAL, a distinguished Turkish general, was born in 1673. He was brought up among the youth of the seraglio destined to public employments; and, by his proficiency in learning languages and military exercises, and his amiable disposition, obtained the esteem of his masters. He was appointed superintendent of the carriages; and, in 1698 or 1699, he was sent to Cairo with a message from the emperor. In his passage the vessel in which he had embarked was attacked by an Algerine cruiser, and taken, after an action, in which Osman, bravely fighting, was dangerously wounded in the arm and thigh. The consequences of the latter wound rendered him lame for life, and gave him the surname of *Topal*, which signifies "halting." The prize was carried to Malta, where it was visited by Vincent Arniaud, a native of Marseilles, then port-captain. Osman, on his coming on-board, said to him, "Do a generous action: ransom me: you will be no loser by it." Arniaud, struck with this address, asked the captain who took him, what he demanded for the ransom of this slave: the answer was, a thousand sequins. Arniaud turned to Osman: "I never saw you before in my life; I know nothing of you; and you ask me to pay a thousand sequins for you, on your bare word." "Both of us (replied Osman) act in character. For myself, I am in fetters; and it is natural that I should employ every means to regain my liberty. You naturally distrust my faith. I have no security to give but my word, in which you have no reason to confide; if, however, you will run the risk, I repeat, you will not repent it." Impressed with the frankness of his words

and manner, Arniaud agreed with the captain for five hundred sequins, which he paid down, and, putting Osman on-board a bark of his own, sent him medical assistance, and every thing necessary for his recovery. When cured, Osman proposed to him to write to Constantinople for re-payment of what he had advanced, and desired to be dismissed upon his parole. Arniaud would not be generous by halves; but gave Osman permission to take the bark, and dispose of it as he pleased. He immediately set sail for Damietta, whence he ascended the Nile to Cairo. He there paid the captain one thousand sequins on account of his benefactor, and presented him with two rich pelisses for himself. He executed his commission, returned happily to Constantinople, and was himself the bearer of the news of his captivity. His gratitude to Arniaud terminated only with his life; and, during all the steps of his elevation, he never intermitted a correspondence of letters and presents with him. He even extended his beneficence to all the Frenchmen with whom he had any concern.

In 1715, war having been declared between the Turks and the Venetians, the grand vizier Ali, intending to invade the Morea, assembled his army in the neighbourhood of the isthmus of Corinth, and gave in charge to Osman to force the passage, which he effected, and at the same time carried the city of Corinth by storm. In recompense, he was made a bashaw of two tails. He acted as second at the siege of Corfu in 1716; and, when it was raised, he remained three days after the general, to favour the retreat of the troops, not withdrawing till they were in safety. He was appointed seraskier, or chief commander in the Morea, in 1722, on which occasion he requested Arniaud to send him one of his sons, that he might give him a lucrative employment. He next rose to the rank of a bashaw of three tails, and was nominated to the government of Romelia. In 1731, Osman was called to the high dignity of grand vizier. He caused Arniaud to be informed of this promotion, who, with his son, visited Constantinople on the occasion, bringing with him twelve Turkish captives whom he had ransomed. The vizier received them in the presence of the great officers of the empire, to whom he related the story of his benefactor's generosity to him, adding, "Where is the Mussulman capable of such an action?" He treated them with the most affectionate familiarity, and gave them substantial proofs of his kindness. Osman in 1732 was deposed, more to the regret of the people, to whom he had restored plenty, than to his own; and he felicitated himself that he left his place with a good conscience, and without forfeiting the regard of his sovereign. He set out for the government of Trebisonde, to which he had been appointed; but, by the way, he received an order to take the command of the Turkish army in Persia. In July 1733, he fought a bloody battle with Thomas Kouli-Khan, in which the Ottoman arms were victorious; and his success was rewarded with an accession of power and dignity. A second battle, however, in the following September, proved extremely disastrous to the Turks, and fatal to Osman, who was killed in the field by two musket-shots. *Frazer's Life of Nadir Shah, 1742.*

OSMAND/GIK, a town of Asiatic Turkey, in the government of Sivas: 140 miles north-west of Sivas, and eighty-fourth of Sinob. Lat. 40.45. N. lon. 35.10. E.

OSMAN'THUS, *f.* in botany. See OLEA.

OSMI, a town of Daghestan: twenty-eight miles north-west of Desbund.

OS'MINGTON, a village in Dorsetshire, near Weymouth; where is a quarry of stone called Horfeffesh. On the south side of the church-yard was a burial-place for the anabaptists; now an orchard. The church is a large ancient structure, with some ancient grave-stones.

OSMI'TES, *f.* [from *οσμη*, Gr. odour; on account of its powerful sweet smell.] In botany, a genus of the class syngenesia, order polygamia, fruticosa, natural order of compositae discoidae, (corymbiferae, *Juss.*) Generic cha-

raeters—Calyx: common imbricate, gibbous; with the innermost leaflets augmented at the tip. Corolla: compound radiate; corollets hermaphrodite, several in the disk; female in the ray. Proper of the hermaphrodite tubular, five-cleft; of the female ligulate, entire. Stamina: in the hermaphrodite; filaments five, very short; anther cylindrical, tubular. Pistillum: in the hermaphrodites; germen oblong; style filiform, the length of the corollet; stigma bifid. In the females, germen smaller; style filiform, the length of the corollet; stigma obsolete. Pericarpium: none; calyx unchanged. Seeds: in the hermaphrodites solitary, oblong; with scarcely any pappus, or only margined; the pappus obsolete and somewhat chaffy: in the females, rudiments commonly abortive. Receptacle: chaffy.—*Essential Character.* Calyx imbricate, scarious; corolla of the ray ligulate; down obsolete; receptacle chaffy. There are five species.

1. *Osmites bellidiastrum*, or hyssop-leaved osmites: leaves linear, fleshy; stems scarious. Branches woody and thickish. Leaves oblong, narrow, acute, nearly of the same form and size with those of hyssop, sessile all over the branches to the very flowers, which are several in number, at the ends of the stems and branches; the disk of them is yellow, and the ray white.

2. *Osmites dentata*, or toothed osmites: leaves obovate, toothed, villose. Adopted on the authority of Thunberg.

3. *Osmites camphorina*, or sweet-smelling osmites: leaves lanceolate, subserrate, toothed at the base. Stems quite simple, with one peduncled flower. Leaves like those of *Chrysanthemum leucanthemum*, or ox-eye daisy, tooth-serrate, naked, gradually smaller towards the top; they are sessile, alternate, clustered, tomentose. Ray of the corolla white; disk yellow. It has a very strong smell of camphor, whence both its names. See the Plate, fig. 1.

4. *Osmites asteriscoides*, or faint-smelling osmites: leaves lanceolate, obsoletely-ferrulate. Stem thick. Leaves alternate, thickly set, slightly embracing the stem. Flowers capitate, terminal, sessile, yellowish-white. The smell of camphor is not so strong in this species as in the preceding. See fig. 2.

5. *Osmites calycina*: leaves lanceolate, naked; calyxes scarious. Stem erect. Leaves scattered, erect, narrow-lanceolate, naked, or very little pubescent, nerved underneath. Flowers terminating, solitary, sessile; corolla yellow.

These are all shrubs, natives of the Cape of Good Hope. This last species is made a distinct genus, *Lapeyrousia*, by Thunberg and Willdenow.

OSMIUM, *f.* See the article MINERALOGY, vol. xv. p. 508.

OSMOND (St.), was born in Normandy, of a noble family. In 1066 he followed the fortunes of William, who became the conqueror of England, and who made him the chancellor of this kingdom, and nominated him to the bishopric of Salisbury. He reformed the liturgy for his diocese, which form afterwards became general throughout the kingdom, under the name of the Salisbury Liturgy. He died in 1099, and was canonized by Calixtus III.

OSMONDS, *f.* in our old writers, a kind of iron anciently brought into England. It is mentioned in stat. 32 Hen. VIII. c. 14.

OSMONDSTON, or SCHOLE, a village in Norfolk, on the north side of the river Waveney, in the road from Ipswich to Norwich, it being on the borders of Suffolk. In the reign of Edward III. Schole was only a hamlet to Osmondston; but was so increased in the reign of Henry VIII. as to become the chief part of the town. Here is the White Hart, called the Schole-inn, formerly remarked for its fine carved-work, and images as big as the life. It is ninety-three miles from London.

OSMOR'ZSKOI, a town of Russia, in the government of Kolivan, on the Irtysh: 201 miles west-south-west of Kolivan. Lat. 53.15. N. lon. 76.14. E.

OSMUND,

1. Sweet-smelling Osmites 2. Taint-smelling Osmites.

OSMUND, or OSMUND ROYAL, *f.* A plant sometimes used in medicine. It grows upon bogs in divers parts of England. See OSMUNDA.

OSMUNDA, *f.* [a word of which no explanation has ever been given, and which Linnæus, in his *Philosophia Botanica*, mentions as one of those which can hardly be traced to any language. But *Osmund* is a Saxon proper name for a man, and expresses "domestic peace." Its application to the plant is found to have originated in England. The elegant *Filix florida*, or flowering fern, which first received it, and which is an aquatic plant, should seem, by Gerard's *Herbal*, a type or memorial of some "Osmund, a water-man," whose history had not come down, even to that old writer, but "whose heart (he says) was commemorated in the core of the root."] In botany, a genus of the class cryptogamia, order filices, natural order of filices, or ferns. Essential generic characters—Capsules distinct, disposed in a raceme in such a manner as to look the same way, or else heaped on the back of the pinna, or division of the frond, sessile, subglobular, opening transversely, without any ring. Seeds very many, extremely minute.

Some of the species (as *struthiopteris*, spicant, and *crispa*) do not belong to this genus, having the elastic ring common to the dorsiferous ferns, or ferns properly so called. *O. spicant* is referred to *Blechnum* by some, to *Acrostichum* by others, to *Struthiopteris* by Haller, Scopoli, and Weis. *O. crispa* is referred to *Pteris*; Villars makes it an *Acrostichum*; old authors, in general, name it an *Adiantum*. "Till the genera of ferns are better arranged, (says Mr. Professor Martyn,) I have left the twenty-seven species as I find them in the 14th edition of *Systema Vegetabilium*; though there is no doubt of the species named above being essentially different from the genuine *Osmundas*."

1. *Osmunda Zeylanica*: scape cauline, solitary; fronds verticillate, lanceolate, undivided. Plant a foot high, with a naked stem, terminated commonly by seven petioled undivided lanceolate leaves, placed in a ring, and erect; among them rises a cylindrical peduncled spike. Native of Ceylon and Amboyna.

2. *Osmunda lunaria*, or moon-wort: scape cauline, solitary; frond pinnate, solitary. Root fibrous. Plant three, four, or five, inches high; sometimes a little higher. The stem divides in the middle into two branches, one of which immediately puts forth leaflets on each side; the other supports a naked flowering raceme. Pinnas of the frond fleshy, crescent-shaped, semi-circular, and halbert-shaped, irregularly scalloped, from three to eight pairs, with an odd one. Spike, or rather panicle, from one to two inches long. The branches lean one way; two rows of globular capsules are affixed to them, green at first, but yellow when ripe, and bursting vertically from the top to the base; these capsules are divided by an annular zone, and contain numerous oval dust-like seeds.

Linnæus observes, that, within the base of the stem, early in the spring, we may find a complete rudiment of the next year's plant. Woodward remarks, that moon-wort so exactly resembles *Ophioglossum vulgatum* in habit and structure, that they ought by no means to be separated.

The difficulty, says Monf. Villars, of meeting with this plant, which is not common, and lies concealed among grass, the singularity of its leaves, and the superstitious reveries of Matthioli, who has attributed supernatural virtues to it, all conspire to make it sought after by philosophers, herbarists, and those who hunt after wonderful secrets and the philosopher's stone. After all, it is merely vulnerary, astringent, and a little mucilaginous. Native of most parts of Europe, in dry pastures; flowering from May to July. With us, near Linton and Chippenham, in Cambridgeshire; Colchester in Essex; Bury in Suffolk; Stratton-heath in Norfolk; Shotover-hill, and North-Leigh-heath, in Oxfordshire; Scadbury-park, Maidstone, Blackheath, and Chiffelhurst-common, in Kent; north

side of Bredon-hill, and near Stourbridge, in Worcestershire; near Bath in Somersetshire; Nottinghamshire; Lancashire; near Settle and Ingletton, in Yorkshire; in mountainous pastures of Westmoreland; in Scotland, on Ard-gath-hill, to the north of Linlithgow; near Dundonald's, two miles from Little Loch Broom, on the western coast of Ross-shire; in the Isle of Skye, &c. In Ireland, on the rising ground of a meadow, two hundred yards north of the second Lock of Lagan-canal; found by Mr. John Templeton, of Orange-grove, near Belfast.

There are several varieties of this curious little plant, with many leaves and spikes, and with the leaves cloven.

3. *Osmunda Virginica*: scape cauline, solitary; frond super-decompound. Native of North America.

4. *Osmunda ternata*: scape cauline, solitary; frond three-parted, super-decompound. Root composed of numerous filiform fibres in bundles, with few fibrils. Stipe simple at bottom, an inch high, and then dividing into a frond and a floriferous scape. Scape from the base of the petiole roundish, striated, erect, naked, smooth, twice as long as the frond, drooping and flowering at top. Native of Japan, about Nagasaki; flowering in October and November.

5. *Osmunda phyllitidis*: scapes cauline, in pairs; frond pinnate; stem even. Native of South America.

6. *Osmunda hirta*: scapes cauline, in pairs; frond pinnate; stem rough-haired. Root a bundle of small fibres. Stems six or seven, a foot high, brittle, green, with brown hairs. On the upper part of these are two opposite fronds, an inch and a half long, and half an inch wide, mucronate, toothed on the edge, green and smooth on the upper surface, but loaded with white hairs on the under. From the base of the fronds arise two scapes, half a foot long, slender, covered with a silky lanugo, and terminated by erect pyramidal racemes, two inches long. Found by Plumier in the island of Martinico.

7. *Osmunda hirsuta*: scapes cauline, in pairs; frond bipinnate, hirsute. This rises a foot or more, and is higher than the next species. In its higher spikes, which are double, it exactly agrees with it; but the pinnules are longer, narrower, not cut quite into the midrib, and of a paler-green colour, something, in their divisions, like the leaves of *Matricaria*. Native of Jamaica.

8. *Osmunda adiantifolia*: scapes cauline, in pairs; frond super-decompound. This is sometimes about a foot, but mostly six or seven inches, high, having a very slender green stalk, at first coming out of the earth of a dark colour. At about four inches from the ground, out of one side of the stalk arises one branch, on which twigs are set alternately, having several broad irregularly-figured roundish pinnules, sometimes deeply cut, at other times a little indented on the edges, of a pale-green colour, like *Adiantum album*, and having many furrows appearing radiated. From the axil of this branch rise two round small green stalks, two inches long, towards the tops of which are several small bunches of capsules, at first green, afterwards ferruginous. The root is covered with blackish hair, having several fibrils. Native of Jamaica, by the banks of Rio Cobre.

9. *Osmunda verticillata*: scapes radicate; racemes verticillate; frond super-decompound. 10. *Osmunda cervina*: scape radicate; frond pinnate; pinnas quite entire. 11. *Osmunda bipinnata*: scape radicate; frond pinnate; pinnas pinnatifid. Found in South America by Plumier.

12. *Osmunda peltata*: shoot creeping; fructifications pedate, distinct, roundish-halved, entire; fronds dichotomous, with linear segments. This is a native of Jamaica, where it was found by Swartz. According to the President of the Linnæan Society, it is a species of *Acrostichum*.

13. *Osmunda aurita*: scapes radicate; fronds bipinnate at bottom; pinnate at top; pinnas at the base eared upwards, serrate, convex, shining. Native of Jamaica, where it was found by Swartz.

C

14. *Osmunda*

14. *Osmunda filiculifolia*: scape radicate, paniced; frond super-decompound. Found in South America by Plumier.

15. *Osmunda regalis*, osmund-royal, or flowering fern: fronds bipinnate; racemiferous at the top. Root thick, externally fibrous, and covered with thin brown scales. Plant from two to four feet high, of a pleasant transparent green. Pinnules of the frond from six to ten pairs, with an odd one at the end, each about two inches long; lanceolate or linear-lanceolate, blunt; finely, but indistinctly, ferrated, divided by a midrib, from both sides of which arise numerous fine bifid dichotomous nerves, their ramifications capillary and parallel; the lower and younger ones often lobed at the base. The central leaves are terminated by a bipinnate branch of fructifications; the pinnules awl-shaped, and crowded with sessile clusters of globular capsules, green when young, but reddish-brown when ripe, and bursting vertically. The external leaves are barren. Native of several parts of Europe, and also of Virginia, in watery places, and bogs. It is the largest and handsomest of our British ferns; and is found near Yarmouth, and St. Faith's Newton-bogs near Norwich; in the New Forest; in Cornwall; in the isle of Anglesea; in several parts of Scotland; in Ireland, where it is called *bog-onion*, in Kirkistown-bog. In Gerard, the names are, water-fern, Osmund the Waterman, St. Christopher's herb. This is the only species of *Osmunda* which is noticed by Mr. Miller. A full idea of it will be acquired by inspecting the annexed Plate.

16. *Osmunda Claytoniana*, or Virginian osmunda: fronds pinnate; pinnae pinnatifid, closely-fructifying at top. Linnaeus remarks, that *O. regalis* connects the preceding with this, and that this connects the following species with that. Native of North America. Introduced in 1772 by Samuel Martin, M.D. It flowers in August.

17. *Osmunda Capensis*: fronds pinnate; pinnae cordate-lanceolate, crenulate. Frond leafy, more than a foot high, simply pinnate, with a chaffy stock. Native of the Cape of Good Hope.

18. *Osmunda cinnamomea*, or woolly osmunda: frond pinnate; pinnae pinnatifid; scapes hirsute; racemes opposite, compound. Native of North America. Introduced in 1772 by Samuel Martin, M.D. It flowers in June.

19. *Osmunda struthiopteris*, bird's-nest, or Russian, osmunda: fronds pinnate; pinnae pinnatifid; fructifying scape distich. The fronds grow in a ring, forming a hollow disk, as in *Asplenium nidus* and *Scrophularia nodosa*, and thus affording an asylum to some of the amphibia, and a nest to birds; whence the name. It is a native of the north of Europe; and was cultivated in 1760 by Peter Collinson, esq. It is represented on Plate II.

20. *Osmunda lineata*: fronds pinnate, lanceolate; obliquely-cordate at the base, entire at the edge; the fructifying pinnae crenulate, scaly in the middle. 21. *Osmunda polypodioides*: fronds lanceolate, pinnatifid; segments confluent, entire, ascending, with raised dots at the edge; scape lanceolate; pinnae remote. Natives of Jamaica.

22. *Osmunda spicant*, or rough spleenwort: fronds lanceolate, pinnatifid; segments confluent, quite entire, parallel. Several barren leaves proceed from one fibrous root, disposed in a ring, half upright or reclining, from a span to a foot in length, resembling those of common polypody; the pinnae close, alternate, lanceolate, oblong, only about two lines broad, quite entire, curved upwards; the middle ones largest, an inch or an inch and a half in length; the upper and lower ones shorter, ribbed, the edge cartilaginous, very slightly notched, and bent backwards.

Dr. Withering, who in his second edition had made this fern an *Acrostichum*, in his third introduces it as a *Blechnum*, in compliance with the opinion of Dr. Smith and Mr. Robson, though, from the narrowness of the leaflets, it is not easy to determine whether the rows of capsules may more properly be considered as contiguous and

parallel to the midrib, which is the character of that genus, or as disposed along the edge of the leaf, which would refer it to the *Pteris*. It appears, however, from Hedwig's microscopical dissections, that the antheræ are found upon the midrib; and that circumstance seems sufficient to determine that the rows of capsules more properly belong to that than to the edge of the leaf, notwithstanding Hedwig himself has determined it to belong to the genus *Acrostichum*. Wherever botanists may at length agree to fix this fern, it is clear that it cannot be an *Osmunda*. It is a native of several parts of Europe, in woods and on moist heaths, producing its fructifications from July to September. It is not uncommon in Great Britain.

23. *Osmunda crispa*, curled osmunda, or, stone-fern: leaf-stalks from two to seven inches long, waved, green; leaf from an inch and a half to three inches long. Capsules surrounded with an elastic ring; and therefore this fern is not an *Osmunda*. Native of several parts of Europe, as Switzerland, Denmark, the south of France, Italy, and Great Britain. With us, in the county of Rutland; Cader Idris in Wales; Shap, near Kendal, &c. in the northern counties, on rocks, heaths, and old walls, common; on rocks and stones upon the highland mountains of Scotland. The fructifications are ripe in September.

24. *Osmunda Japonica*: frond bipinnate; pinnae cordate-lanceolate, ferrate. Stipe of the frond round, yellow, smooth. Frond bipinnate, with an odd leaflet. It differs from *O. regalis*, which it resembles very much, in having the fertile fronds distinct. Native of Japan; flowering in April and May.

25. *Osmunda lancea*: frond bipinnate; pinnae lanceolate, ferrate. This also has the fertile fronds distinct, with the flowering spikes super-decompound, ternate. Native of Japan; flowering in April and May.

26. *Osmunda discolor*: fronds pinnate; pinnae oblong, sharpish, entire, sessile, alternate, approximating. 27. *Osmunda procera*: fronds pinnate; pinnae remote, ovate-oblong, acuminate, ferrate, sessile. Natives of New Zealand.

Propagation and Culture. Osmund-royal, and the other European sorts, except moon-wort, will grow in a moist shady situation in gardens; but will not thrive very well without bog-earth. Moon-wort must have a dry situation. See *ACROSTICHUM*, *BLECHNUM*, *BOTRYCHUM*, *ONOCLEA*, and *PTERIS*.

OSNABRUCK TOWNSHIP, the fourth township in the county of Stormont, in Upper Canada, in ascending the river St. Lawrence. In front of this township is the rapid called the Long Sault.

OSNABURG, or **OSNABRUCK** (Bishopric of), a principality of Germany, bounded on the north and west by the bishopric of Munster, on the east by the counties of Ravensberg and Diepholz, and principality of Minden, and on the south by the county of Ravensberg; about forty miles long, and from sixteen to twenty-four wide. Almost half of this bishopric consists of heath-lands, which yield several sorts of turf and pasturage. The best spot in it lies about Quackenbruck, and is called *Artland*. This country produces as much rye as supplies the necessities of the inhabitants, and five hundred stills; but considerable quantities of wheat, oats, and barley, are imported from the principality of Minden, and the county of Schauenburg. The breeding of cattle is but small: out of East Friesland, during harvest-time in particular, large numbers of cattle are brought hither. In this country, too, is little wood; but, besides turf, it produces coal. Bishop Ernest Augustus II. established a salt-work at Dissen. Marble is also found here in plenty; and bishop Ernest opened a silver-mine, but this was afterwards abandoned. In the whole country are four principal towns, and three smaller, and about 20,000 fire-places or hearths; and in each of these two families frequently reside. The inhabitants are diligent and industrious. Of the peasants, about the number of 6000 go yearly to Holland, where they mow, till, cut turf, and do other work, for hire. The religion

religion of this country is partly Roman-catholic, and partly Lutheran. No Jews are tolerated.

The greatest and most beneficial occupation of the inhabitants of this country consists in the spinning of yarn, and the manufacturing a coarse kind of linen, which is conveyed by the Dutch, English, and Spaniards, to Guinea and America, and annually brings into this country 1,000,000 of rix-dollars.

The bishopric of Osnaburg is the first and oldest in all Westphalia, being founded by the emperor Charlemagne. In 1648, it was settled that this bishopric should alternately have a Roman-catholic and a Lutheran bishop, and that the chapter might choose and select the former, either from among themselves or elsewhere; but that they should always select the latter out of the house of Brunswick-Luneburg, and therein out of the posterity of duke George, and, on the full extinction of these, out of the posterity of duke Augustus. At the settling of the indemnities in 1802 at Ratisbon, it was agreed, that the bishopric should devolve to the house of Brunswick in perpetuity, on condition that the king of England, as elector of Hanover, should resign all pretensions to Hildesheim, Corvey, and Hoxter; and abandon his rights in the cities of Hamburg and Bremen; that he should cede the bailiwick of Wildhausen to the duke of Oldenburg, and his right of succession in the county of Sayn Altenkirchen to the prince of Nassau Usingen. By the peace of Tilfit, the new kingdom of Westphalia was announced, and Osnaburg annexed to it, and formed part of the department of the Weser. That short-lived kingdom being now defunct, the territory of Osnaburg has returned to the house of Brunswick.

OSNABURG, the chief city of the above-mentioned principality, has its name from a bridge over the river Hase, or Ose, which divides it into the Old and New Town; and stands seventy-five miles west of Hanover, and thirty north-east of Munster; being surrounded with walls and ditches, but commanded by a mountain within cannon-shot. It stands in a fine plain, and is adorned with several good buildings; and on the mountain there is an abbey. The magistracy of this city, which is re-chosen yearly on the 2d of January, is Lutheran; and the churches belong, some to the Lutherans, and some to the Papists. Both parties have the full and free exercise of their religion, whether the bishop be protestant or papist. The bishop's palace, called *Peterburgh*, was built by bishop Ernest Augustus, brother to king George I. It is well fortified, and separated from the town by a bridge. It is a hexagon, with a court in the middle, and at each corner a turret. In the town-house are still preserved the pictures of the plenipotentiaries that assisted at the conferences there for the famous treaty of Westphalia. In the treasury of the cathedral are still to be seen some ornaments given by Charlemagne; as also his crown, which is only of silver gilt, and his comb and baton, six feet in length, both of ivory; together with other curiosities. They have the best bread and beer that is to be met with in all Westphalia; and have a pretty good trade in bacon and linen, as also by brewing a palatable thick sort of beer called *buse*. This city is noted for a treaty between the emperor and the king of Sweden in 1648, wherein the affairs of the Protestants were regulated, which was a branch of the treaty of Westphalia. The town, with the rest of the principality, is subject to its bishop, who is a count of the empire, and by the treaty of Westphalia must be alternately a protestant and papist. The papist bishop is suffragan to the archbishop of Cologne; but the protestant bishop is indeed a temporal prince, and always of the house of Brunswick. Frederic duke of York, brother to his majesty George IV. is the present bishop. The cathedral is in the hands of the Roman-catholics, with the church and monastery of the Dominicans in the old city, and the collegiate church of St. John in the new. The Protestants are masters of the great parochial church of St. Mary in the old city; and both religions have a

voice in the election of the magistrates. The bishop's palace is fortified like a castle; here it was that George I. was born, on the 28th of May, 1660, his father Ernest-Augustus being then bishop and prince of the place; and here also he died, in the night of the 10th of June, 1727; and, as some say, in the very room in which he was born.

Not far from this city are to be seen the ruins of an old church and castle called *Beelem*, which some say was built by king Wittekind, upon his conversion; and about two miles from it lies the monastery of Rulle, on the bank of a lake, so deep, that report says it could never yet be fathomed. This was the first town in Westphalia which received the Lutheran doctrine. Osnaburg is twenty-four miles north-north-east of Munster. Lat. 52. 17. N. lon. 7. 4. E.

OSNABURG, a township of North America, in the state of Ohio, and in Stark-county; containing 300 inhabitants.

OSNABURG HOUSE, a settlement or station of the Hudson's Bay Company in North America, situated at the north-east corner of lake St. Joseph, 100 miles west-by-south of Gloucester-house. Lat. 51. 0. N. lon. 90. 15. W.

OSNABURG ISLAND, a small island in the South Pacific Ocean, supposed to have been first discovered by Quiros, in 1606, who called it *Dezana*; Bougainville called it *Boudoir*; Capt. Wallis, who visited it in 1769, called it *Osnaburg*; the natives name it *Maita*. The form is nearly circular, and the land elevated, but no anchoring-place was found. In some parts it appeared covered with cocoa-nut and other trees, and in others nothing but a naked rock; the inhabitants were well clothed, and seemed to be of a humane disposition: they made use of canoes to visit the neighbouring islands: some hogs were seen. Captain Cook visited this island in the year 1769. Lat. 17. 51. S. lon. 147. 30. W.

OSNABURG ISLAND, an island in the South Pacific Ocean, discovered by Capt. Carteret in the year 1767. It is a small flat island, covered with trees. Lat. 22. S. lon. 141. 34. W.

OSNABURGS, *f.* White and brown coarse linens imported from Osnaburg in Germany. A cloth resembling them is manufactured in Angus in Scotland.

OSNEY. See the article OXFORD.

OSOKOL'SKO, a town of Russia, in the government of Archangel, on the river Mezen: 104 miles east-north-east of Archangel.

OSO'LA, a town of the island of Sardinia: fourteen miles north-north-east of Sassari.

OSONA'LA, a town of Naples, in Abruzzo Ultra: ten miles east-south-east of Aquila.

OSO'PO, a fortress of Italy, in Friuli: five miles west of Gemona, and fifteen north-west of Udina.

OSO'RIO (Jerome), a learned Portuguese prelate, who flourished in the sixteenth century. Flattery and sabbie deduce the family of the Oforios from no less a person than Osiris, who figures in the fabulous history of Portugal. Without going back to the demigods, Jerome was descended by both his parents from illustrious families, and born at Lisbon in the year 1506. From early childhood he discovered a strong inclination for learning, and astonished his masters by the rapidity with which he became such a proficient in the Latin language as to be able to converse in it. At the age of thirteen he was sent to the university of Salamanca, where he perfected himself in Latin and Greek, and afterwards, by the command of his parents, applied for some time to the study of the civil law, carefully reading the best writers in that faculty. When he was nineteen years old he removed to Paris, where he studied dialectics and natural philosophy under the celebrated professors in that city. From Paris Oforio went to Bologna, where he devoted himself entirely to the study of divinity, the sacred scriptures, and the Hebrew language. The character which he here acquired for profound skill in theological and biblical knowledge, induced king John, upon Oforio's return to his native

native country, to appoint him professor of sacred literature at the university of Coimbra, where he explained the prophet Isaiah, and the Epistle of St. Paul to the Romans, with great applause. Some time afterwards he was ordained priest, when the infant Don Louis presented him to the benefice of Tavara. Not long after this, cardinal Henry, brother to the king, and archbishop of Evora, made him archdeacon of his church; upon which occasion he voluntarily resigned his benefice of Tavara, that he might afford no ground for suspicion that he had devoted himself to the ecclesiastical profession from interested motives. He retained this post till Catharine of Austria, the widow of king John, and regent of the kingdom during the minority of her grandson Sebastian, promoted him to the bishopric of Sylves. He now applied to the government of his diocese with exemplary diligence and fidelity. Every third year he regularly visited the whole of it, exercising the strictest vigilance over the characters and morals of his clergy; and, where his admonitions failed in correcting the profligate and insufficient, supplying their places with well-informed and worthy successors. Instead of accumulating his revenues, or expending them in needless ostentation, he devoted the whole, beyond what his frugal and necessary demands required, to useful and benevolent purposes. His palace was the resort of learned and worthy men, whom he supported and encouraged in their honourable pursuits. He was free of access to all; and the poor and afflicted found in him a kind adviser and generous benefactor.

When king Sebastian arrived at his majority, he determined to attempt the conquest of Africa, against which Oforio earnestly admonished and humbly entreated him, foreseeing and predicting the disastrous consequences that would necessarily result from it. When he found his remonstrances unavailing, he went under various pretences to Rome, that he might not be a witness to the calamities which he was sensible were impending over his country. He was favourably and respectfully received by Gregory XIII. Sebastian, though he would not follow the advice of this prelate, could not bear that he should be absent from his country, and recalled him to Portugal within twelve months of his departure. He returned, and almost immediately received the fatal intelligence of the destruction of his sovereign and his army in the battle of Alcazar against the Moors. (See the article PORTUGAL.) We cannot in this place enter into the miseries in which the consequences of that battle involved Portugal, particularly after the death of king Henry. On this last event, Oforio, always the friend of peace, advised submission to the claims of Philip II. king of Spain to the crown, and he laboured to preserve the people of his diocese from taking a part in the tumults which distracted and laid waste the kingdom. These disorders he took so much to heart, that it is said he died with grief, in the year 1580, when about the age of seventy.

Dupin gives him the following character as an author: "He wrote with ease and eloquence. He is entitled to the denomination of the *Portuguese Cicero*, since no writer has more closely imitated that Roman, whether we regard his style, his choice of subjects, or his manner of treating them." Notwithstanding the eulogium of this critic on his style, our countryman Bacon condemns "the weak and waterish vein" of Oforio. His works are numerous, partly political and partly theological. The latter chiefly consisted of Paraphrases on Job, the Book of Psalms, the Book of Wisdom, and Isaiah; and Commentaries upon several of the books of the Old Testament. These works, with twenty-one Sermons, were collected together, and published at Rome in 1592, in four volumes, by his nephew Jerome, canon of Evora, who also wrote, 1. A Life of his uncle, which he prefixed to the collection of his works. 2. Notationes in Hieronymi Oforii Paraphrasim Psalmorum, printed in the third volume of the above-named collection; and said by Dupin to con-

tain valuable critical observations on the Hebrew text. 3. Paraphrasis et Commentaria in Ecclesiastem nunc primum edita; et Paraphrasis in Canticum Canticorum et in ipsum recens auctæ Notationes, 1611, 4to.

"The work (says Mr. Southey) by which the bishop of Sylves is best known, is his history *De Rebus Emmanuelis, Lusitanæ Regis, &c.* of which a new edition appeared so lately as 1791, at Coimbra, in 3 vols. 12mo. Of this work, which is beautifully printed, there is a French translation, and also an English one. The kings of Portugal, as their history was more splendid than that of all others, seem to have been of all sovereigns most desirous that it should be fully related and extensively known. Not content therefore with the works of Castanheda, Bras d'Albuquerque, and Joam de Barros, they would have their eastern conquests chronicled in Latin, that all learned men might become familiar with triumphs so glorious. Pursuant to the desire, two histories in Latin of the discovery of India, and the conquests there, appeared about the same time, one by the Jesuit Maffæus, and the other this work by Oforio. Oforio's library was carried off by the English fleet on their return from Cadiz in 1596. The Bodleian was opened the ensuing year; and Essex gave sir Thomas Bodley a considerable part of this collection. *Gen. Biog.*

OSOR'NO, a town of Chili, situated in a district abounding in gold mines: forty miles south-east of Valdivia. Lat. 40. S. lon. 73. 40. W.

OSPRAY, or OSPREY, *f.* [corrupted from *osifragus*, Lat. *Johnson*.—Serenius derives it from the Goth. *os*, the mouth of a river, and *prey*.] The sea-eagle. See FALCO osifragus, vol. vii.—Among the fowls that shall not be eaten, are the eagle, the osifrage, and the *ospray*. *Lev. xi. 13.*

I think he'll be to Rome,
As is the *ospray* to the fish, who takes it
By sovereignty of nature. *Shakespeare's Coriolanus.*

OSPRINGE. See FEVERSHAM, vol. vii. p. 343.

OS'QUES, or OP'QUES, a people of Italy, called also Ausonians, or Aurones; and thought to be the most ancient inhabitants of Italy, and the original possessors of Herculeum. A Grecian colony which established itself upon the neighbouring coasts, and founded the city of Cuma, dispossessed the Osques of all the coast on the gulf of Naples, and consequently of Herculeum. See *Gen. Mag.* for 1755. p. 123.

OSRHOENE, in ancient geography, a small state of Asia, which occupied the northern and most fertile part of Mesopotamia, between the Euphrates and the Tigris. Under the Seleucidæ, a part of this country took the name of *Mygdonia*, with the title of kingdom. Polybius speaks of this kingdom in connection with Antiochus the Great. The capital of this kingdom was EDESSA; which see. The feeble sovereigns of Osrhoene, placed on the dangerous verge of two contending empires, were attached from inclination to the Parthian cause; but the superior power of Rome exacted from them a reluctant homage, which is still attested by their medals. After the conclusion of the Parthian war under Marcus, it was judged prudent to secure some substantial pledges of their doubtful fidelity. Forts were constructed in several parts of the country, and a Roman garrison was fixed in the strong town of Nisibis. During the troubles that followed the death of Commodus, the princes of Osrhoene attempted to shake off the yoke; but the stern policy of Severus confirmed their dependence, and the perfidy of Caracalla completed the easy conquest. Abgarus, the last king of Edessa, (A.D. 216.) was sent in chains to Rome, his dominions reduced into a province, and his capital dignified with the rank of colony; and thus the Romans, about ten years before the fall of the Parthian monarchy, obtained a firm and permanent establishment beyond the Euphrates.

OSRUSH'NAH, a town of Turkestan, and capital of a district,

a district, or province, to which it gives name: sixty-five miles north-north-east of Samarcand, and seventy south-west of Kojend. Lat. 40. 30. N. lon. 64. 40. E.

OSSA, a lofty mountain of Thessaly, near the Peneus, which runs between this mountain and Olympus; famous in the fabulous story of the giants; (Homer, Virgil, Horace, Seneca, Ovid.) The bending and unbending of its pines, on the blowing of a strong north wind, formed a clashing sound like thunder; (Lucan.) It was once the residence of the Centaurs, and was formerly joined to Mount Olympus; but Hercules, as some report, separated them, and made between them the celebrated valley of Tempè. This separation of the two mountains was more probably effected by an earthquake, which happened about 1885 years before the Christian era. Its greatest celebrity arises from its being one of those mountains which the giants in their wars against the gods heaped up one on the other, to scale the heavens with more facility.

OSSA, a river of Prussia, which runs into the Vistula fifteen miles below Culm.

OSSABAW', an island in the Atlantic, near the coast of Georgia, twenty miles in circumference. Lat. 31. 42. N. lon. 81. 17. W.

OSSABAW' SOUND, a channel of the Atlantic, between the islands of Great Waffaw and Ossabaw. Lat. 31. 43. N. lon. 81. 12. W.

OSSAPE'E. See OSSIPPEE.

OSSA'RA, a town of Hindoostan, in Mohurbunge: eighteen miles north of Harriopour.

OSSAT (Arnaud d'), Cardinal, was born in 1536, of parents in humble life, at a village near Auch: he was left an orphan at an early age, and rose in the world wholly by his own merit and industry. Entering into the service of a young nobleman of the house of Marca, he studied with him, and in time became his preceptor. In 1559 he took his pupil, with two other young persons, to Paris, where he carefully superintended their education, at the same time taking care not to neglect his own studies. In philosophy he was a disciple of Ramus, and composed a work in his master's defence. After he had made what he deemed sufficient progress in his legal studies, he practised at the bar in Paris, and was greatly admired for his masculine eloquence. He obtained the post of a counsellor in the presidial court of Melun: after this he went with Paul de Foix, archbishop of Toulouse, who had been nominated by Henry III. ambassador to the court of Rome, as his secretary. After the death of that prelate, in 1584, Ossat took holy orders, and was received into the house of cardinal d'Este. The secretary of state, Villeroy, made him chargé d'affaires for the French court; and in this quality, at the beginning of Henry IVth's reign, he was highly serviceable in promoting the reconciliation of that king with the see of Rome. In 1598 he was honoured with a cardinal's hat; and, in three years afterwards, was made bishop of Bayeux. He died in 1604. An eminent French writer gives him the following character: "He was a man of great penetration, and singularly prudent and circumspect in the management of affairs; so that it is said of him, that he never made a false step." He left behind him a great number of Letters relative to the negotiations in which he was engaged, which are reckoned models of political sagacity. The best edition is that of Amelot de la Houssaye, in 1698, in two vols. 4to. and five vols. 12mo.

OSSEGG, a town of Bohemia, in the circle of Leitmeritz: eighteen miles north-north-west of Leitmeritz.

OSS'LEET, *f.* [Fr. a little bone.] A very hard excrescence, resembling a little bone, on the inside of the knee, (and never on the outside,) appearing to be of the same substance with the rest of the knee, and only distinguishable from the knee by its extending a little lower.

OSS'EN, a town of Silesia, in the principality of Oels: two miles south-west of Mittelwald.

OSSEN'GA, a town of Italy, in the Veronese: six miles north of Verona.

Vol. XVIII, No. 1219.

OSS'EOUS, *adj.* [offeus, Lat.] Bony; resembling a bone. —To pursue the *osseous* and solid part of goodness, which gives stability and rectitude to all the rest. *Brown's Chr. Morals.*—A medullary, and consequently *osseous*, substance. *Biblioth. Bibl.*

OSS'ETT, a village in the West Riding of Yorkshire, containing about 3500 inhabitants, of whom 1000 are employed in trade and manufactures. It is three miles west of Wakefield.

OSS'ERBACH, a river of Germany, which runs into the Wichra near Frobburg, in the margravate of Meissen.

OSSI'ACH, a town of the duchy of Carinthia, on the lake Ossiacher: four miles south-west of Feltkirchen.

OSSI'ACHER SEE', a lake of Carinthia, four miles long and two wide: four miles north-east of Villach.

OSS'IAN, [*O'Sian*, Irish and Gothic, the Man of Song.] A Celtic bard, who, as well as Fingal and other heroes whom he is said to have celebrated in his poems, is claimed both by the Highlanders of Scotland and by the Irish. It is highly probable, that the name of Ossian and his heroes would have been confined to these people, had not Macpherson, about the middle of the last century, published two volumes of poems, as the genuine offspring of this Celtic bard. The circumstances which he stated as having attended the discovery of these poems, and the nature and description of the poems themselves, excited strong suspicions of their authenticity, almost as soon as they were given to the world: the controversy to which these suspicions gave birth, contributed to render them known and popular; however, it would be unfair to deny, that their intrinsic merits, though certainly very much misrepresented and overrated, also obtained them popular applause and favour. There were also other circumstances, besides the singular and suspicious nature of their discovery and publication, and the poetic merit which they possessed, or were supposed to possess, which fixed on them the curiosity and interest of men of philosophy and literature. They exhibited a most uncommon and unparalleled picture of human manners; a picture which, if it were drawn from nature, would confound all the principles which philosophy had deduced from the history of mankind: they also related events, not easily reconcilable to the authenticated history of the country where the scene was laid. On these accounts, the interest of almost all classes was fixed upon them: they were admired by the lovers of poetry, who, in their admiration, had not time or inclination to investigate their authenticity; while, by those who viewed them more coolly and philosophically, and who could not permit themselves to admire before they were convinced of their authenticity, strong and various objections were urged against their claim to be considered as the poems of Ossian. The interest which they excited was still farther increased, by the Highlanders taking up the question, both respecting their authenticity and their poetical merits, as one in which their honour and pride were immediately and deeply concerned: they could not tamely or quietly abandon the belief that Ossian wrote these poems; and, when Macpherson was charged with having forged them, the firm conviction they had expressed of their authenticity, joined to the disgrace which, through Macpherson, they thought would fall on themselves, rendered them most obstinate in their original belief.

Whether Ossian and his heroes were Scotch or Irish—the period during which they flourished—and the controversy respecting the authenticity of the poems—are points to which more attention has been given than to the real merits of the compositions themselves.

Although the claims of the Highlanders to Ossian and his heroes have been more urgent and repeated than those of the Irish, there is good reason for believing that the latter possess the greatest justice. There are numberless traditions in Ireland concerning the *Fions*, a species of militia inhabiting Leinster, and commanded by Fin Mac Coul: that this Fin Mac Coul is the same as the Fingal

of Macpherson is clear, from the identic name of the father Cowal, the son Oisín, and the grandson Oskir; and from the old Scotch poets, who sometimes call him Fingal, and sometimes Fin Mac Coul. Among the warriors of this ancient militia, the Irish traditions and histories hand down the names of Goll Mac Morn, (Gaul the son of Morni,) of Osgur the son of Oisín, evidently the Oisían of Macpherson, of Fergus O'Fillan, and other warriors. Ossian himself, also, is celebrated among the Fions. Besides these heroes, Irish traditions and ancient manuscripts mention a military order in Ulster of earlier date, the chief ornament and support of whom was Cuchullin. This evidence undoubtedly ascribes Ossian and his heroes to Ireland; but it is farther corroborated, even by the traditions and old songs and poems of the Highlands; though the passages in the latter which describe Ireland as the native country of Ossian, Fingal, &c. have been altered for controversial purposes: it is needless to cite all these passages. The following, from Erse poems, collected in the Highlands by Dr. Young bishop of Clonmore, and published in the first volume of the Irish Transactions, may suffice. In the combat of Con the son of Dargo, and Gaul son of Morne, the Fions are called "the noble Fions of Ireland:" this, in the Perth edition of this poem, is changed into "the nobles and great chieftains." In the combat of Osgar, and Illan son of the king of Spain, for "the Fions of Ireland," the Perth edition substitutes the "noble Fions." In a poem called the Death of Oscar, of which Macpherson made use in the first book of Temora, Ireland is expressly mentioned as the country of that prince: "The death of Oscar grieved my heart; our loss is great in the prince of the chiefs of Ireland:" and, in another poem on this subject, still current in the Highlands, Oscar is called the "prince of Ireland: the prince of the heroes of fertile Ireland." Even so late as the time of Gawin Douglas, Ireland seems to have been regarded as the country of Fingal and the other heroes of Ossian:

Great Gow Mac Morn, and Fin Mac Coul, and how
They should be gods in Ireland, as men say.

There is another circumstance, which considerably strengthens the opinion that the Fions were natives of Ireland. No Highlander ever heard of *Selma*, except through the poems published by Macpherson; whereas *Almhuin* is pointed out by every old Irishman as the abode of Fingal: the name of this place occurs frequently in the poems which were collected in the Highlands by Dr. Young; it is always mentioned as the palace of Fingal; neither Selma, nor any other place of residence, is given in these poems to this hero; and it is worthy of remark, that Macpherson, in the use he has made of these poems, has either omitted altogether the name of Almhuin, in order that no trace of Fingal's real country might exist, or changed it into *Albin*, in order to countenance the idea that he was a native of Scotland; as will appear from the following passages: "Greater love seized all the heroes of Fin of Almhuin." On this passage Dr. Young remarks: "The palace of Fin Mac Cumhal in Leinster, was seated on the summit of the hill of Allen, or rather, as the natives of that country pronounce it, Allowin: the village and bog of Allen have thence derived their name. There are still the remains of some trenches on the top of the hill, where Fin Mac Cumhal and his Fions were wont to celebrate their feasts. The country hereabouts abounds in wonderful tales of the exploits of these ancient heroes. These two lines are omitted in the Perth edition." Irish Transactions, i. 76.

In the Dublin copy of the poem on the invasion of Ireland by Erragon, which Macpherson appears to have made use of in his battle of Lora, these words occur: "To Almhuin in Leinster, the residence of the Fions, they took their voyage across the sea;" in this place Macpherson has substituted the word *Albin*, though, as Dr. Young remarks, there can be no excuse for this alteration, "as the king of Lochlin is represented steering his fleet boldly

to the coasts of Ireland, and challenging the heroes of Innisfail. The infidelity therefore of the queen of Lochlin could not be said to have been the cause of spilling Scottish blood, since the scene of the whole transaction is laid in Ireland, and they are the heroes of Innisfail who fell in battle."

As therefore the Irish traditions respecting the Fions are uniform and consistent; as, even in the poems which celebrate their exploits, and which are current and popular in the Highlands, many passages occur, in which Ireland is expressly mentioned as their native country; and as, besides, the palace of Fingal is a place not known in the Highlands, but is still pointed out, at least by similarity of name, in Ireland, we are justified in concluding that Ossian and his heroes were natives of Ireland. This conclusion will be still farther strengthened, if we examine the vague and inconsistent notices which Scotch tradition and history records of Ossian and his heroes. Indeed, in Scottish history they were never heard of till Bruce claimed them as of Scotch extraction; for, in the passages quoted by the Highland Society (in their Report on the Poems of Ossian), Fingal, and the other heroes of that bard, are mentioned, without any reference to the country of which they were natives. The Highland Society lay great stress on the proverbs which are current in the Highlands respecting Ossian, and the names of places corresponding with the names of his heroes. *Ossian dale*, blind Ossian, is a person as well known there as strong Sampson, or wise Solomon: the very boys, in their sports, cry out for fair play, "the equal combat of the Fingalians:" and "Ossian, the last of his race," is proverbial, to signify a man who has had the misfortune to survive his kindred. Old people (says Mrs. Grant) can very well remember, before Mr. Macpherson ever thought of translating these remains, when many comparisons and allusions to be found in them were as current as Scripture-quotations in the last age among the peasants of the west. "She is as beautiful as Agandecca, the daughter of the snow; she is musical as Malvina; he is as forlorn as Ossian after the departure of the Fingalians; such a one is alert and nimble as Cuchullin:" were phrases in common use. Whatever embellishments or whatever anachronisms the injudicious vanity of a translator may have grafted on these poems, no person who lived in the country of their reputed author ever doubted their existence or antiquity: there every stream and mountain, every tale, song, or adage, retained some traces of the generous hero, or the mournful bard. And, in answer to the queries which were transmitted by the Highland Society, several of their correspondents mentioned the names of various places in their neighbourhood, tending to show the universal ancient traditionary belief of the existence of Fingal and his heroes. "Among many others, were enumerated the well-known cave of Staffa, first made known by the description of sir Joseph Banks; the whirlpool, or gulf, set down in Blair's Atlas Scotiæ, published A. D. 1662, called *Coire Fin Mac Coul*, or the Whirlpool of Fion son of Comhal; and the hill in the isle of Sky, known by the name of *Ait Suidh Fhinn*, or Fingal's Seat. Indeed, there are few districts in the north-west of Scotland, where such instances may not be found." Report on the Poems of Ossian. Poems by Mrs. Grant of Laggan.

But all these circumstances, even when collected and taken together, do not amount to a proof that Ossian and his heroes were natives of the Highlands of Scotland: they merely prove the antiquity of the tradition and belief respecting them. In Ireland, on the other hand, there are not only similar proverbial and local notices (if the expression may be allowed) of Ossian and his heroes, but there is historical evidence that the Fions were Irish, and the palace of their chief is still recognised and pointed out. None of the traditions, or genuine poems, preserved in the Highlands, which have reference to them, name or claim them as natives of that country; whereas, in several passages of the latter, they are clearly and expressly declared to have been natives of Ireland, and to have re-

ided

sided there, and there to have carried on their military exploits. But it may be asked, how happens it, if Ossian and his heroes were Irish, that the tradition of them is so strong and prevalent in the Highlands, the proverbial expressions relating to them so marked and numerous, and the places named after them so common. The solution of this difficulty is very easy: it is well known that, at the period when the Fions lived, the intercourse between that part of Ireland where they are said to have resided, and the Highlands of Scotland, was frequent; and it is also highly probable, as will afterwards be shown, that an Irish colony, nearly at, or immediately subsequent to, this period, passed over to that part of the Highlands where the traditions and notices of Ossian are most commonly met with.

It is not very easy accurately and satisfactorily to fix the period when Fingal and Ossian flourished: the era which Macpherson assigns them must be given up. Later Irish manuscripts, traditions, and poems, both in Ireland and the Highlands, represent Ossian as contemporary with St. Patrick; but, if we may depend on the account of the Irish militias of Ulster and Leinster, Fingal must have preceded St. Patrick nearly two centuries; and, consequently, his son Ossian could not have been contemporary with him. According to the Irish annals (on the authenticity of which, however, much stress ought not to be laid), Fingal flourished under Cormac O'Cuin, about the year 254. That Ossian was not contemporary with St. Patrick, is, however, most satisfactorily proved from Jocelin, a writer of the twelfth century, in his life of that saint, who places Fin Mac Coul above a hundred years before him. Ossian and his heroes may therefore be placed about the end of the third and the beginning of the fourth century; and it may be inferred, that all poems that refer them to a later period, are not the genuine poems of Ossian. It will be proper to keep this remark in our recollection when we come to discuss the authenticity of the poems which have been ascribed to this bard.

There are scarcely any notices respecting these poems to be found in old authors who treat either of Ireland or of Scotland: the bards or *seanachies* of the latter country do not trace up their kings to the Fions, or heroes of Fingal, but to the Dalriadic monarchs. At the coronation of Alexander III. a Highland genealogist is introduced by Fordun to recite the royal pedigree; but, instead of ascending from Fergus Mac Erth, to Erth Congal, Fergus, Fingal, and from thence, according to Ossian, to Comhal, Trahal, and Trenmor, he proceeds through the whole race to Fergus I. a sufficient proof that there was no tradition then of "the six kings of Morven," nor any poems which treated of the exploits of Fingal and his heroes. Had these poems existed in the time of Monro dean of the Isles, he would have appealed to them in his genealogy of the clans. Buchanan indeed, in his account of the family of Buchanan, mentions the militia of Fin, and speaks of "rude rimes," on the actions of Fin Mac Coul, as retained by the Irish and Scottish Highlanders. There is, however, a passage in bishop Carswell's introduction to his translation of the Forms of Prayer into Gaelic, printed at Edinburgh in the year 1567, which is quoted in the Report of the Highland Society, in order to give an idea of the general impression and delight which the recital of the poems or ballads (of Ossian) produced among the inhabitants of the Highlands. In this passage the bishop complains, that "great is the blindness and sinful darkness, and ignorance, and evil design, of such as teach, and write, and cultivate, the Gaelic language, that, with a view of obtaining for themselves the vain reward of this world, they are more desirous and more accustomed to *compose* vain, tempting, lying, worldly histories, concerning the *Tuatha de dannan*, and concerning warriors and champions, and Fingal the son of Cumhall, with his heroes, and concerning many others which I will not at present enumerate, than to write, and teach, and maintain, the faithful word of God, and of the perfect way of truth." Now this passage, cited by the Highland Society,

in order to prove the currency and popularity of Ossian's poems, actually proves, that the bards were accustomed, in the time of bishop Carswell, to *compose* poems concerning Fingal, which poems were probably in subsequent ages considered as the genuine poems of Ossian.

The first person who seems to have conceived the idea of collecting the poems and ballads of the Highlands, was a young man, Jerome Stone of Dunkeld, who had acquired a knowledge of the Gaelic language. Of one of the poems which he collected he published a translation in rhyme, in the Scotch Magazine for January 1756. Nearly about the same time, Mr. Pope, minister of Reay in Caithness, entertained the design of making a collection of the ancient poetry of the Highlands; but, in consequence of the death of the gentleman who engaged with him in this undertaking, he seems to have dropped it very soon.

The next collector of Gaelic poetry was Mr. James Macpherson. In the year 1759, Mr. Home, the author of Douglas, met him at Moffat; in the course of a conversation on the manners of the Highlands, Macpherson informed him that one of their favourite amusements "was to listen to the tales and compositions of their ancient bards, which he described as containing much pathos and poetical imagery; and, at Mr. Home's desire, he translated some fragments which his memory served him to recollect. The beauty of these fragments struck Mr. Home, and his friends at Moffat, to whom he communicated, them so forcibly, that they prevailed on Mr. Macpherson, who was rather averse to the undertaking, to publish them in a small volume at Edinburgh, of which they agreed to superintend the publication, and defray the expense." (Report of the Highland Society on the Poems of Ossian, p. 27.) This small volume contained the opening, and some episodes, of Fingal; and an intimation was given, that, if it were favourably received, the whole of Fingal might be recovered. A subscription was accordingly set on foot, to enable Macpherson to perform a tour through the Highlands, to collect larger and more complete specimens of Gaelic poetry. When he returned to Edinburgh, he communicated to his literary patrons the result of his expedition; and, soon afterwards, FINGAL, an Epic Poem in Six Books, was published, along with some small detached pieces. In the year 1765, he published another epic poem, entitled TEMORA. To one of the books of this poem he annexed what he called the original Gaelic; but of the rest he only published the translations. At his death, however, he left 1000*l.* to defray the expense of the publication of the originals of the whole; on which publication we shall afterwards offer some remarks.

The success which attended Macpherson's researches, and the fame he acquired by the publication of the poems of Ossian, incited several others to proceed into the Highlands, and to collect, from tradition or manuscripts, Gaelic ballads; while, as a suspicion of the authenticity of what Macpherson had published arose in the minds of many, enquiries were also set on foot, for the purpose, if possible, of detecting the supposed imposture. There is reason to believe, too, that some of the poems which were given to the world, after the success and fame of Macpherson, were not genuine Gaelic poems, nor even founded on the traditionary ballads of the Highlands, but entirely the fabrication of those who published them.

Previously to the year 1780, Mr. Duncan Kennedy, formerly a school-master in Argyleshire, and afterwards practising as an accountant in Glasgow, began to collect and transcribe from oral recitation, among the natives in the western Highlands, several fragments of Gaelic poetry; and his collection, consisting of three thin manuscript volumes in folio, was purchased by the Highland Society of Scotland, in whose possession they still remain. It is however very uncertain what part of these MSS. is genuine ancient Gaelic poetry, and what is to be ascribed to the collector as his own composition; since he has avowed himself the author of two of the poems, and has hinted

hinted that various passages in others of them were either composed or altered by him. Whether or not we are to set these confessions to the account of Mr. Kennedy's vanity, it is impossible for us to determine; but it is generally allowed that at least a considerable part of the MSS. is of an ancient date.

In the year 1780, Mr. John Clark, land-surveyor in Badenoch, published translations of Gaelic poetry. The principal of these was a regular poem in three books, two of which were afterwards published in a verse-translation by Mrs. Grant of Laggan. In the same year, Mr. Hill, in a tour through the Highlands, collected, chiefly from one Macnab, a blacksmith in Argyleshire, copies of several ancient poems; which, from the incidents they contain, and other internal evidence, must be deemed of a later date than that which Macpherson is disposed to attribute to the poems which he published. Along with translations of these poems Mr. Hill gave the Gaelic original; and to the whole he subjoined remarks on the authenticity of Macpherson's Ossian, which at that time had become the subject of keen controversy.

But the most voluminous collector of Gaelic poetry, since the time of Macpherson, was Dr. Smith, minister of Comletown in Argyleshire. In the year 1780, he published "*Dissertations on Gaelic Antiquities*," to which he annexed a "*Collection of Ancient Poems, translated from the Gaelic of Ossian, Ullin, Oran, and others*;" and afterwards, in 1787, he published the original Gaelic poems from which he professed to have translated that collection. Of these compositions, too, much has been ascribed to Dr. Smith as an author; and, as the doctor declined giving a categorical answer to the questions of Dr. Graham on this delicate point, we may perhaps construe his silence into a tacit confession that he had at least a share in the formation of the poems. It appears evident, however, from Dr. Graham's literal translations of passages in Smith's Gaelic poems, compared with the English versions published by the latter gentleman, that these poems were originally composed in Gaelic, which is at least a strong presumption in favour of their antiquity; for, whatever the opposers of Macpherson may allege respecting the poetical abilities of this gentleman, and other later collectors of Gaelic poems, it is improbable that, in the present state of Gaelic literature, (when the language is confessedly declining in use,) and in the present altered state of manners and society in the Highlands, (which is by no means favourable to poetic genius,) persons should still be found capable of composing, in that language, poems equal in beauty and sublimity to what we might expect from a much more ancient, and, as far as genuine poetry is concerned, a more enlightened period.

Some years after Dr. Smith had published his *translations*, but a year previous to the appearance of his *originals*, a large collection of Gaelic poetry, ancient and modern, was printed by Mr. John Gillies, a bookseller at Perth. Of this work we know nothing; but, in the opinion of Mr. Mackenzie, it has considerable merit; though it is evident, from the manner in which it is arranged, that it was not prepared for the press with sufficient accuracy and attention.

About the year 1784, Dr. Young, afterwards bishop of Clonmore, made an excursion through the Scottish Highlands, for the purpose of collecting all the information in his power concerning the authenticity of Macpherson's Ossian. The result of his enquiries and investigation he gave to the world in the first volume of the *Transactions of the Royal Irish Academy*. It consisted of some rude ancient Gaelic poems respecting the race of the Fions, which we have already had occasion to notice and quote. These poems Dr. Young transcribed letter for letter from the copies current in the Highlands, except so far as they were corrected by the edition published at Perth. Dr. Young does not mention the apparent antiquity of the MSS. from which he transcribed these ballads.

These are the principal collections of Gaelic poetry

which have been published, as preserved by tradition or in manuscript, in the Highlands of Scotland. In Ireland a collection made its appearance soon after Macpherson's Ossian; this consisted of a translation in rhyme, by Miss Brooke, of some Irish ballads, which she supposes to be of a later date than that in which Ossian flourished, and probably of the eighth, ninth, and tenth, centuries. Most of these Irish poems relate to the Fingalians; but they differ both in the incidents which they relate, and in their manner and style, from the poems under similar titles which have been collected in the Highlands of Scotland. One most striking difference consists in the magical machinery of the Irish poems, instead of the mere reference to the belief of the employment and intervention of departed spirits, which the Fingalian poetry of the Highlands exhibits.

Before we proceed to inquire into the authenticity of the poems of Ossian, we shall endeavour to point out, in very few words, their most striking characteristics.

On the first perusal of these poems, the reader is struck with their obscurity; he finds it necessary to pause and reflect, before he can ascertain the meaning of many passages, or perceive and trace the connection of the narrative. Even after he has become accustomed to the style, he is obliged to leave in despair many parts as absolutely unintelligible, or at least as conveying no clear and distinct idea or image to his mind. Besides this great fault, the poems labour under the imputation of being excessively bombastic and turgid; so that a reader of taste and judgment has several difficulties to overcome, before he can sit down to their perusal in such a state of mind and feeling as will permit and enable him calmly and impartially to appreciate their merits. And, even after he has got over the repugnance excited by their obscurity and bombastic style, he will be in danger of being repelled and disgusted by their sentimental effusions, which, in many instances, are of the most romantic and sickly character. Still, however, there is something in the poems which gets the better of all these objections, and which is more powerful in its attractions than the faults which we have noticed are in their repulsive quality. The great characteristics of Ossian's poetry, are undoubtedly, as Dr. Blair remarks, tenderness and sublimity; but the tenderness is pathetic, melancholy, and solemn; and the sublimity is dreary, desolate, and gloomy. There is nothing gay or cheerful; the mind of the reader is prepared for the grave and solemn events which they record, by the wild and romantic scenery which they describe. The extended heath by the sea-shore; the mountain shaded with mist; the torrent rushing through a solitary valley; the scattered oaks, and the tombs of warriors overgrown with moss; all produce a solemn attention in the mind, and prepare it for great and extraordinary events. We agree with the French poet Lebrun:

Homère, au soleil de la Grèce,
Emprunte ses plus doux rayons;
Mais Ossian n'a point d'ivresse:
La lune glace ses crayons.

Sa sublimité monotone
Plane sur de tristes climats;
C'est un long orage qui tonne
Dans la saison des noirs frimas.

De manes, de fantômes fombres,
Il charge les ailes des vents;
Et le souffle des pâles ombres
Refroidit même les vivans.

Upon the whole, the merits of Ossian's poetry must be allowed to be great; it has also great faults: to those whose judgment and taste have been disciplined by study, and formed on the models of antiquity, the faults will seem to counterbalance the beauties; but, in the opinion of the multitude, the beauties will preponderate, and with them the poems of Ossian will always be popular.

Though

Though the publication of *Fingal* and *Temora* procured for Macpherson a considerable share of public favour, and were supported by all the abilities and enthusiasm of Dr. Blair, yet, even on their first appearance, persons of talent and critical acuteness openly avowed a disbelief of their authenticity. Many others, though disposed to favour the poems and their editor, expressed scepticism with respect to the manner in which the originals were said to have been obtained, and the fidelity with which they had been translated. Among these may be ranked David Hume, who, in his letters to Dr. Blair on this subject, written in 1763, and reprinted by the Highland Society in the beginning of their Report, intimates the suspicions which he and others entertained, and points out the method in which he thinks these doubts are most likely to be removed. From the first of these letters, it appears that, immediately after the publication of the poems, many literary men rejected them with disdain and indignation, as a palpable and most impudent forgery; on the grounds, that the manners described in the translations were not such as were likely to prevail at the early period which was assigned as the era of Ossian; and that it was scarcely possible for such long and connected compositions to be preserved, by oral tradition alone, during the lapse of fourteen centuries.

Notwithstanding the statement of these difficulties, the editor refused to satisfy the world respecting those points in which his veracity had been called in question; and nothing of importance was published on either side, till Dr. Johnson and Mr. Boswell returned from their northern tour. During that journey, they had made several inquiries concerning the traditinary poems said to exist among the Highlanders; but these inquiries were unsuccessful, and tended to confirm the preconceived notions of Johnson; who, always prejudiced against Scotchmen and Scottish literature, had, almost without examination, condemned Macpherson as a literary felon. Dr. Johnson's objections to the authenticity of Ossian's poems rest almost entirely on the idea that no written poems in the Gaelic language were then extant, and of course that the published translations must be a forgery: to this charge Macpherson replied only by menaces and abuse; a conduct which tended materially to injure his cause, and still farther to impugn his veracity.

The spirit of scepticism was not confined to the English literati; but none of Mr. Macpherson's countrymen appeared openly as his opponents, till Mr. W. Shaw, author of the *Gaelic Dictionary and Grammar*, published in 1781 "*An Enquiry into the Authenticity of the Poems ascribed to Ossian*." The arguments and assertions adduced in this inquiry were truly formidable, and to many readers appeared perfectly conclusive. Mr. Shaw seemed to have proved that both the fable and the machinery of Macpherson's principal poems were Irish; that none but Irish MSS. had been or could be offered to the inspection of the public; that many of the testimonies adduced by Dr. Blair were either falsehoods or misrepresentations; and that the principal literary characters of Scotland had engaged in a combination to support the cause and credit of their countrymen, at the expense of honesty and truth.

Ossian and his editor soon encountered a much more formidable, because more respectable, antagonist, in Mr. Malcolm Laing, who, at the end of his *History of Scotland*, published in 1800, gave an elaborate "*Dissertation on Ossian's Poems*;" in which he minutely examined the compositions in question, and compared them with other publications of Mr. Macpherson. In the controversy on this subject, before Mr. Laing took it up, the whole jet of the argument and proof lay on the existence, in tradition or manuscript, of poems in the Highlands, composed by Ossian, and similar in all their leading features to those published by Macpherson: the *internal evidence*, though generally mentioned by the disbelievers in their authenticity as strongly in favour of their opinion, was never minutely and thoroughly examined, before Mr. Laing in-

VOL. XVIII. No. 1220.

vestigated it. The objections to the authenticity of these poems may be thus stated and arranged.

1. It is highly improbable, that, at the time when Ossian lived, he could compose such long and regular poems, without the use and assistance of letters; and the most sturdy and zealous advocates for these poems will not contend that letters were known in the Highlands in the third century. It may indeed be urged, that Homer composed his *Iliad* and *Odyssey* when he was equally a stranger with Ossian to the use of letters; but of this assertion there is no proof: the presumption, on the contrary, is, that in the time of Homer letters were known in Greece. It is scarcely necessary to dwell on the position here laid down, that, if letters were unknown in the Highlands in the time of Ossian, that bard's compositions must have been very short, and probably very irregular; certainly not of the description of poems which Macpherson published in his name, and which Dr. Blair, in his *Dissertation*, has proved to be written in exact conformity to the rules which Aristotle lays down for the composition of an epic poem.

Even allowing that such long and regular poems could have been composed without the use of letters, it is not credible that they could have been transmitted from the time of Ossian to the time of Macpherson, or at least to the time of the date of the most ancient manuscripts found in the Highlands. This objection cannot be put in a stronger way, than in the words in which Hume has expressed it, in a letter to Gibbon: "It is indeed strange, that any man of sense could have imagined it possible, that above 20,000 verses, along with numberless historical facts, could have been preserved by oral tradition, during fifty generations, by the rudest, perhaps, of all civilized nations, the most necessitous, the most turbulent, and the most unsettled. There is nothing similar to this in any other language, or among any other nation: the Gothic poems are all short; the Death-song of Radnor Lodbrog, which is amongst the longest pieces of Gothic poetry supposed to be traditionally preserved, extends but to twenty-nine octavo stanzas, of short lines; and, in order to relieve the memory in this and other Gothic poems, there is always a burden. Besides, these ballads were written only a few centuries before letters were common among the Gothic nations; and, consequently, their preservation (independently of the circumstance of their shortness) cannot be considered as in the least similar to the supposed preservation of Ossian's poems."

2. The inconsistency of the events related in these poems with the Roman history of Britain, and with the history of the middle ages, has been pointed out by Mr. Laing, as another proof of their forgery. "The arrival or return of the Scots from Ireland, under Fergus Mac Erth, and his brother Loarn, is established by the concurrence of every Scottish and Irish historian; and their first arrival is marked by Bede, under Riada their leader, from whom their settlement was named *Dalriada*:" hence it is an historical fact, that there was not a Highlander in Scotland, of the present race, at the beginning of the era assigned to *Fingal*. This observation will derive great additional weight, if we have proved that *Fingal* and his heroes belong originally to Ireland; and, consequently, were probably introduced to the knowledge of the Highlanders at the era of the Dalriadic settlement in Scotland. *Fingal*, in the poems published by Macpherson, is connected with Caracalla in 208, and with Carausius in 286; and his reign and exploits are prolonged in the *Temora* to the battle of Gabhra, in 296; "with the same propriety (Mr. Laing observes) as if a youthful patriot, who resisted a union in the Scotch parliament, were again introduced at the end of the century, opposing a union with Ireland in the British senate!"

3. With respect to the MSS. said to have been procured by Macpherson, he always refused to produce them, except one, which Mr. Laing examined, and which, instead of being a MS. of Ossian's poems, is an Irish MS. in a character

E

character

character and language which scarcely any Highlander can distinctly read; and which, as far as it has been made out, contains no poems, either of Ossian or of any other bard. It has been already mentioned, that Macpherson left a sum of money for the purpose of publishing his Gaelic MSS. after his death; from some cause or other, their publication was delayed till the year 1807, when they appeared, with a literal translation into Latin by the late Robert Macpherson, A.M. together with a Dissertation on the Authenticity of the Poems, by Sir John Sinclair; a translation on the abbé Cefarotti's Dissertation on the Controversy, with Notes, and a Supplemental Essay, by Dr. Mac Arthur: the work was published under the sanction of the Highland Society of London. The editors of this work thought that they should decide the controversy; but there were certain awkward and troublesome questions asked: the Gaelic poems thus published were all in Macpherson's hand-writing; what had become of the MSS. which he pretended to have got in the Highlands, and from which, if they really existed, he must have made his copy? To this no satisfactory answer can be given. On the margin of the first edition of his Ossian, Macpherson marked, with his own hand, the time when the Gaelic was delivered to Mr. John Mackenzie, the secretary to the Highland Society; among these memoranda, the following are found: "Delivered the three Duans of Cathlode, as *complete as the translation*." Does not this expression warrant the belief that the Gaelic was written after the English? else why say, "as complete as the translation?" It would be natural and proper to talk of a translation being as complete as the original, but to speak of an original being as complete as the translation, would scarcely have occurred to any one whose thoughts and language had not been at direct variance. Again, he says, "Delivered all that could be found of Carthon;" but, if the English Carthon had been the translation, why could he find little more than half the original from which the translation was made? The mere circumstance of the poems of Ossian being published in Gaelic, from MSS. in Macpherson's hand-writing, can prove nothing in favour of their authenticity; nor be a satisfactory answer to those who called for MSS. before they would give up their scepticism; unless there had been satisfactory evidence, that this Gaelic Ossian had been copied from old MSS. for Macpherson could forge poems as well in Gaelic as in English; and the undoubted facts, that he never would show any old MSS. that he delayed publishing the Gaelic during his life-time, and that he was very slow in delivering it over to those to whom he committed the publication, confirm the suspicion of Mr. Laing, that he translated his English Ossian into Gaelic, and that this translation he left for publication after his decease.

4. But Macpherson, in various passages of his prefaces and introductions, seems disposed to acknowledge the imposture, and to claim the higher merit of an original poet: in one place he says, "Those who alone are capable of transferring ancient poetry into a modern language might be better employed in giving originals of their own, were it not for that wretched envy and meanness, which affects to despise contemporary genius. I assure my antagonists, I should not translate what I could not imitate." And in his preface he says, "Without increasing his genius, the author may have improved his language, in the eleven years that the poems have been in the hands of the public." And again, "In a convenient indifference for a literary reputation, the author hears praise without being elevated, and ribaldry without being depressed;" and, in the conclusion, he says, "the translator *who cannot equal his original*, is incapable of expressing its beauties." These passages, when considered in connection with all the other suspicious circumstances; with Macpherson's inability to produce any ancient MSS. with the plagiarisms contained in the poems; and with the internal marks of forgery which they display; tell strongly against their authenticity. But there is more direct and positive proof that Macpherson confessed the imposture:

The late venerable bishop of Dromore, in a letter to a friend, (quoted by the British Critic, for 1809, p. 275.) says, "I repeatedly received the most positive assurances from sir John Elliot, the confidential friend of Macpherson, that all the poems published by him as translations of Ossian, were entirely of his own composition. This I did not understand so strictly as that Macpherson might not have introduced some fragments of ancient Erse poetry, preserved by tradition; but that he had no genuine originals of Ossian's composition. This, sir John Elliot did not communicate to me as the result of one single conversation, but what he was fully assured of, by repeated conversations, during the intimacy of many years."

We have now enumerated the most important objections that have been stated at various times against the authenticity of Ossian's poems; from which objections has even arisen a doubt whether ever "Fingal fought, or Ossian sung."

It was not to be expected that the admirers of Ossian, and the friends of his translator, should regard these hostilities with that silent contempt and pertinacious forbearance which Macpherson himself seems to have gloried in displaying. At a very early period of the dispute, the respectable professor, who had at first attempted to prove the authenticity, and point out the beauties, of the poems, stood up in defence of his adopted child; and, in deference to the advice of his friend Hume, he collected and published numerous testimonies in favour of its legitimacy. These testimonies consist chiefly of eleven letters from gentlemen and clergymen of respectability in the Highlands, and are reprinted by the Committee of the Highland Society, at the head of the Appendix to their Report: they tend to prove that, at the time in which they were written, viz. 1763, there were living in the Highlands and Islands of Scotland several persons who either possessed ancient Gaelic MSS. or could recite long passages from traditional Gaelic poems, which agreed in their subject, and often in their composition, with those that had been published in English by Macpherson. These testimonies, though satisfactory as far as they go, are by no means complete; and much more was wanting to satisfy the doubts and remove the scruples of the English literati.

In consequence of the serious attack made by Mr. William Shaw on the authenticity of the poems, and on the literary and moral character of Mr. Macpherson and his advocates, but particularly to vindicate his own reputation against the attacks of that author, Mr. John Clark, member of the society of Scottish Antiquaries, and translator of the Caledonian Bards, published in 1781, "An Answer to Mr. Shaw's Enquiry into the Authenticity of the Poems ascribed to Ossian." In this Answer, Mr. Clark not only repelled the allegations of Mr. Shaw against himself, and exposed Mr. S.'s ignorance of the Gaelic language and antiquities, but affirmed, on what appeared to be the fullest evidence, that the accusations of Mr. Shaw had been dictated by private pique and resentment, and were in numerous instances false and malicious; that Mr. S. had really been shown an ancient Gaelic manuscript, referring to Oscar the son of Ossian, which, however, he appeared scarcely to understand; and that he had never applied to Mr. Macpherson for a sight of the MSS. in Mr. M.'s possession, as he had asserted.

For the purpose of throwing the fullest light on this far-famed controversy, and procuring the most complete evidence which the nature of existing circumstances would allow, the Highland Society of Scotland, some time previous to the year 1797, appointed a committee of their body to inquire into the nature and authenticity of the poems of Ossian. In the time of nominating this committee, the society were peculiarly fortunate: Dr. Blair, Professor Ferguson, Dr. Carlyle, and Mr. John Home, the principal advisers and promoters of the original publication of Macpherson, and many other gentlemen of respectability, who had been intimately acquainted with

with Mr. Macpherson, and had either assisted him in his researches, or witnessed the prosecution of his undertaking, were still living; and the immediate descendant of the last of the Caledonian bards remained, to give his testimony as to the manner in which Macpherson had become possessed of an ancient Gaelic MS. which was said to have supplied him with a great part of his materials. By the direction of this committee, queries, very distinctly and accurately worded, were transmitted to every one who, from personal knowledge or opportunities of enquiry, was supposed capable of throwing light on the subject. In 1805 the report of this committee was published, sanctioned by the name of Mr. Henry Mackenzie, chairman. The line of conduct pursued by the committee was very similar to that which had been chalked out by Hume, in a letter to Blair, soon after the first appearance of the poems of Ossian by Macpherson. Dr. Blair had written to Hume respecting the reception, in England, of his dissertation on these poems. Mr. Hume, in his answer, mentions the general incredulity of the English literati on their authenticity arising partly from the behaviour of Macpherson, who refused to satisfy any one who doubted of his veracity, and partly from the extreme improbability that such long connected pieces should have been preserved by oral tradition for fourteen centuries. Mr. Hume there points out the line of conduct which it would be necessary for Dr. Blair to pursue, if he wished to silence this general scepticism: "The testimonies may, in my opinion, be of two kinds. Macpherson pretends that there is an ancient MS. of part of Fingal in the family, I think, of Clanranold: get that fact ascertained by more than one person of credit; let these persons be acquainted with the Gaelic; let them compare the original and the translation; and let them testify the fidelity of the latter. But the chief point in which it will be necessary for you to exert yourself will be, to get positive testimony from many different hands, that such poems are vulgarly recited in the Highlands, and have there been long the entertainment of the people. This testimony must be as particular as it is positive. It will not be sufficient that a Highland gentleman or clergyman say, or write to you, that he has heard such poems: nobody questions that there are traditional poems in that part of the country, where the names of Ossian and Fingal, and Oscar and Gaul, are mentioned in every stanza. The only doubt is, whether any of these poems have any farther resemblance to the poems published by Macpherson. Generality must be carefully guarded against, as being of no authority."

It is evident from these precautionary directions, that Mr. Hume was well aware of the loose and unsatisfactory evidence which most probably would be produced in support of the authenticity of Ossian; and the Highland Society, notwithstanding they transmitted very clear, precise, and distinct, queries, received, in most cases, only very general answers: such was the impatient zeal, or such the clouded understandings, of the Highlanders on this subject, that they either would not permit themselves to reply to any objections with an appeal to facts, or they misapprehended the question, and supposed it was the existence of traditional poetry respecting Ossian and Fingal, and not the fidelity of Macpherson's translation, on which they were requested to give evidence. The consequence was, that much of the evidence produced on the report of the Highland Society is quite exceptionable, on the grounds which Hume states and wishes to guard Dr. Blair against; and the evidence which goes to the point, only confirms that scepticism which it was intended to remove; since it only proves that there were in the Highlands MSS. and traditional ballads respecting Fingal and his heroes, attributed to Ossian, of which ballads Macpherson had made use, but which were *not* the originals of his poems.

In the report it is expressly admitted that, "The committee has not been able to obtain any one poem the

same in title and tenor with the poems published by Macpherson." This admission is sufficient to put the seal upon the question of their forgery: and the Highland Society, after this admission, should have disdained the unworthy and ridiculous substitute to which they have had recourse, in order to make out something like an original for some of Macpherson's poems.

There can be no doubt that Macpherson collected Gaelic poetry, and made use of it in his Ossian; but his materials were few and scanty, and of a very different character, in every respect, from the poems which he constructed from them. Fingal is principally founded on a ballad narrating the invasion of Ireland by Magnus the Bare-footed: this ballad contains about fifty stanzas of four lines each; which Macpherson has enlarged into six books, and thrown into the form of a regular epic poem. The story of the ballad bears some resemblance to that of Fingal; but, in the former, there is no mention of the battle between Cuthullin and Siwaran, nor of those circumstances related by Macpherson in such detail, and by means of which he has swelled Fingal into six books. Besides this ballad of Magnus, Macpherson, in the composition of his Fingal, has made use of other small genuine pieces of Celtic poetry.

The Battle of Lora, the next piece for which any authority has been discovered, is founded on a poem called Erragon: the incidents are nearly the same, but the manner of relating them, the sentiments, and the language, are extremely unlike; and these sufficiently prove, that the peculiarities of Ossian's poetry are, in fact, the offspring solely of Macpherson's muse.

Carthon, the next poem, is founded on the tale of Conloch, natural son of Cuthullin, who, being educated in Scotland, comes to Ireland, encounters his father there, without being known to him, and is slain by him. Macpherson has altered the incidents in some respects; and, as usual, substituted his own sentiments and language. There is good reason for supposing that the famous address to the sun, with which this poem concludes, is not genuine. No Gaelic original has been discovered for the death of Cuthullin. Darthula is well known in the Highlands under the name of *Deidre*; but Macpherson has very materially altered the story. The ballad of Lammon Mor seems to have been the foundation of Macpherson's "Luthmon;" but, in the latter, the story is told differently; and the night-attack, by Ossian and Gaul, with the imagery which Blair extols, are not in the ballad. For the first book of Temora there is some authority, in a poem celebrating the fatal battle of Gabhra, in which Oisur and most of the Fions were slain: as however Macpherson intended, when he published the first book of Temora, to add a second, he has omitted this catastrophe: and the Fions still live and fight. Such are the slender materials on which Macpherson constructed the pieces contained in his first publication: for those contained in his second volume no genuine authorities can be found.

The result, therefore, of the enquiries of the Highland Society, must be considered as having finally and completely settled the question respecting the authenticity of Ossian's poems. As published by Macpherson, they are much more his own, even in incidents, and most especially in sentiment, imagery, and language, than the composition of Ossian, or any Celtic bard; and the ballads which he employed in their construction, or such as exist in MS. or in tradition in the Highlands, can on no positive or probable evidence be ascribed to Ossian, nor indeed traced up to any particular bard or era whatever.

It seems not to have been the design of the Society to refute the objections urged by Mr. Laing, in his Dissertation; or at least they have not attempted to carry such a design into execution. This task, therefore, was left to some other admirer of Ossian's poems, and it has been performed by two writers, Mr. Archibald Macdonald of Liverpool, and Dr. Graham. The former of these gentlemen

tlemen has published "Some of Ossian's lesser Poems, rendered into verse; with a Preliminary Discourse, in answer to Mr. Laing." But the latest, and by far the most respectable, tract on this side of the controversy which we have seen, is an "Essay on the Authenticity of the Poems of Ossian, in which the Objections of Malcolm Laing, Esq. are particularly considered and refuted; by Patrick Graham, D.D. Minister of Aberfoyle. To which is added, an Essay on the Mythology of Ossian's Poems, by Professor Richardson, of Glasgow College." Our limits, however, preclude us from entering farther into this controversy, which indeed we think absolutely settled by what we have already adduced. But we may refer our readers to the Monthly Review for December 1810, where that work and four others are examined with great judgment and liberality; and we may add, that Dr. Graham's work is written with some degree of elegance, and, what is not usual in controversy, with temper and moderation.

OSSICLE, *f.* [*ossiculum*, Lat.] A small bone.—There are three very little bones in the ear, upon whose right constitution depends the due tension of the tympanum; and, if the action of one little muscle, which serves to draw one of these *ossicles* fixt to the tympanum, be lost or abated, the tension of that membrane ceasing, sound is hindered from coming into the ear. *Holder on Speech.*

OSSIFIC, *adj.* [from the Lat. *os*, a bone, and *facio*, to make.] Having the power of making bone, or changing carneous or membranous to bony substance.—If the caries be superficial, and the bone firm, you may, by medicaments, consume the moisture in the caries, dry the bone, and dispose it, by virtue of its *ossific* faculty, to thrust out callus, and make separation of its caries. *Wise man.*

OSSIFICATION, *f.* Change of carneous, membranous, or cartilaginous, into bony substance.—*Ossifications* or indurations of the artery, appear so constantly in the beginnings of aneurisms, that it is not easy to judge whether they are the cause or the effect of them. *Sharp.*

OSSFRA'GA, *f.* in botany. See **EUPHORBIA**.

OSSIFRAGE, *f.* [*ossifragus*, or bone-breaker, Lat.] A kind of eagle.—The *ossifragus*, or osprey, is thus called, because it breaks the bones of animals in order to come at the marrow. It is said to dig up bodies in churchyards, and eat what it finds in the bones, which has been the occasion that the Latins call it *avis bustaria*. *Calmet.*—See, however, **OSPRAY**.—Among the fowls that shall not be eaten, are the eagle, the *ossifrage*, and the ospray. *Lev. xi. 13.*

OSSIFRAGOUS, *adj.* [from the Lat. *os*, a bone, and *frango*, to break.] Breaking the bones.

OSSIFRANGENT, *adj.* Breaking the bones.

To OSSIFY, *v. a.* To change to bone.—The dilated aorta every-where in the neighbourhood of the cyst is generally *ossified*. *Sharp's Surgery.*

OSSIG, a town of Silesia, in the principality of Neisse: three miles east-north-east of Grotkau.

OSSIG, a town of Saxony, in the bishopric of Naumburg: four miles south of Zeitz.

OSSIPE'E, **OSSAPEE**, or **OSAPY**, a post-town, mountain, and lake, in Strafford-county, New Hampshire, North America. The town was incorporated in 1785, and has 1205 inhabitants: it is forty miles north of Concord. The lake lies north-east of Winnepiscogee-lake, between which and Ossapee-lake is the Ossapee-mountain. Its waters run east, and are joined by South-river, from Great Ossapee-river, which discharges itself into Saco-river, near the division-line between York and Cumberland counties in Maine, and between Limeric and Gorham, in lat. 43.46. N. lon. 70.45. W.

OSSIPEE GO'RE, a township of the same state and county; with 125 inhabitants.

OSSIV'OROUS, *adj.* Devouring bones.—The bore of the gullet is not in all creatures alike answerable to the body or stomach; as in the fox, which feeds on bones, and swallows whole, or with little chewing; and next, in

a dog, and other *ossivorous* quadrupeds, it is very large.—*Derham.*

OSSNO'BIAN, or **ASSENEBOYNE**, a river of North America, which runs into Winnipeg-lake in lat. 50. 3. N. lon. 97. 0. W.

OSSNOBIAN or **ASSENEBOYNE INDIANS**, a tribe of savages found about the source of the above river, far west of Lake Superior. The Moravian missionaries report, that these men, instead of cultivating the land, live wholly upon animal food, or at least restrict themselves to the spontaneous productions of nature, denominating those who dig the ground "slaves." Bread is unknown to them; and they reject it from their mouths, calling it rotten wood. These Indians, as well as those numerous nations who inhabit the country from Lake Superior towards the Shining Mountains, are great admirers of hunting-horses, with which the country abounds. The Ossnobiens have no permanent place of abode; and live in tents made of buffalo and other hides, with which they travel from one place to another, like the Arabs; and, as soon as the food for their horses is expended, they remove, and pitch their tents in another fertile spot: and thus they emigrate, without scarcely ever returning to the same spots again.

OSSO'LA, or **OSEL'LA**, a district of Italy, between the Valais and Lake Maggiore, about thirty-five miles in length, and from fifteen to twenty-five in breadth; the country is composed of mountains and valleys, but is fertile and populous. Domo d'Ossello is the capital.

OSSOLIN, a town of Poland, in the palatinate of Sandomirz: twenty miles west of Sandomirz.

OSSOO'RAH, a town of Hindoostan, in Bengal: sixteen miles north of Bissunpour.

OSSORY, the name of a bishopric in Ireland, the cathedral of which is at Kilkenny. It includes almost the whole county of Kilkenny, a good part of the Queen's County, and some of the King's County, extending forty-six English miles in length and twenty-nine in breadth, and containing 136 parishes. Such however are the unions of parishes, that there are only fifty benefices, and of these twenty were without churches when Dr. Beaufort published. There is also a barony called Ossory, which gave the title of earl to the eldest son of the dukes of Ormond.

OSSUARY, *f.* [*ossuarium*, Lat.] A charnel-house; a place where the bones of dead people are kept.

OSSUERO. See **OSERO**.

OSSUN, a town of France, in the department of the Upper Pyrenées: six miles south-south-west of Tarbe, and twelve north of Argellez.

OSSUNA, an ancient and well-peopled town of Spain, in the province of Seville. It derives great advantage, in case of a siege, from a fountain in the middle of it, which furnishes water to the inhabitants, whilst the whole country, for eight miles round, is totally destitute of that necessary article. When Cæsar besieged Ossuna, he was obliged to bring his provisions, and particularly water, from a great distance. It is forty-five miles north-east of Seville.

OST, or **OUST**, *f.* A kiln where hops or malt are dried. See **OAST**.

OSTABAT, a town of France, in the department of the Lower Pyrenées: six miles south of St. Palais, and nine west of Mauleon.

OSTA'DE (Adrian Van), an eminent painter of the Dutch school, was born at Lubeck in 1610. He studied his art at Haarlem under Francis Hals, and was fellow-pupil with Brouwer, with whom he contracted a great intimacy. His taste and style were perfectly those of the country in which he practised, being characterised by a most exact imitation of nature, with great beauty of colouring and exquisite finish, but the lowest possible choice of subjects, which are uniformly taken from ale-houses, kitchens, and places of vulgar resort, and often exhibit

objects of disgust. Mr. Fuseli, in his edition of Pilkington's Dictionary, describes him as an artist in the following energetic terms: "He has contented himself to trace the line which just discriminates the animal from the brute, and stamps his actors with instinct rather than with passions. He has personified the dregs of vulgarity without recommending them by the most evanescent feature of taste; and yet decoys our curiosity to dive with him into the habitation of filth, beguiles the eye to dwell on the loathsome inmates and contents, and surprises our judgment into implicit admiration, by a truth of character, an energy of effect, a breadth and geniality of touch and finish, which leave no room for censure. If he is less silvery, less airy, than Teniers, he is far more vigorous and gleaming; if his forms be more squat and brutal, they are less fantastic and more natural; if he group with less amenity, he far excels the Fleming in depth and real composition."

Ostade long resided at Haarlem, where he attained a high reputation. The approach of the French troops in 1672, drove him to Amsterdam, where he died in 1685. His genuine works of his best time and manner are very scarce, and bear extremely high prices. Those of his brother *Jsaac*, who painted in the same style, but with much inferior excellence, often pass for his; many of them, indeed, are copies of his works. Adrian was frequently solicited by cotemporary landscape-painters to add figures to their pieces, which has given them a great additional value. He etched a number of his own designs, and several eminent engravers have wrought from his pictures. The ciphers he used to his own engravings may be seen on the preceding Plate.

OSTAKRE, a town of the kingdom of the Netherlands: four miles north of Ghent.

OSTAL'RIC, a town of Spain, on the Tordera. In 1694, this town was taken by the French, who quitted it the year following, after having destroyed the fortifications: twenty-two miles south-west of Gerona, and twenty south-east of Vique.

OSTA'NO, a town of Italy: ten miles north of Como.

OSTASCH'KOV, a town of Russia, in the government of Tver, near the lake Seliger: eighty miles west of Tver. Lat. 56. 50. N. lon. 33. 34. E.

OST'BY, a town of Sweden, in Angermanland: sixty miles north of Hernofand.

OST'E, a river which rises in the south part of the duchy of Bremen, passes by Bremervorde, &c. and runs into the Elbe, at its mouth, in lat. 53. 54. N. lon. 8. 54. E.

OSTELLA'TO, a town of Italy, in the department of the Lower Po: fourteen miles south-east of Ferrara.

OST'EN, a town of Germany, in the duchy of Bremen: eleven miles north-west of Stade.

OSTEN'D, a strong seaport-town of the kingdom of the Netherlands, in the province of West Flanders; with a good harbour, and well fortified.

Among the flourishing and numerous cities of the Netherlands, Ostend formerly held a distinguished rank. It had, however, long declined, though its port continued to be frequented. About the commencement of the French revolution, it appeared almost a desolate and deserted place. That event, if it did not restore it to its former opulence, at least prevented its utter decay. By the various circumstances of the revolutionary war, Ostend acquired a partial revival of its commerce and consequence. In the long line of coast from the Texel to Brest, there is not one good natural harbour; for the embouchures of the Rhine and Scheldt, though accessible at all times of the tide in fine weather, yet are so blocked up and impeded by sand-banks and shifting sands, that the approach in bad weather, or during dark nights, is very dangerous. The other ports are factitious tide-harbours, dry at low water, and some of them even at half-tide. Of these, Ostend (which word signifies *East Port*) is among the best. The harbour is formed by a natural inlet of the sea, which has forced a passage between two

sand-hills. The south-western bank, or beach, is of a triangular shape, and possesses some degree of elevation above high-water mark and the surrounding flat country, so that, at half-tide, it is completely peninsulated; and on this bank the town is built. This inlet has been improved at different times. The ground has been scooped out so as to form the interior harbour or basin, which terminates in the great canal of Bruges, to which it is connected by superb flood-gates, piers, and sluices. Externally the channel is confined and deepened by two piers or jetties: their construction is simple, yet effective, being nothing more than double rows of piles driven into the sand, and connected by a flooring of strong planks. Not above a hundred yards from the end of the piers there is a bar, which runs across the harbour's mouth, upon which, in neap-tides, there is not more than seven or eight feet water; at high-water, in ordinary tides, there are twelve feet; and, in lunar tides, twenty-five feet and upwards on the bar. If these jetties were carried out so as to rest upon the sand-bank which forms the bar, it would deepen the water, and prevent the further accumulation of sand, which is constantly thrown by the northern current on the east side of the harbour.

During the period of its commercial prosperity, that is, between the years 1720 and 1780, the town of Ostend became greatly enlarged. Ramparts were demolished to make room for buildings, and a new town was regularly laid out and completed. It in some respects resembles an English town, being built of brick, with flagged footways, a convenience not met with any where else on the continent: yet the inhabitants persist in walking in the middle of the street, amidst heaps of dung, carts, horses, &c. so inveterate are prejudice and habit. The beauty of the new town consists principally in a fine quay, which borders the inner harbour, where the large and handsome hotel of the *ci-devant* East-India Company makes at this day a conspicuous figure.

The old town has a shattered and somewhat shabby appearance. It contains, however, two good squares. The *Maïson de Ville*, or town-house, forms the entire side of one of them. It was formerly reckoned among the most magnificent structures of the kind in the Netherlands, being ornamented with two fine towers at each wing, and a dome in the centre; but this superb building was nearly ruined by the bombardment of 1745. The body of the town-house still subsists; but of its dome and two beautiful towers, there only remains the stump of one of them, surmounted by a wooden cupola. The church is a large heavy building of brick, without the smallest claim to architectural merit; but the inside is richly ornamented. It has a lofty octangular steeple, with a very clumsy spire; affording, however, an excellent sea-mark, which may be seen at a great distance, when nothing else on land can be discerned. The Pharos is also a striking object. It is a simple column, standing solitary, like Pompey's Pillar, on the beach. It supports a large reverberating lantern. Near the Pharos is a flag-staff, on which a blue flag is gradually hoisted, in proportion as the tide flows into the harbour. The fortifications of Ostend are more than two miles in circumference. They were dismantled, but had not been essentially injured. They are now undergoing repairs and additions, which will make them very formidable. As the place is situated on an elevated beach, the ramparts tower above the flat country, which, being lower than high-water mark, can be speedily and extensively inundated. The only hostile approaches are along the high sand-hills to the north and south: the former is protected by a strong redoubt, built by the late French government, called Fort Napoleon; and there are at present two thousand men at work constructing another on the south side. By a census made ten years ago, the inhabitants of Ostend were found to amount to 10,570 individuals, exclusive of the garrison.

The civil and military history of Ostend is interesting. Like many of the towns of modern Europe, it was indebted for its origin to ecclesiastical establishments, the signiory being invested in the abbey of St. Bertin at St. Omer's. Mankind owes more to saints and their reliques than an incredulous world is willing to allow. If some of these never had existence, we know that their foster-fathers, the monks, had; that, like the martins that built their nests in Macbeth's castle, they enjoyed an instinctive perception in the choice of the most healthy, fertile, and picturesque, situations, for their habitations; and that to their selection we are indebted for some of the finest and most flourishing cities of Europe. On this sanctified ground Robert le Frison count of Flanders built a church, dedicated to Notre Dame, in the year 1072. This Robert was an usurper, and, like most usurpers, was a man of talent and courage. He dispossessed his nephew, the true heir, who fled to Philip I. king of France. Philip marched with a great army to reinstate him; but the usurper totally defeated the French, and the nephew fell in the battle. Robert being now established in the possession of Flanders, the pope enjoined him, as a penance, to build churches and found abbeys. Robert did not dispute the mandate of his holiness; he was one of the first improvers of the country; and, after a long reign, left it in a flourishing condition. The church, like that of Dunkirk, was soon surrounded with dwellings, and became a considerable town; but, on the 22d of November, 1334, both church and town were swallowed up by a sudden influx of the sea. The very next year, however, a new church and a new town, fortified with palisades, were built higher up on the beach, which have braved the fury of the elements ever since. In 1445, Philip le Bon count of Flanders surrounded Ostend with walls, erected the four gates, and formed the harbour. About this period Ostend acquired maritime importance, and became the most noted fishing-station on the whole coast. Its fishermen are commemorated for catching mermaids, sea-monsters, and odd fishes. This species of fishery has of late declined.

It was not until the year 1583 that Ostend was regularly fortified, by Maurice of Nassau prince of Orange, who made it the seaport of the great cities of Ghent and Bruges, which he had recently taken. The same year Alexander Farnese prince of Parma attempted to carry the newly-fortified town by a *coup de main*, in which he failed. But the archduke Albert, the Spanish governor of the Netherlands, having lately espoused Isabella, infant of Spain, daughter of Philip II. thought that he could not better signalize the outset of his government than by the reduction of so important a place. Ostend was therefore invested by the Spaniards with a powerful army in 1601. For two years the siege was prosecuted with that calm fortitude and steady perseverance which so eminently distinguish the Spanish character; but it was defended by that obstinate valour and that indefatigable exertion for which the Dutch were no less remarkable. The latter, moreover, threw in succours by sea, of which they had the undisputed possession. Duke Albert, finding that no serious impression was made on the place, whilst the losses of the besiegers were immense, had the good sense to discover the superior talents of Ambrose Spinosa, then a junior general, to whom he entrusted the future conduct of the siege, notwithstanding the open discontents of his superiors. Spinosa soon changed the aspect of affairs. His first care was to equip a flotilla of galleys, to cut off the supplies by sea; and, though this fleet was defeated in an attempt to raise the siege of Sluys, then besieged by the prince of Orange, yet it partly effected its purpose. Meanwhile Spinosa pushed on his approaches through sands and marshes, which were supposed to be utterly impassable, with the utmost vigour. He succeeded at length in raising his batteries within point-blank shot, from which the works were incessantly battered by cannon of a large calibre, carrying fifty-pound

balls. The fire was returned with equal spirit by the besieged; and it is reported, that the noise of the firing was heard as far as London. At last, the place being totally destroyed, the remnant of the brave garrison capitulated on the 14th of September, 1604, and obtained honourable terms, after a siege, for ever memorable, of three years, three months, and three days. Ostend was commanded during the siege by four successive governors: Charles Vandernoot and Robert de Vere (an English general) were killed, and Frederic van Dorp was dangerously wounded. Daniel de Hortain lord de Marquette survived, and signed the capitulation.

The archduke Albert and his consort Isabella made their triumphal entry into what they expected to find the city; instead of which, their terrified looks glanced over the horrors of an immense cemetery, where mutilated human bodies were intermingled with masses of smoking ruins. They could not contemplate such a scene without reflecting, that so much important time had been thrown away, so much blood and treasure expended, for the forrowful conquest of a sterile bank of sand and a misshapen heap of rubbish. During the siege the garrison was frequently renewed: the besieged sustained a loss of about 50,000 men, whilst that of the besiegers amounted to more than 80,000. See an anecdote connected with this siege under the word ISABELLA, vol. xi. p. 394.

Ostend, being a convenient seaport, soon rose from its ashes. The Netherlands having passed to the house of Austria, it remained under that government till the French revolution. In 1648, the French attempted to carry the place by a *coup de main*. They embarked in bateaux for that purpose a select corps of two thousand men; but the flotilla was intercepted, and most of the troops killed or made prisoners. The town was compelled to sustain another siege in the year 1706. The allies, commanded by field-marshal Nassau de Overkerke, sat down before it on the 23d of June, whilst it was blockaded by an English Squadron under admiral Fairborn. After undergoing a furious bombardment, which again reduced the place to ruins, it surrendered, on capitulation, the 6th of July following. Ostend then received a Dutch garrison; but it was restored to the emperor by the barrier-treaty, concluded in 1715. From this date, Ostend began greatly to prosper. The emperor Charles VI. established an East-India Company there, which had so much success, that it excited the commercial jealousy of the Dutch, English, and French. The court of Vienna was induced to abandon this fertile source of wealth, from political and diplomatic intrigue. It is even affirmed, that a *douceur* of ten millions of florins caused the India-Company of Ostend, with all its rights and charters, to be transferred to Amsterdam. After this, the place soon began to decline: two thousand of its richest and most commercial citizens transported themselves, their wealth, experience, and industry, to other places; and, though various attempts were made to revive its trade, for which purpose, in 1781, it was declared a free port, yet it never could recover itself.

Before its absolute decay, Ostend was fated once more to suffer a destructive siege. When the battle of Fontenoy had laid open all Flanders to the French, Ostend was besieged by count Lowendhal. He sat down before the place on the 23d of August, 1745; and, after thirteen days' open trenches, and five days' bombardment, (which dilapidated the greater part of the buildings, and, among the rest, the superb Maison de Ville,) it surrendered upon honourable terms. The garrison amounted to 3600 men, most of whom were English. Louis XV. made his triumphal entry into Ostend on the 3d of the following September; but it was again restored to Austria by the peace of Aix la Chapelle. When the emperor Joseph II. caused all the towns of the Austrian Netherlands to be unfortified, Ostend was dismantled, but its ramparts remained entire.

On the breaking out of the French revolution, the battle

battle of Jemappe put this maritime fortrefs into the hands of the republicans. The fubfequent reverfes of Dumourier reftored it to the Auftrians. Become now a fort of military shuttlecock, it was again placed at the difpofal of the French; when the fatal battle of Fleurus opened all the Netherlands, and Holland itfelf, to the enemy. The Englifh government having at all times appreciated the importance of Oftend, planned an expedition, in 1700, to furprife the place, or at leaft render it ufelefs to the enemy. About three thoufand men, under the command of fir Eyre Coote, difembarked without oppofition near the city, and immediately proceeded to deftroy the flood-gates, and blow-up the locks which joined the inner harbour to the canal of Bruges, and fituated about a mile and a half outfide the fortifications. After effecting this fervice, the troops attempted to re-embark; but, in the mean time, the weather had become ftormy, and fo great a furf broke on the beach, that no veflel, not even a boat, could approach it. The little army was therefore obliged to bivouac on the fand-hills; and the next day, the wind blowing ftill frefter, it found itfelf furrounded by numerous military corps, called in from all the neighbourhood. A partial action took place, in which the Englifh had about a hundred men killed and wounded, the general being among the latter. No way of efcape being open, the fmall force had the mortification to ground their arms and become prifoners, even within view of the fleet, which could not poffibly affift it. Napoleon meditated great improvements for Oftend; but the fuperior importance of Antwerp engroffed all his care. That city and Oftend were the laft places which the French reluctantly evacuated, agreeably to the late treaty of Paris. Oftend lies twelve miles weft of Bruges, ten miles and a half north-eaft of Nieuport, thirty-one miles and a half north-eaft-by-eaft of Dunkirk. It is fcarcely twenty marine leagues eaft-by-fouth from Ramfgate. Lat. 51. 30. N. lon. 3. 3. E. from London. *Ackerman's Repository*, vol. xiv.

OSTEN'D, a town of Africa, on the Ivory Coaft: thirty miles north-eaft of Cape Palmas.

OSTEN'SIBLE, *adj.* [*oftendo*, Lat. to fhew.] Such as is proper or intended to be fhown.—I take this opportunity of expreffing my furprife, that this *oftenfible* comment of the dumb-flew fhould not regularly appear in the tragedies of Shakfpeare. *Wharton's Hift. E. P.*—Colourable; plaufible.—He had, as dictator, an *oftenfible* right to the cuftody and command of this; and, under pretext of this oftenfible, he by force of arms feized it. *Pownall on Antiq.*

OSTEN'SIO, *f.* A tax anciently paid by merchants, &c. for leave to *fhew*, or expofe their goods to fale, in markets.

OSTEN'SIVE, *adj.* Showing; betokening.

OSTEN'T, *f.* [*oftentum*, Lat.] Appearance; air; manner; mien:

Ufe all the obfervance of civility,
Like one well ftudied in a fad *oftent*,
To pleafe his grandam. *Shakfpeare's Merch. of Ven.*
Show; token. Thefe fenfes are peculiar to Shakfpeare:
Be merry, and employ your chiefeft thoughts.
To courtfhip, and fuch fair *oftents* of love,
As fhall conveniently become you there. *Shakfpeare.*

A portent; a prodigy; any thing ominous:

Latinus, frighted with this dire *oftent*,
For counfel to his father Faunus went. *Dryden.*

To OSTEN'TATE, *v. a.* [*oftento*, Lat.] To make an ambitious difplay of; to difplay boaftingly.—Who is fo open-hearted and fimple, but they either conceal their defects, or *oftentate* their fufficiencies, fhort or beyond what either of them really are? *Bp. Taylor's Artif. Handfom.*—So far I muft needs *oftentate* my reading, as to affure you, that I have viewed with my own eyes, and tranfcribed from all the originals, whatever I have fet down. *Fleetwood's Chron. Pretiofum.*

OSTENTA'TION, *f.* [Fr. from *oftentatio*, Lat.] Outward fhew; appearance.—March on my fellows; make good this *oftentation*. *Shakfpeare's Coriol.*

You are come

A market-maid to Rome, and have prevented

The *oftentation* of our love. *Shakfpeare.*

Ambitious difplay; boaft; vain fhew. *This is the ufual fenfe.*—He knew that good and bountiful minds were fometimes inclined to *oftentation*, and ready to cover it with pretence of inciting others by their example, and therefore checks this vanity: Take heed, fays he, that you do not your alms before men, to be feen. *Atterbury.*

With all her luftre, now, her lover warms;
Then out of *oftentation* hides her charms. *Young.*

A fhew; a fpectacle. *Not in ufe.*—The king would have me prefent the princes with fome delightful *oftentation*, fhew, pageant, antic, or firework. *Shakfpeare's Love's Lab. Loft.*

OSTENTA'TIOUS, *adj.* Boaftful; vain; fond of fhew; fond to expofe to view.—Your modefty is fo far from being *oftentatious* of the good you do, that it blufhes even to have it known; and therefore I muft leave you to the fatisfaction of your own confidence, which, though a filent panegyric, is yet the beft. *Dryden.*

OSTENTA'TIOUSLY, *adv.* Vainly; boaftfully.

OSTENTA'TIOUSNESS, *f.* Vanity; boaftfulnefs.

OSTENTAT'ITIOUS, *adj.* Oftentatious. *Cole.*

OSTEN'TATIVE, *adj.* Apt to boaft; oftentatious. *Phillips.*

OSTENTA'TOR, *f.* [Fr. from *oftento*, Lat.] A boafter; a vain fetter to fhew. *Sherwood.*

OSTENTIFEROUS, *adj.* [from the Lat. *oftentum*, a prodigy, and *fero*, to bring.] Producing omens; bringing prodigies.

OSTEN'TOUS, *adj.* Fond of fhew; fond to expofe to view.—Sometimes we ought to be thankful for an enemy. He gives us occafion to fhew the world our parts and piety, which elfe, perhaps, in our dark graves would fleep and moulder with us quite unknown; or could not otherwife well be feen without the vanity of a light and an *oftenfuous* mind. *Feltham.*—Such rude and imperfect draughts being far better, in their efteem, than fuch as are adorned with more pomp, and *oftentatious* circumftances. *Evelyn.*

OSTEOCOLLA, *f.* [from the Gr. *oflon*, bone, and *κόλλα*, to glue together.] A white or afh-coloured fparry fubftance, in fhape like a bone, and by fome fupposed to have the quality of uniting broken bones, on which account it is ordered in fome plafter; a fuppofition, we fear, which is not warranted by experience.

It is found in long, thick, and irregularly-cylindric, pieces, which are in general hollow, but are fometimes filled up with a marly earth, and fometimes contain within them the remains of a ftick, round which the ofteocolla had been formed; but, though it is plain from thence, that many pieces of ofteocolla have been formed by incrustations round fticks, yet the greater number are not fo, but are irregularly tubular, and appear to be formed of a flat cake, rolled up in a cylindric fhape. The ofteocolla is found of different fizes, from that of a crow-quill to the thicknefs of a man's arm. It is compofed of fand and earth, which may be feparated by wafhing the powdered ofteocolla with water; and is found both in digging, and in feveral brooks, in many parts of Germany, and elfewhere. It is called *hammofteus* in many parts of Germany. It has this name in thefe places from its always growing in fand, never in clay, or any folid foil, nor even in gravel. Where a piece of it any-where appears on the furface, they dig down for it, and find the branches run ten or twelve feet deep. They ufually run ftraight down; but fometimes they are found fpredding into many parts near the furface, as if it were a fubterraneous tree, whole main ftem began at twelve feet depth, and thence grew up in a branched manner till met by

by the open air. The main trunk is usually as thick as a man's leg; and the branches that grow out from it are thickest near the trunk, and thinner as they separate from it. The thinnest are about the size of a man's finger.

The osteocolla found in the earth is at first soft and ductile; but in half an hour's time, if exposed to the air, it becomes as hard as we find it in the shops. The method to take up a perfect piece for a specimen, is to open the ground, clear away the sand, and leave it so for an hour or thereabouts: in this time it will harden, and may be taken out whole. It is certain that the osteocolla is produced at this time; for, if a pit be cleared of it, there will more grow there in a year or two, only it will be softer, and will not harden so easily in the air as the other.

The above account is chiefly from the Phil. Transf. N° 39. for the year 1668. And, in a subsequent volume, for 1739, two surgical cases are given, in which the exhibition of osteocolla as medicine and as food, was supposed to have contributed very considerably to the formation of bone, so as to restore what had been lost by compound fracture and exfoliation. Mr. Ambrose Bearer, of Norimberg, (Phil. Transf. 1748.) endeavours to prove, that osteocolla is the petrified root of the black poplar-tree, *Populus niger*. But see the experiments of Margraf, in the Mem. of the Berlin Academy for 1748.

OSTEOCOPE, *f.* [from the Gr. *οστέον*, a bone, and *κοπέω*, to cut.] Pains in the bones, or rather in the nerves and membranes that encompass them.

OSTEOLOGER, *f.* A describer of the bones.—*Osteologists* have very well observed, that the parts appertaining to the bones, which stand out at a distance from the bodies, are either the adnate or the enate parts. *Smith on Old Age.*

OSTEOLOGIST, *f.* An anatomist; one skilled in osteology.

OSTEOLOGY, *f.* [from the Gr. *οστέον*, bone, and *λογος*, a discourse.] A description of the bones.—Richard Farlow, well known for his acuteness in dissection of dead bodies, and his great skill in *osteology*, has now laid by that practice. *Taitler.*

OSTEOSPERMUM, *f.* [from the Gr. *οστέον*, bony, and *σπέρμα*, seed; in allusion to its hard bony seeds.] In botany, a genus of the class syngenesia, order polygamia necessaria, natural order of compositæ discoidæ, (corymbiferae, *Juss.*) Generic characters—Calyx: common simple, hemispherical, many-leaved; leaflets awl-shaped, small. Corolla: compound rayed; corollets, hermaphrodite very many in the disk; females about ten in the ray. Proper of the hermaphrodite tubular, five-toothed, the length of the calyx; of the female ligulate, linear, three-toothed, very long. Stamens: in the hermaphrodites; filaments five, capillary, very short; anther cylindrical, tubulous. Pistillum: in the hermaphrodites; germen very small; style filiform, scarcely the length of the stamens; stigma obsolete: in the females, germen globular; style filiform, the length of the stamens; stigma emarginate. Pericarpium: none; calyx unchanged. Seeds: in the hermaphrodites, none; in the females, solitary, subglobular, coloured, at length hardened, inclosing a kernel of the same shape; pappus none. Receptacle: naked, flat.—*Essential Character.* Calyx simple, or in two rows, many-leaved, almost equal. Seeds globular, coloured, bony, (berried or nucamentaceous, *Gartner.*) Down none; receptacle naked. There are seventeen species, all natives of the Cape of Good Hope.

1. *Osteospermum spinosum*, or prickly osteospermum: spines branched. This is a low shrubby plant, which seldom rises above three feet high, and divides into many branches; the ends of the shoots are beset with green branching spines; the leaves are very clammy, especially in warm weather; they are long and narrow, and set on without any order. The flowers are produced singly at the ends of the shoots; they are yellow, and appear in

July and August. It is very nearly allied to the next species. The fruit hangs down on an oblong peduncle, and consists of dusky-purple, bony, globular, berries, disposed in a ring. Native of the Cape of Good Hope. Cultivated in 1700 by Dr. Uvedale. It flowers from February to October.

2. *Osteospermum pififerum*, or smooth osteospermum: leaves lanceolate, mucronate, subpetioled, smooth, ferrate; branchlets angular-toothletted. Stem four or five feet high, dividing into many branches towards the top, which spread out flat on every side; they have a purplish bark. Leaves of a thick consistence, and succulent, alternate, of a light-green colour, from two to three inches long, and one inch broad in the middle; more pointed than in the rest. Berry oval, at first green, then red, but, when fully ripe, of a dark-purple colour, having a thin pulp, which covers one hard seed. It produces tufts of yellow flowers at the extremity of the shoots, from spring to autumn; and frequently ripens seeds. It was cultivated in 1757 by Mr. Miller.

3. *Osteospermum moniliferum*, or poplar-leaved osteospermum: leaves obovate, ferrate, petioled, subdecurrent. This rises with a shrubby stalk seven or eight feet high, covered with a smooth grey bark, and dividing into several branches. Flowers in clusters at the ends of the branches, six or eight coming out together on petioles an inch and a half long; they are yellow, and shaped like those of ragwort (*Senecio Jacobæa*), having about ten ligulate florets in the ray. This plant flowers but seldom in England; the time of its flowering is July or August. It was cultivated here in 1714.

4. *Osteospermum ilicifolium*, or holm-leaved osteospermum: leaves oblong, tooth-angulate, rugged, half-embracing; branches grooved. Leaves sessile, angular, with three teeth on each side, rolled in at the edge; above rugged, beneath villose.

5. *Osteospermum ciliatum*, or fringe-leaved osteospermum: leaves elliptic-lanceolate, crenate, ciliate. This is a woolly shrub, with oblong, toothed, ciliate, leaves.

6. *Osteospermum junceum*, or reedy osteospermum: leaves linear, acute, keeled, distant; panicle terminating. Stem five feet high, upright, stiff and straight, even. Leaves awl-shaped or linear, stiff, even, sessile, very remote.

7. *Osteospermum triquetrum*, or three-sided osteospermum: leaves linear, three-sided. Stem suffruticose; leaves even, a finger's length, abundant. Flowers from the uppermost axils, solitary, yellow.

8. *Osteospermum corymbosum*: leaves lanceolate, smooth; flowers panicled. Stem upright, the thickness of a finger. Leaves alternate, sessile, stiff, a finger's length, on the flowering branches smaller, rugged at the edge. Flowers yellow. Seeds oblong, larger than grains of wheat.

9. *Osteospermum imbricatum*: leaves ovate, blunt, imbricate. Stem two feet high. Peduncle terminating, filiform, the length of the flower; one-flowered, pubescent, leafless; corolla yellow. It differs from *O. polygaloides*, in not having the leaves lanceolate, or acute, or keeled; and the peduncles without a linear leaflet.

10. *Osteospermum herbaceum*: leaves ovate, subsessile, spatulate, ferrate; stem herbaceous. This resembles a *Verbesina*. Leaves exactly spatulate.

11. *Osteospermum niveum*: leaves ovate, petioled, toothed, woolly. The whole herb is covered with a thick and very white lanugo.

12. *Osteospermum perfoliatum*: leaves ovate, petioled, angular-toothed, tomentose underneath, petioles perfoliate-embracing. This is singular in having the petiole dilated at the insertion, like a little wheel round the stem.

13. *Osteospermum polygaloides*: leaves lanceolate, scattered, decurrent, smooth, quite entire, axils woolly. Stalk about four feet high, dividing into many small branches. The flowers come out at the end of the branches, standing singly on peduncles about an inch long.

long. The stem between the leaves has frequently villose hairs on it, like those on the bag of the silk-worm. It was cultivated by Mr. Miller in 1759.

14. *Osteospermum calendulaceum*: leaves lanceolate, sessile, toothed, rugged; stem fleshy, lax. This resembles *Calendula arvensis* very much, and thence has its name; but it differs in the seeds not being winged, but cylindrical, bony, and smooth.

15. *Osteospermum arctotoides*: leaves lyrate, petioled; petioles eared at the base, half-embracing, tomentose. In the surface, the figure of the herb, and leaves, and almost in the flower, this species resembles an *Arctotis*, but in the smoothness of its seeds an *Osteospermum*. *Linn. Suppl.*

16. *Osteospermum rigidum*, or rigid *osteospermum*: leaves toothed-pinnatifid, hairy; branches unarmed. Introduced by Mr. Francis Masson in 1744. It flowers from April to July.

17. *Osteospermum cæruleum*, or blue-flowered *osteospermum*: leaves pinnate; pinnas toothed. This is an undershrub, three feet high, with a strong smell. Root woody, branching, fibrous. Stem somewhat woody, erect, round, regularly branched, grey. Leaves alternate, spreading; they are without veins, and have only one nerve prominent beneath; they are of the same colour on both sides, and fragrant; from an inch and a half to two inches in length, and fifteen lines in breadth. Flowers blue, an inch wide. Seeds obovate, somewhat angular and rugged, not at all bony. *L'Heritier.*

Propagation and Culture. These plants, being too tender to live in the open air in England, are placed in the green-house in October, and may be treated in the same manner as myrtles, and other hardy green-house plants, which require a large share of air in mild weather; and, in the beginning of May, the plants may be removed into the open air, and placed in a sheltered situation during the summer-season. The first and second sorts must have plenty of water, being very thirsty plants. They are propagated by cuttings, which may be planted in the summer-months upon a bed of light earth, and should be watered and shaded until they have taken root, which they will in five or six weeks, when they must be taken up and planted in pots: for, if they are suffered to stand long, they will make strong vigorous shoots, and will be difficult to transplant afterwards, especially the second and third sorts. During summer the pots should be frequently removed, to prevent the plants from rooting through the holes at the bottom of the pots into the ground, which they are very apt to do when they continue long undisturbed, and then they shoot very luxuriantly; and, on their being removed, these shoots, and sometimes the whole plants, will decay. See *POLYMNIA*.

OSTER, a river of Russia, which runs into the Desna near Kozeltz, in the government of Kiev.

OSTER, a town of Russia, in the government of Kiev, at the union of the rivers Oster and Desna: twenty-four miles north of Kiev. Lat. 50. 58. N. lon. 31. 14. E.

OSTER CAPPELN, a town of Westphalia, in the bishopric of Osnaburg: ten miles east-north-east of Vorden.

OSTER O'EN, an island near the coast of Norway: twenty miles north-west of Bergen.

OSTERBURG, a town of Westphalia, in the Old Mark: thirty-six miles north-west of Brandenburg, and sixty west-north-west of Berlin. Lat. 52. 48. N. lon. 11. 56. E.

OSTERBY, a town of Sweden, in the province of Upland. This place is remarkable for its furnaces; and near it is the iron-mine of Dannemora, one of the largest and richest in Sweden. It was first opened in 1527; and the ore yields from 70 to 90 per cent. to the amount of 18,000 tons annually: twenty-four miles north of Upsal.

OSTERFELD, a town of Saxony, in the bishopric of Naumberg: eight miles west of Zeitz, and seven south-east of Naumberg. Lat. 51. 5. N. lon. 11. 53. E.

VOL. XVIII. No. 1220.

OSTERHOFEN, a town of Bavaria, on the Danube: nine miles north-west of Vilzhofen, and twenty north-west of Passau.

OSTERHOLZ, a town of the duchy of Bremen. The principal trade of the inhabitants is digging peat or turf, of which they sell to the amount of 18,000 rix-dollars yearly to the inhabitants of Bremen: seven miles east of Bremen.

OSTERLOF, a town of Sweden, in the province of Schonen: eight miles north of Christianstadt.

OSTERMARK, a town of Sweden, in East Bothnia: eighteen miles north-east of Christianstadt.

OSTERO, a small island on the east side of the gulf of Bothnia. Lat. 63. 23. N. lon. 21. 39. E.

OSTEROD, a town of Norway: twenty-eight miles north-north-west of Drontheim.

OSTERO'DE, a town of Westphalia, in the principality of Grubenhagen, on the Saal. It contains about 800 houses, and a magazine for corn, which is delivered out to the miners of Harz Forest always at a fixed price. Here is a manufacture of woollen stuffs. It is sixteen miles south-west of Goslar, and eighteen east-south-east of Einbeck. Lat. 51. 44. N. lon. 10. 16. E.

OSTERO'E, one of the Feroer-islands, east of Stromoe, from which it is separated by a narrow channel. Lat. 61. 50. N.

OSTERRO'DE, a town of Prussia, in the province of Oberland, on the river Dribentz, defended by a castle: sixty-five miles south-east of Dantzic, and seventy south-south-west of Königsberg. Lat. 53. 36. N. lon. 19. 52. E.

OSTERSUND, a town of Sweden, and capital of Jamtland, on the east side of the lake Storfio: ninety-five miles west-north-west of Hernofand, and eighty-six north-west of Sundswall. Lat. 63. 10. N. lon. 14. 27. E.

OSTERSUNDOM, a town of Sweden, in the province of Nyland: nine miles north-east of Helsingfors.

OSTERTZ, a town of Croatia: fourteen miles south-west of Varasdin.

OSTERVALD (John-Frederic), a celebrated Swiss protestant divine, was descended from an ancient and noble family, and born at Neufchatel in the year 1663. He commenced his academical studies at Saumur, where his proficiency was so rapid, that he was admitted to the degree of M.A. before he was sixteen years of age. Afterwards he pursued his studies at Orleans and Paris, and was admitted to the office of the ministry. We have no account of his settlement with any church in the capacity of pastor before the year 1699, when he entered into that relation with the church at his native place. He contracted an intimate friendship with the celebrated John Alphonfus Turretin of Geneva, and the learned Samuel Werenfels of Basil; and the union of these three theologians, which was called the *triumvirate of Swiss divines*, lasted till their deaths. M. Osterwald died in 1747, about the age of eighty-four. He was the author of several useful works, written in the French language, of which the principal are, 1. A Treatise concerning the Causes of the present Corruption of Christians, and their Remedies, 8vo. 2. A Catechism, explaining the Grounds and Principles of the Christian Religion, 8vo. prefixed to which is An Abridgment of the Sacred History, which was adopted by the Society at London for the Propagation of the Gospel in Foreign Parts, and translated into Arabic, in order to be sent to the East Indies; and the author also had the compliment paid him of being admitted an honorary member of the society. 3. A Discourse against the Sin of Uncleanness, 8vo. 4. A Collection of Sermons. 5. Ethica Christiana. 6. Theologia Compendium. 7. A Treatise on the Sacred Ministry, 8vo. The three pieces last mentioned were collected from his public discourses and lectures, and printed without his knowledge; but met, nevertheless, like all his other performances, with a very favourable reception from the public. The three first pieces on the above list were translated into the Eng-

G lish,

lish, Dutch, and German, languages. M. Ostervald also published an edition of the Geneva French version of The Holy Bible, with arguments and reflections, in folio.

His eldest son, JOHN RODOLPH OSTERVALL, became pastor of the French church at Basil, where he worthily sustained the honour of being a descendant from so excellent a man, and published a treatise held in much estimation by French Protestants, and entitled "The Duties of Communicants," 12mo. *Ency. Brit.*

OSTERWICK, a town of Pomerelia: ten miles south-south-east of Dantzic.

OSTERWICK, a town of Westphalia, in the principality of Halberstadt, on the Ilse, containing several woollen manufactures: thirteen miles west of Halberstadt, and fifteen north-east of Goslar. Lat. 50. 59. N. lon. 10. 33. E.

OSTERWITZ, a citadel of the duchy of Carinthia: four miles east of St. Veit.

OSTERZELLE, a town in the kingdom of the Netherlands: nine miles south-south-east of Ghent.

OSTHAMMAR, a seaport-town of Sweden, in the province of Uppland, formerly a staple-town, on a small rocky island called *Gold Sheor*, in the Aland's Haff, near the coast. It is thirty miles north-east of Upsal. Lat. 60. 15. N. lon. 18. 19. E.

OSTHAN, or OSTEN, a river of France, which runs into the Chiers three miles above Montmedy.

OSTHEIM, a town of the duchy of Wurzburg: two miles west-north-west of Volckach.

OSTHEIM, a town of Germany, in the margravate of Anspach: four miles east of Wassertrudingen.

OSTHEIM, a town of Germany, in the county of Henneberg: eight miles south-west of Meinungen.

OSTHEIM, a town of Bavaria, in the territory of Rothenburg: five miles south of Rothenburg.

OSTHEIM VOR DE RHÖNE, a town of Germany, in the county of Henneberg: six miles south-west of Meinungen.

OSTHOFEN, late a town of France, in the department of Mont Tonnerre: two miles north-north-west of Manheim, and five north of Worms.

OSTIA, a town of Italy, situated at the mouth of the Tiber, about twelve miles to the westward of Rome. It was built by Ancus Martius, the fourth king of Rome; and was called *Ostia Tiberina*, in the plural number, i. e. the Two Mouths of the Tiber, which were separated by the Holy Island, an equilateral triangle, whose sides were each of them computed at about two miles. The colony of Ostia was founded immediately beyond the left or southern, and the port immediately beyond the right or northern, branch of the river; and the distance between their remains measures something more than two miles on Cingolani's map. In the time of Strabo, the sand and mud deposited by the Tiber had choked the harbour of Ostia; the progress of the same cause has added much to the size of the Holy Island, and gradually left both Ostia and the port at a considerable distance from the shore. Its port was one of the most stupendous works of Roman magnificence, and it was a long time one of the best towns on the coast; but, having been destroyed by the Saracens, and the harbour choked up, as mentioned above, it has not been able since to recover itself. Though it be an inconsiderable place, and but poorly inhabited, by reason of the badness of the air, yet it is the see of a bishop, who is always deacon of the cardinals, and crowns the pope. The Old Ostia, where are the ruins of the ancient harbour, is beyond New Ostia, towards the sea; the latter is but a little cluster of houses, built round the cathedral, with a small castle. It is twelve miles south-west of Rome. Lat. 41. 46. N. lon. 12. 13. E.

There were salt-works in Ostia, called *Salinae Ostiensis*, as early as the time of Ancus Martius (Livy); from which the *Via Salaria*, which led to the Sabines, took its name (Varro). It gave name to one of the gates of Rome, which was called *Ostiensis* (Ammian).

OSTIAKS, a people of Siberia in Asia, subject to the Russians, and comprehending three tribes. Before the Russians conquered Siberia, it was under the dominion of the Tartars, who gave the name of *Ouschtaiak*, signifying "savage," to the nations who inhabit it, as a mark of their contempt: hence they were called Ostiaki. The Ostiaks are divided into three very distinct people, both in descent and language; viz. the Ostiaks of the Oby, of the Narym or Narym, and of the Yenissey.

The Ostiaks of the Oby are held to be the most numerous of the three tribes; but accurate statements of the amount of their population are wanting. The Ostiaks of the Southern Oby call themselves *Ajjaks*, from the river Oby, which in their language is called *Yak*; the northern, *Khondi Khui*, People of Konda, because they withdrew from that river towards the north.

The Narym Ostiaks, who are also called Morases, are about the upper parts of the Surgut, in the districts of the Oby quite to the Narym, and about the mouths of the rivers Ket and Tom.

The Yenissey Ostiaks, though they resemble the two other nations of that name in appellation and mode of life, yet speak a language so entirely different from that of the Ostiaks, as well as from all the Siberian tongues, that they might rather be taken for a race of a particular nation, though not the smallest indications of their origin have been hitherto discovered. These dwell about the inferior Yenissey, near and between the Samoyedes. When the Russians, in the seventeenth century, had extended their conquest hither, these Ostiaks not only immediately submitted, but also assisted the Russians to subdue the neighbouring nations.

The Ostiaks are the most numerous nations of Siberia, where the population, on account of the rigour of the climate, is not very great. These people seldom exceed the middle size, and are not remarkable for their beauty; their complexion is yellowish, and their hair generally a deep-red; yet they are not ill made. They are in a state of great barbarism; and get their living chiefly by hunting and fishing, as none of them cultivate the soil. They have neither horses, oxen, nor sheep; their live stock consists of rein-deer, which they employ in draught. Their dress is generally formed of the skins of different animals and furs. They wear short trowsers; their stockings are made of skin, which go all over the feet, and serve them for boots, which they strengthen by placing the skin double for the sole. They have a sort of jacket next their skin; and over all they put a long coat with close sleeves, which has a hood that entirely covers the head, and only leaves out the face; and, in very cold weather, they even wear another over this. *Costume of the Russian Empire*; 1804.

In the winter they build their huts in woods and forests, where they find the greatest plenty of game, and dig deep in the earth, to secure themselves from the cold, laying a roof of bark or rushes over their huts, which are soon covered with snow. In summer they build above ground on the banks of the rivers, to enjoy the convenience of fishing; and make no difficulty of forsaking their habitations. They have a sort of princes among them, in one of whose houses some European travellers found four wives. One of these had a red cloth coat on, and was set off with all sorts of glass beads. There was no other furniture than cradles and chests, made of the bark of trees sewed together. Their bed consisted of wood-shavings, almost as soft as feathers.

Their religion is pagan; and they have some little idols, representing men and animals, made of wood and earth, all of which are dressed in silks, in the manner of Russian ladies. In general, however, they are ill made, every man being his own carver. They place them on the tops of hills, in groves, and in the pleasantest places their country affords, and sometimes before their huts; yet they have no set time for performing religious worship, but apply to their gods for success in their occasional undertakings.

takings. As they have no regular priests, every old man may devote himself to that service; and the office is frequently performed by the masters and heads of families. Strahlenberg says that, when he was among them, he saw one of their temples, which was built of wood in an oblong form, like a great barn, covered at the top with birch-bark. At the end of the wall supporting the gable was a kind of altar, made of timber, on which were placed two idols, representing a man and woman, dressed in all sorts of tawdry rags; and round these were other small figures, as deer, foxes, and hares, all which were roughly carved in wood, and also clothed. They did not appear to have much devotion, nor any great reverence for their idols. When they offer sacrifices, they present the beast to the idol; and, having bound it, an old man puts up the petitions of those who brought the offering; he then lets fly an arrow at the beast, and the people assist in killing it. It is then drawn three times round the idol; and, the blood being received into a vessel, they sprinkle it on their houses; they afterwards dress the flesh and eat it, rejoicing and singing their country-songs: they also besmear the idol with the blood of the sacrifice, and grease their mouths with the fat. What they cannot eat they carry home to their families, and make presents of it to their neighbours: they as often sacrifice a fish as a beast. At the conclusion of the feast they shout, to show their gratitude to the idol for his attending and accepting their devotions; for they are persuaded that the saint or hero represented by the image always attends their sacrifices, and that, when they are over, he returns to his abode in their air.

The Ostiaks are obliged to take an oath of fidelity to the Russian government; and on these occasions they use the following ceremony. After laying down a bear-skin and an axe, and holding over it a piece of bread on a knife, they say, "In case I do not to my life's end prove true and faithful to the supreme government of the country, or if I knowingly and willingly break through my allegiance, or be wanting in the duty I owe to the said supreme government, may the bear tear me to pieces in the wood; may the bread I eat stick in my throat and choke me; may the knife stab me, and the axe cut off my head."

OSTIA'NO, a town of Italy: twelve miles north-east of Cremona.

OSTIA'NY, a town of Lithuania, in the palatinate of Wilna: forty miles south-east of Wilna.

OSTIARY, *f.* [*ostium*, from *os*, mouth, Lat.] The opening at which a river disembogues itself.—It is received that the Nilus hath seven *ostiaries*; that, is by seven channels disburtheneth itself into the sea. *Brown*.—Formerly an ecclesiastical officer.—The office of the *ostiary* was to open and shut the church-doors, to look to the decent keeping of the church, and the holy ornaments laid up in the vestrie. *Weever*.

OSTICO, a small lake of America, in Onondago-county, New York, which sends its waters from the north end by a stream of sixteen miles long to Salt-lake.

OSTIGLIA, a town of Italy: ten miles east-south-east of Mantua.

OSTIMURI, a town of New Mexico, in the province of Hiaqui: forty miles east of Riochico. Lat. 29. 12. N. lon. 110. 56. W.

OSTINGHAUSEN, a town of Germany, in Westphalia: eight miles west of Lippstadt, and four north-east of Werl.

OSTINS TOWN, or CHARLES TOWN, a town of the island of Barbadoes.

OSTIONES, a small island in the Pacific Ocean, near the coast of America. Lat. 4. 10. N.

OSTISCO, or OSTICO, a lake of New York: eight miles south-west of Onondago Castle.

OSTLER, *f.* [*hofselier*, Fr.] The man who takes care of horses at an inn.—The smith, the *ostler*, and the boot-catcher, ought to partake. *Swift*.

OST'LERY, *f.* [*hofselerie*, Fr.] The place belonging to the ostler.

OST'MEN, *f. pl.* [*i. e.* *Eastmen*, as coming from a country *east* of Ireland. *Ostmanni*, low Lat.] Danish settlers in Ireland.—Anlave was chief of the *Ostmen* in that island, and styled king of Dublin. *Ld. Lyttelton*.

OSTRACH, a village of the grand duchy of Baden, in the territory of Salmsweiler: five miles north-east of Pfullendorf.

OSTRACH, a river of Germany, which runs into the Danube about a mile below Scheer.

OSTRA'CION, *f.* the TRUNK FISH; in ichthyology, a genus of the order branchiostegi. Generic characters.—Teeth round, pointing forwards, blunt; aperture of the gills linear; body mailed by a complete bony covering; no ventral fins.

This genus of fishes is easily distinguished by a hard bone or shell covering the whole body except the tail. They resemble consequently the tortoise, but especially the echini; for, like these, their armour is in divisions ornamented with pearly tubercles; and, like the former, their shells are occasionally shed, or come away in the dressing. These bony plates generally have an hexagonal form, decorated with radiated figures or a slight network. The head is truncated; the mouth is small, opening at the extremity; the teeth are blunt, standing close together, and of an orange-colour; the lips are movable, and red; the tongue is short, fixed, and smooth, as is the palate. The eyes are at the top of the head, near together, with a bony ledge or eyebrow hanging over, to protect them from accidents; these ledges form a furrow on the top of the head. The nostrils are small and long, sometimes single, sometimes double, and near the eyes. The gill-aperture is long, narrow, and curved. The back is sharp, and arched in some species, and in others it is broad. The sides are very long, high, and compressed above. The surface of the belly is broad and long; and the vent is near the tail-fin. The tail is naked, smooth, and movable, below the round furrow which is seen on each side of the shell. There is no appearance of lateral line or of scales. They have five fins; two pectorals under the aperture of the gills, which, having the same direction as in the Diodon mola, or sun-fish, cannot assist its progressive motion, but only enable it to keep a balance, or to turn on one side; but, the tail being at liberty, the fish can, by its means, turn any way, or go forwards; for this organ, which is very strong, performs the office of pectoral and tail fin in most fish, and of dorsal and tail in the sun-fish. The other three fins are the dorsal, anal, and tail; the two first are small, like the pectorals; but the fin of the tail is large. The fins are all of a round figure, with branched rays; ventral fins, none. These are carnivorous fish, and haunt the East and West Indian Seas, and the Red Sea. Their flesh is little in quantity, but well-tasted. Gmelin's Linnæus has ten species, Turton's twelve; Cope has fifteen, of which he makes four divisions.

1. Ostracion triquetrum, the smooth trunk-fish. Specific character, the body triangular and without spines, the pieces of shell convex. There are 17 rays in the pectoral fins, 12 in the anal, 14 in the tail, and 11 in the dorsal. The under is the narrowest of the three sides; all three are broad in the middle, and diminish towards the extremities; they form together an acute angle, and a convex rim at the back and belly; the lower rims are smooth and blunt, the upper one sharp and uneven. If the fish be cut in pieces directly through, or from back to belly, each piece forms a triangle, not entirely regular. The shell is in hexagonal pieces rising up towards the middle, upon each of which is a white tubercle. The nostrils are long, and near the eyes. The pupil of the eye is black, in a white iris inclosed in a yellow circle. The body is of a red-brown; the fins yellow. The tail is long, ornamented with round white spots edged with dark-brown.

The

The fins are rounded with ramified rays. This species is from the East and West Indies, living on shell-fish, and growing to the length of a foot and a half. It is so much esteemed as food, that only the rich can procure it; for, according to Brown, it surpasses all the fish of America. This large species is shown on the annexed Plate, at fig. 1.

2. *Ostracion concatenatus*, the fettered trunk-fish: body triangular, without spines, and marked with chain or network. There are 12 rays in the pectoral fins, 9 in the anal, 8 in the tail, and 10 in the dorsal. The sides are narrower, the back less arched, and the extremities of the back and belly more even, than in the preceding. By help of a magnifier, a curious arrangement is observable on the surface of the shell; each piece is composed of six triangles, four of which have almost equal sides, and the two middle ones have long sides; these last being connected with their bases, and their angles touching the adjoining piece, form that chain-work of which we have spoken; but those interfections disappear by degrees towards the belly, because all the triangles become isosceles, or of equal sides. The edges of these pieces are raised, and of a white colour. The aperture of the mouth is small; the upper jaw rather the longest, and five teeth in each. The pupil of the eye is black, with a yellow border, and a green iris. The head is ash-colour, with some stripes of blue. The sides are violet inclining to grey; and the belly is white, as is the network on the shell. The tail is brownish; the fins of a dirty-red. Plumier found this in the Antilles.

3. *Ostracion trigonus*, the triangular trunk-fish: the back arched, 14 rays in the dorsal fin, subcaudal spines 2. There are 12 rays in the pectoral fins; 7 in the tail, 9 in the anal. The surfaces of the three sides are higher in this fish than in any of the other species of this genus; the head is also larger, and more truncated. The mouth is very small; there are ten teeth in the upper jaw, eight in the lower. On the sides, the pieces of armour are raised in the centre, on the belly at the rims; they are marked with lines, on which are strong pearly tubercles. The eyes are large, with a black pupil and golden iris. The head is grey, inclining to yellow; the body yellow, shaded with brown; the fins are yellow, inclining to blue at the extremities, with strong ramified rays; the spines at the anus are very strong, and channelled or fluted. This fish grows a foot long or more. It is natural to the Antilles and Brasil, feeding on coral and the animals it finds therein; Marcgrave found sand or gravel in the stomach, which probably had been taken in to help digestion, as in many birds. The same author found one of these in the stomach of a spotted perch, (*Perca guttata*;) which proves that the hard shell it is covered with does not protect it from the voracious tribes. Duterre says, that, when caught, it grunts like a hog, which has gained it the name of *sea-hog*. The flesh is hard and tough. It is caught with a net; it will bite at a bait; but, if not drawn up quickly, it bites the hook in two with its strong teeth.

4. *Ostracion biaculeatus*, the two-spined trunk-fish: the body triangular and spotted, two spines near the anus. There are 13 rays in the pectoral fins, 9 in the anal, 8 in the tail, and 10 in the dorsal. The eyes are large, with a black pupil and reddish iris; the nostrils are single, and near the eyes. There are sixteen teeth in the upper jaw, and twelve in the lower. The surface of this fish is rough to the touch, and covered all over with black spots, as is the tail and its fin, but not the other fins. The colour of the body is grey, mixed with pale-yellow; the fins are yellow, which is darker towards the extremities, with ramified rays. This species is found in the East Indies; it is from a foot to a foot and a half long; its food is like the preceding.

β. There is a variety of this, which Lister, Ray, Artedius, and Klein, have made a separate species. But the construction is entirely the same; the only difference is, that, instead of the round black spots, each piece of armour has the appearance of a star with six rays. Perhaps

both are only varieties of the *O. trigonus*. The pectoral fins have but 11 rays.

5. *Ostracion tricornis*, the three-spined trunk-fish: body triangular; one spine on the back, and one over each eye. The spines on the forehead are nothing more than prolongations of the bony covering near the eyes, extending to a point, and directed forwards. It is found in the Indian Sea.

Cepede remarks, that the authorities brought by Gmelin for this species belong to other ostracions; and that the remarks of Daubenton and Bonaterre, in the *Encyclop. Method.* should have been applied to Lister's trunk-fish, and not to this.

6. *Ostracion quadricornis*, the four-spined trunk-fish: body triangular, with four spines. There are 6 rays in the pectoral fins, 8 in the anal, 10 in the tail, 7 in the dorsal. In this species, the surfaces of the sides are somewhat broader than the preceding, and the forehead not so flat. The eyes are oval, with a dark-blue pupil enclosed in a yellowish iris. There are fourteen teeth in the upper jaw, and twelve underneath. The shell is rough to the touch, because of the little tubercles with which it is beset. The colour of this fish is brown inclining to red, with long brown spots in various directions. The fins are yellow, with branched rays; the tail is of the same colour; with black spots; its fin is large, but the dorsal and anal are short. The back is arched. Two of the spines are upon the forehead, the other two under the tail. This species inhabits the seas of Jamaica, the Antilles, Guinea, and the East Indies, growing about fifteen inches long. It is not very fleshy, nor much esteemed as food.

7. *Ostracion Lister*, the five-spined, or Lister's, trunk-fish: body triangular; one large spine under the tail. This species has five spines, four of them placed similar to the *quadricornis*; but the two under the belly seem to have been overlooked by Artedius, Daubenton, and Bonaterre, (or rather the two latter have copied the former,) for they have called it the three-spined. As Lister (ap. Will. Ichthyol. p. 19.) first described it properly, Cepede has given it his name. The spine on the tail, below or behind the armour of the body, is hard, pointed, and as long as the anal fin; it is nearer the caudal fin than to the edge of the bony case. The dorsal fin is nearer to the head than the anal is. The scales on the tail cannot be distinguished during the life of the fish. On the back, and on the sides of the head, appear large undulated spots. Its native country is not known.

8. *Ostracion turritus*, the sea-camel: body quadrangular, with a large elevation; one spine on the eyebrows and back, 4 on each side the belly. There are 12 rays in the pectoral fins, 10 in the anal, tail, and dorsal. This fish is broader at bottom than at top. The lower edges are sharp, the upper rims blunt or round. At the lower edge are from three to five short strong spines bent back; it is probable that their number increases with the age of the fish; and there is a spine of the same kind over each eye. The upper surface rises gradually on each side into an eminence or hump, which is broad, thin, and radiated, crowned with a short thick strong spine, bending backwards. The divisions of the shell are marked with lines, and their edges are raised; and, being composed sometimes of six triangles, sometimes of seven or eight, they are either six, seven, or eight, sided; and, the raised edges being of a white colour, the body seems as if covered with a net. The colour of the body is faint-yellow; the head brown, the fins grey; a few round spots of a brown colour are seen on different parts of the body. The head is large and truncated; the mouth a little protruded. There are twelve teeth in the upper jaw, and eight in the lower. The pupil of the eye is black, not entirely round, with a golden iris. The gills have a large aperture; the membrane has only one ray. This species inhabits the Red Sea and the East Indies; it is particularly plentiful about the Molucca Isles. Some say it grows to the length of ten

OSTRACION.

1. Smooth Trunk-fish. 2. Sea Cucumber. 3. Horned Trunk-fish. 4. Caudal Trunk-fish. 5. Beaked Trunk-fish.
Engraved for the Encyclopædia Britannica 1840.

or twelve inches; Cepede says a foot and a half; Linnæus, four inches. Its modes of living are the same as the other species of this genus. The flesh is tough and hard; the liver is large, and yields plenty of oil. The Europeans in the Indies despise it; but the negroes have a method of cooking it so as to make a palatable dish. It is represented, from a small specimen, at fig. 2.

9. *Ostracion cornutus*, the horned trunk-fish: body square, armed with four long spines, two at the head and two at the anus. There are 11 rays in the pectoral fins, 10 in the tail, 9 in the anal and dorsal. Of the four sides, the belly is the broadest, the back the narrowest; the four form an acute angle. The head is short, and much truncated, the rostrum declining almost perpendicularly. The eyes are large, with a black pupil, the iris yellowish-green; and near them are the nostrils. There are usually ten teeth in the upper jaw, and eight in the lower. The pieces of armour rise in the middle, and are rough to the touch; some of these pieces are hexagonal, some heptagonal. The body is of a yellowish-brown colour; the fins yellowish, except the tail, which is brown, and very dark towards the end; the tail and its fin are very long. This singular fish is found in the East Indies, and at the Moluccas. It is eight or ten inches long, and lives in the manner of the preceding species. It is known also at the Bahama Isles, where however it seldom exceeds four inches in length. Its spines defend it from the voracious tribes; only the *Anarhichas lupus*, or wolf-fish, will venture to attack it; and he sometimes loses his life by the spines wounding his entrails. The flesh is hard, tough, and difficult of digestion; so that only the common people eat of it: according to Renard, the liver is so fat, that it melts almost entirely into oil. This is represented at fig. 3.

10. *Ostracion auritus*, the eared trunk-fish: brown, with a spine over each eye, two on each side the back and abdomen, and one on each side the body. Habit thick, broad, and short, with the back very convex; shape subtriangular; above each eye a very strong, thick, sharp-pointed, spine, curving backwards, so as to give the resemblance of a pair of ears; on each side the middle of the ridge of the back two others of similar appearance: on each side the abdomen two more, and on each side the middle of the body a single spine, shorter than the rest. Colour of the whole animal deep-brown, except the spines and fins, which are pale: length of the specimen described, about four inches and a half; pectoral fins somewhat lanceolate; tail nearly even, but with a slight approach towards a lunated shape. Native of the Indian Seas: observed during the voyages of Capt. Cook; and preserved in the British Museum. It is represented at fig. 4. from Dr. Shaw's Gen. Zool. and Nat. Miscel.

11. *Ostracion striatus*, the striped trunk-fish: yellow and blue stripes on the body; a spine over each eye, two on each side the back and abdomen, and one on each side the body. Size and habit of the preceding. Colour a beautiful variation of bright-blue and yellow, in the form of lines disposed in different directions, but principally in a longitudinal one, over the whole fish; above each eye a strong spine as in the former; on the ridge of the back two pair, disposed as in that species; and on each side the abdomen three, the middle of which is higher than the rest. Fins and tail pale-blue, the dorsal and anal fin blue and yellow at the base, and the tail (which is slightly lunated) edged with yellow; all the spines are of a blue colour. Whether this fish be a sexual difference, or a distinct species, may perhaps be doubted; for the eared trunk-fish may in reality be no other than the present animal, changed entirely in colour from having been long preserved in spirits of wine. Described by Dr. Shaw, from a drawing by Capt. G. Tobin, by whom it was observed about the coasts of Adventure Bay in Van Diemen's Land.

12. *Ostracion tetragonus*, the dotted trunk-fish: body quadrangular; little radiated tubercles, but no polygonal figures, on the bony covering; small white spots all over the body. There are 10 rays in the pectoral fins, 9 in the

dorsal, 11 in the anal, 10 in the tail, which is rounded. Commerçon found this species in the Mauritius, or Isle of France. It is only about six inches long. The white lenticular spots are innumerable, not only on the shell, but on the bare parts; they are somewhat larger on the back; larger still, and running one into the other, upon the belly; and are the more remarkable, as the ground-colour is brown. The jaws are equally protruded; the teeth frequently of a dark colour, and commonly ten in each jaw. Under each eye there is a broad, flat, or rather hollowed, space, carved out in a very peculiar manner.

13. *Ostracion tuberculatus*, the tuberculated trunk-fish: body quadrangular, four large tubercles at right angles upon the back, but no spines. This species differs from the preceding only in the tubercles mentioned above; they lie pretty far back, distant from the head. Native of India.

14. *Ostracion oblongus*, Commerçon's trunk-fish: body quadrangular; a tubercle above the mouth, another below. Ten rays in each pectoral fin, 9 in the dorsal and anal, 10 in the tail, which is rounded. This species also is described by Cepede from Commerçon's MSS. It is covered with hexagonal plates and radiated tubercles; the plates on the back are black in the centre; but the general colour of the armour is dirty-red. The fins are brown; the extremity of the tail, the iris of the eye, the intervals of the pieces about the opercula of the gills, are of a bright-yellow; the under parts of the body are of a faint dirty-yellow. The snout is blunt; the mouth small; the teeth are brown, ten in each jaw. The tubercles, which form the specific character, are whitish, and of a cartilaginous substance; one in front of the aperture of the mouth, the other, which is the largest, underneath. The tongue is a shapeless cartilage, somewhat rounded, and whitish. The nostrils are small, and very near the eyes. The gills are four on each side; the concave part of the semicircles which sustain them are minutely serrated. It grows a foot long: was observed by Commerçon at Isle Pralin.

15. *Ostracion gibbosus*, the hunch-back trunk-fish: body quadrangular, a bunch on the back; no spines. Gmelin doubts whether it may not be a variety of the *triqueter*, or smooth trunk-fish; he leaves it a distinct species, however, to which the singular rising on the back seems to entitle it. Knorr has a figure and description of a fish which has been taken for an *Ostracion*, and is called *porte-crête* in the plates of the *Encyclopédie Methodique*; that fish seems to belong to the *Lophius*; but the design is very incorrect, and was probably made from a mutilated specimen, so that no reliance can be placed upon it. Inhabits Africa.

16. *Ostracion cubicus*, the square fish: body quadrangular, with white spots; each fin has 10 ramified rays, no spines; sides flattish, narrow, and long, the lower broader than the upper. The shell in this species is divided into hexagonal pieces, upon each of which is a white spot inclosed in a brown circle; these pieces are of a darker colour towards the back than in the centre. The lips are large; the upper jaw has twelve teeth, the lower ten. The eyes are oval; pupil black; iris yellow. The apertures of the gills are smaller than in the other species. The sides are grey; the head yellowish; the tail brown; the pectoral fins reddish, the others mostly grey. There are little risings on the shell, which render it rough. This fish is caught in the waters of Arabia, and in the East Indies, especially in the Mauritius. It grows about a foot long, living on worms and insects, like the rest of the genus. Forskael says its flesh is very well tasted; Renard adds, that it may be tamed so as to come to the surface and eat out of your hand.

17. *Ostracion nasus*, the beaked trunk-fish: a nasal protrusion above the mouth; nine strong branched rays in each fin. The four sides of this fish are nearly of equal length; they meet in acute angles; and, being long and narrow, the fish forms nearly an oblong square, or parallelogram.

leogram. Each piece of armour is composed of seven smaller pieces, which, by their raised edges, form a star with six rays; in the centre of each star is a round red spot made up of small tubercles; and several spots of the same colour appear upon the head and back. The eyes are large, with a black pupil and white-and-green iris. There are fourteen teeth in the upper jaw, and twelve in the lower. The principal colour of this fish is grey; the fins are reddish; and there are brown spots on the head and tail. This species is found at the mouth of the Nile, and in the Nile. In other respects it resembles the preceding. This is shown at fig. 5.

18. *Ostracion meleagris*, the speckled trunk-fish: body quadrangular, blackish-brown, speckled with white. Length from six to eight inches; habit similar to that of the *O. cubicus*, being of the same square shape; mail divided into hexagons, and of a deep blackish chestnut colour, each division being marked with numerous small white spots; naked or projecting part of the body marked in the same manner; fins and tail whitish, with chestnut-coloured rays; eyes white. Native of the Indian Seas: observed during Capt. Cook's voyages about the coasts of New Holland, Otaheite, &c. *Shaw's Naturalist's Miscellany*, t. 253.

OSTRACISM, *f.* [ὀστρακισμός, Gr.] A manner of passing sentence, in which the note of acquittal or condemnation was marked upon a shell which the voter threw into a vessel. Banishment; public censure.—This man, upon a slight and false accusation of favouring arbitrary power, was banished by *ostracism*; which in English would signify, that they voted he should be removed from their presence and councils for ever. *Swift*.

Hyperbolus by suffering did traduce
The *ostracism*, and sham'd it out of use. *Cleveland*.

OSTRACISM, in Grecian antiquity, denotes the banishment of such persons whose merit and influence gave umbrage to the people of Athens, lest they should attempt any thing against the public liberty. This punishment was called *ostracism*, from the Greek word ὀστρακον, which properly signifies a shell; but, when applied to this object, it is used for the billet on which the Athenians wrote the names of the citizens whom they intended to banish. The learned are divided with regard to the substance of which this billet was formed: some insist that it was a small stone, or a piece of brick; some that it was a piece of bark; and others assert that it was a shell. The word admits most of these interpretations. But what determines its true sense, is the epithet given it by ancient authors, of *ceramitè mastix*; which words signify, "the punishment of potter's clay:" and this expression seems to us a proof, that the word ὀστρακον, when applied on this occasion, signifies a piece of baked earth in the form of a shell; and, undoubtedly, the Latin authors had this idea of the word here, for they translated it by *testula*.

The ancients are likewise divided with regard to the time when ostracism was instituted; but they all agree, that the person who moved the law was its first victim: but, as to the name of its patron, and the time of its establishment, they differ extremely.

However that be, the punishment of ostracism was inflicted by the Athenians when their liberty was in danger. If, for instance, jealousy or ambition had sowed discord among the chiefs of the republic; and if different parties were formed, which threatened some revolution in the state; the people assembled to propose measures proper to be taken, in order to prevent the consequences of a division which in the end might be fatal to freedom. Ostracism was the remedy to which they usually had recourse on these occasions; and the consultations of the people generally terminated with a decree, in which a day was fixed for a particular assembly, when they were to proceed to the sentence of ostracism. Then they who were threatened with banishment omitted no assiduity or art which might gain them the favour of the people.

They made harangues to evince their innocence, and the great injustice that would be done them if they were banished. They solicited, in person, the interest of every citizen; all their party exerted themselves in their behalf: they procured informers to vilify the chiefs of the opposite faction. Some time before the meeting of the assembly, a wooden inclosure was raised in the forum, with ten doors, that is, with as many as there were tribes in the republic; and, when the appointed day was come, the citizens of each tribe entered at their respective door, and threw into the middle of the inclosure the small brick on which the citizen's name was written whose banishment they voted. The archons and the senate presided at this assembly, and counted the billets. He who was condemned by six thousand of his fellow-citizens, was obliged to quit the city within ten days; for six thousand voices, at least, were requisite to banish an Athenian by the ostracism.

The Athenians, without doubt, foresaw the inconveniences to which this law was subject; but they chose rather, as Cornelius Nepos hath remarked, sometimes to expose the innocent to an unjust censure, than to live in continual alarm. Yet, as they were sensible that the injustice of confounding virtue and vice would have been too flagrant, they softened as much as they could the rigour of ostracism. It was not aggravated with the circumstances which were most dishonourable and shocking in the ordinary mode of exile. They did not confiscate the goods of those who were banished by ostracism. They enjoyed the produce of their effects in the places into which they were banished; and they were banished only for a certain time. But, in the common banishment, the goods of the exiles were always confiscated, and no hopes were given them of ever returning to Athens.

This punishment, far from conveying the idea of infamy, became, at Athens, a proof of merit, by the objects on which it was inflicted; as Aristides the sophist justly observes, in his second declamation against the Gorgias of Plato, that ostracism was not an effect of the vindictive spirit of the people against those whom it condemned; that it was only meant to prune the luxuriant growth of transcendent merit; that it condemned to an exile of ten years only those illustrious men who were accused of being exalted far above other citizens by their conspicuous virtue; and that none of that public indignation was shown to the exiles by ostracism, which commonly breaks out against criminals.

Such were the mitigations with which this law was introduced among the Athenians; and by them we see that they were sensible of all the inconveniences to which it was subject. They were indeed too enlightened a people not to foresee the many instances of injustice which it might produce; that, if in some respects it would be favourable to liberty, in others it would be its enemy, by condemning citizens without allowing them a previous defence, and by making a capricious and envious people arbiters of the fate of great men. But, however great these inconveniences were, this law would still have been of service to the state, if the people by whom it was instituted had always had discernment to give it force on such occasions only as endangered liberty. But the people of Athens, naturally jealous and envious, at length availed themselves of it to remove men of eminent merit from the state, by whose presence they were reprovved or intimidated. The fear of tyranny was commonly but a specious pretext with which they veiled their malignity. The repeated victories which they had gained over the Persians, had rendered them, says Plutarch, proud and insolent. Intoxicated with their prosperity, they arrogated all its glory to themselves; they were jealous of those citizens whose political and military talents were the subjects of public eulogium. They thought the glory acquired by great men diminished their own reputation. An Athenian no sooner distinguished himself by a splendid action, than he was marked out as a victim by public

OSTREA.

1. The large Pecten, or Pilgrims Scallop. 2. the Jacobea. 3, 4 the subrufa. 5. the obliterated. 6, 7. varia. 8. Absoluta. 9. Islandica.

public envy. His reputation was a sufficient reason for his banishment. Such was the case with Aristides and some others. See the article GREECE, vol. viii. p. 856.

OSTRACITE, *f.* [from *ostrea*, Lat.] The common oyster in its fossil state. Ostracites are of various shapes and kinds; and the name is by some authors made to signify the shell itself, when preserved in its native state and condition, as is the case with those found about Woolwich and Blackheath; and by others, the stones cast or formed in those shells, or in cavities from whence they have been washed away and dissolved. In both these cases the stone carries the exact resemblance of the shell, even in its nicest lineaments; in the first case, bearing every mark of the inside, in the other, of the outer surface. We have this stone in great plenty in many parts of England; and it is very famous, in some places, for its virtues in cases of the gravel, and the like complaints. Dr. Home, in the Phil. Trans. says, the ostracites rather dissolves the little stones than forces them out, as not being remarkably diuretic. He adds, that he prescribes it in powder, with a third part of flores chamæmeli. The dose is from half a drachm to a whole one, in white wine.

It is to be observed, that all the fossil shells, and particularly the *lapides Judaici*, or Jews' stones, which have been the spines of sea echini, have been esteemed diuretics, and good in the stone and gravel. Among the ancients, Dioscorides, Pliny, and all the rest, recommend them highly.

OSTRACITES is also the name of a kind of cadmir, found at the bottom of furnaces where copper is purified. It is very heavy, and in structure resembles an oyster-shell; whence its name. It has been esteemed astringent and detergent; and introduced as an ingredient in several unguents.

OSTRAU', a town of Moravia, in the circle of Hradisch, on an island in the river Marſch: seven miles south of Hradisch.

OSTRAU', or **OSTROW MA'HRISCH**, a town of Moravia, in the circle of Prerau, on a river of the same name, on the borders of Silesia: twenty miles south-east of Troppau, and forty east-north-east of Prerau. Lat. 49. 47. N. lon. 18. 17. E.

OSTRA'VA, or **OS'TRAWICE**, a river which separates the principality of Teschen from Moravia, and runs into the Oder five miles south of Oderburg.

OSTREA, *f.* The OYSTER; in natural history, a genus of the class *vermes*, or worms, order testacea. Generic characters—Animala tethys; shell bivalve, generally with unequal valves, and slightly eared; hinge without teeth, but furnished with an ovate hollow, and mostly lateral transverse grooves: thus they are immediately distinguished from the genus Arca, in not having teeth alternately locking in each other.

This genus comprehends the two extensive families of Pectens or Scallops, and Oysters; and there are no less than a hundred and thirty-six species in the whole. In both divisions, the animal is well known as a nutritive and valuable food. Both scallops and oysters are found plentifully in the Indian Seas; the Mediterranean, the American Ocean, and in the European seas, where they constitute a considerable article of commerce. The scallops grow a sort of coarse byssus; and have the agility of leaping full half a yard out of the sea, at which time they open their shells, and spout out the stale water within them; after which they rapidly sink, taking in fresh water, and closing their shells with a loud snap, which betrays their beds to the watchful fisherman.

The difference between the Oyster and the Scallop is so obviously impressed by the hand of nature on the respective shells which compose them, that few writers on this subject have passed silently over the impropriety of thus placing them together. The Scallop differs from the oyster in being endowed with a higher locomotive power: the animal is different in having the branchiæ cirrhatæ,

or fringed; in being furnished with a kind of foot, like the Cardium echinatum, delineated in the Helminthology Plate IV. fig. 2. which it protrudes from the shell near the auricle of the hinge; and in throwing out a byssus similar to the pinna and the muscle, by which it fixes itself to other bodies. Aristotle, and other ancient writers, attribute to the scallop the power of springing from place to place on the sea-shore. Argenville describes its movements both in the water and out; he relates, that when left dry, by a sudden closing of its valves, assisted by the foot, it has the power of springing four or five inches at a jerk, repeating this motion in order to regain its element. "In the water, (he says,) it has the power of rising and sustaining itself near the surface, turning about in various directions, and on any alarm suddenly closing the valves and sinking to the bottom. The Oyster, on the contrary, has the branchiæ simple, and not fringed, and is unfurnished either with a foot or with byssus; and its powers of motion consist in turning either the flat or convex side upwards or downwards; and even to effect this, the animal is said to take advantage of the force of the ebbing or flowing of the water to assist it." Yet still, in the articulation of the hinge, the generic character holds good.

I. SCALLOPS. *Valves furnished with ears, and radiate.*

1. Equilateral; ears of the valves equal.

1. *Ostrea maxima*, the large pecten, or pilgrim's scallop: shell with fourteen rounded longitudinally-friate rays. This is delineated by Mr. Donovan, in his British Shells. There are two other varieties described by Lister and Knorr: our representation, at fig. 1. on the annexed Plate, is from the latter. These are found in most European seas, in large beds; whence they are dredged up, and pickled and barrelled for sale. This is the shell that was formerly worn by pilgrims on the hat or coat, as a mark that they had crossed the sea, for the purpose of paying their devotions in the Holy Land; in commemoration of which it is still preserved in the arms of many families. The shell is five or six inches long, and rather broader; the ears are large, with decussate striæ; the hinge with a large deep hollow; lower valve convex, white, often varied with red bands or spots; the upper valve is flat and reddish.

2. *Ostrea Jacobæ*: shell with about fourteen angular and longitudinally-friate rays. It inhabits European seas. The grooves of the shell are transversely friate; the upper valve is flat; the lower valve with angular rays; the ears are concave and smooth on the upper side. See fig. 2.

3. *Ostrea ziczac*: shell with flattened rays. It inhabits the American Ocean; sometimes of one colour, sometimes variegated; the ears are very finely wrinkled; the lower valve is convex, with from eighteen to twenty rays, which are very finely friate transversely, and about twice the number of perpendicular striæ within. The upper valve is flat.

4. *Ostrea striatula*: shell with sixteen faint rays and transverse membranaceous striæ; the margin very entire. It is found in the Indian Ocean. The shell is middle-sized, varied with purple and white, within yellowish.

5. *Ostrea minuta*: shell with twenty convex rays. It inhabits the Indian Ocean. The shell is about the size of a nut: lower valve white, and very convex; upper valve white clouded with brown, flatter and plaited.

6. *Ostrea pleuronectes*: shell equivalve, with twelve doubled rays, and smooth on the outside. It inhabits the Indian Ocean; it is sometimes reddish, or of a flesh-colour, or liver-colour; within it is silvery. There is a variety of an orange-colour radiate with red; it is four inches and a half long, and gaping at each end.

7. *Ostrea Laurentii*: upper valve sub-convex, smooth, with fine perpendicular lines crossing very fine concentric transverse striæ; lower valve with twenty-four rays and forty-

forty-eight striae within. It is found on the shores of South America, and is very rare. The shell is nearly three inches long, and about as broad.

8. *Ostrea Japonica*: shell equivalve, a little convex, margined with yellow; upper valve with faint lines crossing concentric transverse bands, and forty elevated striae within. It is found on the shores of Guinea and Japan; is about five inches and a half long and broad, and resembles the *O. pleuroneustes*, but is coarser and thicker.

9. *Ostrea Magellanica*: shell equivalve, glabrous, with oblong crowded striae. It is found in the straits of Magellan: it resembles the *O. pleuroneustes*. The shell is lateritious, not radiate, quite smooth within; upper valve more convex; lower valve flatter than in most others, the ears are transversely striate.

10. *Ostrea hybrida*: shell with nine or ten rays, the interstices longitudinally striate; margin repand within. It inhabits the Norway seas; thin, lower valve white, upper valve sanguineous, with angular veins and lines.

11. *Ostrea radula*: shell nearly equivalve, with twelve convex rays crossed by crenate striae. It is found in the Indian Ocean; is three inches and a quarter long, and two and a half broad. The shell is oblong, white, or varied with white and brown; the lower valve is a little more convex; ears wrinkled, and furrowed with oblique striae.

12. *Ostrea imbricata*: shell nearly equivalve, with nine unequal rays, imbricate with scales. It is found on the shores of the Red Sea; and resembles the preceding. The colour of the shell is whitish with purple spots, and a little crenate at the margin; the rays alternately larger.

13. *Ostrea subrotunda*: shell roundish, with eight convex chefnut rays; ears roundish, white with a yellowish border. The shell is one inch and a half long, and two inches broad.

14. *Ostrea plica*: shell nearly equivalve, with six convex smoothish rays, and striate acrofs. It inhabits India; is about one inch and a quarter long, and an inch broad. The shell is white, or white spotted with brown, or red spotted with white; the transverse striae are placed at a distance from each other.

15. *Ostrea crenata*: shell roundish with convex rays, the outer ones finely striate longitudinally; margin deeply crenate. The ears are transversely striate.

16. *Ostrea sinuosa*: shell ovate, with very numerous and fine striae; the margin crenate within. It inhabits the British seas; shell varied with saffron.

17. *Ostrea squamosa*: shell oblong, with scaly rays, the interstices broader, and marked with perpendicular striae. The shell is varied with angular lines and spots; ears wrinkled, perpendicular.

18. *Ostrea dubia*: shell roundish, with eighteen rays imbricate with scales. The shell is nearly half an inch long; ears striate transversely.

19. *Ostrea subrufa*: shell with twenty smooth rays, the interstices transversely striate; margin crenate. This is described and figured in Donovan's British Shells. It is found on the British shores, and is about two inches long, and two inches broad. See figs. 3, 4.

20. *Ostrea vericolor*: shell flattened, with eighteen smooth rays, the interstices cancellate. The shell is of a pale-yellow, white, sea-green, blackish, or red; ears transversely striate.

21. *Ostrea rosea*: shell roundish, with five rays. The shell is middle-sized, rosy, with white rays, or green, mixed with yellowish, lurid, and leek-green, with livid rays.

22. *Ostrea fusca*: shell brown, with flat rays that disappear towards the hinge. It inhabits the Indian Sea. The shell is white within; lower valve convex, upper valve flat.

23. *Ostrea tenuis*: shell thin, flat, purple, with very minute perpendicular striae crossing circular transverse ones; within the striae are elevated.

24. *Ostrea lutea*: shell thin, pale-yellow, with thick rays.

25. *Ostrea muricata*: shell roundish and white, with a

mixture of saffron; the rays convex, and very finely and sharply muricate.

26. *Ostrea conspersa*: shell roundish, tawny, dotted with white and black; the rays are thick.

27. *Ostrea nodulosa*: shell roundish, brown, with black transverse lines and dots; the rays are convex and knotty.

28. *Ostrea radiata*: shell thin; the colour is whitish-rosy, with white stripes; the rays convex.

29. *Ostrea punctata*: shell oblong, pale-yellow spotted with white; beaks varied with white and brown; the rays are crenate. The shell is about two inches long; ears cancellate.

30. *Ostrea aculeata*: shell thin, varied with rosy and whitish; in form it is rather roundish; the rays are thick, with aculeate scales.

31. *Ostrea plana*: shell thin, flat, white, with a saffron hinge; the rays are round and broad.

32. *Ostrea pusilla*: shell oblong, red, and very minutely striate.

33. *Ostrea flavescens*: shell convex on each side, and yellowish within; the rays are convex.

34. *Ostrea flabellum*: shell roundish, deep-red, with a white hinge, and a few spots. The rays are smooth.

35. *Ostrea spondylades*: shell glabrous-red, the ears equal.

36. *Ostrea violacea*: shell flattish on each side; the outside brown, the inside violet. It inhabits the Mediterranean.

37. *Ostrea aurantia*: shell roundish, plaited, and very finely striate longitudinally, with a white semicircular band towards the hinge.

38. *Ostrea vittata*: shell purple within, without with alternate brown and red bands; the rays are convex.

39. *Ostrea miniata*: shell white, with confluent red spots; the rays rough; the convex valve with transverse crisp lamellæ. The shell of this species is about an inch and a half long, and the same in breadth.

40. *Ostrea inflata*: shell convex on each side, closed, oblong, pellucid, with thirty-two rays. This is a very rare species; it is ochraceous, thin, and twice as long as it is broad.

2. Ears unequal, one generally ciliate, with spines within.

41. *Ostrea pallium*; the ducal mantle: shell equivalve, with twelve convex rays; the scales are striate, rough, and imbricate. There are three varieties. They are found in India. The shell is solid, red, varied with brown and white; ears striate, crenate, or scaly, one of them longer; margin of the shell denticulate.

42. *Ostrea sanguinolenta*: shell equivalve, with nine thick obtuse rays; the interstices longitudinally striate, tuberculate, prickly. It is found in the Red Sea; resembles the preceding. The shell is white, with sanguineous spots; the margin with crenate plaits, the border purplish; ears with transverse nodulous striae.

43. *Ostrea maculosa*: shell equivalve, pale-yellow, with tawny spots; twelve rays thick and flattish; ears white, with dull ferruginous marks, and transverse scaly ribs.

44. *Ostrea nodosa*: shell with nine rays, covered with apparently-verrucular tubercles. There are three varieties. They inhabit the American and African Oceans. The shell is sometimes red or scarlet, sometimes varied with red and white, or tawny and white, mixed with yellow; the upper valve is more convex than the lower; the ear is spinous within and beneath. This is represented on the CONCHOLOGY Plate XV. fig. 2. vol. v.

45. *Ostrea pes felis*, or cat's-foot scallop: shell with nine striate rough rays; one of the ears very small. It is found on the shores of Africa; is small, thin, pellucid, generally pale flesh-colour, spotted and veined; within glabrous white, with subundulate rays and crenate plaits on the margin; the ears with transverse knotty striae.

46. *Ostrea pellucens*: shell nearly equivalve, with nine rays, smooth, with spoon-like hemispherical scales on the lower

lower valve. It inhabits the African seas; is ovate, minute, pellucid, glabrous, white; the upper valve spotted with red.

47. *Ostrea obliterata*: shell smooth on the outside, with twenty-four doubled rays. It inhabits the Indian Ocean. The shell is marked with very fine decussate striæ; the lower valve pale-reddish, and yellowish at the hinge; upper valve dirty-red, or pale-tawny. See the annexed Plate, fig. 5.

48. *Ostrea sanguinea*: shell equivalve, with twenty-two rough rays; the ears are small. It inhabits the Mediterranean, Atlantic, and American, seas. The shell is round and flattish, red, scarlet, or tawny; the spaces between the rays are longitudinally striate.

49. *Ostrea varia*: shell equivalve, with thirty compressed rays beset with transverse prickly scales; one ear very small. It is found in most European seas; varies very much in colour, from pale-yellow to various shades of orange and brown, with sometimes a few white spots. The shell is rather convex, with rough jags or spinous protuberances down the rays; spaces between the rays not striate; one ear very small, with a double row of spines; the other with wrinkled plaits, and armed beneath with from five to seven spines. See fig. 6, 7.

50. *Ostrea pusio*: shell equivalve, with about forty filiform rays, the surface often irregular or distorted. It is found in the European, Atlantic, and American, seas. The shell is generally small, and a little longer than it is broad; sometimes it is seen with a smooth surface, but mostly with an irregular-waved surface, as if deformed by an accident. In its colours and marks it is very variable, but commonly of a fine red; one of the ears is very small, the other sharply spined beneath.

51. *Ostrea obsoleta*: shell smooth, equivalve, semi-transparent, dark-purple, with eight nearly-obsolete rays. Inhabits British coasts; three quarters of an inch long. Shell thin, the valves equal and shallow, within smooth and brown, with a pearly gloss; outside dull purplish-brown, with numerous longitudinal striæ between the rays; ears very unequal, wrinkled. A small species; see fig. 8.

52. *Ostrea lævis*: shell very smooth; ears ribbed. Inhabits Anglesea and Falmouth; is more than half an inch long.

53. *Ostrea glabra*: ears nearly or quite equal. Shell equivalve, with from ten to fifteen smooth flattish rays; the inside with elevated double striæ. It inhabits the European and American seas; nearly two inches long, and as many broad; roundish; red, yellow, or brown, spotted or clouded, sometimes white, with the upper valve spotted with brown; margin repand.

54. *Ostrea opercularis*: shell with about twenty rays, roundish, and rough, with decussate striæ; the upper valve a little more convex. It inhabits the northern seas of Europe; and is two inches and a half long and broad. The shell is gaping, generally variegated with spots and other marks; rays acute, sometimes rounded; margin repand and toothed within; ears with decussate wrinkled striæ, the larger one emarginate and spinous under the incisure. In Devonshire and Cornwall, where it is found, it is called *frill* or *queen*.

55. *Ostrea gibba*: shell equivalve, gibbous, with twenty glabrous rays. It inhabits the American and Atlantic seas. The shell is convex on each side, red, with sometimes a few white spots, and marked with fine crenate longitudinal striæ; margin crenate; ears nearly equal.

56. *Ostrea fulcata*: shell white, with flesh-colour spots; the rays glabrous, thirty-two on the lower valve, and twenty-five on the upper. It inhabits the shores of Malabar; is about one inch and a half long, and something broader; margin plaited, crenate; lower valve with an emarginate spinous ear, upper valve flattened.

57. *Ostrea histronica*: shell thin, flattened, pellucid,

with very fine transverse wrinkles, and eleven rays. The shell is spotted with red, white, and black; rays waved; ears nearly equal.

58. *Ostrea islandica*: shell orbicular, with purple circles, and about one hundred rays. It inhabits the Mediterranean, in innumerable varieties. The shell is three inches and a half long, and three inches and a quarter broad; sometimes whitish, but mostly mixed with a fine pale-bloom or yellowish, and marked with transverse semilunar bands; upper valve more elegantly marked, with from fifty to one hundred rays, rough, with acute imbricate scales; margin crenate; ears with transverse scaly striæ, the large one emarginate and spinous; the fish is eaten. This beautiful species is represented at fig. 9. from Knorr.

59. *Ostrea triradiata*: shell nearly equivalve, glabrous, immaculate, with very minute striæ. It is found among fuci in the seas of Norway. The shell is red, with small white spots, within reddish; upper valve with three rays; ovary of the fish yellowish.

60. *Ostrea fuci*: shell nearly equivalve, striate, spotted, rough towards the margin. It inhabits the North Seas, on the *Fucus saccharinus*. The shell is rufous, with whitish or paler spots; within red, and quite smooth, with pellucid spots; rays of the upper valve obsolete; ovary of the fish rich red. See the article *HELMINTHOLOGY*, Plate IV, figs. 8, 9. vol. ix.

61. *Ostrea tigrina*: shell nearly equivalve, striate, glabrous, red with whitish spots. It inhabits the North Seas, on fuci. Lower valve more deeply grooved, and varied with large undulate confluent pale-yellow spots; upper valve dotted; ovary of the fish white.

62. *Ostrea septem-radiata*: shell nearly equivalve, striate, glabrous, with seven convex rays. It inhabits the Northern Seas.

63. *Ostrea arata*: shell nearly equivalve, within and without grooved and red; one part rough, the other glabrous. It inhabits the North Sea.

64. *Ostrea senatoria*: shell convex each side, with twenty-two rounded and transverse wrinkled rays, the interstices with longitudinal granulate striæ. It inhabits the Indian Ocean; two inches nine lines long, and about as much broad, outside chestnut varied with violet and white; inside violet, the circumference bordered with dull-bay.

65. *Ostrea citrina*: shell orange, with twenty-two rounded rays and plaited margin; lower valve flatter. It inhabits India; some of the rays are scaly, and some of the grooves have granulate lines.

66. *Ostrea turgida*: shell equally convex, both sides with twenty glabrous rays, the interstices with transverse crowded wrinkles; the margin with plaited teeth. It is found in the American and Indian Seas.

67. *Ostrea sulphurea*: shell flattened, thin, pellucid, striate, with numerous imbricate rays; the margin with crenate plaits. It inhabits the Red Sea; is two inches long, and a little narrower. The shell is thin, fragile, of a sulphur or orange colour, sometimes red with an orange hinge and a semilunar white band, or varied with white and pale tawny, with a sanguineous border; lower valve with equal rays, those of the upper valve alternately less.

68. *Ostrea porphyrea*: shell convex, purple, within white or red, with twenty-five thick rounded scaly rays. It is found in the Red Sea; two inches three lines long, and as much broad; shell varied with a few white spots.

69. *Ostrea vitrea*: shell hyaline, with an acute margin, very slender rays, and concentric scaly curves. It is found in the North Seas, among fuci and zoophytes; size of a pea; shell smooth, brittle, white, or varied with white and red; one ear emarginate and spinous.

70. *Ostrea Tranquebaria*: shell with twenty rounded rays, the interstices very finely wrinkled; margin repand. It inhabits Tranquebar; sometimes of one colour, which is mostly orange; sometimes varied with undulate brown, red, or cinereous, spots; upper valve more convex.

71. *Ostrea fasciata*: shell white, with purple spots, and numerous unequal rays; the margin crenate. Found in the Red Sea.

72. *Ostrea crenulata*: shell oblong, with undulate rays and striæ, and transverse interrupted bands; margin crenulate. This is a very small species.

73. *Ostrea innominata*: shell roundish, spotted, with deep grooves very finely striate transversely; margin crenulate. One of the ears hardly visible.

74. *Ostrea rufescens*: shell roundish, pale rufous, with twenty-four rays; the ears with decussate striæ.

75. *Ostrea squamata*: shell roundish, with thick rays, furnished with distant parallel scales, and prickly at the sides. The shell is convex and spotted; the margin crenate.

76. *Ostrea anonyma*: shell rather oblong, with narrow scaly rays, the interstices broader and striate perpendicularly; ears with perpendicular wrinkles. The shell is varied with angular lines and spots.

77. *Ostrea decem-radiata*: shell flattened, with ten smooth flat unequal rays; ears transversely striate.

78. *Ostrea tenuis*: shell thin, with depressed scaly rays; ears short. It is found in India and the North Seas. The shell is bay, or cinereous spotted with black; sometimes white or carmine, or pale-orange.

79. *Ostrea valentii*: shell with twenty rays, and transverse semilunar bands. It is found in India. The shell is red; it resembles the *O. maxima*, but the ears are unequal.

80. *Ostrea media*: shell somewhat oblong, with crowded rays. Shell middle-sized, reddish, saffron, or piceous.

81. *Ostrea crocea*: shell saffron, with muricate scaly rays alternately lefts.

82. *Ostrea florida*: shell roundish, white, with rosy spots.

83. *Ostrea ochroleuca*: shell oblong, ochraceous, with rays smooth on one part, and granulate on the other.

84. *Ostrea mustelina*: shell pale-tawny, with yellow spots and bands, and smooth rays; ears transversely striate. The shell is two inches and a quarter long, and about as much broad.

85. *Ostrea flammea*: shell saffron, rather oblong, with very fine perpendicular striæ.

86. *Ostrea incarnata*: shell rather oblong, flesh-colour, with interrupted red bands and flattened rays.

87. *Ostrea guttata*: shell yellowish, rounded, dotted with red, with rays unequally converging at the hinge.

88. *Ostrea depressa*: shell ochraceous, with flat bifid rays. The shell is about an inch long, and something broader.

89. *Ostrea regia*: shell roundish, deep-red, with rounded rays. The ear of the lower valve deeply emarginate.

90. *Ostrea palliata*: shell equivalve, with numerous smooth rays. It resembles *O. pallium*, but is less rough, and has fewer rays; shell straw-colour, with purple undulate bands.

91. *Ostrea feminuda*: shell orange, oblong, muricate, with scales as far as the middle; with twenty-two rays. The shell is one inch and three quarters long, and one inch and a quarter broad; ears with very fine scales.

92. *Ostrea modesta*: shell roundish, hoary, with brownish, reddish, and bluish, spots; spaces between the rays broad. The shell has two filiform bands at the hinge.

93. *Ostrea principalis*: shell purple, with a brown margin; the rays scaly from the middle, and smooth at the hinge.

94. *Ostrea versicolor*: shell variegated, with pectinate smooth rays.

3. Valves more gibbous on one side.

95. *Ostrea flavicans*: shell nearly equivalve, with eight striate rays, the margin rounded on one side. It is found in the South Seas. The shell is rather oblique; white varied with brown and red, within white; the rays yellow; one of the ears very short.

96. *Ostrea fasciata*: shell equivalve, with twenty rough

rays, the interstices striate; ears equal, small. Inhabits the American and Atlantic Seas. The shell is white, pellucid, gaping each side, very finely striate within; the margin crenate.

97. *Ostrea fragilis*: shell equivalve, with twenty-five rays; margin very entire; ears acute. Inhabits the Nicobar-islands; resembles the last, but is flatter, and has more rays; shell thin, brittle, one inch and a quarter long, and about half as broad.

98. *Ostrea lima*: shell equivalve, with twenty-two imbricate scaly rays, rounded at one margin; ears obliterated. It is found in the Mediterranean, Indian, and Red, seas. The shell is three inches long, and two inches and a quarter broad; white and rather flat; the scales elevated and acute; ears wrinkled.

99. *Ostrea glacialis*: shell equivalve, with fifty imbricate interrupted rays; ears equal, one of them unequally plaited. It is found in the American Ocean; resembles the last, but has more numerous rays; shell snowy, with a crenate margin; another variety has the margin entire.

100. *Ostrea hians*: shell whitish, thin, gaping each side and oblique, with obsolete undulate rays, and transverse rounded semilunar striæ. Inhabits Norway; is one inch and a half long, and three-quarters of an inch broad; ears very small and acute; margin crenate, very entire within.

101. *Ostrea excavata*: shell dirty-white, with longitudinal undulate striæ, and a few transverse rings, smooth within; one ear obsolete; margin very entire. It is found in Norway, but is rare; five inches long, and three and a quarter broad.

II. OYSTERS. Rough, and generally plaited on the outside.

102. *Ostrea malleus*: shell equivalve, three-lobed, two of the lobes placed transversely, like the head of a hammer. This species is found in the deep parts of the Indian and South Seas, and is very rare. Shell about six inches long, and four inches and three quarters broad; black with a dark-blue cast, gaping, formed like a cross; the valves lamellate.

103. *Ostrea vassella*: shell subpellucid, narrow, elongated, brittle, lamellate; one end rounded; within very smooth and glossy. It inhabits the Red Sea; is three inches and a half long, and one broad. The shell is violet, tawny, or ferruginous, gaping at the hinge; rough on the outside, and thinner at the rounded end.

104. *Ostrea anatina*: shell pellucid, lamellate, and laterally incurved. It inhabits the Nicobar islands; about an inch broad, and, including the curvature, three inches long; its shape in some measure resembles a duck when sitting; shell thin, brittle, varied with white and violet.

105. *Ostrea diluviana*: shell plaited on the outside; the margin with erect acutangular teeth. This is found in a fossil state in the calcareous mountains of Sweden, about the size of a common oyster; the margin with erect serratures, formed as it were of the imbricate lamellæ of the shell, and transversely striate; valves with pectinate plaits and acute wrinkles.

106. *Ostrea folium*: shell ovate, obtusely plaited at the sides, parasitical. It inhabits the Indian Ocean, where it is frequently found adhering to *Gorgonia*; shell straw-colour, pale-tawny, or violet, within silvery; hinge with a triangular hollow; upper valve turgid on the back towards the middle, wrinkled each side, and transversely ribbed; lower valve less, flatter, and grooved in the middle.

107. *Ostrea orbicularis*: shell orbicular, flat, with an entire crenate margin. Shell with a very obtuse margin, about the size of the end-joint of the thumb.

108. *Ostrea edulis*, the common oyster: shell nearly orbicular and rugged, with undulate imbricate scales; one valve is flat and very entire. There are six varieties of this species, found in different parts of the European and Indian Seas, affixed to rocks, or in large beds. The shell is of various sizes, forms, and colours, within white, and often glossy, like mother-of-pearl. It was formerly thought to have no power of locomotion; but it is now ascertained,

ascertained, by accurate observation, that it can move from place to place, and vary its habits, according to circumstances.

Our knowledge respecting the nature and organization, mode of life, nourishment, and propagation, of these shell-fish, says Mr. Professor Beckmann, is confined, defective, and uncertain. They live in a medium which screens them from our observation; they are found on coasts which few naturalists frequent, and are so different from all other animals, that, even from the observations which have been made on them, very little can be concluded.

Oysters live on the shores of the sea, and particularly such as are sandy or stony; on the coasts of islands, on rocks which project into the sea, and on sand-banks; but they seem to thrive best at the mouth of streams, where the water of the latter renders the water of the sea milder. The animal-slime which the streams carry along with them, and which is accumulated on the shores, may serve them as food.

Oysters spawn chiefly in spring, when the sun again begins to warm the water of the sea; and what they then throw out consists of small oysters completely formed, which seem to be innumerable. Each of these young ones expands to a complete oyster, in the same manner as the seeds or fruits of those plants which have hermaphrodite bloom. Those are mistaken who speak of male and female oysters; for how could procreation be possible among animals which either do not change their place during their whole lives, or can change it only perhaps for an inch, and which are capable of no other movement than that of opening a little of their shells? Oysters, therefore, may be considered as hermaphrodite.

The shells are very often covered with productions of the coral kind; they are frequently loaded also with small muscles and multitudes of worms. That peculiar kind of worm which is called the *oyster-worm*, shines in the dark, in the manner of the glow-worm; but with an universal light, and not in a peculiar part only. The first observer of these oyster-worms was M. De Lavoye, who, communicating his observations to M. Auzout, gave occasion to a very distinct account of them from this author. The first thing that presents itself, on the opening of the oysters which contain these worms, is only a sort of shining clammy moisture, which appears like a star of a bluish colour, and, being drawn out, will extend itself to near half an inch long, and shine as much for that whole length as in the contracted state; it will also shine for some time after it is taken out of the oyster. On a stricter observation, these shining substances are found to be real living worms; and there are indeed three species of them. One sort is whitish, and has twenty-four or twenty-five feet on each side: there is a black speck on one side the head, and the back exactly resembles that of an eel, when the skin is stripped off. The black speck in the head is certainly an eye; and it is remarkable that the creature has but one. The second sort of these worms is red: this also has but one eye; its body is made up of several rings; its nose is like that of a dog, and it has the same number of feet with the former. The third sort is very different from the other two: it is speckled, and its head is like that of a foal, and has a tuft of hair on each side. There are other worms found also in the oyster, particularly a large greyish one, with two horns, a great head, and seven or eight whitish feet; but these do not shine. This light occurs more frequently in large than in small oysters; there are few of these large ones that do not yield it in the shells, and in some it is seen in the oysters themselves. *Journal des Sçavans*, 1666.

A more formidable enemy to oysters, however, is that eel-formed fish which at Heligoland is called *nugogen*, or nine-eyes; but which by some has been called the five-fingered fish, or star-fish. It is found sometimes in oyster-shells that are quite close, and in which no traces can be discovered of the first inhabitant. It lies in the shell bent like a ring, and the fishers unanimously assert that it eats

the oyster. On that account the English fishermen strongly recommend destroying it wherever it is found. But, how comes this murderer into the oyster? In all probability it creeps in when the animal opens its shell. Another question is, how happens it that the ancient ichthyologists, though they mention this fish, do not observe that it was found in oyster-shells, which at present is not uncommon?

Oysters are leanest when they spawn, or after that period; and on this account fishing for them at that time is forbidden in England, and other countries where prudent regulations prevail. In Spain, this precaution is employed, because it is imagined that at this period the use of them as food is injurious to the health. It appears that they ought at least to be three years old in order to serve as food; and, where care is taken for the preservation of the oyster-beds, the fishermen are ordered to scrape off all the small ones which adhere to those that are full-grown, and to throw them back into the sea. An old oyster has often twenty small ones attached to it.

Very severe winters injure the oyster-beds and destroy the oysters, as was every-where proved during that of 1739-40. Violent storms in the spring are equally prejudicial; and many beds have been exhausted by fishing-up too many from them. We are told by Paulus Jovius, that he remembered the time when oysters were brought from the coast of Pefaro to Rome; but that these beds were afterwards entirely exhausted, and that people were obliged to be satisfied with oysters brought from Corsica, which, before they arrived, were often in a putrid state. No kind of animal substance, indeed, is more liable to corrupt than shell-fish, both those which are used for food and those which are not.

It is an undoubted truth, that the nature of the shell and fish, as well as the goodness of these animals, are different according to the bottom where they are found; so that fishermen can tell by their external appearance, and connoisseurs by the taste, where any kind of oyster, and in general of shell-fish, have been found. Where the bottom is calcareous, they are tenderer and more friable; where it consists of rock, they are thicker, more solid, and heavier; where it consists of marl, or a mixture of chalk and clay, they are less earthy, softer, and contain more animal gluten. On a slimy bottom they are more oily, and abound more with rich animal particles. The taste is equally liable to change; for instance, on the eastern stony shore of the Adriatic Sea all marine animals are poorer and more insipid than those on the western side, where the bottom is richer. On calcareous rocks the oysters are larger, but have not so good a taste as those which live in slimy bays or creeks. In Norway, those are least esteemed which are found on a muddy bottom, because they have a muddy taste: those of Denmark, found on a sandy bottom, near Tondern and Fladstrand, are much better. The best are those called *rock-oysters*, found on the rocks where they are alternately covered and left dry by the tide; though, in England, those found at the greatest depth in the sea are preferred. The rock-oysters are larger and plumper than others, but their shells much thinner, and many of them so thin that they are transparent. For this reason, a cask, such as those used at Bergen, will contain scarcely 400, or even 300, sand-oysters, but is capable of containing from 700 to 800 rock-oysters.

Oysters are of different colours in different places. In Spain they are found of a red and russet colour; in Illyria they are brown, but the fish is black, and in the Red Sea, of the colour of the rainbow. Those oysters which are distinguished by a green colour, and which the Dutch, on that account, call *groenbaardjes*, are considered to be superior to others. But this distinction is not natural to them, and is produced by art: pits are dug on the sea-shore, and furnished with small sluices, through which the sea-water is suffered to enter at time of spring-tide. When the water has risen to a certain height, the oysters are thrown into the pits, where they are left till they acquire the proper colour. This stagnant water, in warm weather, soon becomes

comes

comes green; and in a few days the oysters assume the same colour; but they do not acquire their full quality, and become fit for sale, till the end of six or eight weeks.

Oysters are found in various places on the coast of France; such as the mouth of the Seine, where, though few in number, they are of an excellent quality. On the coast of Caen in Normandy, there is a bank six miles in length and one in breadth. They are found also in the Bay of Ifigny, and in the neighbourhood of Cherbourg. Those in particular are highly valued which are collected at the mouths of some streams where the sea-water is sometimes thrown entirely back, and which are called *huitres de pied*. Granville in Normandy gains 50,000 livres by this fishery. On the coast of Brittany there are very large oysters, particularly at Cancale, where a great many are preserved in places enclosed for the purpose. The bank at Painpol is almost entirely exhausted. At the mouth of the Loire; between the rocks on the coast of Poitou, on the coast of Aunis and Saintonge, where those who make bay-salt transplant oysters to marshy places, in which they acquire a better quality, though they never become so good as the green ones of Saintonge. In Languedoc, near Cape Leucate, there is an oyster-bank at the depth of twenty feet; another at the mouth of the Rhône, on the coast of Provence. At Paris those oysters are most esteemed which come from Bretagne, Rochelle, Bourdeaux, and particularly from Medoc.

The Dutch have some oyster-beds on the coast of Zealand, near Zierikzee; oysters are kept there also in pits as well as at the town of Brouwerhaven, and particularly at Petten in North Holland: those of the last-mentioned place are much esteemed, and are known under the name of *Petten oysters*. For these pits many ship-loads are transported every year from the coasts of England.

There are exceedingly-rich oyster-banks in the duchy of Holstein and in the neighbourhood of Jutland, which supply most of the oysters used in the northern part of Germany. The royal oyster-beds lie all together on the western coast of the duchy of Schleswig, between the islands Fanø, Rom or Romø, Sylt, Föhr, Amröm, Nordstrand, Silworm, Süderog, and extend from the district of Ripen to Heligoland. The number of the beds from which oysters can be finished is at present reckoned to be fifty: the greater part of them take their names from the persons by whom they were first discovered. Some of them are a furlong, some a quarter of a mile, and some half a mile, in length; and their breadth is equally various. The oysters of these different banks are not all of the same kind; in some they are large, in others of a moderate size, and in many only small: the last, were they left to grow older, would never attain to a larger size. The large oysters are called *deputat-auftern*, the rest *kaufmans-auftern*. Till the year 1794, the royal chamber of domains let these oyster-banks to the highest bidder for the term of six years; but, as this period was too short for the persons who took the lease, and prejudicial to the fishery, they were let to M. Asmussen, a merchant in Tondern, during his natural life, from the year 1795, for the yearly sum of 7505 dollars, to be paid in advance. He bound himself to furnish yearly 112½ barrels of oysters, to be delivered from time to time, but each time never less than four, and never more than eight, barrels, carriage free, at Haderleben, for the royal family. This city is distant about ten miles from the village of Hoyer, where the oysters are landed, and which is a mile from Tondern. The lessee is permitted to fish for and sell oysters only during the four last and four first months of the year. The instruments used for fishing-up these oysters are of the same kind as those employed in other countries. The most common is a drag-net made of thongs of seal-skin worked together, and fastened to an iron frame which scrapes up the oysters. These nets, when the fishermen have arrived at the proper place, are let down by means of ropes made fast to the iron frame. M. Asmussen used eighteen vessels, which were perfectly similar to those of

which figures have been given by Duhamel. The fishermen bring their lading either to the above-mentioned village of Hoyer, or to Husum, which is seven miles from Tondern. Prayers for the preservation of this oyster-bed were formerly offered up in the church of Husum; but this has been omitted for several years past, because the owner refused to allow the clergyman about two hundred oysters, which he claimed for performing that duty. From thence the oysters are conveyed to Apenrade and Flenzburg, and thence in ships to the East Sea, where the consumption is greatest; for a barrel sometimes is sold there at the rate of 100 roubles. It is not true that they cost dearer to the natives than to foreigners: a hundred cost a dollar; and a barrel, containing from 800 to 1000 oysters, about ten dollars, more or less. The number caught, and the consumption, vary exceedingly in different years. During stormy weather and severe frost none can be fished. The number fished-up yearly, the lessee, for reasons which cannot be disapproved, kept a secret; but it is certain that 2000 barrels would scarcely have been sufficient to pay the rent and expenses.

The oyster-banks of Jutland lie on the eastern side of the northern extremity, near Fladstrand, a market-town, where there is a passage over to Norway; also at the island of Læsø, situated in the Cattagat, three miles from Sabie, in the district of Alborg. Respecting this fishery, several regulations have been published, one of which is dated February 1709. Attempts have often been made to transplant oysters to the large bays which extend from the Cattagat twenty miles across the country, and nearly imperfect it; but have been attended with as little success as those on the coast of Seeland.

Sweden has excellent oysters on the coast of Bahus-Län, near the island of Kasterö, a mile west from Strömstad, from which they are sent, as well as from Udewalla, to every part of the kingdom. The fishermen there pretend that, when an oyster-bed has been exhausted, it requires from four to five years before it is again stocked. Norway also has excellent oysters, and in great abundance on the western coasts. The best are those found on the rocks, and called rock-oysters. Many of them are pickled, and sent in jars and other vessels which contain the sixteenth part of a barrel, to different parts of the East Sea. These oysters often contain pearls; but they are not of a large size, and never have complete splendour.

Italy has oysters of different qualities. Those found near Ancona are of a large size, but not very well tasted. Those are accounted the best which are produced in prodigious multitudes near Tarento, in the sea called Mare Piccolo, which is a large bay, that extends past Tarento, towards the north-east. The Mediterranean Sea, in general, has more shell-fish than the ocean any-where contains in the same space; but no part of it is more abundant in this respect than the Golfo Tarantino, the harbour of the city, and the Picciol Mare. Fishing is the principal or only occupation of the inhabitants, who chiefly live by it: on this account the greatest care is taken to preserve and increase the oyster-beds. Great care is here taken that the oysters may not be disturbed during the time they are spawning, and that all the young ones be thrown back again into the sea. It is generally believed here that all shell-fish are fattest and fullest at the time of the full-moon.

The oysters of the Mare Piccolo are at present to the rich Italians what those of the Lucrine Lake were to the ancients. This lake extended in Campania from Baiæ to the Lake Avernus, and was separated from the sea only by a mole; but, though it has been celebrated by so many poets, it is at present only a pond, scarcely sufficient for watering cattle. In the year 1538, on St. Michael's day, an earthquake, which had continued some time, became so violent, that the lake retired from its banks, and its basin was almost entirely dried up; as was the case, in part, with the Lake Avernus. The neighbouring small town of Tripergala was swallowed up, with all

its

its inhabitants and riches. It contained a great many monks and nuns, who, it is said, led very irregular lives. "It might have been expected," says Blainville, "that the gulf would have been satisfied with the nuns and monks, and that it would not have carried its revenge further; but this was not the case; as a monument to posterity, it threw up such a quantity of filth, that it produced a mountain a mile in height, and four miles in circumference."

In tropical regions, the common oyster is found attached to trees; this assertion has been frequently ranked among groundless and fabulous traditions, but the fact is easily explained. In warm climates, where vegetation is very luxuriant, a great variety of plants, among which are large trees, grow on the shores at the very edge of the sea; and particularly on those places which are sheltered from the agitation of the waves. In such places as the heads of bays and harbours, great abundance of mangrove-trees grow up from the bottom, where it is several feet deep, covered with water. It is generally on the mangrove-tree that the oyster is found in the West Indies. Without the trouble of picking them from the trees, the branches growing under water, to which they are attached, are cut off, carried home in baskets, and in this state brought to table, where they are eaten raw or roasted.

Great Britain has long been noted for its oysters; and these, as the French believe, have been produced from oysters formerly fished-up in Cancale Bay, near St. Malo, and transplanted to the English coast; but of this assertion we have no proof. Those however are most esteemed which are found on the coast of Essex; from that coast the brood is transplanted to the sea near Colchester, where the Coln, which flows through the town, forms a great many arms and small creeks exceedingly proper for breeding them. These oysters are in high request, under the name of *Colchester oysters*. Many, however, prefer those oysters which are collected on the coast of Dorsetshire, and particularly those found near Poole. They are said, also, to contain sometimes pearls of larger size than those found in other places. The greater part of the English oysters, which the Dutch carry away every year with more than a hundred vessels, are sold by the fishermen at Feverham in Kent, to the north-west of Canterbury, and which, like the neighbouring small towns of Milton and Middleton, is known on account of this trade. There are a great many oyster-banks also in the Isle of Wight; those, likewise, are well known which are found near Tenby, on the coast of South Wales, and near Milford Haven; but the largest, and perhaps the worst, are those of the Black-rock, near Liverpool.

It appears that the English have taken more trouble than other nations, not only to maintain their oyster-banks, but to form new ones. Since the year 1712, a great many oysters have been found in the small channel or strait of Menai, which separates Anglesey from Caernarvonshire, and where, about the year 1700, none were to be seen. It is known, however, that soon after that period some person threw into the above channel about a hundred oysters, which now extend several miles; so that at present many vessels are employed in this fishery.

Ireland has very abundant oyster-banks near the village of Arklow, on the eastern side of Dublin, from which seed is conveyed to the artificial beds of the capital, on the northern side, near Clontarf; and further south, at Sutton, not far from Howth. Also at Polebeg and Dalkey, not far from Dublin; and particularly Ireland's Eye, where the largest and best oysters lie at the depth of about eighteen or twenty fathoms under the water. Likewise to the north of Dublin, near Rush and Skerries, where the oysters are saltier and harder than in places where more fresh water falls into the sea. Scotland has great abundance of oysters near the island of Inch Keith, which is not far from Leith.

From an account preserved in Sprat's History of the Royal Society, from p. 307 to 309, we learn, that the

VOL. XVIII. No. 1221.

oysters cast their spawn, which the dredgers call their *spat*, in the month of May; this spat cleaves to stones, old oyster-shells, pieces of wood, &c. at the bottom of the sea, which they call *cultch*; and it is conjectured, that the spat in twenty-four hours begins to have a shell. In the month of May, the dredgers, by the law of the admiralty-court, have liberty to take every kind of oyster, whatsoever be their size. When they have taken them, they gently raise with a knife the small brood from the cultch, and then they throw the cultch in again, to preserve the ground for the future, unless they be so newly spat that they cannot be safely severed from the cultch: in this case they are permitted to take the stone or shell, &c. which the spat is upon, one shell having often twenty spats. After the month of May, it is felony to carry away the cultch, and punishable to take any other oysters except those of the size of a half-crown piece; or such as, when the two shells are shut, will admit of a shilling to rattle between them. This brood, and other oysters, are carried to creeks of the sea, and thrown into the channel, which are called their beds or layers, where they grow and fatten; and in two or three years the smallest brood will become oysters of the foresaid size. There are great penalties imposed by the admiralty-court upon those that fish out of the grounds which the court appoints, or that destroy the cultch, or that take any oysters that are not of the proper size, or that do not destroy a fish which they call the five-finger, the common sea-star, because that fish gets into the oysters when they gape, and sucks them out. The reason of the penalty for destroying the cultch is, that they find, when this is taken away, the ouse will increase, and the muscles and cockles will breed there, and destroy the oysters, because they have no convenience for depositing their spat. The oysters are sick after they have spat; but in June and July they begin to mend, and in August they are perfectly well: the male oyster is black-sick, having a black substance in the fin; and the female white-sick, as they term it, having a milky substance in the fin. Oysters are salt in the pits, saltier in the layers, and saltest at sea. It is observed that, when the tide comes in, they lie with their hollow shell downwards, and, when it goes out, they turn on the other side; they do not remove from their places, except in cold weather, to cover themselves up warm in the ouse.

As to the spawning or laying oyster-beds, the manner of preparing, distributing, and managing, them, in the mouths of the breeding-rivers in particular counties and districts, the exact method of performing the business has not been described; but they are spawned or laid somewhat in the bed-manner. The principal rivers in the county of Essex where this sort of work, or that of breeding oysters, is carried on, according to the Corrected Agricultural Report of that district, are those of the Crouch, the Blackwater, and the Coln; but the first is by far the most certain in produce of any of them. The beds, or layings, are made in the creeks, and other similar places, on the sides or parts which adjoin the mouths, openings, or beginnings, of these rivers. It is from these rivers that the oyster-layings, or beds, are usually stocked; though some are constantly supplied from Portsmouth, or places in its neighbourhood, being brought in the largest sort of oyster-vessels, not only into this county, but Kent, where they are laid for the ensuing season. The Colchester oyster-beds are chiefly at Wivenhoe, being partly supplied by the Kentish oyster-smacks. The beds, or layings, in these different situations, are likewise, in all probability, supplied or furnished with oysters from several other places on the southern coast of this country, as well as the northern one of France.

The oyster-fisheries, in different places, are of very great importance to the country at large, as well as to particular counties and districts, especially that of Essex; as they employ great numbers of small vessels, require the labour of many men, and afford considerable profit in the produce

K

duce of food which they supply, as being principally an article of luxury. In the county just mentioned there are several of these oyster-fisheries. In the Blackwater river and neighbouring parts; there is a considerable fishery of this nature; and West-Mersey is one of the principal stations of the dredgers: above thirty boats, it is said, belong to the island, and are almost constantly at work in this business. Vessels come from Kent to purchase the oysters; and they sell some to Wivenhoe, where what are called the Colchester beds are situated. They are sold by the tub of two bushels, and are generally from 6s. to 10s. a-tub. A dredging-boat is from fourteen to thirty or forty tons burthen: all are decked, and built at Wivenhoe, Brightlingsea, and places thereabouts. The price is 10l. a-ton for the hull of the vessel only; the fitting-out of one of twenty tons requiring the amount of 150l. From two to four men are required for each vessel, who are paid by shares; and the master has a share for the vessel. In the spring-season they go to dredge on the coasts of Hants and Dorset. Sometimes one hundred and thirty vessels have been counted at work within sight of Mersey.

The following interesting account of the oyster-business in the same district, is from Mr. Bennet Hawes of Mersey, given as from his own local knowledge of the places where it is carried on, in the above Report. The number of vessels which are employed in it, of from eight to forty or fifty tons, is nearly two hundred, in which are employed from four hundred to five hundred men and boys. A vessel carrying three men has one share and a half of all the earnings, and the men one share each. Large vessels have generally, it is said, two shares; but none, it is believed, more than this. It is said that the vessels which are built at East Donyland, Wivenhoe, Brightlingsea, Burnham, and Mersey, for this business, will last from thirty to forty years, when proper care is taken of them. The writer was informed by a person then living at Wivenhoe, that he had, within the last twenty years, built a hundred vessels for the oyster-business alone. There has been an increase of boats, and of course of men, of more than one half within the last thirty years.

At Burnham they have seven dredging-smacks belonging to the company that hire the river of sir Henry Mildmay, besides four other private ones, and some smaller vessels. The smacks are from eighteen to twenty tons; and there are only about one hundred fishermen and sailors about the place, which are much too few, it is thought, for so fine a river. Most of the vessels of sixteen tons and upwards, go, it is said, to Portsmouth, or places adjacent, in the month of March, to catch and carry oysters; those under twenty-five tons being employed in catching them, and the larger ones in carrying them into this county and Kent, to be used as noticed above; they generally return from thence in the month of June; when the large ones go after mackarel, herrings, and sprats, during the latter part of the summer, and in the ensuing winter, the smaller ones to the catching of oysters in the breeding-rivers, as above.

The oysters are sold to London, Hamburgh, Bremen, and, in time of peace, to Holland, France, and Flanders. The quantity consumed in a season is scarcely to be calculated; but it is supposed that it cannot be less than 12,000 or 15,000 bushels. This sort of fishery is so much blended with others, that it is almost impossible to state the capital which is employed in it; but it is supposed to be from 60,000 to 80,000l.

The oyster affords the curious in microscopic observations a very pleasing entertainment. In the clear liquor many little round living animalcules have been found, whose bodies, being conjoined, form spherical figures, with tails not changing their place otherwise than by sinking to the bottom, as being heavier than the fluid; these have been seen frequently separating, and then coming together again. In other oysters, animalcules of the same kind were found, not conjoined, but swimming by

one another, whence they seemed in a more perfect state, and were judged by Mr. Leeuwenhoek to be the animalcules in the roe or semen of the oyster. An oyster being opened, incredible multitudes of small embryo-oysters were seen, covered with little shells, perfectly transparent, and swimming along slowly in the liquor; and, in another, the young ones were found of a browner colour, and without any appearance of life or motion. Monsieur Joblot also kept the water running from oysters three days, and it appeared full of young oysters swimming about nimbly in it; these increased in size daily, but a mixture of wine, or the vapour of vinegar, killed them.

In the month of August, oysters are supposed to breed, because young ones are then found in them. Mr. Leeuwenhoek, on the fourth of August, opened an oyster, and took out of it a prodigious number of minute oysters, all alive, and swimming nimbly about in the liquor, by means of certain exceeding small organs, extending a little way beyond their shells; and these he calls their beards. In these little oysters he could discover the joinings of the shells, and perceived that there were some dead ones, with their shells gaping. These, though so extremely minute, are seen to be like the large oysters in form. As to the size of them, he computes, that a hundred and twenty of them in a row would extend an inch; and, consequently, that a globular body, whose diameter is an inch, would, if they were also round, be equal to 1,728,000 of them. He likewise found animalcules in the liquor five hundred times less than the embryo-oysters. *Leeuwenhoek, Arcan. Nat. tom. iv.*

Some of the housewives employ their poor in pounding oyster-shells for manure. By experiment in Norfolk (1818), forty bushels of oyster-shell powder is found equal in virtue to eight tons of farm-yard dung. It is described as an excellent manure for wheat, and as a top-dressing for young clovers, &c. also for gardens, as, from its saline exudation, it destroys slugs, &c.

Oyster-shells are indeed an alkali of a more powerful kind than is commonly supposed, and probably are in reality much better medicines than many of the more costly and pompous alkalis of the same class. The proof of alkalis is in their solution by acid spirits; and Mr. Homberg found, that they dissolved much more easily in the acids of nitre and sea-salt than pearls, coral, and the rest; which he supposes owing to their containing in the body of the shell a considerable portion of sal-salsus, which is easily perceived upon the tongue, and which keeps the whole substance of the shell in a sort of half-dissolved state. These shells are found to produce very great effects on the stomach when injured by acid humours; and Mr. Homberg is of opinion, that this their easiness of solution is one great reason of their good effects, and that the quality of sal-salsus which they contain contributes not a little towards it, since we are not to look upon that as a mere salt, but a salt of a peculiar kind, formed of sea-salt by the organs of the animal, and the several fermentations it undergoes in the body of it, in the same manner as the nitrous and other salts of the earth cease to be nitrous, &c. as soon as they have been blended with the juices of plants, and form with them a salt peculiar to that plant; and this is plainly the case in regard to this salt, since it is evidently of a more penetrating taste, and of a different smell, from the salt left by the sea-water between the several external scales or flakes of the shell.

As oyster-shells were found by Mr. Homberg to be a very valuable medicine, and as one of the common methods of preparing them is by calcination, which, he observes, cannot but much impair their virtues, he gives the following method of preparing them for taking inwardly, which was what he always used: "Take the hollow shells of the oysters, throwing away the flat ones as not so good; wash them perfectly clean, and then lay them to dry in the sun: when they appear dry, beat them to pieces in a marble mortar, they will be then found to contain yet a large

large quantity of moisture; lay them again in the sun till perfectly dried; and then finish the powdering them, and sift the powder through a fine sieve. Give twenty or thirty grains of this powder every morning, and continue it three weeks or a month." *Mem. Acad. Par.* 1700.

Oysters are often found in a fossil state; as to which, see OSTRACITES, p. 27 of this volume; but more particularly the article CONCHOLOGY, vol. v. p. 31.

109. *Ostrea semi-aurata*: shell oval, slightly eared, smooth, with an oblique base. It inhabits the Mediterranean; is about one inch and a half long, and one and a quarter broad; of a dirty-olive, with a few undulate white lines; very thin; each valve convex and ending in a beak; hinge with five rounded hollows.

110. *Ostrea striata*: shell oval, with longitudinal filiform ridges; inside green. It is found in European seas, and is about an inch in diameter. The shell is thick, strong, nearly opaque, not membranous, as in the common oyster, with numerous slender irregular ridges, divided towards the bottom; upper valve flattish, lower concave; hinge broad, deep, somewhat triangular, and striate transversely. In many shells is a white radiate mark below the hinge, formed by the cartilage of the fish.

111. *Ostrea fornicata*: shell rough, oblong, linear, with divergent hinges, vaulted internally. It is found in the Red Sea. The shell is brittle, membranaceous, tawny, about as long as a finger, terminating at the hinge in an elongated acutangular beak.

112. *Ostrea sinensis*: shell rough, lamellate, unequal, and glabrous within; lower valve larger, concave, and ending in a beak, with ten obtuse plaits. It is found on the Chinese shores; four inches long, and a little narrowed; shell russet-brown, within whitish towards the hinge.

113. *Ostrea spondiloidea*: shell equivalve, pellucid, flattened, oval, beaked, glabrous, with perpendicular, undulate, granulate, striæ on the upper valve; margin very sharp. Inhabits India: three inches two lines long, two inches five lines broad; shell white, with a few tawny spots.

114. *Ostrea Forskahlîi*: shell plaited, and terminating in a long incurved hollow beak; the middle ribs with imbricate spinous wrinkles; the other valve flat. It is found in the Red Sea. Two inches three lines long, and about an inch broad; the flat valve whitish, the other nearly violet.

115. *Ostrea plicatula*: shell with longitudinal wrinkled plaits; the lower valve a little less, and flatter. It inhabits the American and Mediterranean Seas. Varies very much in shape and colour.

116. *Ostrea rostrata*: shell oblong, rugged; the upper valve lamellate, with a denticulate margin, the other excavated and longitudinally grooved; beak prominent. It inhabits the Mediterranean. Upper valve yellowish-green, the other violet, varied with white; within cretaceous, or chalky-white.

117. *Ostrea Virginica*: shell nearly equivalve, thick, rough, lamellous; one valve with a prominent beak. It is found in the American and Indian Oceans; nine inches long and four broad.

118. *Ostrea cornucopiæ*: upper valve flat, lower one hollow and striate, rough with scales, wrinkles, and plaits, and ending in an elongated beak. It is found in the Indian and African Oceans.

119. *Ostrea parasitica*: shell thin; lower valve convex and thicker, the other flat. It inhabits the Indian and Atlantic Seas, and fixes itself to the roots and stumps of trees growing close to, and hanging over, the water, especially the *Mangifera*; varies in form and size, but is often as large as the palm of the hand.

120. *Ostrea exalbida*: shell thin, the upper valve longer and more convex. This is found in the Adriatic, fixed to other shells, sometimes alone, sometimes several together; about one inch and a half long, but is variable

as to shape and size; generally whitish, rarely yellow or violet.

121. *Ostrea cristata*: shell rugged, with imbricate lamellæ; the margin with obtusely-plaited teeth; the beak of one valve protruded. Shell an inch long, and ten lines broad; white, with a few black spots; hinge with a broad conic tooth in the middle.

122. *Ostrea Senegalensis*: shell equivalve, roundish, smooth, flat. It inhabits the shores of Senegal, and adheres to rocks; about two inches in diameter.

123. *Ostrea stellata*: shell thin, depressed, rough, unequal; the upper valve ribbed, the ribs with a few spines. It is found in Guinea, sometimes affixed to other bodies by the hinge; sometimes round, sometimes oblong; very thin, white, with red or bluish marks.

124. *Ostrea ovalis*: shell oval, very thin, and terminating in a short acute lateral channelled beak; with obsolete, unequal, perpendicular, striæ. The shell is about an inch long, brittle, whitish, within glossy silver-white; lower valve exceeding the upper both in length and breadth.

125. *Ostrea papyracea*: shell roundish, snowy, very thin, pellucid; upper valve terminating in a short acute beak. It is found firmly fixed with the *Lepas tintinnabulum*.

126. *Ostrea annulata*: shell equivalve, orbicular, white, with concentric semicircles. It is found in the North Seas.

127. *Ostrea retufa*: shell equivalve, oblong, white, glabrous, striate; with an umbo or knob remote from the hinge. This is also found in the North Seas.

III. *Hinge with a perpendicular grooved line.*

128. *Ostrea perna*: shell equivalve, obovate, unequal, rounder at one end.

129. *Ostrea isognomum*: shell equivalve, with a larger lobe, nearly forming a right angle with the hinge. There are four varieties of this species. They are found in the Indian Ocean and South Sea; from five to six inches long, and about one inch and three quarters broad in the middle; shell black, with a violet mixture, and pearly within; lamellate, with an open beak. A very rare shell.

130. *Ostrea ephippium*: shell equivalve, orbicular, compressed, membranaceous. Found in the Indian Ocean and at the Cape of Good Hope; very rare. The shell is about five inches long, and five and a half broad; blackish, ferruginous, or purplish, and pearly within; roundish, lamellate, with a very acute margin.

131. *Ostrea pîsta*: shell equivalve, thin, pellucid, and pointed at the hinge, the other end dilated; margin very acute. It inhabits the Red Sea; is more than an inch broad, and about two long; yellowish-brown, with paler undulate rays.

132. *Ostrea legumen*: shell flat, hoary, thin, pellucid, lamellate; hinge with an oblique line; the interstices of the grooves black. This species inhabits the Nicobar Islands; is four lines broad, and above two inches long; near the knob is a livid spot.

133. *Ostrea alata*: shell flat, brittle, pellucid, and dilated towards the margin; hinge with an oblique line ending in a small beak. It is found in America.

134. *Ostrea mytiloides*: shell nearly equivalve, ovate, ventricose, straight. It is found in a fossil state in Alsace.

135. *Ostrea torta*: shell equivalve, intorted. This also is found fossil in Alsace.

136. *Ostrea pes-lutræ*: shell equivalve, smooth, wedge-shaped, with six obtuse plaits; varied with purplish and white, and marked with very fine longitudinal striæ; the margin slightly scalloped.

OSTRICO'NI, a river of the island of Corsica, which runs into the sea near the town of Ostriconi.

OSTRICO'NI, a town of the island of Corsica: twenty-two miles west-south-west of Bastia.

OSTRIF'EROUS, *adj.* [from the Lat. *ostrea*, an oyster, and *fero*, to bear.] Producing oysters; bearing oysters. *Cole.*

OST'TRINGER,

OSTRINGER, or **OSTRENGER**, *f.* An old word for a falconer.

OSTRITZ, or **WOT'ROW**, a town of Upper Lusatia, on the Neisse: seven miles south of Górlitz, and twenty south of Budissen. Lat. 51. 1. N. lon. 15. 1. E.

OSTROCOL, a town of Prussia, in Natangen: nine miles south-south-east of Lick.

OSTROE, one of the Feroe-islands, in the North Sea.

OST'ROG, a town of Poland, in Volhynia, once the capital of a duchy, ceded to Poland in the year 1609. It is thirty-eight miles north-north-west of Constantinov.

OSTROGO'THIA. See **GOTHLAND**.

OSTROGOTHS, or **EASTERN GOTHS**, in ancient history, a denomination given to those Goths who, before they left Scandinavia, inhabited the more eastern parts near the Baltic, in contradistinction to the Westrogoths, or Western Goths, who inhabited that part of Scandinavia which borders on Denmark. The name was afterwards appropriated to those Goths who established themselves on the other side of the Danube, and thus they were distinguished from those who proceeded farther westward, and into Pannonia. Their history is included under the general article **GOTHS**, vol. viii.

OSTROGZEK, a town of Poland, in Volhynia: eighteen miles south-west of Berdiczow.

OSTROGOZ'SK, a town of Russia, in the government of Voronez: forty miles south of Voronez. Lat. 51. N. lon. 38. 4. E.

OSTROKOL'LA, a town of Prussia: eighty miles south-east of Königsberg.

OSTROLEN'KA, a town of the duchy of Warsaw: forty-eight miles north-east of Warsaw.

OSTROMET'KE, a town of Prussia, in the palatinate of Culm: ten miles south of Culm.

OSTROPO'LE, a town of Poland, in Volhynia: ten miles north-east of Constantinov.

OSTROSI'NA, a town of Croatia: twelve miles south-east of Carlstadt.

OST'TROV, a town of Russia, in the government of Pskov, on the river Velika. Lat. 57. 20. N. lon. 28. 14. E.

OSTROUCHOVSKA'IA, a town of Russia, in the country of the Cossacks, on the Choper: forty-four miles west-south-west of Arkadinkaia.

OST'TROVITZ, a town of Croatia: twelve miles south of Bihacs.

OSTROVIZ'ZA, a town and fortress of Dalmatia; supposed by some to be the *Arauzona*, and by others the *Stlupi*, of the ancients, though probably it has no connection with either the one or the other. It was purchased in 1410 by the republic of Venice for five thousand ducats, and some pieces of land besides. Its fortress, which was seated on a rock, perpendicularly cut all round, and deservedly reckoned impregnable before the use of artillery, was taken by Soliman in 1524, but soon after restored to the dominion of Venice. At present no traces of its fortifications remain. It is fourteen miles north of Scardona.

OSTROV'NOE, a lake of Russia, in the government of Kolivan: 120 miles south of Kolivan. Lat. 52. 24. N. lon. 80. 24. E.

OSTROV'SKOI, a town of Russia, in the government of Kostrom: forty-eight miles east-north-east of Vetluga.

OST'ROW, a town of the duchy of Warsaw: sixty miles east-north-east of Warsaw.

OST'TROW, a town of Poland, in Volhynia: twenty-two miles south of Lucko.

OST'TROW, a town of Lithuania, in the palatinate of Novogrodek: forty-four miles south of Novogrodek.

OSTROVIEC', a town of Lithuania, in the palatinate of Wilna: three miles east of Wilna.

OSTROZECK', a town of Poland, in Volhynia: forty-two miles west-north-west of Zytomiers.

OSTRU'THIUM, *f.* in botany. See **IMPERATORIA**.

OSTRY'A. See **CARPINUS**.

OSTRYN'IA, a town of Lithuania, in the palatinate of Wilna: twenty miles west-south-west of Lidda.

OSTUAL'LA, a town of Norway: fifty miles north of Frederickstad.

OSTU'NI, a town of Naples, in the province of Otranto, the see of a bishop, suffragan of Brindisi. It contains two churches and five monasteries. It is fifty-one miles north-west of Otranto, and 164 east of Naples. Lat. 40. 59. N. lon. 17. 38. E.

OSU'NA, a town of Spain, in the province of Seville: twelve miles south-south-west of Ecija.

OSUNPOU'R, a town of Hindoostan, in Bengal: forty-five miles north-north-east of Dacca. Lat. 24. 25. N. lon. 90. 48. E.

OS'WALD, a small island in the Gulf of Florida, near the coast of East Florida. Lat. 25. 48. N. lon. 80. 22. W.

OS'WALD (St.), a town of Austria; five miles north of Rosbach.—Also, a town of the duchy of Stiria; eleven miles north-east of Windisch Gratz.—A town of the duchy of Stiria; six miles south of Landsparg.—A town of Austria; eight miles south-west of Newstadt.—A town of Austria; five miles east of Freystatt.—A town of Upper Carniola; eleven miles east of Stein.

OS'WALD (Erasmus), a learned German professor of the mathematics and of the Hebrew language, was born in the county of Merckentein in Austria, in the year 1511. After having gone through a course of grammar-learning, he studied successively at the universities of Ingoldstadt, Leipzig, and Basil; and, in the place last mentioned, distinguished himself by his proficiency in the mathematical sciences and the Hebrew tongue, under the instructions of the famous Sebastian Munster. From Basil he went to Memmingen in Swabia, on an invitation from the magistrates to become mathematical professor in that city; and afterwards he removed to Tübingen, where he filled the chair of Hebrew professor with great success and applause. In imitation of his tutor, Sebastian Munster, he did not confine his instructions to the Hebrew language only, but also delivered lectures in the mathematics, from which he derived no little reputation. In the year 1552, he accepted of the united chairs of mathematical and Hebrew professor at Friburg in the Brisgaw, which he held for more than seven-and-twenty years, with great advantage to the interests of science and oriental literature in Germany. He died in 1579, in the sixty-ninth year of his age. He was the author of, 1. *Commentaria in Theoricis Planetarum*. 2. *De Primo Mobili*. 3. *Commentaria in Sphaeram Joannis de Sacrobosco*. 4. *In Almagestum Ptolomæi Annotationes*. 5. *Gentium Kalendarium*. 6. *Oratio funebris de Obitu Sebastiani Munsteri*, written in the Hebrew language. 7. *Paraphrasis in Cantica Canticorum, et Ecclesiastem Salomonis, ex Chaldaica Lingua in Latinam conversa*. 8. He translated into Latin, Rabbi Abraham Cai's book on the Sphere, and Rabbi Elias's treatise on Arithmetic, publishing the original Hebrew with his version. He likewise translated the New Testament into Hebrew; an undertaking on which no person had ventured before his time. *Teissier's Eloges des Hommes Savans*.

OS'WALD (John), a native of Scotland, the date of whose birth and death we have not been able to ascertain. He was a lieutenant in the 42d regiment of foot, and served in the war before last in the East Indies. In the year 1783 he left India, and returned by land to England. His predominant passion for travel, and avidity to survey mankind under various points of view, determined him to trace out for himself a new route. He directed his course to the more northern and mountainous parts of Turkey, and pitched his tent for some time among the barbarous hordes of Turkomans and Kurds, whom for many years no traveller had visited except himself and the celebrated walking Stewart. By the most intense application, he had acquired, without a master, a competent knowledge of the Latin tongue. To this he soon added, in the same manner, the Greek; and, in the course of his peregrinations,

tions he made himself familiar with the Arabic language, together with the French, Italian, Spanish, and Portuguese, dialects. The religious and philosophic opinions of this gentleman were extremely singular. He adhered to the Hindoo system of worship, and turned with an abhorrence truly braminical from every species of animal food. To a gentleman who urged him to assign his reasons for an aversion so singular, he replied, "that he thought it cruel to deprive of life an innocent animal, and filthy to feed upon a corpse." He published, in 12mo. 1789, a volume of poems, under the name of Silvester Otway. He wrote, besides, 2. *Rane Comice Evangelicantes*; or, the Comic Frogs turned Methodists; 1786. 3. The British Mercury, a periodical publication; 1787. 4. The alarming Progress of French Politics; a pamphlet on the subject of the Commercial Treaty, 1787. *Biographia Dramatica*.

OSWALD's LAW; the law by which was effected the ejecting married priests, and introducing monks into churches, by Oswald bishop of Worcester, about the year 964.

OSWALDESLAW, a village in Worcestershire, between Worcester and Speechly, the chief place of a hundred of its own name, and the place where bishop Oswald used to keep his court, on a rising ground, where the hundred-court is held still; and not far from it was St. Oswald's hospital, built and endowed by him in the year 960, and pulled down in the reign of queen Elizabeth; but, on the restoration of king Charles II. a neat hospital was erected in its place for twelve poor men. This hundred is exempt from the jurisdiction of the sheriff, and comprehended eight hundred hides of land.

OSWALTWISTLE, a township of Lancashire. In 1801, the population was 2710, with 951 employed in manufactures: six miles north-north-east of Blackburn. *Cruttwell's Gaz.*

OSWAN'SIO, a town of Sweden, in Gestricia: seventeen miles west-south-west of Gefle.

OSWEGAT'CHIES, Indians of Canada, inhabiting the north bank of the St. Lawrence, near Oswegatchy-river.

OSWEGAT'CHY, a river of United America, which runs into the river St. Lawrence in lat. 44. 45. N. lon. 75. 28. W.

OSWEGAT'CHY, a lake of the state of New-York. Lat. 44. 7. N. lon. 75. 24. W.

OSWEGO, a navigable river of New-York, which conveys the waters of Oneida, and a number of small lakes, into lake Ontario. It is more commonly called *Onondago*.—Also, a fortress on the east side of the mouth of the above river, and on the south-east side of lake Ontario: it is about 150 or 160 miles east-by-north of Niagara. Lat. 44. 43. N. lon. 76. 50. W.

OSWEGO CREEK (Great), lies in the county of Lincoln, Upper Canada; and runs into the river Welland, above the Little Oswego Creek, near the north-west part of the township of Wainfleet.

OSWEGO TE'A. See MONARDA.

OSWESTRY, a borough, market-town, and parish, in the hundred of Oswestry, and county of Salop, is situated on the great road from London to Holyhead, at the distance of eighteen miles from Shrewsbury, and 179½ from the metropolis. The town stands upon higher ground than any other in Shropshire, and the country around is delightfully varied with hills, vales, wood, and water, and exhibits some very rich and picturesque scenery. It is a borough by prescription, and is governed by a mayor, recorder, high-steward, town-clerk, murenger, coroner, and other inferior officers; but sends no member to parliament. The body corporate consists of the mayor, twelve aldermen, and fifteen common-councilmen, who elect the mayor, recorder, and murenger; but the high-steward and town-clerk are nominated by the lord of the manor, earl Powis; and the office of coroner is always

held by the chief magistrate of the preceding year. The petty sessions for the hundred are holden here, besides the courts connected with the borough. Wednesday and Saturday of every week are the market-days in this town; and there are six fairs in the year, viz. March 15, May 12, Wednesday before Midsummer, August 15, Wednesday before Michaelmas-day, and December 10, for horses, cattle, sheep, flannel, &c. &c. Here is an excellent free grammar-school, of recent erection. The church is a very spacious building, with a plain well-proportioned tower at one end. Oswestry has been much improved within the last ten years, in consequence of an act obtained, in 1810, for widening, paving, and lighting, the streets, and of the spirit of building which has resulted from that measure. According to the parliamentary returns of 1811, the houses in the town were 788, and the inhabitants 3479 in number.

Oswestry is a town of great antiquity. The Saxons called it *Mæserfeld*, or *Mæserfelth*, signifying the Acorn-field; and the Britons *Tre-ewefan-gluddiu in Urberu*, *Tre-Kadari*, or the Town of Great Oaks. Its present appellation was derived from the name of St. Oswald king of Northumberland, who was defeated and slain here by Penda king of Mercia, one of the most cruel and bloody tyrants that ever disgraced a throne. It was the practice of St. Oswald to erect a cross on the field of battle, as a standard, at the foot of which he and his army, the moment before the trumpets sounded the charge, practised the pious devotion of kneeling, appealing to heaven for the justice of his cause, and imploring its assistance to confound the insolence of his enemies. And hence the place was called by the Welsh *Croes Ofwald*, Oswald's Cross; but, by the English, *Oswald's Tree*, now *Oswestry*. Subsequently, when the great Offa constructed the barrier still known by his name, Oswestry stood between it and Watt's Dyke, which ran parallel to the former, at the distance of two miles. It was thus rendered a border-town, and hence was frequently the scene of contest, first between the Saxons and the Britons, and afterwards between the latter and the Normans. In 1212 king John burnt both the town and castle, which were then in the possession of the Fitz-Alans, and plundered a part of Wales, on account of the refusal of Llewellyn to join his standard in opposition to Louis, the dauphin of France, who had been invited to England by the rebellious barons. Oswestry was likewise destroyed by the Welsh prince called Llewellyn the Great, in 1233. During this period it was encircled by a strong wall, which had four gates fronting the four cardinal points. Some traces of the wall still remain; but the gates were entirely demolished about the year 1769. Of the castle, which stood on a high artificial mount at the west side of the town, only a few fragments now exist. These, however, are sufficient to indicate its former prodigious strength, and consequent importance as a place of defence.

In 1794, a large and handsome building was erected within three quarters of a mile of the town, by virtue of an act of parliament, for the relief and employment of the poor of that and eleven other neighbouring parishes united therewith. They are represented at a weekly court, held every Monday at the house, by sixteen directors, who are chosen out of, and elected by, the guardians or householders, of whom Oswestry sends five, and each of the others one. The good effects of the institution are known from the reduction of the poor's-rates, and the comfort which the aged poor find of cleanliness and plenty in this asylum. The youth of both sexes, and other paupers able to work, are stimulated to industry, by having allowed them for their own use one-sixth part of their earnings; some being employed as tailors, shoemakers, &c. &c. and others in the woollen and other manufactories.

About a quarter of a mile north-east from Oswestry is an ancient fortification called Old-Fort, which the Welsh formerly

formerly denominated *Llys-Ogran*, or *Caer-Ogran*; that is, Ogran's Palace, or Strong Hold. It consists of three deep entrenchments, encircling a natural eminence, having a sudden ascent on all sides. Beyond this stand the venerable ruins of Whittingham-castle, which was built more than a century before the Conquest, and after that event became a baronial residence of the Montgomeries, the Peverells, and the Fitz-guarines. The situation of this castle is extremely picturesque; its eastern walls being washed by a fine lake, shaded with large old oaks, and having a small islet in its centre, covered with tall wych-elm and ash-trees.

Knockin-castle, about five miles from Oswestry, was built by lord Lefrange or Strange, and continued in the possession of his family till the reign of Edward IV. when it passed into the family of the Stanleys, earls of Derby. The village here had formerly a market and fairs, and was a place of considerable importance.

Chirk-castle, on the confines of Denbighshire, stands on the site of a more ancient fortress, called Castell Crogen, which was demolished in the reign of Edward I. and the present structure erected in its stead by Roger Mortimer. In the time of the civil wars between king Charles and his parliament, this castle was the property of sir Thomas Middleton, the celebrated parliamentary general, whose descendants, by the female line, still possess it. It is a square building, strengthened at the angles by massy bastion-like towers, and having a court in the centre. A picture-gallery in this edifice contains a large collection of portraits. *Beauties of England and Wales*, vol. xiii. *Wilkes's British Directory*, vol. iv.

OSWIEC'ZIN, a town of Poland, in the palatinate of Cracow, on the Vistula: thirty-two miles west of Cracow. OSYMAN'DIAS, an Egyptian king, and the first monarch who formed a library. He caused a colossal statue of himself to be erected, on which was this inscription: "I am Osymandias, king of kings; whoever will dispute this title with me, let him surpass my works." For a description of some of these, see the article EGYPT, vol. vi. p. 292. These works must indeed give us a striking assurance of the progress which had been made in the arts at that time; whether he lived, as some have thought, the immediate successor of the first Busiris, which was somewhat later than the period of Semiramis; or, as others have conceived, subsequent to Sesostris, which would be four hundred years later. Diodorus Siculus, who describes the stupendous edifices, says nothing of the age in which Osymandias lived; every opinion, therefore, on that point must be conjecture. We shall only remark, that there is nothing in the works of art in that edifice which should appear too much for the earliest age in which that monarch has been placed, when we look back to what was done of that kind in a period full as early by Semiramis in Assyria. *Bromley's Hist. of the Fine Arts*, vol. i.

OSY'RIS, *f.* [*ὄσις* of Dioscorides, which he describes as "a small shrub, with numerous dark tough branches;" so that professor Martyn's conjectural derivation of the name from *ὄσος*, a branch, is very probably just.] In botany, a genus of the class diœcia, order triandria, natural order of calycifloræ, (elæagni, *Juss.*) Generic characters—I. Male. Calyx: perianthium one-leaved, trisid, turbinate; segments equal, ovate, acute. Corolla: none, except a triple nectariferous rim. Stamina: filaments three, very short; anthers roundish, small. II. Female. Calyx: perianthium as in the male, superior, permanent, very small. Corolla: none, as in the male. Pistillum: germ turbinate, inferior; style the length of the stamens; stigma three-parted, spreading, (roundish, *Syst.*) Perianthium: berry globular, one-celled, umbilicated. Seeds bony, globular, filling the pericarp.—*Essential Character*. Male. Calyx trisid; corolla none. Female. Stigma roundish; drupe one-celled, berry dry, umbilicated.

1. *Osyris alba*, poet's casia, or garderober: leaves linear. This is a very low shrub, seldom rising above two feet

high, having woody branches. Leaves long, narrow, of a bright colour. Flowers of a yellowish colour; succeeded by berries, which at first are green, and afterwards turn to a bright-red colour, like those of asparagus. Scopoli observed rudiments of styles and a germ in the male plant; and asks why it has the epithet of *alba*, or white, when the calyxes, and almost the whole plant, are yellow. Linnæus remarks, that the female should rather be called an hermaphrodite, since it has stamens, although it is barren without the male. Native of France, Spain, Italy, Carniola, and Mount Libanus. Cultivated in 1739 by Mr. Miller.

2. *Osyris Japonica*, or Japanese *osyris*: leaves ovate, floriferous. Stem shrubby, tubercled, a fathom high. Branches alternate, upright, smooth. Leaves alternate, frequent at the ends of the branches, smooth on both sides, unequal, an inch long and more. Petioles one-third of the length of the leaves. Flowers from the midrib of the upper surface of the leaves in umbels, male and female on distinct shrubs; umbels simple, with about eight flowers without an involucre. Perhaps this may form a new genus; but, the female flowers being yet unknown, it cannot be settled satisfactorily. The leaves are said to be eaten in Japan, where it is a native.

Propagation and Culture. This plant grows by the side of roads, as also between rocks, and is with great difficulty transplanted into gardens; nor does it thrive after being removed; so that the only method to obtain this plant is, to sow the berries where they are to remain. These berries commonly remain a year in the ground before the plants appear, and sometimes they will lie two or three years; so that the ground should not be disturbed under three years, if the plants do not come up sooner. These seeds must be procured from the places where the plants naturally grow, for those which have been brought into gardens never produce any, and it is with great difficulty they are preserved alive. See ANTIRRHINUM, CHENOPODIUM, CHRYSOCOMA, HIPPOPHAE, and NITRARIA.

OSY'RIS, in mythology. See OSIRIS, p. 1.

OSZ'MIANA, or OSCHMIANA, a town of Lithuania, in the palatinate of Wilna, the principal place of a district, where provincial diets and justice-courts are held: twenty-eight miles south-east of Wilna.

OTABA'LO, a jurisdiction of South America, in the province of Quito, connected on the south with that of San Miguel de Ibarra. The lands are laid out in plantations, and produce great quantities of sugar. The Indians in the villages, and also those who are independent, manufacture great variety of cottons; viz. carpets, pavilions for beds, quilts in damask-work, either white, blue, or variegated with different colours; all which are highly valued in the provinces of Quito and Peru, where they are disposed of to great advantage. The wheat and barley are sown here, like Indian corn, in little holes, a foot distant from each other, into each of which are dropped five or six grains; and they generally reap above a hundred-fold. This jurisdiction abounds with horses and black cattle; and from the milk of the latter large quantities of cheese are made. The fertility of the country is very much promoted by a great number of rivulets. Its flocks of sheep are also numerous, though they seem to be neglected by the inhabitants.—The principal place in this jurisdiction is OTABALO, which is so large and populous, that it is said to contain 18,000 or 20,000 persons. It is thirty miles north of Quito. Lat. 0. 15. N. lon. 77. 56. W.

OTACOU'STIC, *adj.* [from the Gr. *ὠτα*, ears, and *ακουω*, to hear.] Belonging to the sense of hearing.

OTACOU'STIC, or OTACOUSTICON, *f.* An instrument to facilitate hearing.—Not vouching to see or hear any thing but by perspectives and *otacoustics*. *Hammond*.—In a hare, which is very quick of hearing, it is supplied with a bony tube; which, as a natural *otacoustic*, is so directed backward as to receive the smallest and most distant sound that comes behind her. *Grew's Cosmol.*

Casimol.—Using some *otacouftigon*, and placing the mouth of it towards the found. *Smith on Old Age*.

OTAHAI', one of the Society Islands, in the South Pacific Ocean, situated two miles north of Ulietea, and both inclosed within one reef of coral rocks, so that there is no passage for shipping between them. Otaha affords two very good harbours; one on the east side, called Ohamene, and the other on the west, called Ohererua, which is pretty large, and affords good anchorage in twenty and twenty-five fathom; nor is there any want of fresh water. The land of Otaha, as well as that of Ulietea, is hilly, broken, and irregular, except on the sea-coast; yet the hills appear green and pleasant, and are in many places clothed with wood. This island has been conquered by the king of Bolabola. Lat. 16. 33. S. lon. 151. 20. W.

OTAHEITE, or TAHITI, called by Capt. Wallis "King George the Third's Island," one of the Society Isles, in that division of the world by modern geographers called Polynesia. It is about ninety miles in circumference; and is supposed to have been first seen by Quirós in the year 1606, and by him called *Sagittaria*. Captain Wallis was the first Englishman who discovered it, in the year 1767. The year following it was visited by Monf. de Bougainville, a French commander; and by Capt. Cook, in the years 1769, 1773, 1774, and 1777. From his account, as drawn up by Dr. Hawkesworth, we shall extract what may be called the early history of it; adding some particulars as to its present state, from the Missionary Voyages, and other recent publications.

The island consists of two distinct kingdoms, which are united by a narrow neck of land; the larger being called by the natives *Tiararabou*, or O-Taheitee Nue; the smaller one *Opoureonou*, or O-Taheitee Ete. The country has a delightful romantic appearance. The coast, viewed from the sea, presents a most beautiful prospect, being elevated like an amphitheatre. The island is skirted with a reef of rocks, and towards the sea is level, being covered with fruit-trees of various kinds, particularly the cocoa-nut. At the distance of about three miles from the shore, the country rises into lofty hills that are covered with wood, and terminate in peaks, from which large rivers are precipitated into the sea. The stones every-where appear to have been burnt, not one being found which did not give manifest signs of fire; so that there is great reason for supposing that this and the neighbouring islands are either the shattered remains of a continent, or were torn from rocks, which, from the creation of the world, have been the bed of the sea, and thrown up in heaps to a height which the waters never reach. What is further extraordinary, the water does not gradually grow shallow as we approach the shore, but is of immense depth close by the land; and the islands in this neighbourhood are almost every-where surrounded by reefs which appear to be rude and broken, in the manner that some violent concussion would naturally leave the solid substance of the earth; and Mr. Forster saw a rock with projecting longitudinal angles of black compact basaltes. The exterior ranges of hills are sometimes entirely barren, and contain a great quantity of yellowish clay, mixed with iron ochre; but others are covered with mould and wood, like the mountains in the internal parts of the country. Pieces of quartz are sometimes met with here; but no indications of precious minerals or metals of any kind have been observed, iron only excepted. One of the greatest natural curiosities of the country, is a pond or lake of fresh-water, at the top of one of the highest mountains, remarkable for its depth, and for its eels of enormous size.

The coral-rocks, by which the island is surrounded, form several excellent bays and harbours, where there is room and depth of water for any number of the largest ships. Port Royal, or Matavai, which is not inferior to any, may be easily known by a very high mountain in the middle of the island, which bears due south from Point Venus. The best anchoring is on the east side of the bay,

with sixteen and fourteen fathom upon an oozy bottom. The shore of the bay is a fine sandy beach, behind which runs a river of fresh-water, so that any number of ships may be supplied without incommoding each other.

The soil of the island, except on the very tops of the ridges, is extremely rich and fertile, watered by a great number of rivulets of excellent water, and covered with fruit-trees of various kinds. The low land that lies between the foot of the ridges and the sea, and some of the valleys, are the only parts that are inhabited; and here it is populous. The houses do not form villages or towns, but are ranged along the whole border, at the distance of about fifty yards from each other, with little plantations of plantains, the tree which furnishes them with cloth. The whole island, according to the best information, could furnish 6780 fighting men, from which the number of inhabitants at that time may easily be computed.

The produce of this island is bread-fruit, cocoa-nuts, bananas of thirteen sorts, plantains, a fruit not unlike an apple, which, when ripe, is very pleasant; sweet potatoes, yams, cocoas, a kind of arum; a fruit known here by the name of *jambu*, and reckoned most delicious; sugar-cane, which the inhabitants eat raw; a root of the salep kind, which the inhabitants call *pea*; a plant called *ethee*, of which the root only is eaten; a fruit that grows in a pod, like that of a large kidney-bean, which, when it is roasted, eats very much like a chestnut, by the natives called *ahce*; a tree called *wharra*, called in the East-Indies *pandanes*, which produces fruit something like a pine-apple; a shrub called *nono*; the *morinda*, which also produces fruit; a species of fern, of which the root is eaten, and sometimes the leaves; and a plant called *theve*, of which the root also is eaten; but the fruits of the *nono*, the fern, and the *theve*, are eaten only by the inferior people, and in times of scarcity. All these, which serve the inhabitants for food, the earth produces spontaneously, or with little culture. They have also the Chinese paper-mulberry, of the bark of which they make their cloth; an herb which the inhabitants eat raw, its flavour somewhat resembling that of the West-India spinach called *calletoon*, but its leaf very different; a plant which the natives call *ava* or *eava*, from the root of which they express a liquor, which, if drank to excess, intoxicates like wine or distilled spirits. Here is a sort of shady tree, covered with a dark-green foliage, bearing golden-coloured apples, which, in juiciness and flavour, resemble the ananas or pine-apple. One of the most beautiful trees in the world received here the name of *Barringtonia*; it had a great abundance of flowers larger than lilies, and perfectly white, excepting the tips of their numerous chives, which were of a deep crimson. Such a quantity of these flowers were seen dropped off, that the ground underneath the tree was entirely covered with them. The natives called the tree *buddov*; and the fruit, which is a large nut, when bruised and mixed-up with some shell-fish, and thrown into the sea, intoxicates the fish for some time, so that they come to the surface of the water; and suffer themselves to be taken with the hand. Several other maritime plants in tropical climates are found to have the same quality. Mr. Dalrymple describes the method of catching fish with these plants as follows: The plant is thrust under the coral-rocks or hollows where the fish haunt; the effect is most sensible in still water, though it is effectual in the open sea; for the same gentleman says he has seen fish soon after float on the surface of the water half dead, and some totally without life; and, where the effect is less violent, the fish will be seen under the water to have lost their poise, without coming up to the surface. Fish caught in this manner are not in the least noxious or ill-tasted.

Their domestic poultry exactly resemble those of Europe: besides which there are wild ducks; also beautiful green turtle-doves; large pigeons, of a deep-blue plumage and excellent taste; a small sort of parrots, very singular on account of the various mixture of red and blue in their

their feathers; also another sort of a greenish colour, with a few red spots; the latter are frequently tamed, and are valued on account of their red feathers. Here is a kingfisher of a dark green, with a collar of the same hue round his white throat; a large cuckoo, and a blue heron. Small birds of various kinds dwell in the shady trees; and, contrary to the generally-received opinion that birds in warm climates are not remarkable for their song, have a very agreeable note. There were no quadrupeds but dogs, hogs, and rats: and for these last the natives were said to have a scrupulous regard, inasmuch that they would by no means kill them; however, Capt. Cook, in 1773, turned about fourteen cats on the island, which have probably reduced the number of these vermin. No frogs, toads, scorpions, centipedes, or any kind of serpent, have been found here; the ants, however, are troublesome, but not very numerous. When the Endeavour first arrived here, in 1769, the flies were found excessively troublesome; but musquito-nets and fly-flaps in some measure removed the inconvenience. Sydney Parkinson, in his journal, says that, notwithstanding these flies are so great a nuisance, the natives, from a religious principle, will not kill them. But there is a strange disagreement in the accounts of different voyagers concerning this matter: for M. Bougainville says, "this island is not infested with those myriads of troublesome insects that are the plague of other tropical countries." And Mr. Forster says, "not a gnat or musquito hummed unpleasantly about us, or made us apprehensive of its bite." This inconvenience must therefore be felt at certain seasons of the year, and in certain districts of the country, more sensibly than at other times and places. There is great variety of excellent fish; and, according to Aitourou, a native who embarked with M. Bougainville, there are sea-snakes on the shore of Otaheite, whose bite is mortal.

The inhabitants of Otaheite are a stout, well-made, active, and comely, people. The stature of the men, in general, is from five feet seven to five feet ten inches; the tallest man seen by Capt. Wallis measured six feet three inches and a half; and Capt. Cook, in his second voyage, describes Otoo, the king of Otaheite, to be of that height. "In order to paint Hercules or a Mars," says M. de Bougainville, "one could no-where find such beautiful models." They are of a pale-brown complexion; in general their hair is black, and finely frizzled; they have black eyes, flat noses, large mouths, and fine white teeth; the men wear their beards in many fashions, all of them plucking out a great part. Most of them smell strong of the cocoa-nut oil. The women in general are much smaller, especially those of the lower rank, or *tautous*, which is attributed to their early and promiscuous intercourse with the men; whilst the better sort, who do not gratify their passions in the same unbridled manner, are above the middle stature of Europeans. Their skin is most delicately smooth and soft; they have no colour in their cheeks; their nose is generally somewhat flat, but their eyes are full of expression, and their teeth beautifully even and white. "The women," says M. de Bougainville, "have features not less agreeable than the generality of Europeans, and a symmetry of body and beautiful proportion of limbs which might vie with any of them. The complexion of the men is tawny; but those who go upon the water are much more red than those who live on-shore. Some have their hair brown, red, or flaxen, in which they are exceptions to all the natives of Asia, Africa, and America, who have their hair black universally; here, in the children of both sexes, it is generally flaxen. The strongest expression is painted in the countenances of these people; their walk is graceful, and all their motions are performed with great vigour and ease." "I never beheld statelier men," says Sydney Parkinson. The men of consequence on the island wear the nails of their fingers long, which they consider as a very honourable badge of distinction, since only such people as have no occasion to work can suffer them to grow to that length.

This custom they have in common with the Chinese; but the nail of the middle finger on the right hand is always kept short, the meaning for which peculiarity could not be learned. Only one single cripple was met, with among them, and he appeared to have been maimed by a fall."

Both sexes have a custom of staining their bodies, nearly in the same manner as is practised in many other parts of the world, which they call *tattooing*. They prick the skin, so as just not to fetch blood, with a small instrument, something in the form of a hoe; that part which answers to the blade is made of a bone or shell, scraped very thin, and is from a quarter of an inch to an inch and a half wide; the edge is cut into sharp teeth or points, from the number of three to twenty, according to its size; when this is to be used, they dip the teeth into a mixture of a kind of lamp-black, formed of the smoke that rises from an oily nut, which they burn instead of candles, and water: the teeth, thus prepared, are placed upon the skin, and the handle to which they are fastened being struck, by quick smart blows, with a stick fitted to the purpose, they pierce it, and at the same time carry into the puncture the black composition, which leaves an indelible stain. The operation is painful, and it is some days before the wounds are healed. It is performed upon the youth of both sexes when they are about twelve or fourteen years of age, on several parts of the body, and in various figures, according to the fancy of the parent, or perhaps the rank of the party. The women are generally marked with this stain, in the form of a Z, on every joint of their fingers and toes, and frequently round the outside of their feet: the men are also marked with the same figure; and both men and women have squares, circles, and crescents, and ill-designed representations of men, birds, or dogs, and various other devices, impressed upon their legs and arms, some of which, we were told, had significations, though we never could learn what they were. But the part on which these ornaments are lavished with the greatest profusion, is the breech: this, in both sexes, is covered with a deep black; above which arches are drawn one over another as high as the short ribs. These arches are their pride, and are shown both by men and women with a mixture of ostentation and pleasure. The face, in general, is left unmarked.

Both men and women are not only decently but gracefully clothed, in a kind of white cloth that is made of the bark of a shrub, and very much resembles coarse China paper. Their dress consists of two pieces of this cloth; one of them, having a hole made in the middle to put the head through, hangs from the shoulders to the mid-leg before and behind; another piece, which is between four and five yards long, and about one yard broad, they wrap round the body in a very easy manner: this cloth is not woven; but is made like paper, of the macerated fibres of the inner bark spread out and beaten together. Their ornaments are feathers, flowers, pieces of shell, and pearls; the pearls are worn chiefly by the women. In wet weather they wear matting of different kinds, as their cloth will not bear wetting. The dress of the better sort of women consists of three or four pieces: one piece, about two yards wide and eleven long, they wrap several times round their waist, so as to hang down like a petticoat as low as the middle of the leg; and this they call *parou*. This simple drapery affords the sex an opportunity of displaying an elegant figure to the greatest advantage. Two or three other pieces, about two yards and a half long and one wide, each having a hole cut in the middle, they place one upon another; and then, putting the head through the holes, they bring the long ends down before and behind; the others remain open at the sides, and give liberty to the arms: this, which they call the *tebuta*, is gathered round the waist, and confined with a girdle or sash, of thinner cloth, which is long enough to go many times round them, and exactly resembles the garment worn by the inhabitants of Peru and Chili, which the Spaniards

Spaniards call *poncho*. The drefs of the men is the fame, except that, inftead of fuffering the cloth that is wound about the hips to hang down like a petticoat, they bring it between their legs, fo as to have fome refemblance to breeches; and it is then called *maro*. Upon their legs and feet they wear no covering; but they fhade their faces from the fun with little bonnets, either of matting or of cocoa-nut leaves, which they make occasionally in a few minutes. This, however, is not all their head-drefs; the women fometimes wear little turbans, and fometimes a drefs which they value much more, and which, indeed, is much more becoming, called *tomou*; which confifts of human hair, plaited in threads, fcarcely thicker than fowing-filk. Sir Jofeph Banks has pieces of it above a mile in length, without a knot. Their perfonal ornaments, befides flowers, are few: both fexes wear ear-rings, but they are placed only on one fide; when our navigators came, they confifted of fmall pieces of fhell, ftones, berries, red peafe, or fome fmall pearls, three in a ftring; but the beads brought by captain Cook very foon fupplanted them all. The children go quite naked; the girls till they are three or four years old, and the boys till they are fix or feven.

The dwellings of thefe people are all built in the woods, between the fea and the mountains, and no more ground is cleared for each houfe than juft fufficient to prevent the dropping of the branches from rotting the thatch with which they are covered. From the houfe, therefore, the inhabitants ftep immediately under the fhade, which is the moft delightful that can be imagined. It confifts of groves of bread-fruit and cocoa-nuts, without under-wood, which are interfefted, in all direftions, by the paths that lead from one houfe to the other. The ground on which the houfe is built is an oblong fquare, twenty-four feet long, and eleven wide; over this a roof is raifed, upon three rows of pillars or pofts, parallel to each other, one on each fide, and the other in the middle. The utmoft height within is about nine feet, and the eaves on each fide reach to within about three feet and a half of the ground: below this, and through the whole height at each end, it is open, no part of it being inclofed with a wall. The roof is thatched with palm-leaves, and the floor is covered, fome inches deep, with foft hay; over this are laid mats, fo that the whole is one cushion, upon which they fit in the day, and fleep in the night. In fome houfes, however, there is one ftool, which is wholly appropriated to the mafter of the family; befides this, they have no furniture, except a few little blocks of wood, the upper fide of which is hollowed into a curve, and which ferve them for pillows. The houfe is, indeed, principally ufed as a dormitory; for, except it rains, they eat in the open air, under the fhade of the next tree. The clothes that they wear in the day, ferve them for covering in the night; the floor is the common bed of the whole houfehold, and is not divided by any partition. The mafter of the houfe and his wife fleep in the middle, next to them the married people, next to them the unmarried women, and next to them, at a little diftance, the unmarried men; the fervants fleep in the open air, except it rains, and in that cafe they come juft within the fhed. There are, however, houfes of another kind, belonging to the chiefs, in which there is fome degree of privacy. Thefe are much fmall, and fo conftituted as to be carried about from place to place, and fet up occasionally, like a tent; they are inclofed on the fides with cocoa-nut leaves, but not fo clofe as to exclude the air, and the chief and his wife fleep in them alone. There are houfes alfo of a much larger fize, not built either for the accommodation of a fingle chief or a fingle family, but as common receptacles for all the people of a diftrict. Some of them are 200 feet long, thirty broad, and, under the ridge, twenty feet high; thefe are built and maintained at the common expenfe of the diftrict, for the accommodation of which they are intended.

Their candles are made of the kernels of a kind of oily

nut, which they flick one above another in a fkewer that is thruft through the middle of them; the upper one, being lighted, burns to the fecond, at the fame time confuming that part of the fkewer that goes through it; the fecond, taking fire, burns in the fame manner down to the third, and fo to the laft: they burn a confiderable time, and afford a pretty good light; fo that the candle and the candleftick burn out together. No very great quantity, however, of thefe is ufed, as the natives generally retire to reft about an hour after it is dark.

The food of the common people entirely confifts of vegetables. Thefe are, the bread-fruit, with bananas, plantains, yams, apples, and a four fruit, which, though not pleafant by itfelf, gives an agreeable relifh to roasted bread-fruit, with which it is frequently beaten up. The fleft, which is referved for the tables of the great, is either poultry, hogs, or dogs; the fleft of their fowls is not well-tafted, but that of dogs is efteemed by the natives beyond pork. The fmaller fifh are generally eaten raw, as we eat oysters: every thing that can be procured from the fea is made an article of their food; for they will eat not only fea-infefts, but what the feamen call *blubbers*, though fome of them are fo tough that they are obliged to fuffer them to become putrid before they can be chewed. A very large fiark, being caught by the Dolphin's people, was given to the natives; who foon cut it to pieces, and carried it away with great fatisfaction.

They kill the animals they intend for food by fuffocating them, which is done by ftopping the mouth and nofe with their hands; they then finge off the hair, by holding the animal over a fire, and fcraping it with a fhell: with this inftrument they cut it up, and take out the entrails; which are wafhed, and put into cocoa-nut fhells, together with the blood. Dogs that are eaten are fed wholly upon bread-fruit, cocoa-nuts, yams, and other vegetables, and are never fuffered to tafte animal food; and thofe who have tafte the fleft of a dog thus fed, have declared it to be little inferior to Englifh lamb. In order to drefs their food, they kindle a fire, by rubbing the end of one piece of dry wood upon the fide of another, in the fame manner as a carpenter with us whets a chifel. They then dig a pit about half a foot deep, and two or three yards in circumference; they pave the bottom with large pebble ftones, which they lay down very fmooth and even, and then kindle a fire in it with dry wood, leaves, and the hulks of cocoa-nuts. When the ftones are fufficiently heated, they take out the embers, and rake up the afhes on every fide; they then cover the ftones with a layer of green cocoa-nut leaves, and wrap up the animal that is to be drefsed in the leaves of the plantain. If it is a fmall hog, they wrap it up whole; if a large one, they fplit it. When it is placed in the pit, they cover it with the hot embers, and lay upon them bread-fruit and yams, which are alfo wrapped up in the leaves of plantain. Over thefe they fpread the remainder of the embers, mixing among them fome of the hot ftones, with more cocoa-nut tree leaves upon them, and then clofe up all with earth, fo that the heat is kept in; the oven is kept thus clofed a longer or fhorter time, according to the fize of the meat that is drefsed. They ufe fhells for knives; and carve very dexteroufly with them, always cutting from themfelves, like the Jefuits.

They were quite unacquainted with the method of boiling water, as they had no vefels among them that would bear the fire. The gunner of the fhip, who was appointed comptroller of the market which was eftablifhed on fhore with the natives, ufed to dine on the fpot; the aftonifhment of thefe people was very great to fee him drefs his pork and poultry in a pot; at length an old man, who was extremely ferviceable in bringing down provifions to be exchanged, was put into poffeffion of an iron pot, and from that time he and his friends ate boiled meat every day. Several iron pots were likewife given to queen Oberea and fome of the chiefs.

M

Salt

Salt water is the usual sauce to their food: those who live near the sea have it furnished as it is wanted, others at a distance keep it in large bamboos. The kernels of the cocoa-nut furnish them with another sauce; these, made into a paste something of the consistence of butter, are beat up with salt water, which has a very strong flavour; but, though at first it seemed very nauseous, yet, when the taste became familiar, it was much relished.

Their general drink is water, or the milk of the cocoa-nut. They showed in general an aversion to strong liquors; and, whenever any one of them happened to drink so freely with any of the ship's company as to be intoxicated, he resolutely refused to taste any thing that was likely to produce the same effect again; but they have a plant which they call *ava-ava*, from the root of which they procure a liquor which has an inebriating quality. Their manner of preparing this strong drink is as simple as it is disgusting to an European. Several of the people take some of the root, and chew it till it is soft and pulpy; they then spit it out into a platter or other vessel, every one into the same: into this general receptacle water is poured, according to the quantity prepared. The juice thus diluted is strained through some fibrous stuff like fine shavings, after which it is fit for drinking, and it is always prepared for present use: it has a pepperish taste; drinks flat, and rather insipid; and, tho' it will intoxicate, yet Capt. Cook saw but one instance where it had that effect, as the natives generally drink it with great moderation, and but little at a time. Sometimes they chew this root as Europeans do tobacco, and sometimes they will eat it wholly.

They eat alone, or at least only in company with a guest that happens to call in; and the men and women never sit down together to a meal: the shade of a spreading tree serves them for a parlour; broad leaves spread in great abundance serve for a table-cloth; and, if a person of rank, he is attended by a number of servants, who seat themselves round him: before he begins his meal, he washes his mouth and hands very clean, and repeats this several times whilst he is eating. The quantity of food which these people eat at a meal is prodigious. Captain Cook says, he has seen one man devour two or three fishes as big as a perch; three bread-fruits, each bigger than two fists; fourteen or fifteen plantains, or bananas, each six or seven inches long and four or five round; and near a quart of the pounded bread-fruit. Men of rank are constantly fed by their women; and one of the chiefs who dined on-board the ships in 1769, showed such reluctance to feed himself, that one of the servants was obliged to feed him, to prevent his returning without his meal. In one of the excursions which the gentlemen of the ships made into the country in 1773, they arrived at a neat house, where a very fat man, who seemed to be a chief of the district, was lolling on his wooden pillow; before him two servants were preparing his desert, by beating up with water some bread-fruit and bananas in a large wooden bowl, and mixing with it a quantity of fermented four paste called *mahie*. While this was doing, a woman, who sat down near him, crammed down his throat by handfuls the remains of a large baked fish, and several bread-fruits, which he swallowed with a voracious appetite: his countenance was the picture of phlegmatic insensibility, and seemed to testify that all his thoughts centered in the gratification of his appetite. He scarcely deigned to look at the strangers; and a few monosyllables which he uttered, were extorted from him to remind his feeders of their duty, when, by gazing at them, they grew less attentive to him.

That these people, who are remarkably fond of society, and particularly that of their women, should exclude its pleasures from the table, where, among other nations, whether civil or savage, they have been principally enjoyed, is truly inexplicable. How a meal, which everywhere else brings families and friends together, comes to separate them here, was a singularity much inquired about,

but never accounted for. "They ate alone (they said), because it was right;" but why it was right to eat alone, they never attempted to explain. Such, however, was the force of habit in this instance, as it is in every other, that they expressed the strongest dislike, and even disgust, at their visitants eating in society, especially with women, and of the same victuals. "At first (says Cook) we thought this strange singularity arose from some superstitious opinion; but they constantly affirmed the contrary. We observed also some caprices in the custom, for which we could as little account as the custom itself. We could never prevail with any of the women to partake of the victuals at our table, when we were dining in company; yet they would go five or six together into the servants' apartments, and there eat very heartily of whatever they could find: nor were they in the least disconcerted if we came in while they were doing it. When any of us have been alone with a woman, she has sometimes eaten in our company; but then she has expressed great unwillingness that it should be known, and always extorted the strongest promises of secrecy. Among themselves, even two brothers and two sisters have each their separate baskets of provisions, and the apparatus of their meal. When they first visited us at our tents, each brought his basket with him; and, when we sat down to table, they would go out, sit down upon the ground, at two or three yards distance from each other, and, turning their faces different ways, take their repast without exchanging a single word. The women not only abstain from eating with the men, and of the same victuals, but even have their victuals separately prepared by boys kept for that purpose, who deposit it in a separate shed, and attend them with it at their meals. But, though they would not eat with us, or with each other, they have often asked us to eat with them, when we have visited those with whom we were particularly acquainted at their houses; and we have often, upon such occasions, eaten out of the same basket, and drank out of the same cup. The elder women, however, always appeared offended at this liberty; and, if we happened to touch their victuals, or even the basket that contained it, they would throw it away."

After meals, and in the heat of the day, the middle-aged people of the better sort generally sleep. They are indeed extremely indolent; and sleeping and eating are almost all that they do. Those that are older, are less drowsy; and the boys and girls are kept awake by the natural activity and sprightliness of their age.

Their amusements are music, dancing, wrestling, and shooting with the bow: they also sometimes vie with each other in throwing a lance. Their only musical instruments are flutes and drums; the flutes are made of a hollow bamboo, about a foot long, and have only two stops, and consequently but four notes. The drum is made of a hollow block of wood, of a cylindrical form, solid at one end, and covered at the other with shark's skin: these they beat, not with sticks, but their hands; and they know how to tune two drums of different notes into concord. They have also an expedient to bring the flutes that play together into unison, which is to roll up a leaf so as to slip over the end of the shortest, like our sliding tubes for telescopes, which they move up and down till the purpose is answered, of which they seem to judge by their ear with great nicety. To these instruments they sing; their songs are often extempore; they call every two verses, or couplet, a song, *palay*: they are generally, though not always, in rhyme; and, when pronounced by the natives, they might be discovered to be metre. Among other diversions, there is a dance called *timorodee*, which is performed by young girls, whenever eight or ten of them can be collected together, consisting of motions and gestures beyond imagination wanton, in the practice of which they are brought up from their earliest childhood, accompanied by words, which, if it were possible, would more explicitly convey the same ideas. In these dances they keep time with an exactness which is scarcely

scarcely excelled by the best performers upon the stages of Europe. But the practice, which is allowed to the virgin, is prohibited to the married woman.

These islanders, who inhabit huts exposed to all the winds, and hardly cover the earth, which serves them for a bed, with a layer of leaves, are remarkably healthy and vigorous, and live to an old age without enduring any of its infirmities; their senses are acute, and they retain their beautiful teeth to the last. M. de Bougainville describes an old man, whom they saw on their landing, who had no other character of old age, than that respectable one which is imprinted on a fine figure. His head was adorned with white hair, and a long white beard; all his body was nervous and fleshy; he had neither wrinkles, nor showed any other tokens of decrepitude. This venerable man seemed displeased at the arrival of these strangers; he even retired without making any returns to the courtesies they paid to him; but he gave no signs either of fear, astonishment, or curiosity: very far from taking any part in the raptures which the multitude expressed, his thoughtful and suspicious air seemed to indicate, that he feared the arrival of a new race of men would interrupt the happiness he had so long enjoyed. From whence it may be inferred, that his mind was not more impaired than his body. There are, however, several sorts of leprous complaints on this island, which appear in cutaneous eruptions of the scaly kind; some were seen that had ulcers upon different parts of their bodies; yet they seemed little regarded by those who were afflicted with them, and no application whatever was used to them, not so much as to keep off the flies. But instances of them are rare, as the excellency of their climate, and the simplicity of their vegetable food, prevent almost all dangerous and deadly disorders. The venereal disease, however, is said to have been entailed upon these people by the crew of M. de Bougainville's ships, who visited this island a short time after Capt. Wallis had left it. In 1769, more than one half of the crew in Capt. Cook's ship had contracted it, during a month's stay here. The natives distinguished it by a name of the same import with *rottenness*, but of a more extensive signification. They described, in the most pathetic terms, the sufferings which the first victims to its rage endured; and told him that it caused the hair and the nails to fall off, and the flesh to rot from the bones; that it spread an universal terror and consternation among the inhabitants, so that the sick were abandoned by their nearest relations, left the calamity should spread by contagion, and were left to perish alone in such misery as, till then, had never been known among them. Both Capt. Cook and Mr. Forster, in their relations of their voyage in the Resolution, endeavour to establish the opinion, that this scourge of licentiousness was felt in the South-Sea islands previous to any of the modern voyages that have been made thither, and that it was an indigenous disease there. But, if that conclusion be well founded, how comes it, that at all the places where the Resolution touched in 1773, which had before been visited by the Endeavour in 1769, such as New Zealand for instance, the crew, more or less, became infected by their commerce with the women; and not at all so at places which they visited for the first time in the Resolution?

The principal manufactures among the Otaheiteans, is their cloth. This is made of the bark of trees, which are of three kinds; viz. the Chinese mulberry-tree, or *aouta*; the bread-fruit tree, or *ooroo*; and one that is described by Dr. Hawkesworth as resembling the wild-fig tree of the West Indies. The colours with which they dye this cloth are principally red and yellow. The red is exceedingly beautiful, and of a brighter and more delicate colour than any we have in Europe. The red colour is produced by the mixture of the juices of two vegetables, neither of which, separately, has the least tendency to that hue; and is a species of fig called here *matte*, and the other the *Cordia sebestina*, or *etou*. Of the fig-tree the fruit is used, and of the *Cordia* the leaves. The yellow is made of the bark of the root of the *Morinda citrifolia*, called *nono*, by scraping and infusing it in water.

The inhabitants of this island have also a method of dyeing yellow with the fruit of the *tamanu*: they have also a preparation with which they dye brown and black.

Another considerable manufacture, is matting of various kinds; some of which is finer and better in every respect than any we have in Europe: the coarser sort serves them to sleep upon, and the finer to wear in wet weather. They are also very dextrous in making basket and wicker work; their baskets are of a thousand different patterns, many of them exceedingly neat; and the making of them is an art that every one practises, both men and women. The women make little bonnets of the cocoa-nut leaf, to shade their faces, at so small an expense of time and trouble, that, when the sun is again low in the evening, they throw them away. These bonnets, however, do not cover the head, but consist only of a band that goes round it, and a shade that projects from the forehead.

Of the bark of a tree called *poerou*, the *Hibiscus tiliacus* of Linnæus, they make ropes and lines, from the thickness of an inch to the size of a small packthread; with these they make nets for fishing; of the fibres of the cocoa-nut they make thread, for fastening together the several parts of their canoes, and belts, either round or flat, twisted or plaited; and of the bark of the *erowa*, a kind of nettle, which grows in the mountains, and is therefore rather scarce, they make the best fishing-lines in the world: with these they hold the strongest and most active fish, such as bonetas and albicores, which would snap our strongest silk lines in a minute, though they are twice as thick. They make also a kind of seine, of a coarse broad grass, the blades of which are like flags; these they twist and tie together in a loose manner, till the net, which is about as wide as a large sack, is from sixty to eighty fathom long; this they haul in shoal smooth water, and its own weight keeps it so close to the ground, that scarcely a single fish can escape. In every expedient, indeed, for taking fish, they are exceedingly ingenious; they make harpoons of cane, and point them with hard wood, which in their hands strike fish more effectually than those which are headed with iron can do in ours, setting aside the advantage of ours being fastened to a line, so that the fish is secured if the hook takes place, though it does not mortally wound him. Of fish-hooks they have two kinds, admirably adapted in their construction, as well to the purpose for which they are designed, as to the materials of which they are made. These are made of mother-of-pearl, or some other hard shell.

The tools used by the Otaheiteans for all their purposes are, an adze made of stone; a chisel or gouge made of bone, generally the bone of a man's arm between the wrist and elbow; a rasp of coral, and the skin of a sting-ray; also coral and sand, as a file or polisher; and with these they fell timber, cleave and polish it, and hew stone. The stone which makes the blade of their adzes is a kind of basalt, of a grey or blackish colour, not very hard, but of considerable toughness; they are formed of different sizes: some, that are intended for felling, weigh from six to eight pounds; others, that are used for carving, not more than as many ounces; but it is necessary to sharpen these rude tools almost every minute; for which purpose a cocoa-nut shell full of water, and a stone, are always at hand. With such tools they generally take up several days in felling a tree; but, after it is down, and split into planks, they smooth them very dexterously and expeditiously with their adzes, and can take off a thin coat from a whole plank without missing a stroke.

Their weapons are slings, which they use with great dexterity; pikes headed with the skins of sting-rays; and clubs of about six or seven feet long, made of a very hard wood. Thus armed, they are said to fight with great obstinacy; and to give no quarter to man, woman, or child, who happens to fall into their hands during the battle, nor for some time afterwards, till their passion subsides. They have likewise bows and arrows; but the arrows are good for nothing except to bring down a bird, being headed

headed only with stone, and none of them pointed. They have targets of a semicircular form, made of wicker work, and plaited strings of the cocoa-nut fibres, covered with glossy bluish-green feathers belonging to a kind of pigeon, and ornamented with shark's teeth, arranged in three concentric circles.

Their boats or canoes are of three different sorts. Some are made out of a single tree, and hold from two to six men: these are principally employed in fishing. Others are constructed of planks very dexterously sewed together; they are of different sizes, and will hold from ten to forty men: they generally lash two of these together, and set up two masts between them; or, if they are single, they have an on-trigger on one side, and only one mast in the middle; and in these vessels they will sail far beyond the sight of land. The third sort seems to be principally designed for pleasure or show. These are very large, but have no sail; and in shape resemble the gondolas of Venice. The middle is covered with a large awning; and some of the people sit upon it, and some under it. The plank of which these vessels are constructed, is made by splitting a tree, with the grain, into as many thin pieces as possible. The boards are brought to the thickness of about an inch, and are afterwards fitted to the boat with the same exactness that might be expected from an expert joiner. To fasten these planks together, holes are bored with a piece of bone, fixed into a stick for that purpose. Through these holes a kind of plaited cordage is passed, so as to hold the planks strongly together. The seams are caulked with dry rushes; and the whole outside of the vessel is painted over with a kind of gummy juice, which supplies the place of pitch.

Upon a second visit to this island, in May 1774, Capt. Cook found that a very considerable number of canoes had been constructed in the course of eight months. The number of war-canoes raised and equipped by the whole island amounted to 1720, manned by 68,000 able men, allowing forty to each canoe; and, as these cannot amount to above one-third part of the number of both sexes, children included, the whole island could not, he thought, contain less than 204,000 inhabitants.

In connection with their navigation, we may mention their wonderful sagacity in foretelling the weather, at least the quarter from which the wind shall blow at any future time. In their longer voyages, they steer by the sun in the day, and in the night by the stars; all which they distinguish separately by names, and know in what part of the heavens they will appear in any of the months during which they are visible in their horizon; they also know the time of their annual appearing and disappearing with more precision than will easily be believed by an European astronomer. In speaking of time, either past or future, they never used any term but *Malama*, which signifies moon; of these moons they count thirteen, and then begin again, so that they have a notion of the solar year: each month, they say, has twenty-nine days, including one in which the moon is not visible. They distinguish them by separate names. Every day is subdivided into twelve parts, each of two hours, of which six belong to the day, and six to the night. In numeration they proceed from 1 to 10, the number of fingers on both hands; and, though they have for each number a different name, they generally take hold of their fingers one by one, shifting from one hand to the other till they come to the number they want to express. In counting from 10, they repeat the name of that number, and add the word *more*; ten and one more, is eleven, &c. When they come to 10 and 10 more, they have a new denomination, as we say a score; and by these scores they count till they get ten of them, when they have a denomination for 200; but they did not seem to have any denomination for expressing a greater number. In speaking of distance from place to place, they express it, like the Asiatics, by the time that is required to pass it.

As to their manners and habits, their propensity to

theft is very great, inasmuch that M. Bougainville says, "even in Europe itself one cannot see more expert filchers than the people of this country;" and indeed, in all the voyages made by Cook and others, they had abundant experience of this disposition of the natives, which often produced quarrels, and sometimes even fatal effects. In their behaviour they are said to be extremely lascivious, almost beyond credibility. A lady of distinction who visited Mr. Banks, used the following ceremony on her first approach to the stranger. After laying down several young plantain-leaves, a man brought a large bundle of cloth; which having opened, he spread it piece by piece on the ground, in the space between Mr. Banks and his visitants. There were in all nine pieces: having spread three pieces one upon another, the lady came forward, and, stepping upon them, took up her garments all around her to her waist; she then turned three times round, after which she dropped the veil: when other three pieces were spread, she practised the same ceremony; and so the third time, when the last three pieces were laid out; after which the cloth was again rolled up, and delivered to Mr. Banks as a present from the lady, who, with her attending friend, came up and saluted him. From the unbridled licentiousness of these people, the French gave this island the name of the *New Cythera*. Yet Capt. Cook says that the women of Otaheite, and of the Society Isles in general, have been calumniated by those who represent them, without exception, as ready to grant the last favour to any man that will come up to their price. This, he says, is by no means the case; the favours of married women, and also of the unmarried of the better sort, are obtained with as much difficulty here as in any other country; neither can the charge be understood indiscriminately of the unmarried of the lower class, for many of these admit of no such familiarities. There are, however, prostitutes here, as well as in other countries, and perhaps more in proportion: but, according to the more recent missionary-accounts, there is no public appearance of immodesty; and they impute those noted exhibitions to the bribes of their English visitors.

Their voice and speech are soft and harmonious; and their dialect is the Italian of the Pacific Ocean. It abounds with vowels, and the pronunciation of it is easily acquired: but it was found excessively difficult to teach the natives to pronounce English words; but Spanish and Italian words, if ending in a vowel, they pronounced with the greatest ease. They called Capt. Cook *Toole*; Mr. Hicks, the first lieutenant, *Hete*, &c. and in this manner they formed names for almost every man in the ship. In some, however, it was not easy to find any traces of the original; and they were perhaps not mere arbitrary sounds, formed upon the occasion, but signified words in their own language; and it seems that they could perfectly remember these appellations at the distance of four years, by their enquiries after such gentlemen as were absent on the second voyage by name. Mr. Monkhouse, a midshipman, they called *Matte*, which in their language signifies *dead*; because he commanded a party that killed a man for stealing a musket.

The Otaheiteans are remarkable for cleanliness: both men and women constantly wash their whole bodies three times a-day in running water. They are most expert swimmers, being accustomed to the water from their infancy. Capt. Cook relates the following remarkable instance of their expertness. On a part of the shore where a tremendously high surf broke, inasmuch that no European boat could live in it, and the best European swimmer, he was persuaded, would have been drowned, as the shore was covered with pebbles and large stones, yet here were ten or twelve Indians swimming for their amusement. Whenever a surf broke near them, they dived under it, and rose again on the other side. The stern of an old canoe added much to their sport. This they took out before them, and swam with it as far as the outermost beach; when two or three getting into it, and turning

the square end to the breaking wave, were driven in towards the shore with incredible rapidity, sometimes almost to the beach; but generally the wave broke over them before they got half way; in which case they dived, and rose to the other side with the canoe in their hands, and, swimming out with it again, were again driven back. This amazing expertness drew the captain's attention for more than half an hour; during which time none of the swimmers attempted to come ashore, but seemed to enjoy the sport in the highest degree. At another time, one of the officers of the quarter-deck intending to drop a bead into a canoe for a little boy of six years of age, it accidentally missed the boat, and fell into the sea: but the child immediately leaped overboard, dived after it, and recovered it. To reward him for this feat, some more beads were dropped to him; which excited a number of men and women to amuse the officers with their amazing feats of agility in the water, and not only fetched up several beads scattered at once, but likewise large nails, which, from their weight, descended quickly to a considerable depth. Some of these people continued a considerable time under water; and the velocity with which they were seen to go down, the water being extremely clear, was very surprising.

The government of the Otaheiteans seems greatly to resemble the early state of the European nations under the feudal system. Their orders of dignity are *earce-rahie*, which answers to king; *caree*, baron; *manahouni*, vassals, and *toutow*, vassal. There are two kings in the island, one being the sovereign of each of the peninsulas of which it consists. Each of them is treated with great respect by all ranks, but does not appear to be invested with so much power as is exercised by the earces in their own districts. When the king, whom they called *Otoo*, made a visit to Capt. Cook, the chiefs, who happened to be there before him, immediately stripped themselves in great haste. Captain Cook took notice of it; upon which they said *earce-rahie*, signifying, that it was on account of *Otoo*, being present; but this was the only outward token of respect they paid him, for they never rose from their seats, or made any other obeisance. The *earces* are lords of one or more of the districts into which each of the peninsulas is divided, and of which there are forty-three in the larger one. These parcel out their territories to the *manahounis*, who superintend the cultivation of the ground. The lowest class, called *toutows*, seem to be nearly under the same circumstances with the vassals in feudal governments. They do all the laborious work, cultivate the land, catch fish, fetch wood and water, &c.

In this country a child succeeds to his father's titles and authority as soon as he is born; and thus the king no sooner has a son born, than his sovereignty ceases. A regent is then chosen; and the father generally retains his power under that title, until his child becomes of age. The child of the baron succeeds to the titles and honours of his father as soon as it is born, as well as the son of the king; so that a baron who was yesterday called *caree*, and was approached with the ceremony of lowering their garments, so as to uncover the upper part of the body, is to-day, if his wife happens to be delivered of a child, reduced to the rank of a private man; all marks of respect being transferred to the child, if it is *suffered to live*, though the father still continues possessor and administrator of his estate. But the acquiescence which the lower class of people, or *toutows*, yield to the command of their chiefs, is very remarkable. They are not suffered to taste any animal food, although they are employed in feeding it for their lords. They endure patiently very severe blows, if, when collected into a large body, they in any manner press upon, or annoy, the king or a chief in his progress; and all this passive spirit is preserved without any power being lodged in the hands of the king to exact it; for he uses no military force, nor is even attended with body-guards.

As to their religion, they believe, besides a supreme

Deity, that there are numerous subordinate deities, or *eatuas*, of both sexes; the male are worshipped by the men, and the female by the women; and each have morais to which the other sex is not admitted, though they have also morais common to both; men perform the priestly office to both sexes, and each sex has its priests; for those who officiate for one sex do not officiate for the other. They also believe the immortality of the soul, at least its existence in a separate state, and that there are two situations of different degrees of happiness, somewhat analogous to our heaven and hell: the superior situation they call *tavirua l'erau*, the other *liahoboo*. They do not, however, consider them as places of reward and punishment, but as receptacles for different classes; the first, for their chiefs and principal people; the other, for those of inferior rank; for they do not suppose that their actions here in the least influence their future state, or indeed that they come under the cognizance of their deities at all.

Their *morais* are used both as burying-grounds and places of worship; they are approached with the most wonderful expressions of reverence and humility; and this, it should seem, not because any thing there is esteemed sacred, but because they there worship an invisible being, for whom they entertain the most reverential respect, although not excited by the hope of reward or the dread of punishment. One of these cemeteries, or places of worship, was known to captain Cook, on his first voyage, by the name of *Tootahah's morai*, then the regent; but when, on his second voyage, after the death of that chief, he called it by that name, Maratata, a chief that accompanied the party, interrupted him, intimating, that it was no longer *Tootahah's* after his death, but was then known as *Otoo's morai*, the then reigning prince. The chief and his wife, on passing by it, took their upper garments from their shoulders. From hence it would seem, that the royal family have a particular morai, and that it always bears the name of the reigning prince.

An Indian, who had snatched away a musket from a sentry whilst on duty, was, by the inhumanity of a midshipman who commanded the guard, pursued and shot. The unhappy fate of this poor fellow gave an opportunity for seeing the manner in which these people treat their dead. They placed the corpse in the open air till the bones became quite dry: a shed was erected close by the house where the deceased had resided; it was about fifteen feet long and eleven broad; one end was left quite open; the other end, and the two sides, were partly inclosed with a sort of wicker-work. The bier was a frame of wood, like that on which the sea-beds called *cots* are placed, with a matted bottom, and supported by four posts, at the height of about four feet from the ground. The body was covered first with a mat, and then with white cloth; by the side of it lay a wooden mace, one of their weapons of war; and near the head of it, which lay next to the close end of the shed, lay two cocoa-nut shells; at the other end a bunch of green leaves, with some dried twigs, all tied together, were stuck in the ground, by which lay a stone about as big as a cocoa-nut. Near these lay one of the young plantain-leaves that are used for emblems of peace, and close by it a stone axe. At the open end of the shed also hung, in several strings, a great number of palm-nuts; and without the shed was stuck up in the ground a stem of a plantain-tree, about six feet high, upon the top of which was placed a cocoa-nut shell full of fresh water; against the side of one of the posts hung a small bag, containing a few pieces of bread-fruit ready roasted, which had not been put in all at one time, some being fresh and others stale. The food so placed by the corpse is designed as an offering to their gods. They cast in, near the body, small pieces of cloth, on which the tears and blood of the mourners have been shed; for, in their paroxysms of grief, it is an universal custom to wound themselves with a shark's tooth. The mourner is always a man; and he is dressed in a very singular

gular habit. When the bones are stripped of their flesh, and become dry, they are buried. This regard to their dead is very remarkable: one of the ship's company happening to pull a flower from a tree which grew on one of their sepulchral inclosures, an Indian came suddenly behind him and struck him; and a party of sailors, who were sent to get some stones for ballast for the ship, had like to have been embroiled with the natives, by pulling down some part of an inclosure of this kind. This shade under which their dead are laid is called *tupapow*; the inclosure in which their bones are deposited is called *morai*: these latter, as has been already related, are also places of worship.

Captain Cook, who had some reason to believe that, among the religious customs of this people, human sacrifices were sometimes offered up to their deities, went to a *morai*, or place of worship, accompanied by Capt. Furneaux, having with them a sailor who spoke the language tolerably well, and several of the natives. In the *morai* was a kind of bier, with a shed erected over it, on which lay a corpse and some provisions. Captain Cook then asked if the plantains were for the *Eatua*? if they sacrificed to the *Eatua* hogs, dogs, fowls, &c.? To all of which an intelligent native answered in the affirmative. He then asked if they sacrificed *men* to the *Eatua*? He was answered, *taato eno*, "bad men they did; first *tipararakhy*, beating them till they were dead." He then asked if good men were put to death in this manner? His answer was *no*, only *taato eno*. The captain then asked if any *caracs* (nobles) were? The native replied, They had hogs to give the *Eatua*. He was then asked if *towns*, who had no hogs, dogs, or fowls, but yet were good men, were ever sacrificed to the *Eatua*? The answer still was, *No*, only bad men. Many other questions were put to him; all his answers to which seem to confirm the idea, that men for certain crimes were condemned to be sacrificed to the gods, provided they did not possess any property which they might give for their redemption: and Capt. Cook, on his last visit to Otaheite, in 1777, took the opportunity of attending Otoo to a *morai* at one of these public solemnities. The unhappy victim, offered to the object of their worship on this occasion, was a middle-aged man, who was one of the lowest class of the people; and he had been selected, not on account of any particular crime committed by him meriting death. In general, however, such guilty persons are chosen for their sacrifices; or else, common low fellows, who stroll about from place to place, and from island to island, without having any fixed abode, or any visible way of getting an honest livelihood. This person appeared to have been privately knocked on the head with a stone; for those who are devoted to suffer, in order to perform this bloody act of worship, are never apprised of their fate, till the blow is given that terminates their existence. Whenever any one of the great chiefs thinks a human sacrifice necessary on any particular emergency, he pitches upon the victim. Some of his trusty servants are then sent, who fall upon him suddenly, and put him to death with a club, or by stoning him. The king is next acquainted with it, whose presence at the solemnities that follow is absolutely necessary. The solemnity itself is called *Poore Erce*, or Chief's Prayer; and the victim who is offered up, *taata-taboo*, or consecrated man. The *morai*, which is a place of worship, sacrifice, and burial, where the sacrifice was now offered, is that where the supreme chief of the whole island is always buried, and is appropriated to his family and some of the principal people; it differs little from the common ones, except in extent. Its principal part is a large oblong pile of stones, lying loosely upon each other, about twelve or fourteen feet high, contracted towards the top, with a square area on each side, loosely paved with pebble-stones, under which the bones of the chiefs are buried. At a little distance from the end nearest the sea is the place where the sacrifices are offered, which, for a considerable extent, is

also loosely paved. Here is a very large scaffold, on which the offerings of fruits and other vegetables are laid; but the animals are deposited on a smaller one, and the human sacrifices are buried under different parts of the pavement. There are several other relics which ignorant superstition has scattered about this place. But one place, more particular than the rest, is a heap of stones, at the end of the large scaffold, before which the human sacrifice was offered; and on a kind of platform at one side are laid the skulls of all the human sacrifices, which are taken up after they have been several months under ground. It cannot less than be regretted, that a practice so horrid, and such bloody rites of worship, should prevail, as is probably the case, through all the widely-extended islands of the Pacific Ocean.

When Capt. Cook was at Otaheite in 1773, in company with Capt. Furneaux, the latter took on-board his ship (the *Adventure*) a young man named *Omai*. This youth is said to have had some property in his native soil, of which he was dispossessed by the people of *Bolabola*: but he was not one of the *caracs*, or gentry of that country, but of the middling class of people. He was eminent neither for figure, shape, nor complexion; his colour being of deep hue, resembling a *town*, or one of the common people; and both Capt. Cook and Mr. Forster agreed in thinking him no proper sample of the inhabitants of those islands, in respect of personal beauty. However, they were both of opinion, that the qualities of his heart and head resembled those of his countrymen in general, and that no one of the natives would have given more general satisfaction by his behaviour whilst he remained in England. He is described as possessing a good understanding, quick parts, and honest principles: not an extraordinary genius; yet not at all deficient in intelligence, which appeared from his knowledge of the game of chess, in which he made an amazing proficiency. His principal patrons, whilst in England, were, the earl of Sandwich, Mr. Banks, and Dr. Solander. The earl introduced him to his majesty at Kew; and, during his stay in England, he was caressed by many of the principal nobility. He naturally imitated that easy politeness which is prevalent among the great, and which is one of the ornaments of civilized society. Indeed, he adopted the manners, the occupations, and amusements, of his companions in general, and gave many proofs of a quick perception and a lively fancy. He appears, however, to have been treated, whilst he resided here, rather as a fashionable exhibition, than as a rational being. No attention seems to have been paid to the enriching his mind with useful knowledge, such as might have rendered him a valuable acquisition to his country on his return thither; no means were used to instruct him in agriculture, or any mechanical art or useful manufacture; and, above all, to possess him with a moral sense; to teach him the exalted ideas of virtue, and the sublime principles of revealed religion. After a stay of two years in England, and having been inoculated for the small-pox, he embarked with Capt. Cook, on-board the *Resolution*, on his return home, loaded with a profusion of presents. At parting with his friends here, his tears flowed plentifully, and his whole behaviour bespoke him to be sincerely affected at the separation; but, though he lived in the midst of amusements during his residence in England, his return to his native country was always in his thoughts; and, though he was not impatient to go, he expressed a satisfaction as the time of his return approached. It was in August 1777, that Capt. Cook visited Otaheite for the last time, having *Omai* with him. But his conduct was so imprudent, that he soon forfeited the friendship of Otoo, and of every other person of note in the island. He associated with none but vagabonds and strangers, whose sole views were to plunder him; and thus incurred the ill-will of the principal chiefs. The captain, therefore, settled him in the island of *Huaheine*; and, having provided a comfortable habitation, with suitable accommodations

for him, our navigators took their leave of him on the 2d of November, 1777; but in parting with Capt. Cook his feelings were much agitated, and he wept all the time in going ashore. "Whatever faults (says Capt. Cook) belonged to Omai's character, they were more than overbalanced by his great good-nature and docile disposition."

At the time that Omai was in this country, he attracted a great deal of attention; and indeed, the public discourse was about nothing but Otaheite and its beautiful girls, and queen Oberea, and king Otoo, and his wife and accomplished privy-counsellor Tupia. At length, our admiration of Otaheite excited some degree of ridicule on the continent. The unfortunate La Perouse observes, in one of his letters, "I flatter myself you will see with pleasure, that, in the course of so long a voyage, I shall have no occasion to put in at those everlasting Society Islands, about which more has been written than concerning several kingdoms of Europe; and I confess to you, that I congratulate myself on having nothing to say either about Otaheite or queen Oberea."

It is confessed that the women have fine black eyes, with white even teeth, soft skin, and elegant limbs; while their hair is of a jetty black, perfumed and ornamented with flowers. But, with all these advantages, they yield infinitely in beauty to the women of the Marquesas; the face being widened from continual pressure during infancy, which, by distending the mouth, and flattening the nose and forehead, gives a broad masculine appearance. Hence it is evident that the Grecian and academical forms, given by artists void of real taste or precision to the people of the South Seas, in the prints that accompany the English and French voyages, are totally false and imaginary; nor can there be a greater injury to books of genuine character, and solid information, than this practice, which renders the modern prints far inferior in every respect to some excellent ancient representations of De Bry.

We may, however, just remark, that there must have been something extremely fascinating in the persons, manners, or customs, of the inhabitants, or in the soil and appearance of the country, that could tempt the greater part of a ship's crew to resist authority, and forcibly to return to Otaheite; yet, such we know was the case; and the sufferings of the commander, and those who refused to join in this vile conspiracy, and who were therefore exposed in an open boat, are well known.

The first missionary-voyage to Otaheite was undertaken in the year 1796; and the first preachers of the Gospel there, set foot on land on the 25th of March, 1797. Here they found that Otoo, the king of whom we have before repeatedly spoken, and Pomaree his father, had obtained the sovereignty over the whole island of Otaheite, (both kingdoms,) and likewise over that of Eimeo. On the 7th, some of the missionaries and the captain waited on the king. "The captain informed the king, that our only inducement for leaving Pretane (Britain) to come and visit them, was to do them good, by instructing them in the best and most useful things; and for this end, some good men of our number intended to settle among them; requiring on their part the free gift of a piece of land, sufficiently stocked with bread-fruit and cocoa-nut trees; that they (the missionaries) would not on any account intermeddle in their wars. If he consented, they would stay on the island; if not, they would go elsewhere." It appeared doubtful whether Otoo understood this harangue; though he signified that a large house, which stood near Point Venus, should be their own, and that they might take what land they pleased.

The missionaries, from various causes, made their way but slowly. In a luxuriant climate like that of Otaheite, where mirth, good-nature, and beauty, reign uncontrolled, it is natural to suppose that strangers must be exposed to many temptations. The apostle, when he holds forth to the natives, and sees himself surrounded with a number of beautiful and naked females, soon feels the strongest

emotions excited in his breast: and, if his eyes happen to meet those of his more artful hearer, she is sure of darting at him such a look as we shall not here attempt to describe, at the same time smiling, and showing two rows of teeth whiter than the finest alabaster. The saint is thrown off his guard, and we see religion prostrate at the feet of female beauty. But now the malignant and triumphant Otaheitean shows her just contempt for the sanctified hypocrite, who a few minutes before expatiated on chastity, temperance, and virtue; and, so far from bestowing on him the favour he thinks so easily to obtain, he is repulsed with the most severe rebuke, for presuming to make a crime of following the irresistible dictates of nature, and which he now proves, by his own actions, cannot be resisted. Other difficulties arose, from the ignorance of the natives, or from the difficulty of making them fully understand every point of doctrine that was urged. Thus, when the missionaries told them that the God of Britain is the God of Otaheite and the whole earth, and that it is from this being they receive their hogs, bread-fruit, and cocoa-nuts; this the Otaheiteans flatly denied; alleging, that they possessed all these articles long before they had heard of the God of Britain. And, when these missionaries spoke to them respecting *salvation*, they fondly thought that it was to be *saved from sickness*, and to abide in this world: the salvation of the soul they affect to despise, and the resurrection of the body they ridicule as extreme folly.

The next communication from this place is the account of Mr. Turnbull, whose voyage round the World was performed in the years 1800-1804. He informs us of the sudden death of Otoo, (who appears to have been called Pomaree, as well as his father,) which happened while Mr. T. was there. The account he gives of the place is melancholy indeed. We shall make a few extracts.

"The population has diminished in a degree which threatens to reduce the country to a desert. Capt. Cook computed them at upwards of two hundred thousand; the population has now dwindled to five thousand; but, on the arrival of the Duff, they exceeded triple this number. Mr. Elder and Mr. Wilson had just returned from the Mottos, whither they had been conveyed by our boat on the 18th of August. They reported that the population did not exceed *three hundred*.

"The mortality which raged at this period, and which, I fear, is but too epidemic and frequent, was such as to inspire us with the most melancholy ideas. During our short absence in our visit to the Sandwich Islands, many young persons of both sexes were no more; they had died in the prime and vigour of life, and others, of an appearance equally healthy, were following them very fast. Great part of this mortality must be imputed to their ignorance: the doctrine of fatality prevails among them to a most dangerous excess. Every disease is the immediate consequence of the vengeance of their offended deities, and therefore every thought of remedy or relief is rejected as equally useless and impious. They are left to their fate; and their diseases are unfortunately such as, however easy of cure under a regular course, are but too fatal when suffered to augment under neglect. They are moreover convinced that the greater part of their plagues and diseases flow immediately from the shipping. They insist upon it that Capt. Cook brought the intermittent fever, the crooked backs, and the scrophula, which breaks out in the necks, breasts, groins, and arm-pits; that Vancouver brought a bloody flux, which in a few months killed a great number of them, and then abated; they say that Capt. Bligh also brought the scrophula; but I could not learn what ship introduced the elephantiasis and epilepsy.

"Another cause of the depopulation of this beautiful island, is the dreadful crime of infanticide. When reproaching Pomaree with this barbarous and inhuman practice, he alleged in reply, that, should all the children born be reared to maturity, there would not be a sufficiency

ciency of food on the island for their support. The *earees*, or gentry, are a society so licentious and profligate, as to call loudly for punishment, even from the Divine power. The very principle of their union is the community of their women, and the murder, at the moment of their birth, of all their issue of both sexes. By a strange and most lamentable perversity of mind, these wretches are venerated as a superior order of beings, and are treated as such wherever they go. I am persuaded that the example of these murderers extends this horrible mischief beyond themselves; the common people of all countries usually judge, and in consequence act, more from the example of their superiors than as guided by their own reason. The common people may thus be led to imitate what they see in their chiefs. I believe, throughout the whole island, it is a matter of choice, whether a child shall be brought up or murdered.

"To any man of humanity, nothing can be more distressing than to cast his eye on the island of Otaheite, a spot blessed by nature with every thing that can render life pleasing; fertility of soil, and serenity of climate: but now become a scene of general mortality, and a prey to disease, which, to all human appearance, in a few years must render it a desolate wilderness, untrodden by human feet. They impute the greater part of these diseases to their European visitors; but for the most part very absurdly, though indeed we must take our share. There can be no doubt but that thousands of them have been swept off by the venereal disease since their intercourse with Europeans.

"Besides the disorders above mentioned, they have many others with which I am unacquainted, but which, doubtless, have their share in the destruction of the population. But the most effectual instrument of the annihilation of these people, is the horrible practice already noticed, that of infant murder and human sacrifices. It is computed that at least two-thirds of the births are thus stifled. In vain does nature raise her voice against what long usage and profligacy, confirmed by habit and example, has so barbarously induced. If the future diminution of these people keep pace with that of late years, and particularly during the time of my abode among them, the population must soon be extinct."

Considering the miserable state of this island, the reader will no doubt be surprised at being informed, that a general rebellion broke out in the month of November, 1808, by which Pomaree (this seems to have been a general name for their kings) was driven off the island, and continued in exile at Eimeo till the very same month in the year 1815.

The missionaries, who had precipitately fled when the insurrection broke out, and repaired to New South Wales, now returned to their labour of love; and from that time were so wonderfully successful, that, in less than two years, the whole of the natives had been converted. The following is an extract of a letter from the Rev. John Davies, one of the missionaries, to the Rev. John Hughes, of Montgomeryshire, dated July 2, 1817. "I shall now give you a short account of the state of things with us. The *revival* and reformation which commenced in 1813-1814, continued, and increased in 1815 and 1817, so that the whole of the inhabitants of Otaheite, Eimeo, Tapan-manu, Huaheine, Raintea, Tahaa, Bolabola, and Maura, have entirely renounced idolatry. The gods, altars, &c. are utterly destroyed. The offering of human sacrifices, and the practice of infanticide, are at an end. The worship of the true God, and the profession of Christianity, are general throughout all the above islands. In Otaheite 66 chapels have been built; and in Eimeo 16. The people assemble for worship thrice every Sunday, and on every Wednesday evening. The Lord's day is strictly observed throughout the whole of the islands. Private and family prayer is general among the people. About 4000 persons have learned to read, and many of them to

write. In a word, the change far exceeds our expectation. They have been furnished with a printing-press by the London Missionary Society; and part of the Gospels, translated into the language of the nations, is now printing. The culture of the sugar-cane, and other arts of civilization, are also in progress." Another letter says, "The king, Pomaree, has sent all his family-idols to the missionaries, desiring them either to destroy them, or send them to Europe, that the people of England may see what *foolish gods* they formerly worshipped." Mr. Marsden sent these gods, nailed up in a case, to England; and they are now exhibited at the Museum of the Missionary Society, in Jewin-street, London.

But surely there must have been a revival (as it is called) of people as well as of devotion; for the 66 chapels, &c. could be of little use, if the island were now in the depopulated condition described by Turnbull. See Turnbull's Voyage. Cook's three Voyages. Missionary Voyages. State of Christianity in the Island of Otaheite, by a Foreign Traveller, 1811.—Otaheite lies in lat. 17. 30. to 17. 48. S. lon. 149. 15. to 150. 0. W. Mata-vai Point is in lat. 17. 29½. lon. 210. 22. 28. E. Variation of the compass, from 4. 46. to 5. 34. E. Dip of the needle, 29. 12.

OTAKOOTAI'A, or WEENOOA-ET'TE, signifying *Little Island*, an island of the South Pacific Ocean, about three miles in circuit; discovered by Captain Cook in the year 1777. The beach, within the reef, is composed of a white coral sand; above which the land within does not rise above six or seven feet, and is covered with a light reddish soil, but is entirely destitute of water. The only common trees found there were cocoa-palms, of which there were several clusters, and vast numbers of the *wharra*. A sort of bind-weed covers the vacant spaces; except in some places, where was found a considerable quantity of treacle-mustard, a species of spurge, with a few other small plants; and the *Morinda citrifolia*, the fruit of which is eaten by the natives of Otaheite in times of scarcity. The only bird seen among the trees was a beautiful cuckoo, of a chestnut-brown variegated with black. But upon the shore were some egg-birds, a small sort of curlew, blue and white herons, and great numbers of noddies. Here was found a lizard, of a most forbidding aspect, though small, running up a tree; and many of another sort were seen. The banks toward the sea were frequented by an infinite number of a sort of moth, elegantly speckled with red, black, and white. There were also several other sorts of moths, as well as some pretty butterflies, and a few other insects. Although no fixed inhabitants were found on this island, indubitable marks remained of its being, at least, occasionally frequented. Some huts were found; and also several large stones, erected, like monuments, under the shade of some trees; and several spaces enclosed with smaller ones, where probably the dead had been buried; and, in one place, a great many cockle-shells of a particular sort, finely grooved, and larger than the fist, were to be seen; from which it was reasonable to conjecture, that the island had been visited by persons who feed partly upon shell-fish: about three or four leagues from Wateoo. Lat. 19. 15. S. lon. 201. 37. E.

OTAL'GIA, *f.* [from the Gr. *ωτα*, ears, and *αλγος*, pain.] A pain of the ear; the ear-ach.

OTANGU'RA, a town of Bengal; sixteen miles south-south-west of Tomar.

OTBERT'US, or OBERTUS, a celebrated ecclesiastic, was first canon at St. Lambert, near Liege; but was banished, as is said, by the bishop, on account of his misconduct. He then repaired to the court of the emperor Henry IV. where he was appointed to a place in the imperial chapel; and, the episcopal chair becoming vacant, he obtained it from the emperor, either by money or promises, in the year 1091. Some writers, however, say nothing of these reproaches; and testify that he conducted himself in his episcopal quality in a very laudable manner.

Otbert

Othbert purchased from the celebrated Godfrey of Bouillon, when he went on his expedition to the Holy Land, the castle of Bouillon, together with the lands belonging to it; and on that account, in all probability, he has been styled by some Duke of Bouillon. Being strongly attached to the emperor Henry IV. he left an account of his life and death, which seemed so hostile to the church of Rome, that its historian, Baronius, considered it to be a piece interpolated by Reinerus Reinecius. The oldest editions were printed without the name of the author, till it was added to it by Goldasti. The first was published by John Aventinus, who found it in the monastery of St. Emeran, near Ratibon. It is entitled "Henrici IV. Cæsaris Augusti, ducis vero Boiorum VII. Vita. Eiusdem Epistolæ inventæ a J. Aventino," Augustæ, 1518, 4to. It is printed also in the *Ortuini Gratii Fasciculus rerum expendarum et fugiendarum*; Col. 1535. Lond. 1690. tom. i. *Gen. Biog.*

OT'CHAKOV. See OCZAKOW, vol. xvii.

OT'CHI HO'TUN, a town of Asia: 150 miles north-east of Calagar. Lat. 40. 46. N. lon. 84. 14. E.

OTCHTER BAY, a bay on the north coast of South America: ten miles west of Cumana.

OTEAVANOO'A HAR'BOUR, a bay on the south-west coast of the island of Bolabola.

OTEWHE'I. See POLI.

OTFORD, a village in Kent, five miles north of Sevenoaks, where Offa king of Mercia defeated and killed Aldred king of Kent. Offa, the treacherous murderer of Ethelbert, to atone for the blood he had shed in this battle, gave Otford to Christ Church, Canterbury, *in pascua porcorum*, (as the deed says,) "for pasture for the archbishop's hogs." Such were the acts of piety so much esteemed in that superstitious age, that Malmesbury, one of the best of our old English historians, declares himself at a loss to determine whether the merits or crimes of this prince preponderated! Otford continued in the see of Canterbury till the time of Henry VIII.

OTHAIN', a river of France, which runs into the Chiers near Montmedy.

OTHER, *pron.* [Saxon.] Not the same; not this; different. In this sense it seems an adjective, yet, in the plural, when the substantive is suppressed, it has, contrarily to the nature of adjectives, a plural termination; as, Of last week, three days were fair, the *others* rainy.—Of good actions some are better than *other* some. *Hooker*.—No leaves shall ever be made *other* than leaves for years not exceeding thirty-one, in possession, and not in reversion or remainder. *Swift*.

Will it not be received

That they have done 't?—

Who dares receive it *other*? *Shakespeare's K. Lear*.

Not I, or he, but some one else: in this sense it is a substantive, and has a genitive and plural.—Physicians are some of them so conformable to the humour of the patient, as they press not the cure of the disease; and some *other* are so regular in proceeding according to art, as they respect not the condition of the patient. *Bacon*.—The confusion arises, when the one will put their sickle into the *other's* harvest. *Leslie*.—Never allow yourselves to be idle, whilst *others* are in want of any thing that your hands can make for them. *Law*.

Were I king,

I should cut off the nobles for their lands;

Desire his jewels, and this *other's* house. *Shakespeare*.

The king had all he crav'd, or could compel;

And all was done: let *others* judge how well. *Daniel*.

Not the one, not this, but the contrary.—There is that controlling worth in goodness, that the will cannot but like and desire it; and, on the *other* side, that odious deformity in vice, that it never offers itself to the affections of mankind, but under the disguise of the *other*. *South*.—Correlative to *each*.—In lowliness of mind let *each* esteem *other* better than themselves. *Phil.* ii. 3.

VOL. XVIII. No. 1223.

Scotland and thou did *each* in *other* live;

Nor would'st thou her, nor could the thee, survive. *Dryd.*

Something besides.—The learning of Latin being nothing but the learning of words, join as much *other* real knowledge with it as you can. *Locke on Education*.—The next:

This *other* gold-bound brow is like the first;

A third is like the former. *Shakespeare's Macbeth*.

The third part:

Bind my hair up. As it was yesterday?

No, nor the *t'other* day.

Ben Jonson.

It is sometimes put elliptically for *other thing*; something different.—I can expect no *other* from those that judge by single sights and rash measures, than to be thought fond or insolent. *Glanville*.—Used in Spenser for left, in opposition to right.—A distaffe in her *other* hand she had. *Fairy Queen*.

Their feet unhod, their bodies wrapt in rags,

And both as swift on foot as chased stags;

And yet the one her *other* legge had lame. *Fairy Queen*.

In this last example (any more than in the preceding one) the word *other* cannot possibly be construed in its usual way, as no leg at all is previously mentioned; but the sense left equally accords with both passages, and makes each an explanation of each. *Mason*.

OTHER, a celebrated Norwegian, who resided some time at the court of Alfred the Great. He was a man of considerable note in his own country, though his whole riches consisted of no more than twenty head of cattle, twenty sheep, and as many swine; and, being possessed of an enterprising spirit, he undertook a voyage of discovery to the country of the Permians, or towards the White Sea; and another towards Sweden, or the shores of the Baltic. Alfred, who in his younger days had been at Rome, where in all probability he collected the materials for his Geography, having caused the Ormeist of Orosius to be translated into the Anglo-Saxon, introduced into it the relations of Other, and of Wulfstan, a Dane, who perhaps became acquainted with Other in the course of his voyages, or resided with him in England. Dr. J. R. Forster says, that Alfred's account of the two voyages of Other and of that of Wulfstan, which is both exact and authentic, is exceedingly valuable, as it contains the best information in regard to the geography of the northern regions in the ninth century. *Forster's Hist. of the Discoveries and Voyages in the North*.

OTHERA, *f.* [derivation unknown.] In botany, a genus of the class tetrandria, order monogynia, natural order of berberides, *Juss.* Generic characters.—Calyx: perianthium one-leaved, permanent, four-parted, with ovate segments. Corolla: petals four, ovate, blunt. Stamina: filaments four, inserted at the very bottom of the petals, shorter by half than the corolla; antheræ twin, four-grooved. Pistillum: germen superior, smooth; style none: stigma sessile. Pericarpium: unknown, probably a capsule.—*Essential Character*. Calyx four-parted; petals four, ovate, flat; stigma sessile; capsule? There is but one species,

Othera Japonica. Stem shrubby. Branches round, striated, purple. Leaves alternate, ovate, blunt, smooth, an inch and a half long. Flowers axillary, aggregate, white. Native of Japan; where it is named *mukade ko*, that is, millepedes.

OTHERGATES, *adv.* [from *other*, and *gate*, way.] In another manner.—If Sir Toby had not been in drink, he would have tickled you *othergates* than he did. *Shakespeare's Tw. Night*.

OTHERGUISE, *adj.* [*other* and *guise*. This is often pronounced, and sometimes written, *othergues*.] Of another kind. It is a common expression in several parts of England; and in Cheshire forms part of the following proverb: "I have *othergues* fish to fry than snigs [eels] without butter:" i. e. My time is better employed; I have something better to do than what you propose.

O

OTHERWHERE,

OTHERWHERE, *adv.* In other places.—As Jews, they had access to the temple and synagogues; but, as Christians, they were of necessity forced *otherwise* to assemble themselves. *Hooker*.

His godlike acts, and his temptations fierce,
And former sufferings, *otherwise* are found. *Milton*.

OTHERWHILE, or **OTHERWHILES**, *adv.* At other times.—Sometimes he was taken forth to be set in the pillory, *otherwhile* in the stocks. *Sir G. Buck's Hist. of Rich.* III.—Some adversities shall follow; and *otherwhiles*, now one discomfort, now another, shall appear. *Homily on Matrimony*.

OTHERWISE, *adv.* In a different manner.—The evidences for such things are not so infallible, but that there is a possibility that the things may be *otherwise*. *Wilkins*.

Thy father was a worthy prince,
And merited, alas! a better fate:
But heaven thought *otherwise*.

Addison's Cato.

By other causes.—Sir John Norris failed in the attempts of Lisbon, and returned with the loss, by sickness and *otherwise*, of eight thousand men. *Raleigh*.—In other respects.—It is said truly, that the best men *otherwise*, are not always the best in regard of society. *Hooker*.—Men seldom consider God any *otherwise* than in relation to themselves, and therefore want some extraordinary benefits to excite their attention and engage their love. *Rogers*.

OTHERWISED, *adj.* Fallen out in a manner different from what was expected. *Chaucer*.

OTH'MAN, the third caliph of the Saracens. See the article ARABIA, vol. ii. p. 11, 12.

OTH'MAN, or **OS'MAN**, from whom the Turkish empire took the name of the Ottoman Porte. See the article TURKEY.

OTH'NI, [Heb. my time.] A man's name.

OTH'NIEL, [Heb. the time of God.] The son of Kenaz, of the tribe of Judah, and first judge of Israel. By taking of Debir from the Canaanitish giants, he gained Achah, the daughter of Caleb his uncle, to wife. *Josh.* xv. 16–19. When Cushan-rishathaim had oppressed Israel eight years, God stirred up Othniel to levy an army against him. With these he routed the Mesopotamian troops, and delivered Israel; after which the Hebrews' land enjoyed rest forty years, or till the fortieth year of their settlement. *Judg.* iii. 8–11.

O'THO, Emperor of ROME. See that article.

O'THO, the name of four emperors of GERMANY. See that article, vol. viii.

O'THO of FRISINGEN, a chronicler of the twelfth century, was the son of Leopold marquis of Austria, and Agnes daughter of the emperor Henry IV. Being educated for the ecclesiastical profession, he was appointed by his father provost of the college which he had founded at Newenburg in Austria. He afterwards spent some years in his studies at Paris, and then became abbot of a monastery of Cistercians at Morimond in Burgundy. In 1138, his uterine brother, the emperor Conrad III. created him bishop of Frisingen in Bavaria. He accompanied that prince in his expedition to the Holy Land, and was frequently consulted by him in his affairs, as he was also by Frederic Barbarossa, who was his nephew. Otho died at Morimond in 1158. This bishop is said to have been the first, or among the first, of the German prelates who were versed in literature, and acquainted with the Aristotelian philosophy. It is, however, as an historian that his memory has been preserved. He composed, in seven books, a Chronicle from the creation to his own times; with one added, relating to Antichrist and the end of the world; and, in two books, a Narrative of the Actions of Frederic Barbarossa. They are written in Latin, and are judged to be faithful as far as his own knowledge extended, notwithstanding his near relationship to Frederic, and his concern in the transactions of the time. These writings were first made public by John Cuspinian;

and the Chronicle was afterwards published with the addition of more than fifty chapters, by Christ. Uratius of Basil, in his *Hist. German. Illustr.* It is also contained in the collections of Pistorius and Muratori. *Vossii Hist. Lat.*

O'THON, the first of the three principal divinities worshipped by the native Americans.

OTHON'NA, *f.* [Gr. from *othn*, a linen cloth or napkin, on account of the pubescence, like lint, on some of the species.] **AFRICAN RAGWORT**; in botany, a genus of the class syngenesia, order polygamia necessaria, natural order of compositæ discoidæ, (corymbifera, *Juss.*) Generic characters.—Calyx: common, quite simple, one-leaved, blunt at the base, sharp at the end, equal, divided into eight or twelve segments. Corolla: compound rayed; corollets hermaphrodite, many in the disk. Females in the ray, the same number with the segments of the calyx, often eight, sometimes ten. Proper of the hermaphrodite tubular, five-toothed, scarcely longer than the calyx; of the female ligulate, lanceolate, longer than the calyx, three-toothed, reflex. Stamina: in the hermaphrodites, filaments five, capillary, very short; anther cylindric, tubular, the length of the corollet. Pistillum: in the hermaphrodites, germen oblong; style filiform, commonly longer than the stamens; stigma bifid, simple. In the females, germen oblong; style filiform, the same length as in the others; stigma reflex, larger. Pericarpium: none; calyx unchanged, permanent. Seeds: in the hermaphrodites none; in the females solitary, oblong, naked, or downy. Receptacle: naked, dotted; somewhat villose in the middle, excavated about the edge. In some species the seeds are crowned with a down; in some the calyx is divided beyond the middle, in others only toothed; but the figure is the same in all.—*Essential Character*. Calyx one-leaved, multifid, subcylindrical; down almost none; receptacle naked. There are twenty-seven species.

1. *Othonna cacalioides*, tuberous othonna, or African ragwort: tuber-denuded, finger-lobed, plant-bearing; scapes one-flowered; leaves obovate-toothletted. This is very distinct, by its smooth fleshy stalk like the *Cacalia*, and the flower of *Othonna*. The scars of the leaves are round and tomentose. Introduced in 1774 by Mr. Francis Masson. It flowers from May to November.

2. *Othonna bulbosa*, or bulbous African ragwort: leaves oblong, naked, petioled; stem herbaceous, peduncles one-flowered, very long. This has a thick shrubby stalk, dividing into several branches which rise five or six feet high; the leaves come out in clusters from one point, spread on every side; they are smooth, narrow at their base, enlarging gradually to their points, which are rounded; their edges are acutely indented, like those of the holly. From the centre of the leaves arise the footstalks of the flowers, which are five or six inches long, branching out into several smaller, each sustaining one yellow radiated flower, shaped like the former; these are succeeded by slender seeds crowned with down. Flowers in May and June.

It is one of the most variable plants we have; being, 1. Herbaceous, 2. With ovate quite entire leaves. 3. With the root-leaves pinnate, quite entire. 4. With the leaves linear, very narrow. 5. With the leaves lanceolate, quite entire. 6. With the leaves lanceolate, toothed. 7. With the leaves lanceolate-subelliptic. 8. With the leaves sub-lanceolate, three-toothed. Or, 1. Shrubby; 2. With the leaves of the top lanceolate, subsessile. 3. With the leaves alternate, lanceolate, toothed.

3. *Othonna denticulata*, or dentated African ragwort: leaves oblong, toothletted, smooth, attenuated at the base, embracing; flowers paniced. Introduced in 1774 by Masson. It flowers from April to July.

4. *Othonna tagetes*: leaves linear, pinnate, somewhat toothed. Root annual. Stem filiform. Calyx pitcher-shaped, with about fourteen teeth at the edge; ray many-flowered.

5. *Othonna*

5. *Othonna trifida*: leaves trifid, linear; flowers lateral, peduncled. Stem shrubby. Leaves scattered, somewhat fleshy, with a white wool in the axils of the leaves. Seeds white, with wool.
6. *Othonna pectinata*, or wormwood-leaved African ragwort: leaves pinnatifid; segments linear, parallel. This rises with a shrubby stalk about the thickness of a man's thumb, two or three feet high, dividing into many branches, covered with a hoary down. Leaves also hoary, about three inches long and one broad, cut into many narrow segments almost to the midrib. The flowers are produced on long axillary peduncles towards the ends of the branches; they have large yellow rays; and are succeeded by oblong purple seeds crowned with down. Linnaeus remarks that the whole plant is often tomentose. It flowers in May and June; and was cultivated in 1731 by Mr. Miller, who says, that the seeds were sent to Holland from the Cape, and plants raised from them, in the Amsterdam-garden, in 1699.
7. *Othonna abrotanifolia*, or southernwood-leaved African ragwort: leaves multifid, pinnate, linear; the joints of the stem villose. This has a low shrubby branching stalk. The flowers are produced on short peduncles at the ends of the branches; they are yellow, and the seeds are brown. It flowers from January to March.
8. *Othonna Athanasia*: leaves pinnate, filiform; calyx hemispherical, twelve-toothed. Stem shrubby, like that of *Athanasia*, proliferous, even. Flower rather large, on a one-flowered peduncle; corolla yellow, both in the ray and disk; the former twice as long as the calyx. Seeds downy.
9. *Othonna ciliata*: leaves pinnatifid, sessile; pinnae ovate, ciliate; peduncles terminating, elongated, one-flowered.
10. *Othonna pinnata*: leaves pinnatifid; pinnae lanceolate, quite entire, decurrent.
11. *Othonna trifurcata*: leaves trifid-pinnatifid; pinnae linear; peduncles lateral, fastigate. Found at the Cape by Thunberg.
12. *Othonna munita*: leaves pinnatifid, imbricated, curved inwards; pinnae three-sided, awl-shaped; stem dichotomous; peduncles from the divarications. This resembles *O. ericoides* very much, and differs only in having pinnatifid leaves.
13. *Othonna coronopifolia*, or buckhorn-leaved African ragwort: lower leaves lanceolate, quite entire; upper sinuate-toothed. This rises with a shrubby stalk four or five feet high, dividing into several branches. Leaves greyish, placed without order; those on the lower part narrow and entire, but the others indented on the edges after the manner of hart's-horn. The flowers are produced in loose umbels at the ends of the branches, and are yellow. Receptacle narrow, somewhat convex, with hollows or cells in the middle; the edges of the cells are set with very short bristly-ciliate hairs, giving the receptacle the appearance of being villose; next the edge are six or eight wider cells, receiving the germens of the female flowers. The seeds, which are the produce of these germens, are largish, obovate, somewhat beaked at the base, striated, with a silky hoariness. Down very abundant, capillary, white-silky, three times as long as the seed. Cultivated in 1731 by Mr. Miller. It flowers from July to September.
14. *Othonna cheirifolia*, or stock-leaved African ragwort: leaves lanceolate, three-nerved, quite entire, stem suffruticose, creeping. This has a strong fibrous root, which shoots deep in the ground, and sends out many woody stems, which spread on every side, and trail upon the ground. The flowers are produced upon long thick succulent peduncles, at the ends of the branches, and from the axils; they are yellow, the rays sharp-pointed, and not much longer than the calyx, which is cut into eight equal segments at top; the disk is large, and the florets as long as the calyx. The seeds are crowned with long down. It was discovered by Dr. Shaw growing naturally near Tunis in Africa. Mr. Miller cultivated it in 1758; and it flowers from April to June.
15. *Othonna crassifolia*, or thick-leaved African ragwort: leaves lanceolate, quite entire, somewhat fleshy; stem upright. This has round stalks, which at first are herbaceous and succulent, but by age become woody; they rise three or four feet high, and divide into many branches from the bottom. Leaves thick and succulent; about two inches long, and one broad in the middle; of a grey colour, placed without order, and sessile. The flowers are produced towards the end of the branches upon succulent peduncles about four inches long, each sustaining one yellow flower, smaller than the preceding. It begins to flower in August, and there is a succession of flowers till the middle of winter. Cultivated by Mr. Miller in 1758.
16. *Othonna parviflora*, or small-flowered African ragwort: leaves lanceolate, glaucous, embracing; flowers panicled. Stem shrubby, two feet high, even. Flowers small, yellow.
17. *Othonna tenuissima*, or fine-leaved African ragwort: leaves filiform, fleshy; stem shrubby. Stem from a foot to two feet high and more, even. It did not flower with Linnaeus, though he cultivated it for a long time; but, from the villose hairs at the base of the leaves, as in *O. fruticosa*, he placed it in this genus, till greater certainty could be obtained. Mr. Miller had made it a *Craffula*; and says that it rises with a shrubby stalk, four or five feet high, dividing into many branches, which at first are taper and succulent, but by age become woody. The leaves are very slender, taper, succulent, flaccid, generally turning downward, especially in winter, near three inches in length. It did not flower with him. It was sent him from Leyden by Adrian Van Royen. According to the Kew Catalogue, it flowers in July.
18. *Othonna linifolia*, or flax-leaved African ragwort: herbaceous; leaves linear, margined, grassy. Stem a span high, filiform, even; with one or two one-flowered branches; flowers only the size of pease, yellow.
19. *Othonna digitata*, or digitate-leaved African ragwort: leaves oblong, undivided, or digitate-toothed; peduncles one-flowered. Root bulbous. It greatly resembles *O. ciliata*, N^o 9.
20. *Othonna lingua*: leaves ovate-lanceolate, half embracing. Root bulbous.
21. *Othonna lateriflora*, or side-flowering African ragwort: leaves lanceolate; flowers lateral; peduncles the length of the leaves. This is an upright shrub, with the stem the size of a swan's quill. Flowers solitary, roundish; corolla yellow.
22. *Othonna heterophylla*: root-leaves ovate, angular-toothed; stem-leaves lanceolate, almost entire. Root bulbous.
23. *Othonna ericoides*, or heath-like African ragwort: stem dichotomous, imbricated; leaflets acroser; peduncle very long, solitary, from the divarications. This is an upright shrub, resembling heath, commonly dichotomous. Flower single, roundish, not large.
24. *Othonna capillaris*, or capillary-branched African ragwort: leaves lyrate; branches capillary. Root fibrous, very slender. Root-leaves, and one or two stem-leaves, lyrate, an inch long, even. Stems upright, a palm high, filiform, with the branches finally setaceous and capillaceous, even. Flowers terminating, the size of hemp-seed, yellow.
25. *Othonna Virginea*: leaves wedged, gashed. Stem shrubby, compound, erect, round. The young shoots quite simple: those of the present and former year leafy. Leaves scattered in clusters, small in proportion to the plant, sessile. Flowers from the upper part of the internodes, lateral, solitary, small, like those of *Cotula*; yellow.
26. *Othonna frutescens*, or shrubby African ragwort: leaves oval, somewhat toothed; stem frutescent. This is allied to the next species. Stem of the first year a foot high, upright, simple, round, even, smooth. It differs from *O. arborescens* in having remote toothed leaves, not clustered,

clustered, and quite entire, as in that; the stem without any hairy scars of the leaves; the ray eight-petalled, not five-petalled.

27. *Othonna arborescens*, or tree African ragwort: leaves oblong, quite entire; stem arborescent, fleshy, with woolly scars. Height (at five years of age) one foot, with a stem the thickness of a human finger, resembling *Sedum arborescens*, and, like that, fleshy and woody, though never so tall or thick; pliant, covered with a brownish ash-coloured bark, not rough, but rather smooth, and having white woolly tubercles scattered over it, which is peculiar to this species; the branches also have them, and are obliquely curved inwards; the ends of the branches and bases of the leaves have a fine wool on them, not conglobated, but scattered. The branches are otherwise naked, somewhat woody, covered with a bark like that of the stem, brownish-green towards the end, more tender and herbaceous; these leaves come out alternately at short distances; they are oblong, wider towards the top, and blunt, contracted towards the base, green on both sides, somewhat glittering, and as it were mealy, like those of *auricula*. Among these leaves spring the peduncles, solitary or in pairs, round, tender, of a pale glaucous colour, having a woolly scale or jag near the middle, terminated each by a single flower; corolla yellow, succeeded by thickish, short, oblong-round, seeds, at first whitish, but, when ripe, brownish, crowned by a copious short brownish down; the seeds in the disk are longer, slender, round, and barren, with a more slender whitish down. This plant makes very slow progress here. In August it puts out young leaves, which it keeps all the winter; the heads of flowers appear about the end of November, and do not open till the middle or end of January: in spring the leaves gradually drop off, and the plant appears as if dead, till the succeeding autumn. Cultivated in Sherard's garden, at Eltham, in 1723.

All the species, except the fourteenth, are natives of the Cape of Good Hope.

Propagation and Culture. These plants are preserved in the dry stove, or even in the green-house, without any artificial warmth: it is sufficient to protect them well from frost; and in mild weather they must have a large portion of air. In summer, place them in a sheltered situation. They may be increased during the summer-months by cuttings, planted upon an old hot-bed, and covered with glasses, shading them from the sun in the heat of the day. When they have taken root, plant each into a separate pot filled with soft loamy earth, and place them in the shade till they have taken new root; then remove them to a sheltered situation, where they may remain till autumn; treating them in the same way as the old plants. The fourteenth will live in the open air, in a warm situation and a dry soil. See *CINERARIA*.

OTHRYADES, one of the three hundred Spartans who fought against three hundred Argives, when those two nations disputed their respective right to Thyreata. Two Argives, Alcinoor and Cronius, and only one Spartan, Othryades, survived the battle. The Argives went home to carry the news of their victory; but Othryades, who had been reckoned among the number of the slain, recovered himself, and carried some of the spoils of which he had stripped the Argives into the camp of his countrymen; and, after he had raised a trophy, and had written with his own blood the word *vici* on his shield, he killed himself, unwilling to survive the death of his countrymen.

O'THRYS, in ancient history, a mountain, or rather a chain of mountains, in Thessaly, the residence of the Centaurs. *Strabo*.

OTHU'MA, a town of Arabia, in the province of Yemen: eighty miles north-north-east of Mocha. Lat. 14. 32. N. lon. 43. 57. E.

OT'IBAR, a town of Spain, in the province of Grenada: twelve miles west-north-west of Motril.

OTIO'SI, *f. pl.* [Lat. idle or lazy.] The learned are

exceedingly divided about the *decem otiosi*, "ten idle persons," spoken of in the Jewish synagogues.

Some say they were the three presidents and the seven readers; others, that they were ten persons hired to attend constantly at the synagogue, because, without the number ten, it could be no regular synagogue, or legal assembly; so that the *decem otiosi* were ten idle folks kept in pay, to form by their presence a legal synagogue, or quorum.

Vitringa, in his *Archi-Synagoga*, refutes this opinion; and will have the *otiosi* to have been ten directors or officers in the synagogue. He shows, that each synagogue had its directors; that the number was greater or less, according to the dignity of the synagogue; that the smallest had at least two; that, from the earliest times, each synagogue had its chief, called *archi-synagogus*, who had two colleagues, to be present at the ceremonies, and other acts of religion, and to take care every thing were done with decency; but that the *archi-synagogus* reserved to himself the power of teaching: that, besides these three, the *archi-synagogus* named several readers, who read in the synagogue every sabbath, and that these made the *decem otiosi* of the synagogue; so called, because, being disengaged from all other employment, their whole attendance was on divine service.

O'TIS, *f. the BUSTARD*; [in Gr. *ὄτις*; in Lat. *avis tarda*, or slow bird: and from this the Italian name *sturda* is evidently formed. And may not the old French term *bislarde*, and the English *bustard*, be only a corruption of *avis tarda*? The German appellation *trappe*, is of the same origin with the English verb *to trape*, and alludes to its heavy sluggish pace.] A genus of birds of the order gallinæ. The generic characters of the bustard are—Bill somewhat convex; nostrils oval, pervious; tongue bifid, sharp; feet three-toed, formed for running; legs tall, naked above the knees. Of this genus there are eleven species, viz.

1. *Otis tarda*, the great bustard: wave-spotted with black and rufous, beneath whitish; head of the male, and throat on each side, tufted. This bird is found in the plains of Europe, Asia, and Africa; but has never been observed in America. In England it is met with on Salisbury-plain, and in the wolds of Yorkshire; it was formerly seen in flocks of forty or fifty. It is the largest of British land-birds, the male weighing from twenty-five to thirty pounds, and frequently more; the length near four feet, the alar extent nine. The head and neck are ash-coloured; the back transversely barred with black and bright rust-colour; quills black; belly white; tail barred with red and black, and consisting of twenty feathers; the legs dusky. The female is about half the size of the male; the crown of a deep-orange, crossed with transverse black lines; the rest of the head brown; the lower part of the neck before ash-coloured; in other respects like the male; but the colour of the back and wings is more dull. The male differs also from the female in having a tuft of feathers, about five inches long, on each side of the lower mandible; besides which, it is furnished with a pouch capable of containing near seven quarts of water, situated on the fore-part of the neck, the entrance being immediately under the tongue. This is of use when the female is sitting, which is generally at a distance from water; or for the young, till they can move from the nest. A further use of it has also been observed at Morocco, where they fly the hawk at the bustard; for, on the attack of the hawk, it has been known that the bustard has made use of this reservoir of water to spit out against the assailant, who, not uncommonly, is by this means baffled in the pursuit.

The bustard is a granivorous bird: it lives on herbs, grain, and every kind of seed; on leaves of coleworts, of dandelion, of turnips, of mouse-ear, of vetches, of smallage, of carrots, and even on hay, and on those large worms which, during the summer, swarm before sun-rise on downs. In the depth of winter, and when the ground

is covered with snow, they feed on the bark of trees; and, at all times, they swallow small stones, or even bits of metal, like the ostrich. The academicians of Paris, on opening the stomach of one of the great bustards, found it filled partly with stones, some of which were of the size of a nut, and partly with doubloons, to the number of ninety, all worn and polished where they were exposed to the attrition, but without the least appearance of erosion. Willughby found in the stomach of these birds, which were killed in the harvest-season, three or four grains of barley, with a large quantity of hemlock-seed; which indicates a decided preference, and shows that these seeds would make the best bait for ensnaring them.

The liver is very large; the gall-bladder, the pancreas, the number of pancreatic ducts, their insertion, and that of the hepatic and cystic ducts, are liable to some variation in different subjects. In the pairing season, the male struts round the female, and spreads his tail into a sort of wheel. The eggs are not so large as those of a goose; they are of a pale-olive green, sprinkled with small dark spots, in which respect their colour bears a great resemblance to that of the plumage. This bird, however, does not build a nest, but only scrapes a hole in the ground, and drops into it two eggs, which it hatches in thirty days. When the anxious mother dreads the visits of the sportsmen, she takes her eggs under her wings, and transports them to a safe place. She commonly chooses fields of corn in the ear, from an instinct which prompts all animals to bring forth their young in situations that supply the proper food. Klein pretends that she prefers oats, as having the shortest stalks; and that, while she sits on her eggs, her head is so elevated as to glance along the plain, and notice what is going forward. But this assertion agrees neither with the general opinion of naturalists, nor with the instinct of the great bustard, which, as it is wild and timid, must seek for safety rather by concealing itself in tall corn, than by over-topping it, in order to observe the sportsman at a distance, and incur the danger of being itself discovered. She sometimes leaves her eggs in quest of food; and if, during her short absence, one handle or even breathe on them, it is said that she perceives it on her return, and abandons them for ever.

The great bustard, though a very large bird, is excessively timorous, and seems neither conscious of its strength, nor animated by the spirit of exerting it. Sometimes they assemble to the number of fifty or sixty; but they gain as little confidence from their multitude as from their strength or their size: the slightest appearance of danger, or rather the least novelty, alarms them; and they can hardly provide for their safety, but by flight. Dogs they dread most, especially as greyhounds are often used to hunt them; but they are also afraid of the fox, the polecat, and every other animal, however small, which has courage to attack them. They shrink from the fierce animals, and even from the birds of prey. So dastardly they are, that, though only slightly hurt, they die through fear, rather than from the effect of their wounds. Yet Klein asserts that they are sometimes irritated, and inflate a loose skin which hangs below the neck. If we believe the ancients, the great bustard has no less affection to the horse than antipathy to the dog. As soon as the timorous bird perceives that noble animal, it flies to meet him, and generally places itself under his feet. If we admit this sympathy between such different animals, we might explain the fact, by saying, that the great bustard finds in horse-dung some grains of corn that are half-digested, and which prove a resource when pressed by hunger.

When it is hunted, it runs exceedingly fast, and sometimes proceeds several miles without the least interruption. But, as it takes wing with difficulty, and never attempts to rise but when favoured by the wind, and as it cannot perch, on account of its weight, or by reason of the want of a hind toe, with which it might cling on a

branch and support itself; we may admit, on the testimony of both the ancients and moderns, that it can be caught by greyhounds. It is also chased by a bird of prey; or nets are spread, into which it may be decoyed by leading out a horse, or by merely disguising one's self in a horse's skin. Every kind of snare, how artless soever, must succeed, if it be true, as *Ælian* affirms, that, in the kingdom of Pontus, the foxes attract them by lying on the ground, raising their tail, and moving it like the neck of a bird: the bustards, he says, mistake this object for one of their own species, advance to it without hesitation, and become the prey of the insidious animal. But this implies much subtlety in the fox, much stupidity in the bustard, and perhaps more credulity in the writer.

The great bustard is found in *Lybia*, near *Alexandria*, according to *Plutarch*; in *Syria*, in *Greece*, in *Spain*, in the *Netherlands* and *Germany*; in the *Ukraine* and *Poland*; where, according to *Rzacynski*, it passes the winter in the midst of the snow. *Pennant* affirms, that these birds seldom leave the place where they were bred, and that their greatest excursions never exceed twenty or thirty miles; but *Aldrovandus* asserts that, towards the end of autumn, they arrive in flocks in *Holland*, and limit their haunts to the fields remote from cities and inhabited places. *Linnaeus* says, that they travel into *Holland* and *England*. *Aristotle* also mentions their migrations; but the cause of their variations in this impulse of nature, requires to be ascertained by more accurate observations. What appears most certain is, that the great bustard is but rarely found in mountainous or populous countries; as in *Switzerland*, *Tyrol*, *Italy*, &c. and that, when this does occur, it happens generally in the autumn and winter. But, though it can live in cold countries, and, according to some authors, is a bird of passage, it would seem that it never has migrated into *America*, or farther north than *Sweden* and *Russia*; or south, than *Greece* or *Syria*. It abounds in the deserts of *Tartary*, and is solitary, except at the times of migration, when they unite into small flocks.

As late as the year 1750, these birds are said to have been seen in great plenty in *England*, annually visiting the large open downs of *Dorsetshire* and *Wiltshire*, particularly *Salisbury-plain*, and the wolds of *Yorkshire*; but they are now very rarely seen with us; and in *Scotland* they are said to be quite extinct. In *France*, they are observed to arrive and retire regularly in the spring and autumn, in small flocks; but they seldom halt, except on the most elevated spots. In this country, says *Mr. Montagu*, (*Supplement to his Ornithological Dictionary*,) they have decreased so rapidly within these twenty years, that, in a few years more, not a vestige of them will remain in these realms. "The shepherds with whom we have conversed lately, declare they have not seen one in their most favourite haunts, upon the extensive downs of *Wiltshire*, for the last two or three years, where we have often contemplated this noble bird with so much pleasure, and regarded them as an object well worth every attempt to cultivate in their native plains; for all the artful means tried to keep and domesticate them, so as to procure increase, have proved abortive. The length of their days is so reduced in that state, that few have exceeded two or three years, and have never shewn any inclination to breed."

This we think is much to be lamented, for the reasons we have given under the article *ORNITHOLOGY*, in the preceding volume, p. 779. Observers, ancient and modern, agree that the flesh of the bustard is excellent. That of the young ones, after being kept a short time, is remarkably delicate; yet *Hippocrates* forbids persons subject to the falling sickness to taste it. *Pliny* recommends the fat of the bustard to allay the pain in the breasts after child-birth. *Capt. Flinders* remarks, of a bustard shot at *Sweer's Island* in *Terra Australis*, "the flesh of this bird is distributed in a manner directly contrary to that of the domestic turkey, the white meat being upon the legs, the black upon the breast." Voyage

to Terra Australis, in 1801-3.—This circumstance was previously known to ornithologists, but not to the generality of persons. The following anecdote is related by Mr. Montagu, in the work before quoted: "One of this species, shot in Devonshire in the year 1804, and taken to Plymouth market, was bought by a publican for a shilling; an evident proof that refined luxury had not found its way so far westward from the metropolis, since a poulterer in London would have demanded two or three guineas for it. But so rare a wanderer was not stamped with its real value where it was unknown; and the landlord, perhaps considering it fit for a secondary table, fairly speculated upon the cost of a dish that perhaps did not exceed one halfpenny in the pound, and had it dressed for the dinner of some riders. These itinerant gentlemen, being as ignorant as the natives of the prize set before them, and perceiving, upon dissection, the difference in the colour of the pectoral muscle from the other part of the breast (a circumstance not unusual, especially in the grouse kind), voted it improper food, and ordered it from the table." The great bustard is represented on the annexed Plate, at fig. 1.

2. *Otis Arabs*, the Arabian bustard: crests springing from the ears. This bird, which the Arabians call *lo-hong*, and which Edwards first figured and described in his *Gleanings of Natural History*, is nearly the size of our great bustard, and, like it, has three toes on each foot, turned the same way, only rather shorter; the feet, the bill, and the neck, are longer; and, on the whole, it is more taper in its shape. The plumage on the upper part of the body is browner, and similarly marked to that of the woodcock; or it is tawny, and radiated with deep brown with white spots, in the form of a crescent, on its wings. The lower part of the body is white, as also the margin of the upper part of the wings. The crown of the head, the throat, and the fore-side of the neck, are marked with transverse bars, dull brown on a cinereous ground. The lower part of the leg, the bill, and the feet, are of a bright brown, and yellowish; the tail droops like that of the partridge, and is stained with a cross black bar; the great quills of the wing and the crest are also of the same colour.

The crest forms a remarkable character in the Arabian bustard; it is pointed, directed backwards, and much inclined to the horizon: from its base it sends off two black lines, of which the longer one passes over the eye, and makes a kind of eye-lid; the other, which is much shorter, stretches under the eye, but does not reach it; the eye is black, and placed in a white space. An individual of this species lived several years in the possession of sir Hans Sloane; it was brought from Arabia Felix, which is supposed to be its native climate. It penetrates the Asiatic continent as far as the Caspian sea.

3. *Otis tetrax*, the little bustard: head and throat smooth. It is seventeen inches long. The eggs are of a shining green; the bill is grey-brown; crown black, with rufous bands; temples and chin reddish-white, with small dark spots; neck of the male black, with a white collar; body above varied with black, rufous, and white; beneath and outer edge of the wings white. It is shy and cunning: if molested, it will fly two hundred paces, and run so fast that a man cannot overtake it. Towards the close of the season, they prepare to quit the country; and are then observed to assemble in flocks, and the young ones are no longer distinguishable from the old. They feed, like those of the great species, on herbs and grain, and also on ants, beetles, and small flies; and are said to be extremely fond of the tender leaves of the sow-thistle.

This bird was not known to the ancients. It is not dispersed through so wide a range as the large species. Linnaeus says it is found in Europe, and particularly in France. It has been met with only a few times in England, and all the specimens were females. It is more frequently taken in France in nets, like the partridge, as

well as by hawking. The flesh is dark in colour, yet is much esteemed, being of a very high flavour. The eggs are also accounted a delicacy.

One of this species, preserved in the museum of Mr. Turnhill, was a few years since shot in Suffex. They are frequent in the south-west parts of Russia, and in the deserts of Tartary; but have not yet been seen in Siberia.

4. *Otis Afra*, the African, or white-eared, bustard: black; back cinereous, ears white. This differs from the Arabian bustard, by the colours of its plumage, and its smaller size. It is nearly as large as the pintado; length twenty-two inches. The bill yellow, and bent at the end, where it is black; the crown of the head is blackish brown, irregularly barred with white lines; on the ears a large spot of white; the rest of the head, with the forehead, neck, and under parts of the body, black. Round the lower part of the neck is a band of white, which passes forwards to the breast like a collar, but does not quite meet before. The upper parts of the body, great part of the wings, and tail, are deep blackish brown, crossed with irregular streaks of different shapes, and of a rufous colour. The outer edge of the wing and quills are black; above these a large bed of white, occupying almost the whole length of the wing; the secondaries are longer than the quills, and hang over and hide them in a state of rest. The tail consists of fourteen feathers, is five inches in length, and a little rounded; all the feathers are marked not unlike those of the back, but more inclined to ash-colour, palest at the end; besides which, all but the two middle ones are crossed with two bars of black. The lower part of the feathers, round the middle of the thighs, are white: the legs yellow: claws black. See the Plate, fig. 2. The female has the head and neck like the back, but the lines more delicate, and the breast and belly black, like the male; but the white spot on the ears, and ring at the lower part of the neck, are wanting.

These birds are natives of the Cape of Good Hope, where they are known by the name of *kor-rhaan*. Kolben calls them *knor-cock*, *knor-hen*. They frequent heaths and places remote from habitations: they build their nests in bushes, but never lay above two eggs in a season. The flesh is of an agreeable taste, but not equal to that of the great bustard. Sparrman says, that it artfully conceals itself till one comes pretty near it, when it suddenly soars almost perpendicularly aloft, with a sharp quavering scream, *korrh, korrh*; whence the name it has received at the Cape.

5. *Otis Bengalensis*, the Bengal bustard: black; space about the eyes dusky brown; back, rump, and tail, shining brown. This species is not only smaller than the European, the African, or the Arabian, but it is taller in proportion, and more slender. It is twenty inches high, from the crown of the head to the plane on which it stands; its neck seems to be shorter in proportion to its legs; but in other respects it is entirely analogous to the common bustard. The bill is somewhat hooked, though more elongated. Black, fulvous, white, and grey, are the predominant colours of its plumage, as in the European bustard; but they are differently distributed. The black is spread on the crown of the head, on the neck, the thighs, and the lower part of the body; a bright-yellow occupies the sides of the head and the circuit of the eyes; a browner yellow, and one more shaded with black, stains the back, the tail, that part of the wings next the back, and the top of the breast, where it forms a broad belt on a dark ground; the white appears on the coverts of the wings farthest from the back, and white mixed with black on the intermediate space; the deepest grey is laid on the eye-lids, the extremity of the longest quills of the wing, of some of the middle and shortest ones, and on some of their coverts; lastly, the brightest grey, which verges on white, is spread on the bill and the feet. This bird is a native of Bengal, where it is called *churge*. It is represented on the Plate, at fig. 3.

6. *Otis aurita*, the paslarage bustard: black; body above reticulate

1. The Great Bustard. 2. The White eared Bustard. 3. The Bengal Bustard.

reticulate with brown; the hind head has four capillary feathers on each side, rhombic at the tips; the spot on the wings and ears white. The size of the little bustard, *O. tetrax*: length eighteen inches. Bill long and slender, brown and white: the head, neck, breast, and belly, black: on the ears a large white patch: junction of the neck and back white: the whole back, wings, and tail, black, with a net-work of the finest lines of black and brown furrounding the meshes of black: the greater wing-coverts are white. On the hind head are four pairs of capillary feathers; each pair of different lengths, and dilating at their ends in a lance-shaped tuft; the longest four inches, the shortest scarcely rising in sight. The legs are strong, and of a pale-yellow; toes divided to their origin. It inhabits India, where it is called *passurage plover*. The similarity of markings in this and the African bustard are worthy observation, as one drawing might almost serve to represent both birds; but the last described, being much smaller in size, with the addition of the long capillary feathers on the ears, induced Dr. Latham to determine its being a different species.

In the possession of Mrs. Wheeler, Dr. Latham found a specimen of a bird, which he supposed to be the female of the above. It is nineteen inches or more in length; and the plumage not unlike that of the little bustard, but less delicate in its markings. It is known in India by the name of *oorail*; by some of the English called *shercher*. It is much esteemed, consequently greatly fought after; but, though not uncommon, very few are taken, as it is a very shy bird. The flesh of the breast is part white, part brown, and is accounted a great delicacy.

7. *Otis houbara*, the ruffed bustard: yellowish, spotted with brown; feathers of the neck long, whitish, with black shafts; the quill-feathers black, with a white spot in the middle. This species was discovered by Dr. Shaw, who asserts that it has the shape and plumage of the great bustard, but is much smaller, not exceeding the size of a pullet. It is marked all over with little brown spots: the neck-feathers whitish, very long, and streaked with black. It lives on vegetable substances and insects; and generally inhabits the borders of an African or Arabian desert. It is decorated with a ruff, formed by long feathers which rise from the neck; and which, as in the domestic cock, bristle when the bird is irritated. "It is curious (says Dr. Shaw) to observe, when it apprehends the attack of a rapacious bird, the turnings and windings, the marches and counter-marches, which it performs; in a word, the evasions and stratagems which it makes to elude its enemy." This learned traveller subjoins, that it furnishes an excellent medicine for sore eyes; and that, for this reason, its gall, and a certain substance found in its stomach, are sometimes sold at a very high price.

8. *Otis rhaad*, the rhaad bustard: a sky-blue crest on the back of the head in the male; head black; upper side of the body and the wings yellow, with fainter spots; under parts white, the tail dusky, with black transverse streaks. The rhaad is distinguished from the little bustard by its crest, and from the preceding species by the defect of the ruff. It is however of the same size with the latter.

Of this African species there are two varieties, the little and the great. The little rhaad differs from the great one by its size, being no larger than a common fowl; also by some varieties in the plumage, and by the want of a crest. In Arabia they are both termed *saf-saf*. *Rhaad* signifies thunder in the African language, and is expressive of the noise that these birds make in springing from the ground. *Saf-saf* denotes the rustling of their wings when flying.

9. *Otis Indica*, the Indian, or white-chinned, bustard: crown of the head black; upper part of the body brown, waved with black; round the eyes mottled with black; on each side of the head a black streak; chin white. The rest of the under parts dusky yellowish cream-colour; sides nearly white; legs pale dusky brown. Inhabits India.

10. *Otis ædicnemus*, the thick-kneed bustard: greyish; two first quill-feathers black, white in the middle;

bill sharp-pointed; legs cinereous; knees thick, as if swollen. It inhabits Europe, Asia, and Africa; feeds in the night on worms, caterpillars, and reptiles; breeds in holes or among stones on the bare ground; the eggs are of a copper colour, spotted with darker red; makes a piercing shrill cry, and migrates. The bill is black; legs greenish-yellow; lower eye-lid naked, pale yellow: above and beneath the eyes there is a yellow line; from the bill under the eyes to the ears there is a brown line. Under parts white.

11. *Otis Chilensis*, the Chilian bustard: head and throat smooth; body white; crown and tail-feathers cinereous: primary quill-feathers black. It inhabits Chili; is even larger than the *O. tarda*; is gregarious, and feeds on herbs; it is thought not to belong to this genus. The tail, which consists of eighteen feathers, is short; it has four very thick toes.

O'TIS, a town of the North-American states, in Berkshire-county, Massachusetts, containing 1111 inhabitants.

O'TISFIELD, a town of Massachusetts, in the district of Maine: forty miles north-west of Portland.

OTITES, *f.* in botany. See *CUCUBALUS* and *POLYPODIUM*.

OTLEY, a market-town in the West Riding of Yorkshire, is situated under a cliff called Chevin, near the fourth bank of the river Wharfe. This town was formerly remarkable for the great quantity of oats cultivated in its neighbourhood, and sold at the market, which is held on Friday, and still affords a very plentiful supply of that species of grain: the fairs are Aug. 1 and Nov. 5. At Akkerton, near this place, was an hospital for lepers in the time of Edward II. who were bound to keep the bridge over the Wharfe in repair. No vestige of this building now remain, neither can any traces be discovered of the ancient palace of the archbishops of York, to whom the manor of Otley was given by king Athelstan. In 1673 this town suffered severely from an inundation, which spread to a considerable distance over the adjoining country. Here is a free grammar-school, called *P. nce Henry's School*, founded in 1611. The church is a large and rather elegant edifice, and contains a great variety of monumental erections in honour of the families of Fairfax, Fawkes, Vavasour, Palmes, and Pulleyn. From the population-returns of 1811, Otley appears to contain 573 houses, and 2602 inhabitants.

The vicinity of this town presents to the eye a very rich and beautiful prospect, particularly when surveyed from the summit of the Chevin. It abounds with gentlemen's seats, among which Newhall, (formerly called Stank,) Weston, Farnley Hall, Denton Park, and Harewood House, are the principal. The latter, the chief seat of lord Harewood, is one of the most magnificent mansions in England. It was erected by the late lord, who laid the foundation in 1760. The style of the architecture is Corinthian; and the whole is fitted-up suitably to its external grandeur. The extensive pleasure-grounds and gardens were laid out by the justly-celebrated Browne. Near this mansion may be seen the ancient church of Harewood, rendered truly venerable by containing the tomb of that illustrious and virtuous judge, sir William Gascoigne, of Gawthorpe, who committed to prison the then prince of Wales, afterwards Henry V. for offering insult to him on the bench. The ruins of the castle are seated on a lofty eminence overlooking the Wharfe. These are very extensive, covering above an acre of ground; but, from their extremely dilapidated condition, it is impossible to form a correct idea of the construction and appearance of this immense pile in its pristine state.

Farnley Hall, the seat of Walter Fawkes, esq. is about three miles north of Otley, and is justly ranked among the finest mansions of the county, on account of the scale of the house, the style in which it is fitted-up, its superb and valuable collection of paintings and drawings, and for the natural character of the surrounding country. *Beauties of England*, vol. xvi.

OTMARSCH, a town of Holland, in the province of

of Overissel, situated on the river Dinckel: nine miles north of Oldenzeel.

OTODINI, or **OTTADINI**, in ancient geography, a people of Britain, north-east of the Brigantes, who inhabited the countries now called Northumberland, Merse, and the Lothians. As the Otodini are not mentioned by any of the Roman historians, but only by Ptolemy, it is uncertain whether they formed a distinct independent state, or were united with the Brigantes. They were, however, a considerable people, and possessed a long tract of the sea-coast, from the river Tyne to the Firth of Forth. Their name is derived by Baxter from the old British words *Ot o dineu*, which signify "a high and rocky shore," descriptive enough of their country. They were probably reduced by Agricola at the same time with their more powerful neighbours, the Brigantes; but, as they lived without the walls of Severus, they were, like the rest of the *Mæatæ*, engaged in frequent revolts. In the most perfect state of the Roman government in this island, the country of the Otodini made a part of the Roman province called Valentia, which comprehended all that large tract between the two walls. As this province was never long together in the peaceable possession of the Romans, they had but few stations in the country of the Otodini, except those on the line of the wall of Severus. Besides these, there were two or three Roman towns without the wall, situated on or near the military way which ran through their country into Caledonia, which are mentioned both by Ptolemy, and in the Itinerary of Antoninus. These towns were *Barmantum*, now Riecheffer, and *Curia* or *Corflupitum*, now Corbridge. Between these two towns, and at a little distance from the military way, at a place now called Rivingham, there are very conspicuous vestiges of a Roman station; which, from the inscription of an altar found there, appears to have been named *Habitaneum*.

OTO'GAMIES, a tribe of Indians in the north-west territory, who inhabit between the Lake of the Woods and Mississippi-river. Its number of warriors is 300.

OT'OMACKS, or **OTOMAUQUES**, savages of America, on the **OROONOKO**. See vol. xvii. p. 789.

OTOO'RACITE, a small island in the South Pacific Ocean, near the east coast of Otaheite.

OT'ORACKS, *f.* [Arab. signifying to set down.] The superannuated janizaries. *Phillips*.

OTO'QUE, a small island in the bay of Panama: thirty miles south-south-west of Panama. Lat. 8. 30. N. lon. 80. 20. W.

OTORO'WA, a town of the duchy of Warfaw: sixteen miles west of Posen.

OTOULIN'GOU, a town of Chinese Tartary. Lat. 43. 54. N. lon. 128. 16. E.

OTRAHER'MANA, a small island in the Eastern Indian Sea, near the west coast of Luçon. Lat. 15. 55. N. lon. 120. 6. E.

OTRAN'TO, or **TERRA D'OTRANTO**, a province of Italy, in the kingdom of Naples; bounded on the north by the Terra di Bari and the Gulf of Venice, on the east by the same gulf, and on the south and west by a great bay which is between that and the Basilicata. It is about sixty miles in length, and from twenty to twenty-five in breadth. The principal productions are olives, figs, and grapes. To prevent the incursion of the Turkish corsairs, towers are erected at small distances all along the coast. Some authors call it *The Country of Lecce*, from a town of that name, where the governor resides. Besides Lecce and Otranto, the principal towns are Tarento, Brindisi, Matera, Castro, Gallipoli, Motala, Santa Maria de Leuca, Alessany, Ugento, Nardo, Ostuni, and Castellaneta.

OTRAN'TO, a city and sea-port in the kingdom of Naples, and capital of the above province; with a commodious harbour, an archbishop's see, and a strong citadel, where the archbishop resides. Mr. Swinburne gives this account of it: "It is (says he) small, stands on a

hill, and contains only 3000 inhabitants. Its little harbour is not so bad but it might induce more people to settle here, as no port on the coast lies so convenient for traffic with Greece. The Adriatic Gulf is here but sixty miles wide. I climbed to the top of a tower, to get a sight of the Acroceranunian mountains; but a vapour hanging over the sea, along the horizon, hid them from my view: in a clear morning, their snowy tops are said to be very visible. The cathedral of Otranto is Gothic, and, according to the Puglian fashion, has its subterraneous sanctuary. The columns are of beautiful marble and granite; the pavement, a rude species of mosaic, commonly called *Saracenic*: as it is to be met with in all churches founded by the Norman kings of Sicily, the artists who laid it were probably Saracens, or at least Greeks, their scholars. These mosaics are composed of pieces of porphyry, serpentine, and cubes of gilt glass, disposed in stars, circles, or chequers. The compartments of the stalls are bordered with them; and the small twisted columns, which support the pulpits and canopies, are ornamented with a spiral stripe of the same work. It is a pity so much durability, compactness, and beauty, of materials, should have been lavished on such barbarous designs. Otranto was a Roman colony, as is certified by an inscription, almost the only monument of antiquity left there. In the tenth century it was made an archbishop's see. In 1480, Laurence de Medici, to deliver himself from the attacks of the king of Naples, persuaded Mahomet II. to invade the realm; and Otranto was the unfortunate place where the Turks landed. It was invested, stormed, and pillaged. Its prelate was slain at the door of his church; 800 principal citizens dragged out of the gates and butchered; their bodies left unburied, till the duke of Calabria retook the city, and committed them to hallowed earth. About a hundred years after, a devout person affirmed that these bones had appeared to him in a dream; and, upon the strength of his vision, they became, for the vulgar, objects of almost equal veneration with the relics of the primitive martyrs." Swinburne's *Travels in the Two Sicilies*, vol. i.

This city, or town, is situated on a rocky island, joined to another island by a bridge, which by another bridge communicates with the continent; surrounded by walls and ramparts, and defended by a citadel on a rock. The harbour is good, and the trade is considerable. It is 94 miles south-east of Bari, and 206 east of Naples. Lat. 40. 30. N. lon. 18. 20. E.

OT'RAQUE, *f.* A kind of drink made of a nut in the East Indies. *A/h.*

OTRAR', or **FARAB'**, a town of Turkestan, on the Argh; formerly a place of extensive trade, and great importance. It was taken by Jenghis Khan, after a brave defence. Here died the celebrated Timur Bec. Fifty-five miles west of Taraz, and 110 north-west of Tocat.

OTRAU', a town of Moravia, in the circle of Prerau: twenty miles north-east of Prerau, and twenty-eight north-east of Olmutz.

OT'REUS, in ancient history, a king of Phrygia, son of Cisseus, and brother to Hecuba.

OTRICO'LI, a town of Italy, in the Sabina, near the Tiber, formerly the see of a bishop. Here are the ruins of a theatre, and other magnificent buildings: twenty-four miles south-west of Spoleto, and thirty-three north of Rome.

OTROKOT'SKI-FO'RI'S (Francis), an Hungarian, who completed his studies at Utrecht, and became minister in his native country. He afterwards renounced the Protestant religion, and obtained some preferment in the state. He died at Tirnau in 1718. His works are, 1. *Origines Hungaricæ*, 2 vol. 8vo. 2. *Antiqua Religio Hungarorum vere Christiana et Catholica*, 8vo.

OTSE'GO, a county of New-York, bounded on the north by the counties of Oneida, Herkemer, and Montgomery; on the east by the county of Schoharie; on the south by the county of Delaware; and on the west by the county

county of Chenango; about thirty miles from east to west, and twenty-five from north to south. It contains 38,802 inhabitants.

OTSEGO, a township and lake in the above county. The township was taken from Unadilla, and incorporated in 1794. On the east, the township includes Lake Otsego, which separates it from Cherry Valley. The Lake is the head of Susquehanna-river; and is about nine miles long, and somewhat more than a mile wide. The lands on its banks are good, and well cultivated. The township contains 4224 inhabitants. Lat. 42. 40. N. lon. 74. 58. W.

OTSKE, a town of Turkish Armenia: twenty miles north-west of Akalzike.

OTT (John-Henry), a learned Swiss divine and professor, was the son of a country minister in the canton of Zurich, and born in the year 1617. After having been for some time a pupil of Breitingger at Zurich, he was sent, in 1635, to pursue his studies at Lausanne. From thence he went to Geneva and Groningen; and, in the latter place, distinguished himself by his proficiency under the instructions of Gomar and Altling. He then spent five years at Leyden and Amsterdam, in the study of the rabbinical writings, and of the oriental languages. Afterwards he took a tour to England and France; and, upon his return to his native country, was presented to a good living, which he served for twenty-five years. In 1651, he was nominated to the professorship of eloquence at Zurich; in 1655, to that of Hebrew; and, in 1668, to the chair of ecclesiastical history. He died in 1682, at the age of sixty-five, leaving behind him several treatises on subjects in divinity and various literature, which are held in esteem on account of the erudition displayed in them. Among others, he was the author of, 1. *Franco-Gallia: Oratio de Causa Janfenitica*. 2. A Latin dissertation on the questions, Whether St. Peter was ever at Rome? and When he was there? 3. A translation of a treatise On the Grandeur of the Church of Rome, with Remarks. 4. Annals relating to the History of the Anabaptists. 5. *Onomastodoria*, five Nomina Hominum propria. 6. An Examination of the Annals of Baronius. 7. A Defence of that Examination. 8. A Discourse in favour of the Study of the Hebrew Language. 9. A Treatise on the Resurrection. 10. On Alphabets, and the Manner of Writing, in all Nations. 11. On Poetry in general. Most of these works are in Latin.

He had a son, called JOHN BAPTIST OTT, who was born in 1661, and acquired celebrity by his knowledge of the oriental languages, and antiquities. He was educated to the ministry, and officiated as deacon at Stettin, and afterwards as pastor at Zollicken; and, in 1702, he was made professor of Hebrew at Zurich. In 1715, he was promoted to the archdeaconry of the cathedral in that city. He was the author of several works, in which his learning and research were conspicuous. Of these we may mention, 1. A Dissertation on Vows. 2. A Letter on Samaritan Medals. 3. On the manuscript and printed Versions of the Bible, before the *Æra* of the Reformation. 4. A Disquisition on certain Antiquities discovered at Klothien, in 1724. The two first of these works are written in Latin, the two last in German. *L'Advocat's Bibl. portatif*.

OTTA, a town of Portugal, in Estremadura: twenty-four miles north-north-east of Lisbon.

OTTACANO, a town of Naples, in the province of Lavoro: eleven miles east of Capua.

OTTA'NI, a town of Naples, in the Principato Citra: ten miles south-west of Cangianno.

OTTA'VA, a town of Naples, in the province of Bari: eleven miles south-south-east of Monopoli.

OTTAWA, a river which rises in the south part of Bohemia, and runs into the Muldau twelve miles east of Blatna.

OTTAWA, or UTAWA, called also *Grand River*, a river of Canada, which is the most important of all the tributary streams of the great river St. Lawrence, issues

from various lakes towards the centre of Canada, and falls into the St. Lawrence about thirty miles above Montreal; forming, by its confluence with that river, *Le Lac des Deux Montagnes, et le Lac St. Louis*, i. e. the Lake of the Two Mountains, and the Lake of St. Louis, in which are several islands. The water of the Utawa-river is remarkably clear, and of a bright greenish colour; whilst that of the St. Lawrence, on the contrary, is muddy, owing to its passing over deep beds of coral, for some miles, before it enters into Lake St. Louis. For a considerable way down the lake, the waters of the two rivers may be plainly distinguished from each other. At the mouth of the Utawa-river, is situated the island of Perot, about fourteen miles in circumference, the soil of which is fertile and well cultivated.

The North-West Company principally carries on its fur-trade by the Utawa-river. For this purpose they make use of canoes, formed of the bark of the birch-tree; some of which are constructed upon such a large scale, that they are capable of containing two tons; but they seldom put so much in them, especially in this river, as it is in many places shallow, rapid, and full of rocks, and contains no less than thirty-two portages. The canoes are navigated by the French Canadians, who prefer this employment to that of cultivating the ground. Having ascended the Utawa-river for about 280 miles, which it takes them about eighteen days to perform, they then cross, by a portage, into Lake Nipissing; and from this lake, by another portage, they get upon French-river, that falls into Lake Huron on the north-east side; then, coasting along this last lake, they pass through the Straits of St. Mary, where they have another portage into Lake Superior; and, coasting afterwards along the shores of Lake Superior, they come to the Grand Portage, on the north-west side of it; from hence, by a chain of small lakes and rivers, they proceed on to the Rainy Lake, to the Lake of the Woods, and for hundreds of miles beyond it, through Lake Winnipeg, &c. The canoes, however, which go so far up the country, never return the same year: those intended to bring back cargoes, immediately stop at the Grand Portage, where the furs are collected ready for them by the agents of the company. At the Grand Portage, and along that immense chain of lakes and rivers which extend beyond Lake Superior, the company has regular ports, where the agents reside; and they have also established trading-ports within 500 miles of the Pacific Ocean. *Weld's Travels through Lower Canada, &c.* vol. i.

OTTAWA'S, a tribe of Indians who inhabit the east side of Lake Michigan, twenty-one miles from Michillimackinac, in Wayne county or territory. Their hunting-grounds lie between lakes Michigan and Huron. About thirty years ago they could furnish 200 warriors. A tribe of them also lived near St. Joseph's, and had 150 warriors. Another tribe lived with the Chippewas, on Saguinan Bay; who, together, could raise 200 warriors. Two of these tribes, previously hostile, signed the treaty of peace with the United States, at Grenville, Aug. 3, 1795. In consequence of lands ceded by them to the United States, that government has agreed to pay them, in goods, 1000 dollars a-year for ever.

OTTEL-AM'BEL, *f.* in botany. See STRATIOTES.

OTTELMENHAUSEN, a town of the duchy of Wurzburg: three miles north of Königshofen in der Grabfeld.

OTTENDORF, a town of Germany, in the duchy of Bremen, capital of a small county called Hadeln, on the river Meden: twenty-four miles north of Stade. Lat. 53. 50. N. lon. 8. 53. E.

OTTENDORF, a town of Bohemia, in the circle of Koniggratz: two miles south-east of Branau.

OTTENDORF, a town of the duchy of Wurzburg: eight miles east of Schweinfurt.

OTTENDORFF, a town of Austria: four miles south-west of Ehrnsprunn.

OT'TENGRUN, a town of Saxony, in the Vogtland: six miles south-west of Oelsnitz.

OT'TENGRUN, a town of Germany, in the principality of Culmbach: two miles north of Munchberg.

OT'TENHEIM, a town of Austria, on the north side of the Danube: five miles west-north-west of Lintz, and sixteen south-west of Freystadt.

OT'TENHOF, a town of Germany, in the principality of Culmbach: two miles south of Lauenstein.

OT'TENSCHLAG, a town of Austria: seven miles south of Zwettl.

OT'TENSEN, a village of Holstein, on the right bank of the Elbe. At this place the duke of Brunswick died of the wounds he received at the battle of Jena, in 1807: two miles west of Altona.

OT'TENSTAIN, a town of Austria: eight miles east of Zwettl.

OT'TENSTEIN, a town of Germany, in the bishopric of Munster: twenty-five miles west-north-west of Munster.

OT'TER, *f.* [otep, Sax. *lutra*, Lat.] An amphibious animal that preys upon fish. See *MUSTELA*.—The toes of the *otter's* hinder feet, for the better swimming, are joined together with a membrane, as in the bevir; from which he differs principally in his teeth, which are canin; and in his tail, which is felin, or a long taper; so that he may not be unfitly called *putoreus aquaticus*, or the water-polecat. He makes himself burrows on the water-side, as a bevir; is sometimes tamed and taught, by nimbly surrounding the fishes, to drive them into the net. *Grew*.

Would you preserve a numerous finny race?
Let your fierce dogs the ravenous *otter* chase;
The amphibious monster ranges all the shores,
Darts through the waves, and every haunt explores. *Gay*.

OT'TER, an island in the North Sea, on the coast of Norway, at the mouth of Romsdal Bay. Lat. 62. 45. N. lon. 7. 9. E.

OT'TER, a river of England, which runs into the sea about five miles east of Exmouth.

OT'TER (John), professor of Arabic at Paris, was born in 1707, at Christianstad in Sweden, where his father, by commercial speculations, had amassed considerable property. In 1724, he was sent to the high school of Lund, where he applied also to natural philosophy and theology, under the direction of Rhydelius, the bishop of that place; but, by private intercourse with persons of the catholic persuasion, and the reading of catholic books, he began to entertain some scruples in regard to the reformation introduced by Luther; which induced him to repair to Stockholm, in order that he might have his doubts cleared up. A few months after, he abjured the Lutheran tenets; and count de Brancas, French ambassador at the Swedish court, resolved to send this new convert to France. Otter was admitted into the seminary of Rouen; and, after a residence of three years, was called to Paris by cardinal Fleury, the minister, who gave him an appointment in the post-office: a situation for which he was exceedingly well qualified, by an extensive knowledge of modern languages. Having soon recommended himself by his talents and assiduity to the notice of count Maurepas, that nobleman determined to send him to the east, in order that he might make himself master of the oriental languages; and at the same time discover the best means of reviving the French trade in Persia. In consequence of orders from the court, he embarked at Marseilles in January 1734, and arrived at Constantinople in the March following. His principal object, while in this capital, was to learn the Turkish and Arabic languages; and, for that purpose, he frequented the company of the most learned men in the city, whether Armenians or Turks, and particularly that of Ibrahim Efendi, a celebrated writer on geography, known by his works, and by the establishment of a printing-office at Constantinople. In the course of a little time he had acquired the principles of the Arabic; and was so completely master of the Turkish, that he found himself in a

condition to continue his journey to Persia; which he did in December 1736. After a journey of nearly eight months, he reached Ispahan, which at that time exhibited a most melancholy spectacle, having been reduced almost to a heap of ruins by the fury of the Afghans, who had over-run the whole empire. The situation of the empire at that period deterring Otter from making any attempts towards the re-establishment of the French trade in Persia, he confined himself to the second object of his journey, which was to make himself acquainted with the Persian and other eastern languages. After a residence of twenty months at Ispahan, he set out, in April 1739, for Busfora on the Persian gulf, which at that time was subject to the dominion of Achmed pacha of Bagdad, who ruled with unlimited sway, though a vassal of the grand signior. As the commerce of this town had risen to a most flourishing state on the ruins of the Persian trade, Otter flattered himself with the hope that the pacha, who was accounted one of the greatest politicians of his time, would readily listen to the proposals, which he had not ventured to make to the Persian usurper; and with that view he proceeded to Bagdad. Here he soon procured access to the pacha; and, having met with a cordial reception, he transmitted an account of his success to the marquis de Villeneuve, the French ambassador at Constantinople, by whose means a treaty, favourable to the wishes of the French government, was at length concluded. Otter then embarked on the Tigris, and returned to Busfora, where he resided all together nearly four years, first in a private capacity, and then as consul of the French nation.

The commotions by which Persia had been agitated spreading at length to Busfora, the spirit of insurrection rose to such a height, that, in the year 1741, the neighbouring Arabs, throwing off all restraint, appeared in a state of open rebellion. Besides keeping the town blockaded for nearly two months, they plundered the merchants, and committed every kind of excess, in the neighbouring district. Otter, who at this time was shut up in the place, participated in the general terror; but he did not on that account neglect the study of the Arabic, which he assiduously prosecuted, under the direction of the most expert masters. He improved himself also in the Turkish language, by his own application, and by frequenting the company of a dervish, celebrated for his genius and learning. With the help of his preceptor, he began a translation of the New Testament into the Turkish language, for the use of the Christians in that neighbourhood, most of whom were not sufficiently well acquainted with the Arabic to understand the version of the Maronites; and the work was nearly completed, when he received orders, in the month of May, 1743, to return to France; which he did by the way of Constantinople, whence he proceeded by sea to Marseilles, where he arrived in the month of January, 1744, after an absence of about ten years. Having been accustomed, during his travels, to keep a journal of every thing remarkable that occurred to him, he revised this work after his return, and published it, under the patronage of count Maurepas, with the title of "*Voyages en Turquie et en Perse, avec une Relation des Expéditions de Thamas Kouli Khan; Paris, 1748.*" This work, besides a great many useful observations in regard to the names and situations of places determined by Arabian astronomers, remains of antiquity, natural history, and the manners and customs of the Persians and other eastern nations, contains a short account of the revolution effected in Persia by the celebrated Kouli Khan, with some anecdotes of his life, which are the more worthy of notice, as the author was on the spot; and had an opportunity of seeing the facts he relates, or of receiving them from persons deserving of credit.

Soon after his return to France, he was appointed, by count Maurepas, to be interpreter of the oriental languages in the king's library; an office which enabled him to render the knowledge he had acquired during his long travels of more utility to literature. As he now had free access

access to a most valuable collection of manuscripts, he resolved to examine those of the historical class, and to compile from them, a view of the various political changes produced by the followers of Mahomet, from the origin of their religion to the present time; taking, as the foundation of his work, the writings of the celebrated Noviar, an historian of the fourteenth century, who, according to the testimony of the abbé Longuerue, in his History of the Arabs, is one of the most authentic sources of information on that subject. In the year 1746, after completing a part of this undertaking, he was appointed regius professor of Arabic; in 1748, he was elected a member of the Academy of Inscriptions; and soon after his admission he read, in that assembly, a Dissertation on the Conquest of Africa by the Arabs, enriched with a great many learned observations, as a specimen of his proposed work; and this was to have been followed by another on the conquest of Spain; but, in consequence of his premature death, the work remained unfinished, as did several others which he had projected, and particularly a French translation of Dalin's History of Sweden, begun at the request of his friend and patron Maurepas. He died of a putrid fever at Paris, in the month of September, 1749, before he had completed the forty-second year of his age. Otter was a man of great learning and integrity; mild in his manners, and of a modest deportment. *Hist. de l'Acad. des Inscriptions*, tome xxiii.

OTTER BAY, a bay on the south coast of Newfoundland, near Cape Ray.

OTTER CREEK, a river of Kentucky, which runs into the Ohio in lat. 37. 45. N. lon. 86. 24. W.

OTTER CREEK, a river of Virginia, which runs into the Staunton in lat. 36. 55. N. lon. 79. 30. W.

OTTER CREEK, a river of Vermont, which runs into Lake Champlain five miles north-west Newhaven. Lat. 44. 13. N. lon. 73. 20. W.

OTTER'S HEAD, a lofty rock on the north shore of Lake Superior, in lat. 48. 4. N. lon. 85. 55. W.

OTTER PEAKS, a mountain of Virginia: one hundred miles west of Richmond.

OTTERBACH, a river of France, which rises near Weissemburg, and runs into the Rhine about ten miles above Germerheim.

OTTERBERG, late a town of France, in the department of Mont Tonnerre: five miles north of Kayerslautern.

OTTERBURN, a village in the county of Northumberland, near Eldon. This was the field of battle between the English and Scots in 1388, wherein Henry Percy, called Hotspur, was taken prisoner, and Douglas, the Scots general, was killed. On this battle was founded the delightful old ballad of Chevy-chase, the village being situated by the river Rhead, on the south side of the Cheviot Hills. The entrenchments are still visible, and a number of tumuli scattered over the adjacent ground, to mark to future ages the slaughter made there.

Rocheffer is another little village near Otterburn to the north-west, on the Watling-street road, and on the river Rhead, near the source of it. It has furnished some Roman antiquities, as altars, inscriptions, &c.

OTTERBURN, a small village in Hampshire, about midway between Winchester and Southampton, being six miles from each. Near this is Cranbury, the seat of sir Nathaniel Dance, bart. which commands delightful prospects of the Isle of Wight, Southampton-river, &c. It is an extensive mansion, with suitable offices, gardens, &c. well stocked with exotics, and every necessary. A beautiful ruin of an obelisk lies in the park.—Silkstead is to the right of Otterburn, and Bishop's Stoke to the left. In this last parish is the hamlet of Fair Oak.

OTTTERSBERG, a town of the duchy of Bremen, defended by a fort with four bastions: thirty-four miles south of Stade, and sixteen east of Bremen. Lat. 53. 9. N. lon. 9. 11. E.

OTTERSEE, a town of the duchy of Bremen: two miles from Ottersberg.

OTTERTON, a village in Devonshire, near the influx of the river Otter into the sea, on the south-west side of Sidmouth; with two fairs, on Wednesday in Easter-week, and the first Wednesday after Oct. 10. It had formerly a priory.

At a village near this place, in the year 1814, a curious antique purse was dug up, of which the following account, comprehending also some interesting particulars relating to Otterton and its priory, was sent to the Antiquarian Society.

"In taking down a hedge some time since, near the stream at the western extremity of the village of Budleigh-Salterton, there was found, under the root of an elm, a curious antique, which deserves the attention of such as are fond of antiquarian research. The material of which it is made is metal, which appears to be of a mixed nature, containing a large proportion of brass, and somewhat resembling bronze. It consists of an oblong ring, sufficiently large to admit the middle joints of a moderately-sized fore-finger, to which is hung, on a pivot, a small beam, like the beam of a pair of scales, six inches and a half in length, and half an inch in breadth; from the end of this beam is suspended a double oblate thin frame, the two parts of which are joined by a hinge on each side, and open nearly in the manner of the steel frame of a modern card-purse, and, when open, present a perfect ellipse. The frame is nearly eight inches in its longest diameter, four inches and a half in its shortest, and about a quarter of an inch in thickness. The metal is somewhat corroded by lapse of time, but not so much as to render the inscription on it incapable of being deciphered. The letters are engraved, and the cavities have been filled up by some metallic substance of a lighter colour, which appears to be neither silver nor lead, as it yields no impression to any instrument, but cracks on being strongly pressed by a knife. The motto on the beam, is the salutation of the angel Gabriel to the Virgin Mary, in small old English characters: AVE MARIA GRĀ PLENA, is on one side; and, on the other, DOMINUS TECUM. On each half of the oblate frame is inscribed, in Roman capitals, SOLI DEO HONOR ET GLORIA. Its form shows it most clearly to have been the frame of a purse, which was affixed to it by threads passing through four-and-twenty holes, the perforations still remaining. The inscription proves it to have been intended for sacred use, being dedicated to the honour and glory of God. There is only one purpose for which a purse is used in the performance of divine offices in the Romish church; and that is for conveying the silver vase, containing the consecrated oil, for the administration of extreme unction. But how could a purse of this description find its way to so remote a corner as Budleigh-Salterton? It is clearly ascertained, by the evidence of various authentic records, many of them still existing in the Tower, or Court of Exchequer, inspected by sir William Pole in preparing his collections towards a History of Devonshire, and particularly specified by bishop Tanner in his Notitia Monastica, that William the Conqueror, who distributed many allotments of his newly-acquired territory among his Norman subjects, conferred upon the abbey of St. Michael, *in periculo maris*, in Normandy, the district bounded on the east by the river Syd, on the west and north by the Otter, and on the south by the British Channel. This tract of land has a lofty ridge of hills passing through it, and terminated towards the sea by Peak-hill, which suggested the obvious division of it into two distinct manors, now constituting the two parishes of Sidmouth and Otterton. In each of these the abbey of St. Michael founded a priory of Benedictine or black monks, which, on the suppression of alien priories, were annexed to the monastery of Sion in Middlesex, (1 Ed. IV.) and, at the general dissolution of monasteries, they were granted (31 Hen. VIII.) as parcel of the endowments of Sion, to John Duke, who made the priory-house at Otterton, the principal part of, which still exists, his place of residence; and in the possession of whose family it continued

tinued till a few years since, when it was sold by their representatives, the Rev. Duke Yonge and others, to the father of the present lord Rolle.

"It was the usual practice of monastic establishments to augment their original endowments, by procuring the right of advowson to adjacent parishes, and appropriating to the support of the monastery the rectorial tithes; presenting one of their own body to the care of souls, and allotting the small tithes for the endowment of the vicarage. The parish of East-Budleigh, in which the hamlet of Salterton is situated, being an adjoining parish to Otterton, was obtained by the priory, either through purchase or donation, and appropriated in the usual manner. On the recent sale of an estate in Salterton, there was found, among the title-deeds, a permission for the monks of Otterton to make salt at the salt-works at Salterton. This document accounts for Salterton being frequented by ecclesiastics, though a very small and obscure hamlet, where no church or chapel had ever been erected. Connecting these several circumstances together, there appears to be considerable ground of probability for the suggestion that the sacred purse in question belonged to the monks of Otterton-priory; that it was brought to Salterton by one of the fraternity, who came to administer extreme unction to a dying labourer employed in their own salt-works; and that it was either stolen by artifice, lost by accident, or secreted by design, for the purpose of security on some emergent occasion. At all events, the discovery of this relic is somewhat interesting, if the investigation of it has only contributed incidentally to the elucidation of local history, or helped to ascertain the origin of the name of a hamlet now growing up into an agreeable little watering-place, which, from the salt-works carried on near the estuary of the Otter, evidently acquired the appellation of Salterton."

OTTERY, MOUNT-OTTERY, or UPPER-OTTERY, a village in Devonshire, on the north-west side of Axminster, is the place where the spring of the Otter, or Autre, river, makes the first show of a stream.

OTTERY ST. MARY, a market-town in the county of Devon, situated near the bank of the river Otter, at the distance of $12\frac{1}{2}$ miles from the city of Exeter, and 161 from London. It is a large irregularly-built town; and is chiefly supported by its manufactories of flannel, serge, and other woollen goods. The market-day is Tuesday; and Carlisle states that there are fifteen fairs annually. Wilkes gives it two market-days, Tuesday and Saturday; and three fairs, Tuesday se'nnight before Easter, Whit-Tuesday, and the 15th of August. Here is a grammar-school, formerly kept by the father of the poet Coleridge.

Edward the Confessor, or earl Otho, gave the manor of Ottery to the cathedral of St. Mary at Rouen in Normandy; but, in the reign of Edward III. the dean and chapter, with the king's permission, sold it to Grandison bishop of Exeter, who founded a college in the parochial church here, "for a warden, eight prebendaries, ten vicars, a master of music, a master of grammar, two parish-priests, eight secondaries, eight choristers, and two clerks." At the dissolution, the endowments were valued at 338l. 2s. 9d. and the site of the college was granted by Henry VIII. to Edward earl of Hertford. The chief part of the manor now belongs to sir George Yonge. Some of the old collegiate houses are still to be seen. In one of these buildings is a large hall, which Oliver Cromwell used as a convention-room; and in Mill-street are the remains of the ancient mansion of the celebrated sir Walter Raleigh.

The situation of this town is extremely pleasant and healthy. The principal building is the church, which is very large, and has many singularities in its construction. On each side is a square tower, opening into the body of the church, and forming two transepts, as in Exeter cathedral. The towers are furnished with pinnacles and open battlements; that on the north has also a small spire. At the north-west corner is a richly-orna-

mented chapel, built by bishop Grandison; the roof of which is covered with highly-wrought fan-shaped tracery. The interior of the church is sadly neglected; many of the monuments are broken, and various parts filled up with lumber. The altar-screen is of stone, finely carved into niches and tabernacle-work; but this is partly covered with boards, and painted. On the south side of the communion-table are three stone seats, rising one above another. Most of the windows are narrow, and lancet-shaped.

In 1811, Ottery St. Mary contained 583 houses, and 2880 inhabitants. The petty sessions for the hundred are held here.

Clyst-house, lately built by lord Graves, occupies the site of one of the ancient palaces of the bishops of Exeter. It is a very noble edifice, and commands several rich and extensive views over the adjacent country.—The other principal seats in this vicinity are, Cadhay, and Farington-house. The latter is a very spacious mansion, and surrounded by luxuriant plantations. Windmill-hill, near this house, is said to have been the position of a Roman encampment. *Beauties of England and Wales*, vol. iv. *Wilkes's British Directory*, vol. v. Appendix. *Gent. Mag.* April 1819, which contains an engraving of the church.

OTTFRIDE, a German benedictine monk, who flourished towards the middle of the ninth century, was a disciple of Rabanus archbishop of Mentz, and spent the greater part of his life in the monastery of Weissenburg, in Lower Alsace. He distinguished himself by the progress which he made in sacred and profane literature, and wrote a variety of works in prose and verse. He directed his attention to the improvement and purification of the German language, then called the *Teutonic*; and with this view drew up a Grammar, or rather perfected in part that commenced by the emperor Charlemagne. In order that the common people might be instructed in the gospel-history, he wrote a work in Teutonic rhymes, divided into five books, containing the principal circumstances of the life of Christ, taken from the four evangelists, and digested into the order of time. This work was published, but from a corrupt and mutilated copy, by Flacius Illyricus, in 1571, 8vo. A much larger, and more correct, copy, is preserved in the imperial library at Vienna, of which a particular account, together with the long preface, and various specimens of the work itself, are given by Lambecius, in his *Comment. de Augusta Bibl. Cæsar. Vindobon.* vol. ii. The preface, above-mentioned, is inserted in the sixteenth volume of the *Bibl. Patr.* Lambecius also gives an account of other works of Otfride in the same collection; among which are, 2. Homilies, in Teutonic, upon the Evangelists. 3. Paraphrases on the Songs of Isaiah, Ezekiel, &c. the Lord's Prayer, the Song of Zacharias, of the Virgin Mary, and the Creed of St. Athanasius. *Cave's Hist. Lit.* vol. ii.

OTTINGBA'U, a town of Meckley, in Thibet: sixty-eight miles west of Munnypour.

OTTMARSHEIM, a town of France, in the department of the Upper Rhine: eight miles north of Huningen.

OTTMACHAU, a town of Silesia, in the principality of Neisse, on the river Neisse: six miles west of Neisse, and ten south-east of Munsterberg. Lat. 50. 20. N. lon. 17. 2. E.

OTTO GUERICHE. See GUERICHE, vol. viii.

OTTO VENIUS, or VAN VEEN. See VENIUS.

OTTOBEUREN, a princely abbey of Germany, first founded in the year 764, under the cathedral of Augsburg, but at present exempt from all subordination, having in the year 1626 paid to the cathedral the sum of 100,000 florins, in consideration of which it renounced all supremacy, jurisdiction, and authority, together with the power of imposing taxes, over it; which agreement was confirmed by the emperor. The convent was immediately under the empire; and, as such, used formerly to be summoned to the imperial diet; but this privilege has for a long time been discontinued; and, in 1802, the revenues

venues were secularised, and given to Bavaria. Near it is a market-town, over which it is possessed of criminal jurisdiction, as a fief of the empire, granted to it in the year 1512 by Charles V. It is twenty-five miles south-east of Ulm, and thirty-one south-west of Augburg.

OT'TOK, a town of Croatia: twenty-eight miles south-south-west of Carlsbad.

OT'TOMAN, or OTHOMAN, an appellation given to the empire of the Turks, or rather to their emperors, from Othomannus, or Osman, the first prince of the family. This Osman, to distinguish his followers from others, gave them the name of *Osmannes*, from which, by the change of the *s* into *t*, we have made Ottomans; which new name soon became formidable to the Greeks of Constantinople, from whom Osman conquered a sufficient extent of territory to found a powerful kingdom. He soon bestowed on it that title, by assuming, in 1300, the dignity of Sultan, which signified absolute sovereign. The true era of the Ottoman empire may be dated from the conquest of Prusa. The establishment of the Ottomans in Europe took place A.D. 1353. See TURKEY.

OTTO'NE, a town of Sardinia: twenty-one miles north-east of Genoa.

OTT'SBERG, OTZBERG, or UTZBERG, a town of Hesse Darmstadt: twenty-six miles north of Heidelberg, and six south-east of Darmstadt.

OTTWEILER, late a town of France, in the department of the Sarre, situated among mountains; and containing a castle, a Protestant and a Roman-catholic church. It is thirteen miles north of Saarbruck, and forty south-east of Treves.

OTUBUE, a small island in the South Pacific Ocean, near the coast of Bolabola.

OTUGUNGE, a town of Bengal: twenty-four miles south of Calcutta.

OTURA, a town of Spain, in the province of Grenada: five miles south of Grenada.

OTUTUELA. See MAOUNA.

OT'WAY (Thomas), an eminent writer of tragedy, born in 1651 at Trotten in Sussex, was the son of the rector of Woolbeding in that county. He received his school-education at Winchester; and was entered a commoner of Christ-church, Oxford, in 1669; but the narrowness of his circumstances, and perhaps an irregularity of disposition, caused him to leave the university without a degree, and without any professional determination. Going to London, his resource against want was to commence actor; and he made some attempts in that capacity, but with little success. As he was possessed of talents for poetry, it was natural that he should turn his thoughts to writing for the stage; and in 1675 he produced his first tragedy, "*Alcibiades*," which was acted at the duke's theatre. In the following year, he brought out at the same theatre his "*Don Carlos, Prince of Spain*," which proved highly successful. From some illiberally-sarcastic lines of lord Rochester in his Session of the Poets, it appears, that the profits of this play rescued the author, for a time at least, from a state of extreme indigence. His theatrical exertions also introduced him to the acquaintance of men of fashion and pleasure; and the patronage of the earl of Plymouth, a natural son of Charles II. procured him the commission of a cornet in the new-raised troops destined for Flanders in 1677. He accompanied his regiment to that country; but soon returned, pursued by his habitual poverty. He continued to write for the stage as his sole means of subsistence, which small encouragement, or dissolute habits, rendered very scanty and precarious. He translated two pieces from the French, composed licentious and indifferent comedies, and two more tragedies, namely, "*The Orphan*" in 1680, and "*Venice Preserved*" in 1682, on which his fame is founded.

Though he was permitted to join men of quality in their parties of debauchery, he obtained no substantial favour from them; and, to avoid his creditors, was obliged to lodge at a public-house on Tower-hill, where,

in 1685, he miserably terminated his unhappy life, at the early age of thirty-four. It is a traditionary story, that, being nearly famished, he begged a shilling of a gentleman, who gave him a guinea, and that he was choked by ravenously devouring a roll which he then bought. Dr. Johnson hopes the case was not so bad; and Pope was informed that Otway died of a fever, occasioned by his exertions in the pursuit of a thief who had robbed one of his friends. It is not doubted, however, that he closed his life under the pressure of severe penury. His memory, associated with the tender scenes that he has written, has been celebrated in various pathetic lamentations for his hard fate; but, like many of his fellow-sufferers, he was too deficient in moral qualities to excite that regard which is the only foundation of sober sympathy. Besides the dissoluteness of manners displayed in his life and writings, he was a shameless flatterer of the great, and seems to have had no other public principle than a servile attachment to authority.

To Thomas Otway was reserved the honour of giving tragedy its true and genuine tone of language, divested of unnatural flight and unnecessary pomp. This writer began, like the rest of our dramatic poets in that age, with tragedy in rhyme. But he wanted the variety and harmony of Dryden's numbers; nor had he his various learning, or reasoning faculty, to embellish and diversify his tragedies in rhyme. He soon followed that poet's example, and relinquished his chiming fetters for blank verse, which approaches nearest to the iambic of the ancients. Otway, like Dryden, warmed his genius with the fire of Shakespeare; but, not content with borrowing from his original, he stole whole scenes from *Romeo and Juliet*, and incorporated them in his "*Caius Marius*:" this, indeed, he acknowledges in his prologue.

"But the reputation of Otway for pathetic powers was, by the success of his *Orphan*, justly exalted above all the dramatists of his own and succeeding times. The characters, by being brought nearer to the condition of the audience, more deeply interest their passions than the fate and fortune of persons who are eminently placed above them. A young lady, destitute of fortune, and who had lost her parents, left, when a child, to the care and protection of a nobleman, the friend of her dead father, is passionately solicited by his two sons, Castalio and Polydore. The pretensions of the elder, unknown to his brother, are founded on honourable love. The younger, confiding in the sincerity of his brother's declaration, that he would never marry Monimia, but strive to gain her for a mistress, is impelled to affront her with his *brutal passion*, as she rightly terms it; for his address, however justified in the rank days of Charles II. would scarcely now be tolerated in a brothel. During the progress of their courtship, Chamont, the young lady's brother, arrives; and, on the information of an old woman, whom the author's poetical fancy transforms into a witch, he questions his sister on her present situation. The scene is varied with beautiful imagery and affecting passion. Polydore, the younger brother, by the help of a page, discovers Castalio's treachery; and, not knowing of their marriage, listens, and overhears the appointment of the new-married pair. By a stratagem, he contrives to impose himself, in the dark, on Monimia, for his brother; and enjoys her. The distress, raised in consequence of this, ends in the death of the lady and the two rival brothers. From a plot so simple, the author has raised pathetic scenes, which, from their first representation to the present day, have melted into tenderness the heart of every spectator. The language is easy, flowing, and familiar; sufficiently forcible, without degenerating into vulgarism; it is occasionally strengthened by pleasing description and warm imagery. Had it been raised to greater force, by higher exertion of the poet, it would neither have suited the plot nor the characters. In the character of *Acasto*, Otway has drawn a portrait of a worthy nobleman, who, retired from court, retains his

veneration and loyalty for his royal master. Of all the noblemen who in the reign of Charles II. distinguished themselves for worth and attachment to their royal master, James duke of Ormond stands the foremost; and I cannot avoid conjecturing, that his character is here shadowed, at least part of it, under Acasto. What strengthens my opinion is, the discourse of the two servants, Paulino and Ernesto, in the first scene. Paulino, after expressing his wonder that Acasto should still persist in hating the court, where he was born and bred, is informed by Ernesto that he had reason for his disgust:

When, for what he had borne,
Long and faithful toil, he might have claim'd
Places in honour and employment high,
A huffing, thining, flatt'ring, cringing, coward,
A canker-worm of peace, was rais'd above him.

That Ormond was displaced from his government of Ireland, where he was beloved by all ranks of people, by the ungrateful Charles, to gratify the worst man in the kingdom, Villiers duke of Buckingham, is a fact, to which, I think, Otway alludes. It is true, Ormond did not, like Acasto, retire from court, but kept his place of steward of the household; which office, Charles, who respected virtues, though he wanted the honesty to imitate them, had not the courage to take from him.

"The fable of Venice Preserved afforded a larger field for the exertion of Otway's abilities than the catastrophe of an unhappy marriage in a private family. A plot, formed for the destruction of a state, is a subject that would rouse the genius of any writer. The story is taken from St. Real's Conspiracy of the Marquis de Bedamar and the Duke d'Osuna against the Republic of Venice. The narrative of St. Real is skilfully written; but is by no means superior to the English tragedy, as Voltaire presumptuously asserts. In the History, you have some characters strongly marked and well delineated; more especially of that extraordinary man, the marquis of Bedamar, the most accomplished politician then living; you have likewise a good outline of the most remarkable conspirators, particularly Pierre and Renault. But can we compare a bare narrative with the animated dialogues of Pierre and Jaffier, and the heartfelt scenes of anguish between the lovely distressed Belvidera and her almost-distracted husband? In St. Real, Jaffier becomes a conspirator against the state of Venice, in whose military service he was employed, from the hopes of plunder, and his attachment to Pierre, his friend. In the tragedy, he is driven to the utmost distress, with a wife whom he tenderly loves, by a cruel father-in-law; and, though nothing can justify treason, yet, surely, the being surprised into a conspiracy by extreme want, and the insidious arts of a man he esteems to be a friend, exhibits motives less fordid than the other. St. Real's account of the conspiracy resembles a gloomy representation of a storm, interspersed with flashes of lightning which serve to make the picture more terrible and deformed. The scenes of conflicting passions, animated by interesting situations of character, render Venice Preserved a grand historical painting, worthy the pencil of the most accomplished artist." Davies's Dramatic Miscellanies, vol. iii.

We have mentioned five tragedies written by Otway. He produced also, 6. Titus and Berenice, a tragedy. 7. The Cheats of Scapin, a farce. 8. Friendship in Fashion, a comedy. 9. The Soldier's Fortune, a comedy. 10. The Atheist, or The Second Part of the Soldier's Fortune, a comedy, 1684.

Besides these plays, Otway made some translations, and wrote several miscellaneous poems. His whole works were printed in 3 vols. 12mo. 1757. and 4 vols. 8vo. 1813.

In the year 1719 was printed a piece ascribed to Otway, but certainly not written by him, called "Heroic Friendship," a tragedy. At the time of his death, however, he had made some progress in a play, as will appear from the following advertisement, printed in L'Estrange's Obser-

vator, Nov. 27, 1686: "Whereas Mr. Thomas Otway, some time before his death, made four acts of a play; whoever can give notice in whose hands the copy lies, either to Mr. Thomas Betterton, or to Mr. William Smith, at the theatre royal, shall be well rewarded for his pains." *Biographia Dramatica*.

OU-ANG-KIANG', a town of China, of the third rank, in Kiang-nan: twenty-eight miles south-west of Ngan-king.

OU-CHANG', a town of China, of the third rank, in Se-tchuen: eighteen miles east of Koei-tcheou.

OU-HO, a town of China, of the third rank, in Kiang-nan: twenty-five miles east-north-east of Fong-yang.

OU-KANG', a town of China, of the third rank, in Tche-kiang: twenty-three miles north-north-west of Hang-tcheou.

OU-KANG', a city of China, of the second rank, in Hou-quang. Lat. 26. 40. N. lon. 110. 48. E.

OU-KIAM', a town of China, of the third rank, in Pe-tche-li: twelve miles east of Ching.

OU-KIANG', a town of China, of the third rank, in Kiang-nan: nine miles south of Sou-tcheou.

OU-KIAO', a town of China, of the third rank, in Pe-tche-li: twelve miles south-east of King.

OU-KU'EN, or VOU-RING', a city of China, of the second rank, in Yun-nan. Lat. 25. 34. N. lon. 102. 20. E.

OU-LONG', a town of China, of the third rank, in Se-tchuen: forty-five miles south-south-east of Pei.

OU-MONG', a city of China, of the first rank, in Se-tchuen. Lat. 27. 20. N. lon. 103. 29. E.

OU-NHING', a town of China, of the third rank, in Kiang-nan: thirty-two miles north-east of Nhing-tcheou.

OU-PING', a town of China, of the third rank, in Fo-kien: forty-five miles south-south-west of Ting-tcheou.

OU-POEY-TSE', *f.* A name given by the Chinese to a kind of nests made by certain insects upon the leaves and branches of the tree called *yen-fou-tse*. These nests are much used in dyeing, and the physicians employ them for curing many distempers. Some of these nests were brought to Europe, and put into the hands of the celebrated Mr. Geoffrey. After having examined them with the utmost attention, this learned academician thought he perceived some conformity in them to those excrescences which grow on the leaves of the elm, and which the vulgar call *elm-bladders*: he found these nests so sharp and asfringent to the taste, that he considered them far superior to every other species of galls used by the dyers. According to him, they are the strongest asfringents existing in the vegetable kingdom. It is certain, that there is a great affinity between the ou-poe-y-tse and the elm-bladders. The form of both is unequal and irregular; they are covered on the outside with a short down, which renders them soft to the touch; within they are full of a whitish-grey dust, in which may be observed the dried remains of small insects, without discovering any aperture through which they might have passed. These nests or bladders harden as they grow old; and their substance, which appears resinous, becomes brittle and transparent: however, the Chinese do not consider the ou-poe-y-tse, notwithstanding their resemblance to elm-bladders, as excrescences of the tree *yen-fou-tse*, upon which they are found. They are persuaded, that insects produce a kind of wax, and construct for themselves on the branches and leaves of this tree (the sap of which is proper for their nourishment) little retreats, where they may wait for the time of their metamorphosis, or at least deposit in safety their eggs, which compose that fine dust with which the ou-poe-y-tse are filled. Some of the ou-poe-y-tse are as large as one's fist; but these are rare, and are generally produced by a worm of extraordinary strength, or which has associated with another, as two silk-worms are sometimes seen shut up in the same ball. The smallest ou-poe-y-tse are of the size of a chestnut; the greater part of them are round and oblong; but they seldom resemble

one another entirely in their exterior configuration. At first, they are of a dark-green colour, which afterwards changes to yellow; and the husk, though pretty firm, becomes then very brittle.

The Chinese peasants collect these ou-poey-tse before the first hoar-frosts. They take care to kill the worm inclosed in the husks, and to expose them for some time to the steam of boiling water, like our treatment of silkworms. Without this precaution, the worm might soon break through its weak prison, which would immediately burst and be useless. The ou-poey-tse are used at Pekin for giving paper a durable and deep-black colour; in the provinces of Kiang-nan and Tche-kiang, where a great deal of beautiful satin is made, they are employed for dyeing the silk before it is put on the loom. The Chinese literati also blacken their beards with them when they become white. The medicinal properties of the ou-poey-tse are very numerous. The Chinese physicians introduce them into the composition of many of their remedies. They recommend them for stopping bleedings; they consider them as an excellent specific for curing inflammations and ulcers, and for counteracting the effects of poison; and they employ them with success in the dropsy, phthisis, epilepsy, catarrhs, sickness, fluxions of the eyes and ears, and in many other disorders.

OU-POU', a town of China, of the third rank, in Honan: twenty-five miles east of Hoai-king.

OU-POU', a town of China, of the third rank, in Chen-si, on the river Hoang: twenty-two miles east of Soui-te.

OU-TA'I, a town of China, of the third rank, in Chan-si: twenty-seven miles south-east of Tai-tcheou.

OU-TAM', a town of China, of the third rank, in Pe-tche-li: thirty-three miles south-east of Pekin.

OU-TCHANG', a city of China, of the first rank, in Hou-quang, on the river Yank-tse: 532 miles south of Pekin. Lat. 30. 36. N. lon. 113. 50. E.

OU-TCHOU', a city of China, of the first rank, in Quang-si. All the rivers of the province unite near this city, which joins to the province of Quang-tong, and is the key of the whole province, and the most considerable city for commerce in it. It hath one city of the second order, and nine of the third, within its jurisdiction. The country is partly mountainous, and partly flat. In the mountains is found cinnabar, and the uncommon tree called quang-lang, which, instead of pith, hath a soft pulp, of which they make flour. Lat. 23. 28. N. lon. 110. 32. E.

OU-TCHOU', a town of China, of the third rank, in Koei-tcheou: twenty miles north of Se-nan.

OU-TCHU'EN, a town of the kingdom of Corea, in King-ki: fifty-five miles south-south-east of King-ki.

OU-TCHU'EN, a seaport-town of China, of the third rank, in Quan-tong: twenty miles south-south-east of Hoa.

OU-TING', a city of China, of the first rank, in Yun-nan. Lat. 25. 53. N. lon. 102. 6. E.

OUA-CONG-YN', a town of Thibet: thirty-two miles south-west of Hami.

O'VA PIS'CIUM, in botany. See COIX.

OU'ABASH. See WABASH.

OUACHI'TA, or OUACHIT'TA, a county and parish of the territory of New Orleans, which, in the year 1810, contained only 1077 inhabitants. The staples of this territory are cotton, tobacco, lumber, and peltries. Ouachitta River, sometimes called Black River, is not navigable in autumn, when the waters are low, for any vessels above the size of canoes.

The hot-springs of Ouachitta, which have been known for many years, are situated on a stream called Hot-spring Creek, which falls into the Washitaw river eight miles below. They lie fifty miles south of the Arkansaw river, in Clark county, territory of Arkansaw, (lately Missouri,) and six miles west of the road from Cadron to Mount Prairie, on Red River. The approach to the springs lies

up the valley of the creek. On the right of the valley rises the Hot Mountain, with the springs issuing at its foot; on the left, the Cold Mountain, which is little more than a confused and mighty pile of stones. The Hot Mountain is about three hundred feet high, rising quite steep, and presenting occasionally ledges of rocks; it terminates above in a confused mass of broken rocks. The steep and otherwise sterile sides are covered with a luxuriant growth of vines. The valley between this and the Cold Mountain is about fifty yards wide. The springs issue at the foot of the Hot Mountain at an elevation of about ten feet above the level of the creek: they are very numerous all along the hill-side; and the water, which runs in copious streams, is quite hot: it will scald the hand, and boil an egg hard in ten minutes. Its temperature is considered that of boiling water; but Dr. Andrews, of Red River, thinks it is not above 200° Fahrenheit.

OUA'DA, or Go'A, a town of Sardinia, on the borders of France: eighteen miles north-north-west of Genoa, and fifteen south of Alexandria.

OU'AGIK, a town of Asiatic Turkey, in Natolia: three miles south of Ismid.

OUA'IS's BAY, a bay on the north coast of the island of Cape Breton.

O'VAL, *adj.* [*ovale*, Fr. from *ovum*, Lat. an egg.] Oblong; resembling the longitudinal section of an egg.—The mouth is low and narrow, but, after having entered pretty far in the grotto, opens itself on both sides in an oval figure of an hundred yards. *Addison on Italy.*

Mercurius, nearest to the central sun,
Does in an oval orbit circling run;
But rarely is the object of our sight,
In solar glory sunk.

Blackmore.

O'VAL, *f.* A triangle is that which has three angles, or an oval is that which has the shape of an egg. *Watts's Logic.*—The proper oval, or egg-shape, is an irregular figure, being narrower at one end than it is at the other; that is, the extreme breadth is not in the middle of its length. In this it differs from the *ellipse*, which is equally broad at both ends. In the common acceptation of the word, the two curves are confounded together; and even geometers call the oval a false ellipse. *Chambers.*

OUALAL'DE, a town of Africa, in the country of the Foulahs, on the side of the Senegal. Lat. 18. 45. N. lon. 13. 8. W.

OUAL'LE (Alonso de), a Jesuit, born at Santiago in Chili, and procurador-general of the order in that province. He came to Rome to obtain a supply of missionaries, and there published "Historica Relacion del Reyno de Chile, y de las Misiones y Ministerios que exercita en el la Compania de Jesus, 1646." This book is dedicated in the title "A Nuestro Senor Jesu Christo Deos Hombre, y a la Santissima Virgen y Madre Maria Senora del Cielo y de la Tierra, y a los Santos Joseph, Joachin Ana, sus padres y aguelos." "This (says Mr. Southey) is a book of great value, though it is meanly printed, and the engravings are execrably bad. At the end of the copy now before me, are some views of the Jesuit settlement in Chili, and of the six principal forts, which were published separately, to be purchased at pleasure. They are, without an exception, the very worst wood-cuts I have ever seen." An abridgment of this work of Ovalle is in Churchill's Collection. *Gen. Biog.*

O'VALLY, *adv.* In the manner of an oval.

OU'AN, a town of Corea: fifty-three miles west-south-west of Koang.

OU'AN, a town of China, of the second rank, in the island of Hai-nan: seventy-five miles south of Kiong-tcheou.

OUAN-LIN-HO'TUN, a town of Chinese Tartary: 588 miles north-east of Pekin.

OUAN-NGAN', a town of China, of the third rank, in Kiang-si: thirty-eight miles north of Kan-tcheou

OUAN.

OUAN-NI'EN, a town of China, of the third rank, in Kiang-si: twenty miles south-south-east of Yao-tcheou.

OUAN-TAI, a town of China, of the third rank, in Kiang si: fifteen miles north of Yuen-tcheou.

OUANAMIN'THE, a town of Hispaniola: fifteen miles south-east of Fort Dauphin.

OUAN'DA, a province of Congo, south-east of Pemba.

OU'ANG KO'A, a town of Corea: twenty-eight miles east-south-east of Koang-tcheou.

OUANGA'RUM, a river of Canada, which runs into the St. Lawrence in lat. 44. 37. N. lon. 75. 45. W.

OUAN'NE, a town of France, in the department of the Yonne: nine miles south-west of Auxerre, and twelve north of Clamecy.

OUAQUAPHEN'OGAW, EKANFANO'KA, or OKER-FON'OKÉ, a marshy lake in the state of Georgia, between the Oakmulgee and Flint Rivers.

O'VAR. See ALTENBURG.

O'VAR, a town of Portugal, in the province of Beira: fifteen miles north-north-east of Braganza Nova, and fifteen south of Oporto.

OUA'RA, a town of Hindoostan, in Bahar: sixty-five miles south-south-west of Patna.

OUARAN'GUE, a small island in the Atlantic, near the coast of Africa. Lat. 11. 32. N.

QUAR'DAN. See VARDAN.

OVA'RIOUS, *adj.* [from *ovum*, Lat.] Consisting of eggs:

He, to the rocks

Dire clinging, gathers his *ovarious* food. *Thomson.*

OVA'RIMUM, *f.* [Latin.] In botany, a name by which botanists, who are fond of assimilating the animal and vegetable kingdoms, have distinguished the germen or seed bud, as containing the rudiments of the future seed.

OU'ARVILLE, a town of France, in the department of the Eure and Loire: ten miles north north-west of Janville, and twelve south-east of Chartres.

O'VARY, *f.* [*ovarium*, Lat.] The part of the body in which impregnation is performed. See the article ANATOMY, vol. i. and CONCEPTION, vol. v.—The *ovary*, or part where the white involveth it, is in the second region of the matrix, which is somewhat long and inverted. *Brown's Vulgar Errors.*

O'VATE, *adj.* [*ovatus*, Lat.] Of an oval figure; marked ovally.—Two rows on each side of the belly consist of larger scales, *ovate* and imbricate. *Russell's Account of Indian Serpents.*

OVA'TION, *f.* [Fr. *ovatio*, Lat.] The smaller triumph among the Romans, allowed to those commanders who had won a victory without much bloodshed, or defeated some less-formidable enemy.—The *ovation* was first introduced in the year of Rome 325, in honour of the consul Posthumius Tubertus, after his defeating the Sabines. *Chambers.*

Ovation was allow'd

For conquest purchas'd without blood. *Hudibras.*

The procession generally began at the Albanian Mountain, whence the general with his retinue made his entry into the city on foot, (sometimes on horseback, but never in a chariot,) with flutes or pipes sounding in concert as he passed along, and wearing a garland of myrtle as a token of peace. The term *ovation*, according to Servius, is derived from *ovis*, a sheep; because on this occasion the conqueror sacrificed a sheep, as in a triumph he sacrificed a bull. The senate, knights, and principal plebeians, assisted at the procession; which concluded at the Capitol.

OUBEQUE'ME, the left branch of the river MECON. See that word, vol. iv.

OUBIN'SKOI, or VOBR'FSKOI, mountains of Russia, which form, at the sources of the Ouba and Ulba, a considerable ridge, towering in lofty summits to high snow-mountains, sending out its branches on both sides of those rivers, especially between them, and at its foot bordered by the Irtysh. The greatest height rises near Vobrosskaia with porphyry, which in the north and south

is frequently changed for granite, whose summits, sometimes with gentle, and then with bold, ascents, surround the most delightful vales, abounding in odoriferous herbs of various kinds. In the region about the fortress Oustkameneyorsk, the granite is under-run by schistose earth, in ancient times explored by the Tshudi, who took pleasure in mining. The mountains in which are the sources of the Ouba consist of granite, porphyry, marlstone, petrosilex, and quartz. Towards the east the Oubinskoi mountains rear their lofty summits, which, measured with the line, were found to be 5691 English feet above the water of the river Ouba, which devolves its pleasant streams beneath their monstrous cliffs. In these mountains have been lately found the Filipofskoi mines, on the Ulba, which promise great success, together with other mines. *Tooke's Russia*, vol. i.

OU'BY. See OBY.

OUCAR'RA, a town of Hindoostan, in the Mysore: five miles south of Sattimungulum.

OU'CENTA, a town of Naples, in Lavora: twelve miles east of Capua.

OUCH, *f.* The blow given by the tusk of a boar. *Ainsworth.*

OUCH, *f.* [*nusca*, *nuca*, low Lat. a button; whence perhaps *nouch*, or *nouch*, and so *ouch*. *Tyrwhitt.*] The bezel or socket for fastening the precious stones in the shoulder-pieces of the high-priest's ephod.—These *ouches* with their stones, served for buttons to fasten the golden chains whereby the breast-plate was hung. *Brown's Dict. Bible.*—Thou shalt make them to be set in *ouches* of gold. *Exod. xxviii. 11, 25.*—A collar of gold, or such like ornament, worn by women about their necks. 24 *Hen. VIII. c. 13.*

A Persian mitre on her head

She wore, with crowns and *ouches* garnished. *Spenser.*

OU'CHE, a river of France, which runs into the Saône twelve miles below Dijon.

OU'CHI, a town of Switzerland, on the lake of Geneva. It is the port of Lausanne.

OU'CHTERMUCHTY, a town in the county of Fife, Scotland, was constituted a royal borough by king James IV. and the charter was subsequently confirmed by James VI. This place still continues to enjoy all its original privileges, except the right of sending members to parliament, or to the convention of royal boroughs. The government is vested in three baillies and fifteen counsellors, who are elected annually; and there is a weekly market for provisions. A very considerable manufacture of brown linens and Silesias is carried on here, as are likewise some tan-works. The parish extends about two miles in length and one and a half in breadth, and displays much variety of surface. In the immediate vicinity of the town the soil is gravelly, but, at a greater distance, is fertile. Freestone and marl are abundant. According to the parliamentary returns of 1811, the whole parish comprises 525 houses, and a population of 2403 persons. *Beauties of Scotland*, vol. iv.

OU'DAL, a town of Norway, in the province of Aggerhuus: forty miles north-east of Christiania.

OU'DAPOUR, a town of Bengal: fifteen miles east of Comillah.

OU'DATUM-OU'DOU'C, a town of Chinese Tartary. Lat. 45. 9. N. lon. 121. 28. E.

OU'DE, a province or soubah of Hindoostan, the dominions of which lie on both sides of the Ganges, occupying (with the exception of Fezoola Cawn's district of Rampour) all the flat country between that river and the northern mountains towards Thibet, as well as the principal part of the fertile tract lying between the Ganges and Jumnah, known by the name of Doob, to within forty miles of the city of Delhi. On the east and south-east it is bounded by Bahar, on the south by Allahabad, ceded by treaty to the English in 1793, and on the west by Agra. According to the statement of Major Rennell, the dimensions of Oude, and its dependencies, may be reckoned,

OVEN.

1, 2. Oven without flues. 3 to 10. Portable Oven.

reckoned 360 British miles in length from east to west, and in breadth from 150 to 180; and their area is about one-third part of that of the Bengal provinces; being to each other in the proportion of 53 to 162. Generally speaking, the whole territory is one continued plain; and is a continuation of that extensive level valley through which the Ganges and its branches take their course. It is, moreover, the central part of the ancient kingdom or empire of the Prasi. Lucknow, situated on the river Goomty, and about 650 miles from Calcutta, is its present capital; having superseded Fyzabad, a city on the Gogra, near the ancient city of *Aiudh*, which seems to have given name to the province. The city of *Aiudh* or Oude, the author of the *Ayeen Akberry* says, was in his time the largest city in Hindoostan; he mentions it as a place of peculiar sanctity: Ferishtah boasts of its existing two thousand years before the Christian era. See the article *HINDOOSTAN*, vol. x. p. 2. The nabob of Oude is in alliance with the British power: and a brigade of the Bengal army is constantly stationed on his western frontier; thus answering the purposes of covering Oude as well as Bengal, and of keeping the western states in awe. The whole expense of it is paid by the nabob of Oude, by a stipulated sum, under the name of a subsidy, amounting annually to 420,000l. provided the Sicca rupee be valued at 2s. 1½d. The late nabob of Oude, Sujah Dowlah, possessed, at the time when he first became an ally of the East India company, the whole soubah of Oude, and the greatest part of Allahabad; to which, in 1774, were added the eastern parts of Delhi and Agra, till that time possessed by a tribe of Afghan Rohillas, and by the Jats. The zemindary of Benares, which includes also the circars of Gazypour and Chunar, constituted a part of the dominions of Oude until the year 1775, when its tribute or quit-rent of 24 lacks (since increased to 40) was transferred to the English. This zemindary, which was lately in the hands of Chut Sing, occupies the principal part of the space between Bahar and Oude, so that only a small part of the territory of the latter touches Bahar on the north-west. The revenues of Oude under Aurungezebe amounted to 80½ lacks of rupees; but they have more lately been reckoned in the gross amount at about 2,500,000l. sterling; of which the new acquisitions of Rohilcund, Corah, and other parts of the Dooab, are more than one million. The military establishment, including the troops employed in the collection of the revenues, is from 50 to 60,000 men; but few of them deserve the name of regular troops.

The province of Oude is watered not only by the Ganges, but by the Jumnah, Agra, Goomty, and several smaller streams; these flow through most of the principal towns, and are navigable for boats in all seasons of the year. They present strong barriers against the neighbouring powers. Oude has seven circars, viz. Bahraitch, Canoge, Goorackpour, Kairabad, Lucknow, Manickpour, and Oude Proper.

OUDE, a circar of Hindoostan, in the soubah of Oude, bounded on the north by Bahraitch, on the east by Goorackpour, on the south by Jionpour and Manickpour, and on the west by Lucknow; about forty-five miles long, and sixteen broad. Fyzabad is the capital.

OU DENAR'DE, a town of the kingdom of the Netherlands, in the province of East Flanders, on the Scheldt, between Ghent and Tournay, about fifteen miles from the former and twenty from the latter. This city appears to have had its origin in very distant times; some say, as far back as the year 411, from a castle built here by the Gotlis. But we may with more probability date its rise from a castle built by count Baldwin of Lile in 1053. The town was extended and fortified under the reign of Philip of Alsace, who built towers and made a bridge over the Scheldt, which divides the place into two jurisdictions. It was afterwards so well fortified by Francis la Noue, a French Calvinist, that it obtained the name of "Little Rochelle." Here are two parish-churches,

VOL. XVIII. No. 1224.

five gates; and many good buildings. The town-house is a remarkable gothic edifice: here is also a college. In this place was born Margaret of Parma, governess of the Low Countries, natural daughter of Charles V. Its population is 5000. Under the walls was fought, July 11, 1708, the famous "battle of Oudenarde, wherein the allies, under the duke of Marlborough and prince Eugene, obtained a splendid victory over the French commanded by the dukes of Burgundy and Vendome. See the article *ENGLAND*, vol. vi. p. 706, 7. It fell into the hands of the French republicans on the 3d of July, 1794; and afterwards formed part of the "department of the Scheldt." By the treaty of Vienna, June 1815, it was assigned to the newly-created kingdom of the Netherlands. *Géographie du Royaume des Pays Bas*; Brussels, 1819.

OU DENAR'DE (Robert Van), a painter and engraver; was born in the year 1663 at Ghent; but his biographer is of opinion that the family was originally of the place which is the subject of the preceding article, and took their name from thence. Oudenarde applied himself to the study of art at a very early period of life, under the direction of Van Cleef, and other Flemish masters. He afterwards travelled to Rome for improvement, and was received into the academy of Carlo Maratti. At this period he is spoken of with praise as a painter; but we shall here consider him only as an engraver. His early progress in the latter art was interrupted by an act of professional indiscretion, which is thus related by Strutt. "He frequently used to amuse himself at his leisure with the point; and being pleased, as it should seem, with a sketch of his master representing the Marriage of the Virgin, he etched a plate from it, of which Carlo Maratti knew nothing, until, the impressions being circulated about, he accidentally saw one of them in a print-shop, and by enquiry soon discovered its author. Oudenarde felt severely the effects of his resentment, which he carried to such a height, that he forbade him to approach his school, declaring he would never see his face again." Maratti, however, though warm in his resentment, was not implacable; and it seems not improbable that the assiduity of Oudenarde was quickened by this occurrence; for he soon made so great progress in engraving, that Maratti was extremely pleased, and many of his best pictures were, at his own instance, put into the hands of Oudenarde to engrave.

As to the merits of Oudenarde, Strutt judiciously observes, "the plates which were done by this artist entirely with the graver, are not equal to those where he also used the point; they are cold and destitute of effect, and often, from his great solicitude to avoid an outline, his draperies appear heavy, and want sharpness in the folds. The same heaviness appears also in his heads and other extremities, and all the naked parts of the figure in general; as I think will readily be allowed, on examination of that which represents the Assumption of the Virgin, from Carlo Maratti, a middling-sized upright plate; which, if compared with the slight etching of Hagar and Ishmael, from the same master, I think the spirit of the latter will well repay the want of that neatness which is found in the former. Oudenarde certainly possessed great knowledge of the human figure, and his drawing is seldom incorrect."

During his stay in Italy, cardinal Barbarigo, with becoming regard for the fame of his ancestry, engaged our artist to engrave the portraits of the distinguished men of that family, with emblematical accompaniments. The work consists of a hundred and sixty-five plates, and for some years remained imperfect on account of the death of the cardinal; but at length the five plates which were wanting to its completion, were engraved at the expense of one of his descendants; and the work appeared at Padua, in large folio, accompanied by Latin poetry, in the year 1762. After residing seventeen years in Italy, Oudenarde returned to his native city, where he died in 1743, being fourscore years of age.

OU'DENBORG, a town of the Netherlands, in the province of West Flanders: six miles south-east of Ostend.

OU'DENBOSCH, a town of the Netherlands, in the province of North Brabant: ten miles west of Breda.

OU'DERKERCH, a town of the Netherlands, in the province of South Holland: six miles south of Amsterdam.

OU'DESCARPEL, a village of Holland, on the Langedike.

OU'DESLUYS, a sluice and village of Holland, at the point on the Zipe-canal: eight miles south of the Helder.

OU'DEWATER, i. e. OLD WATERS, a town of the Netherlands, in the province of South Holland, with a population of about 1660 persons. It is situated on the Little Issel, between Woerden and Schoonhoven, about three miles from each, and on the confines of the provinces of Holland and Utrecht. It obtained the privileges of a city in the year 1254 from Henry de Vianen bishop of Utrecht. In the year 1575 it was taken by assault, pillaged, and burned, by the Spaniards, under the command of Gilles de Barlamont lord of Hierges, after they had been obliged to raise the siege of Leyden. Among the people who were murdered by the Spaniards, were the mother, sisters, and brothers, of the celebrated James Arminius, who was born here in the year 1560. It is twenty miles south of Amsterdam, and ten south-west of Utrecht.

OU'DGAH, a town of Bengal: fifty-four miles south-east of Doesa.

UDGASTEL, a town of the Netherlands: twelve miles west of Breda.

UDIGHIR', a town of Hindoostan, in the country of Dowlatabad: five miles north-west of Beder, and 110 north-west of Hydrabad.

OU'DIN (Casimir), a learned French monk, but who afterwards embraced the Protestant religion, was born at Mezieres on the Meuse, in the year 1638. He discovered an early inclination for learning; and, having gone through his course of rhetoric, at the age of eighteen he entered among the monks of the Premontré order, at the abbey of St. Paul at Verdun. Here he applied to the study of philosophy and divinity, and afterwards directed his particular attention to ecclesiastical history. From this time we find no mention of him before the year 1675, when he had entered into holy orders, and was appointed incumbent of Epinay in the diocese of Rouen. In 1677 he resigned this benefice, and in the following year was placed by his superiors in the abbey of Bucilly in Champagne. He was here in the year 1680, when Louis XIV. in the course of one of his journeys, stopped to take his dinner at the abbey. On this occasion Oudin, in the absence of the abbot and prior, was directed to compliment the king, and do the honours of the house; when he surprised his majesty with the proofs which he afforded of his abilities and address. A discovery being thus accidentally made of Oudin's talents and the bent of his genius, his general sent him, in the same or during the following year, on a visit to all the abbeys and churches belonging to his order, for the purpose of selecting from their archives such documents as might assist him in his enquiries into ecclesiastical history. He first visited all the monasteries in the Netherlands, whence he brought back with him a rich supply of materials; and in 1682 he made the same researches in the religious houses of Lorraine, Burgundy, and Alsace. In 1683 he was sent to Paris; where he formed connections with several eminent characters in the republic of letters; and in 1688 he published a work, by which he acquired great credit, entitled "*Supplementum de Scriptoribus vel Scriptis ecclesiasticis a Bellarmino omisiss, ad annum 1460, vel ad artem typographicam inventum*," 8vo. A revolution afterwards taking place in his religious sentiments, in the year 1690 he withdrew from France and went to Leyden, where he renounced the popish creed, and made a public profession of the Protestant religion. Soon after this he was ap-

pointed sub-librarian of the university of Leyden, and retained that post till his death in 1717, when in the seventy-ninth year of his age. He was the author of, 2. *Acta Beati Lucæ Abbatis Cuiusiacensis*, 4to. 3. *Veterum aliquot Galliarum et Belgii Scriptorum Opuscula sacra nunquam edita*, 1692, 8vo. 4. *Epistola de Ratione Studiorum suorum*, 1692, 4to. 5. *Trias Dissertationum criticarum: Prima de Codice manuscripto Alexandrino Bodleianæ Bibliothecæ; Secunda de Quæstionibus ad Antiochum Principem in Scripturam Sacram: Tertia de Collectaneo seu Collectione Antiquitatum Constantinopolitarum Anselmi Bandurii*, 1717, 8vo. 6. *The Premontré Monk unfrocked*. His principal work, however, was published from his papers after his death, and is entitled, 7. *Commentarius de Scriptoribus Ecclesiæ Antiquis, illorumque Scriptis; adhuc extantibus in celebrioribus Europæ Bibliothecis, a Bellarmino, Possævino. Phil. Labbeo, Guil. Caveo, El. du Pin, &c. 1722*, in three volumes, folio. *Saxii Onomast. Lit. pars v.*

OU'DIN (Francis), a learned French Jesuit, was born at Vignory in Champagne, in the year 1673. He was sent when very young to commence his studies at Langres; and made so rapid a progress, that his uncle, John Oudin, a worthy and learned canon of the cathedral in that city, was determined himself to undertake his tuition. Under his instructions, Francis Oudin, who possessed an excellent memory and a lively genius, soon made a considerable progress in the sciences and the belles-lettres. As soon as he had gone through his course of philosophy, he determined on embracing the ecclesiastical profession; and commenced his noviciate among the Jesuits at Nancy in 1691. In 1707 he took the four vows, and was afterwards admitted to holy orders. Having fixed his residence at Dijon, in pursuance of the will of his uncle, who had on that condition left him an annuity, he filled the rhetorical chair in the college of that city for fifteen years successively, and then the chair of positive theology for fifteen years more, with very high reputation. He died at Dijon in 1752, at the age of seventy-nine. Father Oudin had diligently studied the sacred scriptures, the councils, and the fathers. He was intimately acquainted with the Latin, Greek, Spanish, Portuguese, Italian, and English, languages; and was profoundly skilled in the knowledge of sacred and profane antiquities, and the science of medals. He was also distinguished by his taste in polite literature, and had a wonderful facility in composing Latin verses. Many of his poems, Odes, Elegies, Hymns, &c. are enumerated by Moreri, and the greater part of them were inserted in a collection, entitled "*Pœmata didascalica*," in three volumes, 12mo. His various prose productions were also very numerous, consisting of Orations, Dissertations, Eulogies, Lives of different writers, inserted in Father Nicéron's *Memoires*, and other pieces, which are pointed out by Moreri, as well as the collections in which they may be found. He published a Latin Commentary on St. Paul's Epistle to the Romans, 1743, 12mo. and he wrote Commentaries on the Psalms, the Gospel of St. Matthew, and almost all the Epistles of St. Paul, which are still in manuscript. It was his intention to have written Commentaries on all the books of Scripture; but from this design he was diverted by the direction of his superiors, who employed him on a continuation of the "*Bibliotheca Scriptorum Societatis Jesu*," which was begun by father Ribadeneira, and brought down to the year 1573 by fathers Alegambe and Sotwell or Southwell. On this work many of his last years were spent; and he had prepared for the press the first four letters, and written more than seven hundred articles for the remainder of the work, before his death. His additions are said to be admirably executed; but, owing to the extinction of the society, and the declining interest of the public in what relates to their literary history, it is not probable that they will ever be given to the world. *Gen. Biog.*

OU DIPOU'R, MEYWAR', or MIDWAR, a province of Hindoostan, belonging to the Rajpoots, about 100 miles square, situated on the east of the river Puddah. In former times, it is probable that the whole Rajpootana constituted one kingdom or empire under the rajah or prince of Oudipour, who has always been considered as the head of the Rajpoot states. Oudipour is very mountainous, with a sandy soil in the valleys. Its revenue in the year 1779 was estimated at ten lacks of rupees per annum.

OU DIPOU'R, a city of Hindoostan, and capital of a circar to which it gives name, in the country of Agimere: 120 miles south-south-west of Agimere, and 260 south-west of Agra. Lat. 24. 42. N. lon. 74. 42. E.

OU DO'BO, a country of Africa, subject to Benin.

OU'DON, a river of France, which runs into the Orne at Caen.

OU'DON, a town of France, in the department of the Lower Loire: four miles west of Ancenis, and fifteen north-east of Nantes.

OU'DSONG-PANDANG', JOU'DANDAN, or ROT'TERDAM, a fortress of Celebes, near Macassar.

OU'E, a mountain of Persia, in Chorasán: eight miles east of Kain.

OU'E-KIUM', a city of China, of the first rank, in Ho-nan, on the Ki river: 297 miles south-south-west of Pekin.

OU'E-TCHUEN', a town of China, of the third rank, in Ho-nan: eighteen miles north-east of Hiu-tcheou.

OU'EI, or YU, a city of China, of the second rank, in Chan-fi: 150 miles south-west of Tai-yuen.

OU'EI-LING', or YU-TING, a city of China, of the second rank, in Quang-fi: 117 miles south-south-west of Pekin.

OU'EI-LO', a town of Thibet: 295 miles south-west of Hami.

OU'EI-NING', a city of China, of the first rank, in Koei-tcheou. Lat. 26. 45. N. lon. 103. 50. E.

OU'EI-YU'EN, a town of China, of the third rank, in Se-tchuen: forty-two miles east-north-east of Kai.

OU'EI-YU'EN, a town of Thibet: 275 miles east-south-east of Hami.

OU'EI-YU'EN HO'TUN, a town of Corea: 450 miles east-north-east of Pekin.

OVELGUNN', a town of the duchy of Holstein: nine miles east-south-east of Eutyn.

OVELGUN'NE, or OVELGOENNE, a town of Germany, and chief place of a small free territory, which in the year 1653 was annexed to the comté of Oldenburg: sixteen miles north-east of Oldenburg.

OVELGUN'NE, a town of the duchy of Holstein: three miles south-east of Gluckstadt.

OV'ELTY, *f.* (a law term.) A kind of equality of service in subordinate tenures.

OVEN, *f.* [*ausfn*, Goth. *ofn*, Icel. *open*, Sax. "*Aphah* (Heb.) signifieth to bake, and to seethe, and to dress meat: *oven* seemeth to be derived of this word." Leigh's Crit. Sacra. 1650. p. 15.] An arched cavity heated with fire to bake bread.—Bats have been found in *ovens* and other hollow close places, matted one upon another; and therefore it is likely that they sleep in the winter, and eat nothing. *Bacon*.—The *oven* at Raby Castle was of dimensions suited to the hospitality of the pile; higher than a tall person, for the tallest may stand upright in it, and I think its diameter must be fifteen feet. At present it is converted into a wine-cellar; the sides are divided into ten parts, and each holds a hoghead of wine in bottles. *Pennant*.

He loudly bray'd, that like was never heard,

And from his wide devouring *oven* sent

A flake of fire, that, flashing in his beard,

Him all amaz'd.

Spenser.

OVENS in general use are made with flues, which destroy a great quantity of fire in its passage through them,

and much trouble is required to keep them heated. The fire, which should be employed in roasting meat, is in a great measure dissipated in the flue of the common ovens, if used at the time of roasting; or the common oven does not acquire sufficient heat to answer the purpose, unless much coal is consumed. To avoid these inconveniences, Mr. Holmes, of Castle-court, Strand, London, invented, in the year 1800, an oven which was heated *without flues*, for which, as he did not take out a patent, he received a premium of fifteen guineas from the Society of Arts. The invention consists of a cast-iron oven, with a solid piece of iron projecting from its side into the fire, in which this piece constantly remains, and, becoming red-hot, communicates sufficient heat for baking to the whole oven. The oven keeps continually at a baking-heat, without expense or trouble, as the common fire is sufficient for the purpose. Mr. Holmes's account to the society was accompanied by letters from several gentlemen who have had his ovens fixed in their houses, all of whom speak favourably of them. In addition to which, a committee of the society, in order to ascertain fully how the oven answered, ordered two ovens, of similar forms and dimensions, to be fixed to the sides of a fire-grate, in the model-room of the society, one of which ovens only differed from the other by the piece of cast-iron projecting from its side into the fire; both ovens were heated by the same fire, and fixed in mortar and brick-work in a similar manner. Two loaves, of equal size and quality, being prepared from the same dough, one was put into each oven; and, after remaining therein three quarters of an hour, they were taken out at the same time, and examined. The loaf from Mr. Holmes's oven was in every respect well-baked, but the other was dough-baked and imperfect. An oven upon Mr. Holmes's construction has been since fitted-up in the society's kitchen, which appears to answer every purpose that could be expected from its size, which is thirteen inches and a half wide at the door or in front, and fifteen inches deep. A reference to the annexed Plate, will explain more fully the construction of the oven, and its principle of action. Fig. 1. a perspective view of the oven. Fig. 2. an horizontal section of the same. A, that side of the oven which is placed next the fire. B, the projecting piece of iron, which remains stationary in the fire, and communicates heat to the oven. C, the door of the oven.

In the year 1801, Mr. Power, of Bury St. Edmund's, Suffolk, whitesmith, took out a patent for a *portable oven*, upon an improved construction. As we think this is a useful invention, we shall give a particular description of its parts. Fig. 3. represents the oven detached, so constructed as to be set over a laundry-stove, or any other small stove. Fig. 4. represents the oven and hot-closet complete. Fig. 5. is the inside-view of fig. 4. A, the hot-closet, which is gradually heated to any degree by means of the large valve in the chimney G. F, is the *splitter*, so called because it divides equally the heat of the fire, and throws it up the flues *a, a*, and heats both the oven and hot-closet. In case the splitter should retain too great a heat for the oven B, *b* is a valve for the reception of air, which may be regulated at option. H is the small valve (shown separately at fig. 10.) made round, and fixed about two inches from the front of the oven, with holes in the sides, to secure it from the foot falling into the oven; the use of this valve is in case any nauseous scent may arise from baking; for a current of air passes through the ventilator C, and carries the scent into an open chamber I. The large valve is about twelve inches from the extremity of the oven. K is the scraper, a piece of iron, carried over the hot-closet, which, when pulled out by the two handles *d, d*, scrapes the foot which adheres to the top, and carries it down the flues into an open chamber, L, L, and is swept out of the doors, E, E, by a brush. C, the furnace, which is about eight inches square at bottom, and regularly passed up the sides, front,

and

and back. *e, e, e, e*, are baking-tins. *D*, the cinder-hole. Fig. 6. is a baker's oven, similar in construction to the former one; but with these exceptions: it is four feet long, two deep, and two and a half high, with three ovens, two of which are regulated by ventilators at bottom. *L, L*, is an open chamber, to prevent too great or sudden heat from the splitter. Fig. 8. the ventilator, which is turned by the handle *f*, to enable *g* to admit or secure any quantity of air. Fig. 9. the large valve, which is placed in the chimney *G*, and acts as a damper, to graduate the heat to the hot-closet; it is made with sheet-iron, like the oven, the size of the oven-pipe, turned by a strong thick wire handle in its centre. Fig. 10. is on the same construction, except being closed at the top, with holes in the sides already specified, and rendered, when down, air-tight by two pieces of iron on each side, *i, i*. The splitter is formed of sheet-iron, as in fig. 7. The size of the oven may be varied as circumstances may require.

Admiral sir Isaac Coffin, bart. obtained a patent, in March 1810, for what he designates a *perpetual oven*. This oven is made of an oblong form, of sufficient length and breadth for the purpose intended, and may be formed of any material which will bear fire. A chamber in which the bread, &c. is baked, extends from end to end of the oven, and is open at both ends; that of the oven intended to bake sea-biscuit is twenty feet long, and four feet wide; it is ten inches high at the end farthest from the grate, where the fire is made, and decreases to six inches in height at the end next the grate; but the dimensions vary according to the nature of the article to be baked. This chamber is heated by flues, one of which passes above and the other beneath it, the fire-places of which are placed on each side of the same end of the oven, and are of such forms and dimensions as the heat wanted, and the fuel used, may require; and, beneath this chamber, a passage is made the whole length of the oven, open at both ends. Near each end of the oven is placed a roller of cast-iron, in a horizontal position, of about three feet in diameter, as long as the heated chamber is broad, and supported on its axis by frames of iron or wood. Over these rollers passes an endless web of wire-cloth, of iron or other metal, of somewhat open texture, and rather coarse and strong, of nearly the breadth of the heated chamber, which it traverses near its floor, and returns through the open passage beneath it; it is kept from rubbing on the floor of the heated chamber by iron friction-rollers of two or three inches in diameter, and from six to twelve inches apart, lying across the chamber, and having their axes on an iron frame. When this oven is used, it is first brought to a sufficient heat by means of the flues described, the biscuit or bread is then placed on the endless web or wire-cloth, at the farthest end from the fires; and, by turning the roller near the fire-place slowly, it passes on with the web into the heated chamber, and, by properly proportioning the slowness of the motion to the degree of heat, which experience will soon teach, the bread will come out, at the end where the fire-places are, sufficiently baked, and may be either taken off or suffered to fall off. Fresh biscuits or bread must be continually laid on the wire-cloth as it enters, so that a constant succession may be kept up. A very light door of sheet-iron, or other metal, may be hung at each end of the heated chamber from the top, so as to prevent the escape of much heat, and not to interfere with the entrance and exit of the wire-cloth and substances laid on it. The ceiling of the heated chamber rises gradually from the end next the fire to the opposite end, where the bread enters, for the purpose of facilitating the issue of the steam from the bread or biscuit at the end at which they enter. Cordwood is the best fuel to use upon the grates; but peat or coke, or any kind of fuel which yields little smoke, may also be used. Coals, which generate much soot, would too soon choke up the flues, and prevent the heat from penetrating into the chamber. In small ovens the endless

web may be dispensed with, and a wire-cloth stretched upon a light frame of iron, of the length of the oven, be used, which, with the bread, &c. placed upon it, is to be pushed in at the farthest end from the fire, and to be gradually advanced to the other end, at which it is as gradually withdrawn.

The patentee states, that, by this mode of baking, time, fuel, and labour, are saved, and the bread is better baked, as it experiences the lowest degree of heat when it first enters the oven, and regularly advances to a hotter situation, as it dries and is better able to endure it: the drying is also facilitated by the escape of the steam at the end of the chamber where the bread enters, instead of being confined, as in the common oven; and the bread or biscuit, lying on the open wire-cloth, has the heat admitted freely to all its parts: by this means it is dried sooner when it leaves the oven, and will keep longer. The baker has it also in his power to roll the biscuit, &c. out of the oven the instant he discovers it to be done enough: he may keep the heat of the oven regulated to a proper degree by means of thermometers, and a judicious management of the fires.

The principal objection to the above-described apparatus, would arise from the liability of the wire-cloth to be broken and destroyed, by the frequent bending which it must experience in passing round the rollers. But it is probable that this might be remedied, by putting the wire-web in narrow frames of iron, connected together side-ways by rings, and using polygonal prisms, in the place of the cylindrical rollers, with sides of a fit size each to receive one of the frames.

OUEN-CA'I, a city of China, of the second rank, in Koei-tcheou. Lat. 27. N. lon. 106. 20. E.

OUEN-TCHANG', a town of China, of the third rank, in the isle of Hai-nan: thirty-two miles south-east of Kiong-tcheou.

OUEN-TCHEOU', a city of China, of the first rank, in Tche-kian, on a river, with a good harbour, not far from the sea: 765 miles south-east of Peking. Lat. 28. 1. N. lon. 120. 29. E.

OUEN-TCHUEN', a town of Corea: eighty-five miles north-east of King-ki-tao.

OUEN-Y', a town of Corea: twenty miles south-south-west of Ou-tcheou.

OUEN-YEN', a town of Corea: thirty-three miles south-south-west of Ou-tcheou.

OV'ENDEN, a village in the west riding of Yorkshire, with about 4513 inhabitants: two miles north-west of Halifax.

OUENS-OUET', a town of Corea: forty miles west-north-west of Ou-tchuen.

OU'EPAS, a town of Mexico, on the coast of Costa Rica, south of Carthago.

O'VER hath a double signification in the names of places, according to the different situations of them. If the place be upon or near a river, it comes from the Saxon *oppe*, "a brink or bank;" but, if there is in the neighbourhood another of the same name, distinguished by the addition of "nether," then *over* is from the Gothic *ufar*, "above." *Gilson's Camden*.

O'VER, *prep.* [*ufar*, Goth.] Above; with respect to excellence or dignity.—It will afford field enough for a divine to enlarge on, by shewing the advantages which the Christian world has *over* the Heathen. *Swift*.

How happy some *o'er* other some can be!
Through Athens I am thought as fair as she. *Shakespeare*.

High, *over* all, was your great conduct shown:
You fought our safety, but forgot your own. *Dryden*.

Above, with regard to rule or authority. Opposed to *under*.—The church has *over* her bishops, able to silence the factious, no less by their preaching than by their authority. *South*.—Captain, yourself are the fittest to live and reign, not *over*, but next and immediately *under*, the people. *Dryden*.—Above in place. Opposed to *below*.

Thrice

Thrice happy is that humble pair,
Beneath the level of all care;
Over whose heads those arrows fly,
Of sad distrust and jealousy.

Waller.

Acrofs; from side to side: as, He leaped *over* the brook.
—Certain lakes and pits, such as that of *Avennes*, poison
birds which fly *over* them. *Bacon's Nat. Hist.*

The geese fly *o'er* the barn, the bees in arms
Drive headlong from their waxen cells in swarms. *Dryden.*

Through, diffusively.—All the world *over*, those that received not the commands of Christ and his doctrines of purity and perseverance, were signally destroyed. *Hammond*.—Upon.—Wife governours have as great a watch *over* fames as they have of the actions and designs. *Bacon.*

Angelic quires

Sung heavenly anthems of his victory
Over temptation and the tempter proud.

Milton.

It is in all senses written in poetry, by contraction, *o'er*.

O'VER, *adv.* Above the top.—Give, and it shall be given unto you; good measure, pressed down and shaken together, and running *over*, shall men give. *Luke vi. 38.*—More than a quantity assigned.—Even here, likewise, the laws of nature and reason be of necessary use; yet somewhat *over* and besides them is necessary, namely, human and positive law. *Hooker*.—When they had mete it, he that gathered much had nothing *over*, and he that gathered little had no lack. *Ex. xvi. 18.*—The eastern people determined their digit by the breadth of barley-corns, six making a digit, and twenty-four a hand's breadth; a small matter *over* or under. *Arbuthnot*.—From side to side.—The fan of the Indian king, made of the feathers of a peacock's tail, composed into a round form, bound altogether with a circular rim, above a foot *over*. *Grew*.—From one to another.—This golden cluster the herald delivereth to the Tirfan, who delivereth it *over* to that fon that he had chosen. *Bacon*.—From a country beyond the sea.—It hath a white berry; but is not brought *over* with the coral. *Bacon's Nat. Hist.*

They brought new customs and new vices *o'er*;
Taught us more arts than honest men require. *Philips.*

On the surface.—The first came out red all *over*, like an hairy garment. *Genesis*.—Past. This is rather the sense of an adjective.—Soliman pausing upon the matter, the heat of his fury being something *over*, suffered himself to be intreated. *Knolles*.—Meditate upon the effects of anger; and the best time to do this, is to look back upon anger when the fit is *over*. *Bacon*.

There youths and nymphs in consort gay
Shall hail the rising, close the parting, day;
With me, alas! with me those joys are *o'er*,
For me the vernal garlands bloom no more. *Pope.*

Throughout; completely.—Have you read *o'er* the letters I sent you? *Shakespeare*.—Let them argue *over* all the topics of divine goodness and human weakness, yet how trifling must be their plea! *South's Sermons*.—With repetition; another time.—When children forget, or do an action awkwardly, make them do it *over* and *over* again, till they are perfect. *Locke*.—If this miracle of Christ's rising from the dead, be not sufficient to convince a resolved libertine, neither would the rising of one now from the dead be sufficient for that purpose; since it would only be the doing that *over* again, which hath been done already. *Atterbury*.

Thou, O my Hector, art thyself alone,
My parents, brothers, and my lord, in one:
Oh! kill not all my kindred *o'er* again,
Nor tempt the dangers of the dusty plain;
But in this tower, for our defence, remain. *Dryden.*

He cramm'd his pockets with the precious store,
And every night review'd it *o'er* and *o'er*. *Harte.*

Extraordinary; in a great degree.—The word symbol should not seem to be *over* difficult. *Baker*.

OVER AND ABOVE. Besides; beyond what was first supposed or immediately intended.—Moses took the redemption-money of them that were *over and above*. *Numb. iii. 49.*—He gathered a great mass of treasure; and gained, *over and above*, the good will and esteem of all people wherever he came. *L'Estrange*.

OVER-AGAINST. Opposite; regarding in front.—In *Ticin* is a church with windows only from above. It reporteth the voice thirteen times, if you stand close by the end of the wall, *over-against* the door. *Bacon*.—I visit his picture, and place myself *over-against* it whole hours together. *Addison*.

TO GIVE OVER. To cease from:

These, when they praise, the world believes no more
Than when they promise to give scribbling *o'er*. *Pope.*

To attempt to help no longer; as, His physicians have given him *over*; His friends, who advised him, have given him *over*.

In composition it has a great variety of significations: it is arbitrarily prefixed to nouns, adjectives, or other parts of speech, in a sense equivalent to more than enough; too much.

O'VER, *adj.* Upper:

For these my hands from this my face shall rip,
Even with this knife, my nose and *over* lip. *Mir. for Mag.*

TO O'VER, *v. a.* To get over; to get through: an elliptical expression in the North: as, "I am afraid he'll not *over* it;" i. e. will not recover from his illness. *Pegge*.

O'VER, a village in Gloucestershire, south-west of Chipping-Sodbury, in the hundred of Langley and Swinehead. The manor-house is large, with a park, in which the traces of a large round camp are still visible.

TO OVER-ABOUND, *v. n.* To abound more than enough.—The learned, never *over-abounding* in transitory coin, should not be discontented. *Pope's Letters*.

Both imbibe

Fitting congenial juice, so rich the soil,
So much does fructuous moisture *o'er-abound*. *Philips.*

TO OVER-ACT, *v. a.* To act more than enough.—Princes' courts may *over-act* their reverence, and make themselves laughed at for their foolishness and extravagant relative worship. *Stillingfleet*.—Good men often blemish the reputation of their piety, by *over-acting* some things in religion; by an indiscreet zeal about things wherein religion is not concerned. *Tillotson*.—He *over-acted* his part; his passions, when once let loose, were too impetuous to be managed. *Atterbury*.

TO OVER-ACT, *v. n.* To act more than is requisite.—There, while they acted and *over-acted*, among other young scholars I was a spectator; they thought themselves gallant men, and I thought them fools; they made sport, and I laughed. *Milton's Apol. for Smeclymnus*.

You *over-act*, when you should under-do:
A little call yourself again, and think. *B. Jonson.*

TO OVER-AGITATE, *v. a.* To discuss or controvert too much.—What is fit to be determined in a business so *over-agitated*, I shall shut up in these propositions. *Bp. Hall's Cases of Consc.*

OVER-ANXIOUS, *adj.* Over-careful; too anxious.

OVER-ANXIOUSLY, *adv.* With too great anxiety.

TO OVER-ARCH, *v. a.* To cover as with an arch:

Where high Ithaca *o'erlooks* the floods,
Brown with *o'er-arching* shades and pendant woods. *Pope.*

TO OVER-AWE, *v. a.* To keep in awe by superior influence.—The king was present in person to overlook the magistrates, and to *over-awe* these subjects with the terror of his sword. *Spenfer on Ireland*.

T

Her

Her graceful innocence, her every air
Of gesture, or least action, *over-aw'd*
His malice.

Milton's *P. L.*

To OVER-BAL'ANCE, *v. a.* To weigh down; to preponderate.—The hundred thousand pounds per annum, wherein we *over-balance* them in trade, must be paid us in money. *Locke*.—When these important considerations are set before a rational being, acknowledging the truth of every article, should a bare fingle possibility be of weight enough to *over-balance* them? *Rogers*.

OVER-BAL'ANCE, *f.* Something more than equivalent.—Our exported commodities would, by the return, encrease the treasure of this kingdom above what it can ever be by other means than a mighty *over-balance* of our exports to imported commodities. *Temple*.

OVER-BAL'ANCING, *f.* An over-balance; that which has a power to out-weigh. *King Charles*.

OVER-BAT'TLE, *adj.* [Of this word I know not the derivation; *batten* is to grow fat, and to *battle* is at Oxford to feed on trust. *Johnson*.—It may be from the Sax. *batan*, to bait. But Mr. Stephens says, that *bat* is an ancient English word for *increase*. Perhaps it is from the Goth. *ga-batan*, to advantage. *Todd*.] Too fruitful; exuberant.—In the church of God sometimes it cometh to pass, as in *over-battle* grounds; the fertile disposition whereof is good, yet, because it exceedeth due proportion, it bringeth abundantly, through too much rankness, things less profitable, whereby that which principally it should yield, either prevented in place or defrauded of nourishment, faileth. *Hooker*.

To OVER-BEAR, *v. a.* To repress; to subdue; to overwhelm; to bear down.—What more savage than man, if he see himself able by fraud to over-reach, or by power to *over-bear*, the laws? *Hooker*.—Take care that the memory of the learner be not too much crowded with a tumultuous heap or *over-bearing* multitude of documents at one time. *Watts*.—The horror or loathsomeness of an object may *over-bear* the pleasure which results from its greatness, novelty, or beauty. *Addison*.

The ocean, over-peering of his list,
Eats not the flats with more impetuous haste
Than young Laertes, in a riotous head,
O'er-bears your officers.

Shakespeare.

To OVER-BEN'D, *v. a.* To stretch too intensely.—Consumptions, upon intemperances and licentiousness; madness, upon misplacing or *over-bending* our natural faculties; proceed from ourselves. *Donne's Devot.*

To OVER-BID, *v. a.* To offer more than equivalent: You have *o'er-bid* all my past sufferings,
And all my future too.

Dryden's *Spanish Friar*.

To OVER-BLO'W, *v. n.* To be past its violence.—All those tempests being *over-blown*, there long after arose a new storm, which over-run all Spain. *Spenser*.

Led with delight, they thus beguile the way,
Until the blustering storm is *over-blown*.

Spenser.

This agree-fit of fear is *over-blown*;
An easy task it is to win our own.

Seiz'd with secret joy

When storms are *over-blown*.

Dryden's *Virgil*.

To OVER-BLO'W, *v. a.* To drive away as clouds before the wind:

Some angel, that beholds her there,
Instruct us to record what she was here;
And, when this cloud of sorrow's *over-blown*,
Through the wide world we'll make her graces known.

Waller.

OVER-BOARD, *adv.* Off the ship; out of the ship.—The great assembly met again; and now, he that was the cause of the tempest being thrown *over-board*, there were hopes a calm should ensue. *Howell*.—A merchant having a vessel richly fraught at sea in a storm, there is but one

certain way to save it, which is, by throwing its rich lading *over-board*. *South*.

The trembling dotard to the deck he drew,
And hoisted up, and *over-board* he threw;
This done, he seiz'd the helm.

Dryden.

To OVER-BOIL, *v. a.* To boil too much.

OVER-BO'LD, *adj.* Too bold; impudent.

OVER-BO'LDLY, *adv.* With too much boldness, with impudence.—St. Hierom reporteth, that he saw a satyr; but the truth hereof I will not rashly impugn, or *over-boldly* affirm. *Peacham*.

To OVER-BROW, *v. a.* To hang over.—Strange shades *o'er-brow* the vallies deep. *Collins*.

OVER-BUILT, *part. adj.* Built over:

On either side,

Disparted Chaos, *over-built*, exclaim'd.

Milton.

To OVER-BUL'K, *v. a.* To oppress by bulk:

The feeding pride,
In rank Achilles, must or now be crop'd,
Or, shedding, breed a nursery of like evils,
To *over-bulk* us all.

Shakespeare's *Troil. and Cress.*

To OVER-BUR'DEN, *v. a.* To load with too great weight.—If she were not cloyed with his company, and that she thought not the earth *over-burthened* with him, she would cool his fiery grief. *Sidney*.

To OVER-BURN, *v. a.* To burn too much.—Take care you *over-burn* not the turf; it is only to be burnt so as may make it break. *Mortimer*.

OVER-BUS'Y, *adj.* Too busy; officious.—These *over-busy* spirits, whose labour is their only reward, hunt a shadow and chase the wind. *Decay of Chr. Piety*.

To OVER-BUY, *v. a.* To buy too dear.—He *over-bought* it upon the false pretence of an appendant commodity. *Bp. Hall's Cases of Conscience*.

He, when want requires, is only wise,
Who flights not foreign aids, nor *over-buys*;
But on our native strength, in time of need, relies.

Dryden.

To OVER-CAN'OPY, *v. a.* To cover as with a canopy.—Quite *over-canopied* with luscious woodbine. *Shakespeare's Midf. N. Dream*.

Where'er the rude and moss-grown beech
O'er-canopies the glade.

Gray.

OVER-CA'RE, *f.* Solitude; too great care:

Poets, like lovers, should be bold, and dare;
They spoil their business with an *over-care*:
And he, who servilely creeps after sense,
Is safe, but ne'er will reach an excellence.

Dryden.

OVER-CA'REFUL, *adj.* Too careful.

To OVER-CAR'RY, *v. a.* To hurry too far; to be urged to any thing violent or dangerous.—He was the king's uncle, but yet of no capacity to succeed; by reason whereof his natural affection and duty was less easy to be *over-carried* by ambition. *Hayward*.

To OVER-CAST, *v. a.* To cloud; to darken; to cover with gloom.—Our days of age are sad and *over-cast*, in which we find that, of all our vain passions and affections past, the sorrow only abideth. *Raleigh's Hist. of the World*.

The dawn is *over-cast*, the morning lours,
And heavily in clouds brings on the day.

Addison.

To cover. This sense is hardly retained but by needlewomen, who call that which is incircled with a thread *over-cast*.—When malice would work that which is evil, and, in working, avoid the suspicion of an evil intent, the colour wherewith it *over-casteth* itself is always a fair and plausible pretence of seeking to further that which is good. *Hooker*.

Their arms abroad with gray moss *over-cast*,
And their green leaves trembling with every blast.

Spenser.

To

To rate too high in computation.—The king in his account of peace and calms, did much *over-cast* his fortunes, which proved full of broken seas, tides, and tempests. *Bacon's Hen. VII.*

OVER-CAST'ING, *f.* A kind of needle-work. *Ash.*

To OVER-CATCH', *v. a.* [perhaps only in Spenser.] To overtake :

She sent an arrow forth with mightie draught,
That in the very dore him *over-caught*. *Fairy Queen.*

OVER-CAUTIOUS, *adj.* Too cautious.

To OVER-CHAR'GE, *v. a.* To oppress; to cloy; to surcharge.—On air we feed in every instant, and on meats but at times; and yet the heavy load of abundance, wherewith we oppress and *over-charge* nature, maketh her to sink unawares in the mid-way. *Raleigh's Hist. of the World.*—A man may as well expect to grow stronger by always eating, as wiser by always reading. Too much *over-charges* nature, and turns more into disease than nourishment. *Collier.*—To load; to crowd too much.—Our language is *over-charged* with consonants. *Pope.*—To burthen :

He whispers to his pillow
The secrets of his *over-charged* soul. *Shakespeare.*

To rate too high :

Here's Glo'ster, a foe to citizens,
O'er-charging your free purses with large fines. *Shakespeare.*

To fill too full.—The fumes of passion do as really intoxicate and confound the judging and discerning faculty, as the fumes of drink discompose and stupify the brain of a man *over-charged* with it. *South.*—The action of the Iliad and Æneid, in themselves exceeding short, are so beautifully extended by the invention of episodes, that they make up an agreeable story sufficient to employ the memory without *over-charging* it. *Addison's Spectator.*—To load with too great a charge.—As cannons *over-charge'd* with double cracks. *Shakespeare.*

Who in deep mines for hidden knowledge toils,
Like guns *o'er-charge'd*, breaks, misses, or recoils. *Denham.*

OVER-CHARGE, *f.* An excess in the account.

To OVER-CLIMB, *v. a.* To climb over.—The fatal gin thus *over-clambe* our walls. *Ld. Surrey's Tr. of Virg. Æn. 4.*

The childhood of the cheerful morn
Is almost grown a youth, and *over-climbs*
Yonder gilt eastern hills. *Brewer's Com. of Lingua.*

To OVER-CLOU'D, *v. a.* To cover with clouds.—The labour of wicked men is to turn blessing itself into a curse, to *over-cloud* joy with sorrow at least, if not desolation. *Abp. Laud's Sermons.*

The silver empress of the night,
O'er-clouded, glimmers in a fainter light. *Tickell.*

To OVER-CLOY', *v. a.* To fill beyond satiety :

A scum of Britons and base lackey peasants,
Whom their *o'er-cloyed* country vomits forth
To desperate adventures and destruction. *Shakespeare.*

OVER-CO'LD, *adj.* Too cold; rather too cold.—A gangrene doth arise in phlegmons, through the unseasonable application of *over-cold* medicaments. *Wifeman.*

OVER-CONFIDENCE, *f.* Too great confidence; presumption.—He has afforded us only the twilight of probability, suitable to that state of mediocrity he has placed us in here; wherein to check our *over-confidence* and presumption, we might, by every day's experience, be made sensible of our short-sightedness. *Locke.*

OVER-CONFIDENT, *adj.* Too confident; presumptuous.

OVER-CONFIDENTLY, *adv.* With too great confidence; presumptuously.

To OVER-COVER, *v. a.* To cover completely :

Shut me nightly in a charnel-house,
O'er-cover'd quite with dead men's rattling bones,
With reeky shanks and yellow chapless skulls. *Shakespeare.*

To OVER-COUNT, *v. a.* To rate above the true value :

Thou know'st how much
We do *o'er-count* thee. *Shakespeare's Ant. and Cleop.*

OVER-CRED'ULOUS, *adj.* Too credulous; too apt to believe :

Devilish Macbeth

By many of these trains hath fought to win me
Into his power: and modest wisdom plucks me
From *over-credulous* haste. *Shakespeare.*

To OVER-CROW, *v. a.* To crow as in triumph. Spenser has also written *over-craw*, for the sake of the rhyme.—A base varlet, that being but of late grown out of the dunghill, beginneth now to *over-crow* so high mountains, and make himself the great protector of all outlaws. *Spenser.*

So spake this bold breure with great disdain:
Little him answer'd the oak again,
But yielded, with shame and grief adawed,
That of a weed he was *over-crawed*. *Spenser.*

OVER-DA'RING, *adj.* Too venturefome :

Over-daring Talbot

Hath sullied all his glofs of former honour
By this unheedful desperate wild adventure. *Shakespeare.*

To OVER-DA'TE, *v. a.* To reckon or date beyond the proper period.—Had he redeemed his *over-dated* minority from a pupilage under bishops, he would much less have mistrusted his parliament. *Milton's Eiconoclast.*

OVER-DIGESTION, *f.* The state of having the digestive faculties too powerful. *Floyer.*

OVER-DI'GHT, *part. adj.* Covered over :

Day discover'd heaven's face
To finfull men with darkness *over-dight*. *Fairy Queen.*

OVER-DIL'IGENT, *adj.* Rather too diligent.

OVER-DIL'IGENTLY, *adv.* With too great diligence.—This part of grammar has been much neglected, as some others *over-diligently* cultivated. It is easy for men to write, one after another, of cases and genders. *Locke.*

To OVER-DO', *v. a.* To do more than enough.—Any thing so *over-done* is from the purpose of playing; whose end is to hold the mirror up to nature. *Shakespeare.*—When the meat is *over-done*, lay the fault upon your lady who hurried you. *Swift.*

To OVER-DO', *v. n.* To do too much.—Nature much oftener *over-does* than under-does: you shall find twenty eggs with two yolks for one that has none. *Grew.*

To OVER-DO'SE, *v. a.* To load with too large a dose.

OVER-DO'SE, *f.* A dose larger than it ought to be.—A grown person, surfeiting with honey, no sooner hears the name of it, but his fancy immediately carries sickness and qualms to his stomach: had this happened to him by an *over-dose* of honey when a child, all the same effects would have followed, but the cause would have been mistaken, and the antipathy counted natural. *Locke.*

To OVER-DRESS', *v. a.* To adorn lavishly :

In all, let nature never be forgot;
But treat the goddess like a modest fair,
Nor *over-dress*, nor leave her wholly bare. *Pope.*

To OVER-DRINK', *v. n.* [This was also a Saxon compound, *ofer-drincan*.] To drink too much; to become drunk.

To OVER-DRIVE, *v. a.* To drive too hard, or beyond strength.—The flocks and herds with young, if men should *over-drive* one day, all will die. *Gen. xxxiii. 13.*

To OVER-DRY', *v. a.* To dry too much.—Meats condite, powdered, and *over-dried*. *Burton's Anat. of Mel.*

OVER-DU'E, *adj.* Past the time of being due.

OVER-

OVER-E'AGER, *adj.* Too vehement in desire.—I have seen sad examples of extravagance in the more modest and private, but *over-eager*, pursuits of these recreations, [games of chance.] *Goodman's Wint. Ev. Conf.*

OVER-E'AGERLY, *adv.* With too much haste or vehemence.—Pursuing them *over-eagerly* into York. *Milton's Hist. of Eng.*

To OVER-E'AT, *v. n.* To eat too much.

To OVER-E'AT, *v. a.* To disorder by eating too much; as, He *over-eats* himself.

To OVER-EY'E, *v. a.* To superintend:

My love hath lasted from mine infancy,
And still increased as I grew myself:
When did Perseda passime in the streets,
But her Eraustus *over-ey'd* her sports?
When didst thou, with thy sampler, in the sun,
Sit sewing with thy feres, but I was by,
Marking thy lily hand's dexterity?

Trag. of Soliman and Perseda, 1599.

To observe; to remark:

I am doubtful of your modesties,
Left *over-eying* of his odd behaviour,
You break into some merry passion.

Shakespeare.

To OVER-EM'PTY, *v. a.* To make too empty.—The women would be loth to come behind the fashion in new-fangledness of the manner, if not in costliness of the matter, which might *over-empty* their husband's purses. *Carew.*

OVER-FALL, *f.* A fall of water; a cataract.—To status addeth, that those which dwell near those falls of water are deaf from their infancy, like those that dwell near the *over-falls* of Nilus. *Raleigh's Hist. of the World.*—Part of the side of a canal, or reservoir, over which the water runs away, or escapes, when it is too high. The upper gates or sluices of opening weirs are also called *over-falls*.

To OVER-FATI'GUE, *v. a.* To fatigue too much; to weary too much.—Don't *over-fatigue* the spirits, lest the mind be seized with a lassitude, and thereby nauseate and grow tir'd of a particular subject. *Watts.*

To OVER-FEE'D, *v. a.* To feed more than enough:

Wretched man *o'er-feeds*

His cramm'd desires with more than nature needs. *Dryden.*

OVER-FERMENTA'TION, *f.* A fermentation executed to too great a degree.—If the ferment of the breast be vigorous, an *over-fermentation* in the part produceth a phlegmon. *Wifeman.*

To OVER-FILL', *v. a.* To fill more than enough:

Bending o'er the cup, the tears she shed
Seem'd by the posture to discharge her head,
O'er-fill'd before.

Dryden.

To OVER-FLO'AT, *v. a.* To cover as with water:

The town is fill'd with slaughter, and *o'er-floats*,
With a red deluge, their increasing moats. *Dryden.*

To OVER-FLOUR'ISH, *v. a.* To flourish more than enough; to set off with too great advantage.—As they are likely to *over-flourish* their own case, their flattery is hardest to be discovered; for who would imagine himself guilty of putting tricks upon himself. *Collier.*

To OVER-FLY', *v. a.* To cross by flight:

A falling kite

Can scarce *o'er-fly* them in a day and night. *Dryden.*

OVER-FON'D, *adj.* Too fond.

OVER-FONDNESS, *f.* Too great fondness.—It is an ill way of establishing this truth, and silencing atheists, to take some men's having that idea of God in their minds, for the only proof of a deity; and, out of an *over-fondness* of that darling invention, cashier all other arguments. *Locke.*

OVER-FOR'WARD, *adj.* Too forward; officious.

OVER-FOR'WARDNESS, *f.* Too great quickness;

too great readiness.—By an *over-forwardness* in courts to give countenance to frivolous exceptions, though they make nothing to the true merit of the cause, it often happens that causes are not determined according to their merits. *Hale.*

OVER-FRE'E, *adj.* Too free; too generous; too familiar.

To OVER-FREI'GHT, *v. a.* pret. *over-freighted*, part. *over-fraught*.] To load too heavily; to fill with too great quantity.—A boat *over-freighted* with people, in rowing down the river, was, by the extreme weather, sunk. *Carew.*

Grief, that does not speak,
Whispers the *o'er-fraught* heart, and bids it break.

Shakespeare.

OVER-FRU'ITFUL, *adj.* Too rich; too luxuriant.—Rhyme bounds and circumscribes an *over-fruitful* fancy. *Dryden's Ess. on Dram. Poesy.*

To OVER-GET', *v. a.* To reach; to come up with.—With six hours' hard riding, through so wild places, as it was rather the cunning of my horse sometimes, than of myself, so rightly to hit the way, I *over-got* them a little before night. *Sidney.*

To OVER-GIL'D, *v. a.* To gild over; to varnish:

Gold doth men's thoughts to high attempts prepare,
And *over-gilds* the danger of the warre. *Mir. for Mag.*

To OVER-GIR'D, *v. a.* To bind too closely.—When the gentle west winds shall open the fruitful bosom of the earth, thus *over-girded* by your imprisonment, then the flowers put forth and spring; and then the sun shall scatter the mists, and the manuring hand of the tiller shall root-up all that burdens the soil, without thank to your bondage. *Milton's Reas. of Ch. Gov.*

To OVER-GLAN'CE, *v. a.* To look hastily over:

I have but with a cursory eye
O'er-glanc'd the articles. *Shakespeare's Hen. V.*

To OVER-GO', *v. a.* To surpass; to excel.—Thinking it beyond the degree of humanity to have a wit so far *over-going* his age, and such dreadful terror proceed from so excellent beauty. *Sidney.*

Great nature hath laid down at last
That mighty birth wherewith so long she went,
And *over-went* the times of ages past,
Here to lie-in upon our soft content.

Daniel.

To cover:

All which, my thoughts say, they shall never do,
But rather, that the earth shall *over-go*
Some one at least.

Chapman.

OVER-GO'NE, *part. adj.* Injured; ruined.—Sad-hearted men, much *over-gone* with care. *Shakespeare's Hen. VI. Part III.*

To OVER-GOR'GE, *v. a.* To gorge too much:

Art thou grown great,
And, like ambitious Sylla, *over-gorg'd*? *Shakespeare.*

OVER-GRASSED, *adj.* Having too much grafs; overgrown with grafs:

They bene like foule wagmoires *over-graft*,
That, if thy galage, once stickest fast,
The more to wind it out thou dost swink,
Thou mought aye deeper and deeper sink.

Spenser.

OVER-GREA'T, *adj.* Too great.—Though putting the mind unprepared upon an unusual stress ought to be avoided; yet this must not run it, by an *over-great* shyness of difficulties, into a lazy sauntering about obvious things. *Locke.*

OVER-GREE'DY, *adj.* Too greedy; too close.—The memory of the learner should not be too much crowded with a tumultuous heap of ideas; one idea effaces another; *over-greedy* grasp does not retain the largest handful. *Watts.*

To

To OVER-GROW, *v. a.* To cover with growth.—With wild thyme and the gadding vine *o'er-grown*. *Milton's Lycidas.*

Roof, and floor, and walls, were all of gold,
But *over-grown* with dust and old decay,
And hid in darkness, that none could behold
The hue thereof.

Spenser.

To rise above.—If the binds be very strong, and much *over-grown* the poles, some advise to strike off their heads with a long switch. *Mortimer.*

To OVER-GROW, *v. n.* To grow beyond the fit or natural size.—A huge *over-grown* ox was grazing in a meadow. *L'Estrange.*

Him for a happy man I own,
Whose fortune is not *over-grown*.

Swift.

OVER-GROWTH, *f.* Exuberant growth.—The fortune in being the first in an inventory, doth cause sometimes a wonderful *over-growth* in riches. *Bacon.*

The *over-growth* of some complexion,
Oft breaking down the pales and forts of reason. *Shakespeare.*

To OVER-HA'LE, *v. a.* To spread over:

The welked Phœbus gan avail
His weary wain; and now the frosty night
Her mantle black through heaven gan *over-haile*. *Spenser.*

To OVER-HAND'LE, *v. a.* To mention too often:

You will fall again
Into your idle *over-handled* theme. *Shakespeare.*

To OVER-HANG', *v. a.* To jut over; to impend over.—If you drink tea upon a promontory that *over-hangs* the sea, it is preferable to an assembly. *Pope.*

Hide me, ye forests, in your closest howers!
Where flows the murmuring brook, inviting dreams,
Where bordering hazel *over-hangs* the streams. *Gay.*

To OVER-HANG', *v. n.* To jut over:

The rest was craggy cliff, that *over-hung*
Still as it rose, impossible to climb. *Milton's P. L.*

OVER-HARD', *adj.* Rather too hard; harder than it ought to be.

To OVER-HAR'DEN, *v. a.* To make too hard.—By laying it in the air, it has acquired such a hardness, that it was brittle, like *over-hardened* steel. *Boyle.*

OVER-HA'STILY, *adv.* In too great a hurry.—Excepting myself and two or three more, that mean not *over-hastily* to marry. *Hale's Lett. to Sir D. Carleton, 1618.*

OVER-HASTINESS, *f.* Precipitation; too much haste.—His reply was, that it was well if the duke's *over-hastiness* did not turn to his disadvantage. *Reresby's Mem.*

OVER-HA'STY, *adj.* Too quick; in too great haste.—Not *over-hasty* to cleanse or purify. *Hammond's Works.*

To OVER-HAUL, *v. a.* [A sea-term.] To unfold or loosen an assemblage of tackle.—To examine over again.—I have this day received your plain letter. In it you have *over-hauled* the whole affair, which is already before the public with all its circumstances. *Lowth's Lett. to Warburton.*

OVER-HEAD', *adv.* Aloft; in the zenith; above; in the ceiling.—The four stars *over-head* represent the four children. *Addison.*

Over-head the moon
Sits arbitress, and nearer to the earth
Wheels her pale course.

Milton's P. L.

To OVER-HE'AR, *v. a.* To hear those who do not mean to be heard.—The witness, *over-hearing* the word pillory repeated, slunk away privately. *Addison.*

That such an enemy we have, who seeks
Our ruin, both, by thee inform'd, I learn,
And from the parting angel *over-heard*. *Milton's P. L.*

VOL. XVIII. No. 1225.

To OVER-HE'AT, *v. a.* To heat too much.—It must be done upon the receipt of the wound, before the patient's spirits be *over-heated* with pain or fever. *Wise man.*

Pleas'd with the form and coolness of the place,
And *over-heated* by the morning chace. *Addison.*

To OVER-HE'LE, *v. a.* To cover over:

Thy rude voice, that doth so hoarsely blow;
Thy hair, thy beard, thy wings, *o'er-hel'd* with snow.
B. Jonson's Masques at Court.

To OVER-HEN'D, *v. a.* To overtake; to reach:

Als his fair leman, flying through a brook,
He *over-hent*, nought moved with her piteous look. *Spenser.*

To OVER-JOY', *v. a.* To transport; to ravish.—He that puts his confidence in God only, is neither *over-joyed* in any great good things of this life, nor sorrowful for a little thing. *Bp. Taylor's Guide to Devotion.*

This love-sick virgin, *over-joy'd* to find
The boy alone, still follow'd him behind. *Addison.*

OVER-JOY', *f.* Transport; ecstasy:

The mutual conference that my mind hath had,
Makes me the bolder to salute my king
With ruder terms; such as my wit affords,
And *over-joy* of heart doth minister. *Shakespeare.*

OVER-KEST', *pret.* [used by Spenser for over-cast.]—There a sad cloude of sleepe her *over-keft*. *Fairy Queen.*

To OVER-LA'BOUR, *v. a.* To take too much pains on any thing; to harass with toil:

She without noise will *over-see*
His children and his family;
And order all things till he come,
Sweaty and *over-labour'd*, home. *Dryden.*

To OVER-LA'DE, *v. a.* To over-burthen:

Thus to throng and *over-lade* a soul
With love, and then to have a room for fear,
That shall all that controul,
What is it but to rear
Our passions and our hopes on high,
That thence they may descry
The noblest way how to despair and die? *Suckling.*

OVER-LAN'DERBROECK, a town of the Netherlands, in the department of Utrecht: two miles north of Duerstede.

OVER-LAR'GE, *adj.* Larger than enough.—Our attainments cannot be *over-large*, and yet we manage a narrow fortune very unthriftilly. *Collier.*

To OVER-LASH', *v. n.* To exaggerate.—We are not accountable for every hyperbolical flash or flourish occurring in the Fathers; it being well known that they, in their encomiastic speeches, as orators are wont, following the heat and gaiety of fancy, do sometimes *over-lash*. *Barrow on the Pope's Supr.*

OVER-LASH'INGLY, *adv.* With exaggeration. A mean word, now obsolete.—Although I be far from their opinion who write *over-lashingly*, that the Arabian tongue is in use in two-third parts of the inhabited world, yet I find that it extendeth where the religion of Mahomet is professed. *Brerewood.*

To OVER-LAUNCH, *v. a.* in ship-building, to run the butt of one plank to a certain distance beyond the next butt above or beneath it, in order to make a stronger work. *Chambers.*

To OVER-LA'Y, *v. a.* To oppress by too much weight or power.—When any country is *over-laid* by the multitude which live upon it, there is a natural necessity compelling it to disburthen itself and lay the load upon others. *Raleigh.*

Some commons are barren, the nature is such;
And some *over-layeth* the commons too much. *Tusser.*

U

The

The strong Emetrius came in Arcite's aid,
And Palamon with odds was *over-laid*.

Dryden.

To smother with too much or too close covering.—The new-born babes by nurses *over-laid*. *Dryden*.—To smother; to crush; to overwhelm.—Season the passions of a child with devotion, which seldom dies; though it may seem extinguished for a while, it breaks out as soon as misfortunes have brought the man to himself. The fire may be covered and *over-laid*, but cannot be entirely quenched and smothered. *Addison's Spectator*.

The stars, no longer *over-laid* with weight,
Exert their heads from underneath the mafs,
And upward shoot.

Dryden.

To cloud; to over-cast:

Phœbus' golden face it did attain,
As when a cloud his beams doth *over-lay*.

Spenser.

To cover superficially:

By his prescript, a sanctuary is fram'd
Of cedar, *over-laid* with gold.

Milton's P. L.

To join by something laid over:

Thou us empower'd
To fortify thus far; and *over-lay*
With this portentous bridge the dark abyfs.

Milton.

OVER-LA'YING, *f.* A superficial covering.—The *over-laying* of their chapters [was] of silver, and all the pillars of the court were filleted with silver. *Exod. xxxviii. 17.*

To **OVER-LE'AP**, *v. a.* To pass by a jump:

A step,

On which I must fall down, or else o'er-leap,
For in my way it lies.

Shakespeare's Macbeth.

In vain did Nature's wife command
Divide the waters from the land;
If daring ships, and men profane,
The eternal fences *over-leap*,
And pass at will the boundless deep.

Dryden.

OVER-LEATHER, *f.* The part of the shoe that covers the foot.—I have sometimes more feet than shoes; or such shoes as my toes look through the *over-leather*. *Shakespeare*.

To **OVER-LEAVEN**, *v. a.* To swell out too much:

What then so swells each limb!

Only his clothes have *over-leaven'd* him.

B. Jonson.

To mix too much with; to corrupt:

Some habit, that too much o'er-leavens

The form of plausible manners.

Shakespeare's Hamlet.

OVER-LI'GHT, *adj.* Too light, either in weight or in splendour; as, an *over-light* guinea; an *over-light* room, or place.

OVER-LIGHT, *f.* Too strong light.—An *over-light* maketh the eyes dark, inasmuch as perpetual looking against the sun would cause blindness. *Bacon*.

To **OVER-LIVE**, *v. a.* To live longer than another; to survive; to out-live.—Mufidorus, who showed a mind not to *over-live* Pyrocles, prevailed. *Sidney*.

He concludes in hearty prayers,
That your attempts may *over-live* the hazard
And fearful meeting of their opposite.

Shakespeare.

To **OVER-LIVE**, *v. n.* To live too long:

Why do I *over-live*?

Why am I mock'd with death, and lengthen'd out
To deathless pain?

Milton's P. L.

OVER-LIVER, *f.* Survivor; that which lives longest.—A peace was concluded, to continue for both the king's lives, and the *over-liver* of them. *Bacon's Hen. VII.*

To **OVER-LO'AD**, *v. a.* To burthen with too much.—The memory of youth is charged and *over-loaded*, and all they learn is mere jargon. *Felton*.

Men *overloaded* with a large estate
May spill their treasure in a nice conceit;

The rich may be polite, but oh! 'tis sad,
To say you're curious, when we swear you're mad. *Young*.

OVER-LONG', *adj.* Too long.—I have transgressed the laws of oratory, in making my periods and parantheses *over-long*. *Boyle*.

To **OVER-LOV'E**, *v. a.* To prize or value too much.—I cannot so *over-love* this issue of my own brain, as to hold it worthy of your majesty's judicious eyes. *Bp. Hall's Dedication*.

OVER-LO'W, *adj.* Too low.

O'VER-MAN, *f.* in a coal-mine, the person who has the sole direction of the under-ground economy of a pit. He takes his instructions from the viewer, and every person else in the pit is subordinate to him.

O'VER-MAN, in Scotch Law, a person appointed by arbiters, or by the parties submitters, to determine the matter submitted, in case the arbiters disagree in their opinion.

OVER-MASTED, *adj.* Having the masts too high or too heavy for the weight of the hull to counterbalance:

Cloanthus, better mann'd, pursu'd him fast,
But his o'er-masted galley check'd his haste. *Dryden*.

To **OVER-MASTER**, *v. a.* To subdue; to govern.—They are *over-mastered* with a score of drunkards, the only soldiery left about them, or else comply with all the rapines and violences. *Milton on Education*.

So sleeps a pilot, whose poor bark is prest
With many a merciless o'er-mast'ring wave. *Crashaw*.

To **OVER-MATCH**, *v. a.* To be too powerful; to conquer; to oppress by superior force.—How great soever our curiosity be, our excess is greater, and does not only *over-match*, but supplant it. *Decay of Chr. Piety*.

I have seen a swan

With bootless labour swim against the tide,
And spend her strength with *over-matching* waves. *Shakespeare*.

It moves our wonder, that a foreign guest
Should *over-match* the most and match the best. *Dryden*.

OVER-MATCH, *f.* One of superior powers; one not to be overcome.—Spain is no *over-match* for England by that which leadeth all men; that is, experience and reason. *Bacon*.

Eve was Eve;

This far his *over-match*, who, self-deceiv'd
And rash, before-hand had no better weigh'd
The strength he was to cope with or his own.

Milton.

To **OVER-MEASURE**, *v. a.* To measure or estimate too largely.—An argument, fit for great and mighty princes to have in their hand; to the end, that neither by *over-measuring* their forces they leave themselves in vain enterprises; nor, on the other side, by undervaluing them, descend to fearful and pusillanimous counsels. *Bacon's Essay*.

OVER-MEASURE, *f.* Something given over the due measure.

To **OVER-MIX'**, *v. a.* To mix with too much:

Those things these parts o'er-rule, no joys shall know,
Or little pleasure *over-mix* with woe.

Creech.

OVER-MIC'KLE, *adj.* [Sax. *ofermicel*.] Overmuch: a common word in the north of England.

OVER-MODEST, *adj.* Too bashful; too reserved.—It is the courtier's rule, that *over-moderate* suitors seldom speed. *Hale's Rem.*

OVER-MUCH', *adj.* Too much; more than enough.—It was the custom of those former ages, in their *over-much* gratitude, to advance the first authors of any useful discovery among the number of their gods. *Wilkins*.—An *over-much* use of salt, besides that it occasions thirst and *over-much* drinking, has other ill effects. *Locke*.

OVER-MUCH, *adv.* In too great a degree.—The fault which we find in them is, that they *over-much* abridge the church of her power in these things. Whereupon they

they re-charge us, as if in these things we gave the church a liberty which hath no limits or bounds. *Hooker.*

I also err'd, in *over-much* admiring
What seem'd in thee so perfect, that I thought
No evil durst attempt thee. *Milton.*

OVER-MUCH, *f.* More than enough.—With respect to the blessings the world enjoys, even good men may ascribe *over-much* to themselves. *Grew.*

By attributing *over-much* to things
Less excellent, as thou thyself perceiv'st. *Milton.*

OVER-MUCH'NESS, *f.* Exuberance; superabundance. *Not used, nor elegant.*—There are words that do as much raise a style, as others can depress it; superlatation and *over-muchness* amplifies. It may be above faith, but never above a mean. *B. Jonson's Discoveries.*

To OVER-MUL'TITUDE, *v. a.* To exceed in number:

Nature would be furcharg'd with her own weight,
And strangled in her waste fertility:
The earth cumber'd, and the wing'd air dark'd with plumes;
The herds would *over-multitude* their lords. *Milton.*

To OVER-NAME, *v. a.* To name in a series.—*Over-name* them; and as thou namest them I will describe them. *Shakesp. Merch. of Ven.*

OVER-NIGHT, *f.* The time of the night past before going to bed.—Will confesses, that for half his life his head ached every morning with reading men *over-night*. *Addison.*

If I had given you this at *over-night*,
She might have been o'er-ta'en. *Shakespeare.*

OVER-NIGHT, *adj.* On the evening before; at night before bed-time.

To OVER-NOISE, *v. a.* To overpower by noise:

No tide of wine would drown your cares;
No mirth or music *over-noise* your fears. *Cowley.*

To OVER-OFFICE, *v. a.* To lord by virtue of an office.—This might be the fate of a politician which this *as over-offices*. *Shakespeare's Hamlet.*

OVER-OFFICIOUS, *adj.* Too busy; too importunate.—This is an *over-officious* truth, and is always at a man's heels; so that if he looks about him, he must take notice of it. *Collier on Reason.*

To OVER-PAINT, *v. a.* To colour or describe too strongly.—Him whom no verse *o'er-paints*. *A. Hill.*

To OVER-PA'SS, *v. a.* To cross:

What have my Scyllas and my Syrtes done,
When these they *over-pas*s and those they shun? *Dryden.*

To over-look; to pass with disregard.—The complaint about psalms and hymns might as well be *over-past* without any answer, as it is without any cause brought forth. *Hooker.*

I read the satire thou entitlest first,

And laid aside the rest, and *over-past*,

And swore, I thought the writer was accurst,

That his first satire had not been his last. *Harington.*

Remember that Pellean conquerour,

A youth, how all the beauties of the east

He slightly view'd, and slightly *over-pas*s'd. *Milton's P. R.*

To omit in a reckoning.—Arithmetical progression demonstrates how fast mankind would increase, *over-passing* as miraculous, though indeed natural, that example of the Israelites who were multiplied in two hundred and fifteen years, from seventy to sixty thousand able men. *Raleigh.*—To omit; not to receive; not to comprise.—

If the grace of him which saveth *overpas*s some, so that the prayer of the church for them be not received, this we may leave to the hidden judgments of righteousness. *Hooker.*

OVER-PA'ST, *part. adj.* Gone; past:

What canst thou swear by now?—By time to come.—

That thou hast wrong'd in the time *over-past*. *Shakesp.*

To OVER-PAY, *v. a.* To reward beyond the price:

You have yourself your kindness *over-paid*;

He ceases to oblige who can upbraid. *Dryden.*

To OVER-PEER, *v. a.* To over-look; to hover above. *Out of use.*—They are invincible by reason of the *over-peering* mountains that back the one, and slender fortifications of the other to landward. *Sandys's Journey.*

The ocean, *over-peering* of his list,
Eats not the flats with more impetuous haste,
Than young Laertes, in a riotous head,
O'erbears your officers. *Shakespeare's Hamlet.*

Your Argosies with portly fail

Do *over-peer* the petty traffickers,

That curt'ly to them, do them reverence. *Shakespeare.*

Mountainous error would be too highly heapt,
For truth to *over-peer*. *Shakespeare's Coriol.*

Thus yields the cedar to the axe's edge,
Whose top branch *over-peer'd* Jove's spreading tree,
And kept low shrubs from winter's powerful wind. *Shakesp.*

To OVER-PERCH, *v. a.* To fly over:

With love's light wings did I *o'er-perch* these walls,
For stony limits cannot hold love out. *Shakespeare.*

To OVER-PICTURE, *v. a.* To exceed the representation or picture:

She did lie

In her pavilion, (cloth of gold, of tissue,)

O'er-picturing that Venus, where we see

The fancy out-work nature. *Shakespeare's Ant. and Cleop.*

To OVER-PLY, *v. a.* To employ too laboriously:

What supports me, dost thou ask?

The conscience, friend, to have lost them, *over-ply'd*

In liberty's defence. *Milton's Sonnet.*

To OVER-POISE, *v. a.* To outweigh.—Whether cripples who have lost their thighs will float; their lungs being able to waft up their bodies, which are in others *over-poised* by the hinder legs; we have not made experiment. *Brown's Vulg. Err.*

The scale,

O'er-pois'd by darkness, lets the night prevail. *Creech.*

OVER-POISE, *f.* Preponderant weight.—Horace, in his first and second book of odes, was still rising, but came not to his meridian till the third. After which his judgment was an *over-poise* to his imagination. He grew too cautious to be bold enough, for he descended in his fourth by slow degrees. *Dryden.*

Some *over-poise* of sway by turns they share;

In peace the people, and the prince in war. *Dryden.*

To OVER-POLISH, *v. a.* To finish too nicely.—A judicious ear would be offended with a style *over-polished*. *Blackwall's Sac. Classics.*

OVER-PONDEROUS, *adj.* Too weighty; too depressing.—Neither can I think that, so reputed and so valued as you are, you would, to the forfeit of your own discerning ability, impose upon me an unfit and *over-ponderous* argument. *Milton on Education.*

To OVER-POST, *v. a.* To get quickly over.—You may thank the unquiet time for your quiet *o'er-posting* that action. *Shakespeare's Hen. IV.*

To OVER-POWER, *v. a.* To be predominant over; to oppress by superiority.—Inspiration is, when such an *over-powering* impression of any proposition is made upon the mind by God himself, that gives a convincing and indubitable evidence of the truth and divinity of it. *Watts's Logic.*

Now in danger try'd, now known in arms
Not to be *over-power'd*.

Milton's P. L.

To OVER-PRESS', v. a. To bear upon with irresistible force; to overwhelm; to crush.—When a prince enters on a war, he ought maturely to consider whether his coffers be full, his people rich by a long peace and free trade, not *over-pressed* with many burthensome taxes. *Swift*.

Michael's arm main promontories flung,
And *over press'd* whole legions weak with sin. *Roscommon*.

To overcome by entreaty; to press or persuade too much.

To OVER-PRIZE, v. a. To value at too high price.—Parents *over-prize* their children, while they behold them through the vapours of affection. *Wotton*.

OVER-PROMPTNESS, f. Hastiness; precipitation.—There is an *over-promptness* in many young men, who desire to be counted men of valour and resolution, upon every slight occasion to raise a quarrel, and admit of no other means of composing and ending it but by sword and single combat. *Hale's Sermon on Duels*.

OVER-QUIETNESS, f. A state of too much quiet.—To strenuous minds there is an inquietude in *over-quietness*, and no laboriousness in labour. *Brown's Chr. Mor.*

To OVER-RA'KE, v. a. A sea term; to break in, as waves on a ship from head to stern. *Bailey*.

OVER-RANK', adj. Too rank.—It produces *over-rank* binds. *Mortimer's Husbandry*.

To OVER-RANK', v. a. To place in too high a rank.

To OVER-RATE, v. a. To rate at too much.—To avoid the temptations of poverty, it concerns us not to *over-rate* the conveniences of our station, and, in estimating the proportion fit for us, to fix it rather low than high; for our desires will be proportioned to our wants, real or imaginary, and our temptations to our desires. *Rogers*.

While vain shows and scenes you *over-rate*,
'Tis to be fear'd,

That, as a fire the former house o'er-threw,
Machines and tempests will destroy the new. *Dryden*.

To OVER-RE'ACH, v. a. To rise above.—Sixteen hundred years after the earth was made, it was overflowed in a deluge of water in such excess, that the floods *over-reached* the tops of the highest mountains. *Burnet*.—To deceive; to go beyond; to circumvent. A sagacious man is said to have a long *reach*.—What more cruel than man, if he see himself able by fraud to *over-reach*, or by power to overbear, the laws whereunto he should be subject. *Hooker*.—I have laid my brain in the sun and dried it, that it wants matter to prevent so gross *over-reaching*. *Shakespeare*.—There is no pleasanter encounter than a trial of skill betwixt sharpers to *over-reach* one another. *L'Estrange*.

A man who had been matchless held
In cunning, *over-reach'd* where least he thought,
To save his credit, and for very spite
Still will be tempting him who foils him still. *Milton*.

To OVER-RE'ACH, v. n. A horse is said to *over-reach* when he brings his hinder feet too far forwards, and strikes his toes against his fore-shoes. *Farrier's Dict.*

OVER-RE'ACHER, f. A cheat; a deceiver.

To OVER-RE'AD, v. a. To peruse.—The contents of this is the return of the duke; you shall anon *over-read* it at your pleasure. *Shakespeare*.

To OVER-RECK'ON, v. a. To reckon too much.

To OVER-RED', v. a. To smear with red.

Prick thy face, and *over-red* thy fear,
Thou lily-liver'd boy. *Shakespeare's Macbeth*.

To OVER-RIDE, v. a. To ride over.

The carter, *over-riden* by his cart,
Under the whele lay ful low adowne. *Chaucer*.

To ride too much: as, The horse was *over-ridden*.

OVER-RID'ING, f. The act of riding a horse beyond its strength.

OVER-RIG'ID, adj. Too rigid.

OVER-RI'PE, adj. Too ripe.

To OVER-RIPEN, v. a. To make too ripe:

Why droops my lord, like *over-ripen'd* corn,
Hanging the head with Ceres' plenteous load. *Shakespeare*.

To OVER-RO'AST, v. a. To roast too much:

'Twas burnt and dried away;
And better 'twere that both of us did fast,
Since of ourselves, ourselves are choleric,
Than feed it with such *over-roasted* flesh. *Shakespeare*.

To OVER-RU'LE, v. a. To influence with predominant power; to be superior in authority.—He is acted by a passion which absolutely *over-rules* him; and so can no more recover himself, than a bowl rolling down a hill stop itself in the midst of its career. *South*.—A wise man shall *over-rule* his stars, and have a greater influence upon his own content than all the constellations and planets of the firmament. *Taylor*.—A man may, by the influence of an *over-ruling* planet, be inclined to lust, and yet by the force of reason overcome that bad influence. *Swift*.—To govern with high authority; to superintend.—Wherefore does he not now come forth and openly *over-rule*, as in other matters he is accustomed? *Hayward*.—To supersede: as, in law, to *over-rule* a plea, is to reject it as incompetent.—Thirty acres make a farthing-land, nine farthings a Cornish acre, and four Cornish acres a knight's fee: but this rule is *over-ruled* to a greater or lesser quantity, according to the fruitfulness or barrenness of the soil. *Carew*.

OVER-RU'LER, f. Director; governour.—Then did proof, the *over-ruler* of opinions, make manifest that all these are but serving sciences. *Sidney's Def. of Poesy*.

To OVER-RUN', v. a. To harass by incursions; to ravage; to rove over in a hostile manner.—A commonwealth may be *over-run* by a powerful neighbour, which may produce bad consequences upon your trade and liberty. *Swift's Miscell.*

They err who count it glorious to subdue
By conquest far and wide, to *over-run*
Large countries, and in field great battles win,
Great cities by assault. *Milton's Paradise Regained*.

Till the tears she shed,
Like envious clouds *o'er-ran* her lovely face,
She was the fairest creature in the world. *Shakespeare*.

To out-run; to pass.—Pyrocles, being come to sixteen, *over-run* his age in growth, strength, and all things following it, that not Musidorus could perform any action on horse or foot more strongly, or deliver that strength more nimbly, or become the delivery more gracefully, or employ all more virtuously. *Sidney*.—Ahimaaz ran by the way of the plain, and *over-ran* Cush. 2 Sam. xviii. 23.—Galilæus noteth, that if an open trough, wherein water is, be driven faster than the water can follow, the water gathereth upon a heap towards the hinder end, where the motion began; which he supposeth, holding the motion of the earth to be the cause of the ebbing and flowing of the ocean, because the earth *over-runneeth* the water. *Bacon*.

We may out-run
By violent swiftness that which we run at,
And lose by *over-running*. *Shakespeare's Hen. VIII.*

To over-spread; to cover all over.—This disposition of the parts of the earth, shows us the footsteps of some kind of ruin which happened in such a way, that at the same time a general flood of waters would necessarily *over-run* the whole earth. *Burnet*.

His tears defac'd the surface of the well;
And now the lovely face but half appears,
O'er-run with wrinkles, and deform'd with tears. *Addison*.

To mischief by great numbers; to pester.—To flatter foolish men into a hope of life where there is none, is much

much the same with betraying people into an opinion, that they are in a virtuous and happy state, when they are *over-run* with passion and drowned in their lusts. *L'Estrange*.—To injure by treading down.—Among printers; to change the disposition of lines and words, by reason of infections or erasures.

To OVER-RUN, *v. n.* To overflow; to be more than full.—Cattle in inclosures shall always have fresh pasture, that now is all trampled and *over-run*. *Spenser*.

Though you have left me,
Yet still my soul *o'er-runs* with fondness towards you. *Smith*.

OVER-RUN'NER, *f.* One who roves over in a hostile manner:

Vandal *o'er-runners*, Goths in literature,
Ploughmen that would Parnassus new manure.

Lovelace's Luc. Posth. 1659.

OVER-SCUT'CHT, *adj.* [from *over* and *scotch*.] Flogged with a whip.—Sung those tunes to the *over-scutecht* hufwives that he heard the carmen whistle. *Shakespeare's Hen. IV. P. II.*

OVER-SE'A, *adj.* Foreign; from beyond seas.—Some far-journied gentlemen, at their return home, like as they love to go in foreign apparel, so they will powder their talke with *over-sea* language. *Wilson's Arte of Rhet.* 1553.

To OVER-SHA'DE, *v. a.* To cover with any thing that causes darkness.—No great and mighty subject might eclipse or *over-shade* the imperial power. *Bacon*.

Dark cloudy death *o'er-shades* his beams of life,
And he nor sees nor hears us. *Shakespeare*.

To OVER-SHAD'OW, *v. a.* To throw a shadow over any thing.—Weeds choke and *over-shadow* the corn, and bear it down, or starve and deprive it of nourishment. *Bacon*.

Darkness must *over-shadow* all his bounds,
Palpable darkness, and blot out three days. *Milton's P. L.*
To shelter; to protect; to cover with superior influence.—My *over-shadowing* spirit and might with thee I send along. *Milton*.

On her should come
The Holy Ghost, and the Power of the Highest
O'er-shadow her. *Milton's P. Regained*.

OVER-SHAD'OWER, *f.* One who throws a shade over any thing.—Your nobility in a right distance between crown and people; no oppressors of the people, no *over-shadowers* of the crown. *Bacon's Lett. to the King*, 2 Jan. 1618.

To OVER-SHOOT, *v. n.* To fly beyond the mark.—Often it drops, or *over-shoots*, by the disproportions of distance or application. *Collier on Reason*.

To OVER-SHOOT, *v. a.* To shoot beyond the mark.—Every inordinate appetite defeats its own satisfaction, by *over-shooting* the mark it aims at. *Tillotson*.—To pass swiftly over:

High-raised on fortune's hill, new Alpes he spies,
O'er-shoots the valley which beneath him lies,
Forgets the depths between, and travels with his eyes. *Harte*.

[With the reciprocal pronoun.] To venture too far; to assert too much.—Leave it to themselves to consider, whether they have in this point or not *over-shot themselves*; which is quickly done, even when our meaning is most sincere. *Hooker*.—In finding fault with the laws, I doubt me you shall much *over-shoot yourself*, and make me the more dislike your other dislikes of that government. *Spenser on Ireland*.

OVER-SI'ZE, *adj.* Above the usual size.

To OVER-SI'ZE, *v. a.* To surpass in bulk.—Those bred in a mountainous country, *over-size* those that dwell
Vol. XVIII. No. 1225.

on low levels. *Sandys's Journey*.—[*Over* and *size*, a compound with which masons cover walls.] To plaster over:

He, thus *o'er-siz'd* with coagulate gore,
Old grandfire Priam seeks. *Shakespeare's Hamlet*.

To OVER-SKIP, *v. a.* To pass by leaping.—Presume not ye that are sheep, to make yourselves guides of them that should guide you; neither seek ye to *over-skip* the fold, which they about you have pitched. *Hooker*.—To pass over:

Mark if, to get them, she *o'er-skip* the rest;
Mark if she read them twice, or kiss the name. *Donne*.

To escape:

When that hour *o'er-skips* me in the day,
Wherein I sigh not, Julia, for thy sake;
The next ensuing hour some foul mischief
Torment me! *Shakespeare's Two Gent. of Ver.*

Who alone suffers, suffers most in the mind;
But then the mind much sufferance does *o'er-skip*,
When grief hath mates and bearing fellowship. *Shakespeare*.

To OVER-SLEEP, *v. a.* To sleep too long.

To OVER-SLIP, *v. a.* To pass undone, unnoticed, or unused; to neglect.—He that hath *over-slipt* such opportunities, is to bewail and retrieve them betimes. *Hammond*.

To OVER-SLOW, *v. a.* To render slow; to check; to curb.—Means able to *over-slow* this furious driver. *Hammond*.

To OVER-SNOW, *v. a.* To cover with snow.—Ere age unstrung my nerves, or time *o'er-snow'd* my head. *Dryden's Æn.*

For never-resting time leads summer on
To hideous winter, and confounds him there;
Sap check'd with frost, and lusty leaves quite gone,
Beauty *o'er-snow'd*, and bareness everywhere. *Shakespeare*.

OVER-SO'LD, *part.* Sold at too high a price:

Life with ease I can disclaim,
And think it *over-sold* to purchase fame. *Dryden*.

OVER-SOON, *adv.* Too soon.—The lad may prove well enough, if he *over-soon* think not too well of himself, and will bear away that he heareth of his elders. *Sidney*.

To OVER-SOR'ROW, *v. a.* To afflict with too much sorrow.—The much-wronged and *over-sorrowed* state of matrimony. *Milton's Doct. and Disc. of Div.*

To OVER-SPEAK, *v. a.* To say too much; to express in too many words; with the reciprocal pronoun.—Describing a small fly, he extremely over-worded and *over-spake himself* in his expression of it; as if he had spoken of the Nemean lion. *Hales*.

OVER-SPEN'T, *part.* Wearied; harassed; forespent. The verb *over-spend* is not used.

Thestylis, wild thyme, and garlick beats,
For harvest-hinds, *o'er-spent* with toil and heats. *Dryden*.

To OVER-SPREAD, *v. a.* To cover over; to fill; to scatter over.—Of the three sons of Noah was the whole earth *over-spread*. *Gen. ix. 19*.—Not a deluge that only over-run some particular region; but that *over-spread* the face of the whole earth, from pole to pole, and from east to west. *Burnet*.

Darkness Europe's face did *over-spread*,
From lazy cells, where superstition bred. *Denham*.

To OVER-STAND, *v. a.* To stand too much upon conditions:

Her's they shall be, since you refuse the price:
What madman would *o'er-stand* his market twice? *Dryd.*

To OVER-STARE, *v. n.* To stare widely.—Some warlike

like sign must be used; either a slovenly buskin, or an *over-flaring* frowned head. *Ascham.*

To OVER-STOCK', v. a. To fill too full; to crowd.—Had the world been eternal, it must long ere this have been *over-stocked*, and become too narrow for the inhabitants. *Wilkins.*—Since we are so bent upon enlarging our flocks, it may be worth enquiring what we shall do with our wool, in case Barnstable should be ever *over-stocked*. *Swift.*

To OVER-STO'RE, v. a. To store with too much.—Fishes are more numerous than beasts or birds, as appears by their numerous spawn; and, if all these should come to maturity, even the ocean itself would have been long since *over-stored* with fish. *Hale's Orig. of Mankind.*

To OVER-STRAIN', v. u. To make too violent efforts.—Craesus lost himself, his equipage, and his army, by *over-straining* for the Parthian gold. *Collier.*—He wished all painters would imprint this lesson deeply in their memory, that, with *over-straining*, and earnestness of finishing their pieces, they often did them more harm than good. *Dryden's Dufresnoy.*

To OVER-STRAIN', v. a. To stretch too far.—Confessors were apt to *over-strain* their privileges, in which St. Cyprian made a notable stand against them. *Ayliffe.*

To OVER-STREW', v. a. To spread over.—With all which several medicines the body of the earth is so everywhere replenished, yea and the surface of it so every-where *over-strewed*. *Fotherby's Atheom.* p. 254.

The bottom poison, and the top *o'er-strew'd*
With sweets. *Shakespeare's Venus and Adonis.*

To OVER-STRIKE, v. a. To strike beyond:

For, as he in his rage him *over-strooke*,
He, ere he could his weapon backe repair,
His side all bare and naked *over-tooke*. *Spenser.*

To OVER-SWAY', v. a. To over-rule; to bear down.—When they are the major part of a general assembly, then their voices, being more in number, must *over-sway* their judgments who are fewer. *Hooker.*—Great command *o'er-sways* our order. *Shakespeare.*—Some great and powerful nations *over-sway* the rest. *Heylin.*

To OVER-SWELL', v. a. To rise above:
Fill, Lucius, till the wine *o'er-swell* the cup.
I cannot drink too much of Brutus' love. *Shakespeare.*

When his banks the prince of rivers, Po,
Doth *over-swell*, he breaks with hideous fall. *Fairfax.*

To OVER-TASK, v. a. To burthen with too heavy duties or injunctions.—That office is performed by the parts with difficulty, because they were *over-tasked*. *Harvey on Consumptions.*

To find out that good shepherd, I suppose,
In such a scant allowance of star-light,
Would *over-task* the best land-pilot's art,
Without the sure guides of well-practis'd feet. *Milton.*

To OVER-TAX, v. a. To tax too heavily.

OVER-TEEM'ED, adj. Worn down with teeming:

A clout upon that head,
Where late the diadem stood; and for a robe,
About her lank and all *o'er-teemed* loins,
A blanket in th' alarm of fear caught up. *Shakespeare.*

To OVER-TIRE, v. a. To subdue with fatigue:

He his guide requested
As *over-tir'd*, to let him lean a while
With both his arms on those two massy pillars. *Milton.*

To OVER-TIT'LE, v. a. To give too high a title to.
Over-titling his own quarrels to be God's cause. *Fuller's Holy War.*

To OVER-TOP', v. a. To rise above; to raise the head above.—*O'er-top* old Pelion, or the skyish head of blue Olympus. *Shakespeare's Hamlet.*

In the dance the graceful goddess leads

The quire of nymphs, and *over-tops* their heads. *Dryden.*
To excel; to surpass.—As far as the soul *o'er-tops* the body, so far its pains, or rather mournful sensations, exceed those of the carcase. *Harvey.*

Who ever yet
Have stood to charity, and display'd the effects
Of disposition gentle, and of wisdom
O'er-topping woman's power. *Shakespeare's Hen. VIII.*

To obscure; to make of less importance by superior excellence.—Whereas he had been heretofore an arbiter of Europe, he should now grow less, and be *over-topped* by so great a conjunction. *Bacon's Hen. VII.*

One whom you love,
Had champion kill'd or trophy won,
Ratlier than thus be *over-top'd*,
Would you not wish his laurels cropt? *Swift.*

To OVER-TOWER, v. u. To soar too high.—This miscarriage came very seasonably to abate their *over-towering* conceits of him. *Fuller's Holy War.*

To OVER-TRIP', v. a. To trip over; to walk lightly over:

In such a night,
Did Thisbe fearfully *o'er-trip* the dew,
And saw the lion's shadow ere himself,
And ran dismay'd away. *Shakespeare's Merch. of Ven.*

To OVER-TROW, v. u. [*oepentupan*, Sax.] To be over confident; to think too highly.—I am no thing *overtrowyng* to myself. *Wicliffe, 1 Cor. iv.*

To OVER-TRUST, v. a. To place too much reliance on.—Some there are that do so *over-trust* their leaders' eyes, that they care not to see with their own. *Bp. Hall's Cases of Consc.*

To OVER-VALUE, v. a. To rate at too high a price.—To *over-value* human power, is an argument of human weakness. *Holyday.*

To OVER-VEIL, v. a. To cover:
The day begins to break, and night is fled,
Whose pitchy mantle *over-veil'd* the earth. *Shakespeare.*

Thou mak'st the night to *over-veil* the day;
Then savage beasts creep from the silent wood:
Then lions' whelps lie roaring for their prey,
And at thy powerful hand demand their food. *Wotton.*

To OVER-VO'TE, v. a. To conquer by plurality of votes.—The lords and commons might be content to be *over-voted* by the major part of both houses, when they had used each their own freedom. *King Charles.*

To OVER-WAT'CH, v. u. To subdue with long want of rest:

Morpheus is dispatch'd;
Which done, the lazy monarch, *over-watch'd*,
Down from his propping elbow drops his head,
Dissolv'd in sleep, and shrinks within his bed. *Dryden.*

OVER-WAT'CHED, adj. Tired with too much watching.—While the dog hunted in the river, he had withdrawn himself, to pacify with sleep his *over-watched* eyes. *Sidney.*

OVER-WE'AK, adj. Too weak; too feeble.—Paternal persuasions, after mankind began to forget the original giver of life, became in all *over-weak* to resist the first inclination of evil; or after, when it became habitual, to constrain it. *Raleigh's Hist. of the World.*

OVER-WE'ARY, adj. Too weary for farther exertion.
To OVER-WE'ARY, v. a. To subdue with fatigue.—Might not Palinurus fall asleep and drop into the sea, having been *over-wearied* with watching. *Dryden.*

To OVER-WEATH'ER, v. a. To batter by violence of weather:

How like a younker or a prodigal
The scarfed bark puts from her native bay,

Hugg'd and embraced by the strumpet wind !
How like the prodigal doth the return,
With *over-weather'd* ribs and ragged sails,
Lean, rent, and beggar'd, by the strumpet wind. *Shakespeare.*

To *OVER-WEE'N*, *v. n.* To think too highly ; to think with arrogance. To reach beyond the truth of any thing in thought ; especially in the opinion of a man's self. *Hammer.*—No man is so bold, rash, and *over-weening* of his own works, as an ill painter and a bad poet. *Dryden.*

Take heed of *over-weening* ; and compare
Thy peacock's feet with thy gay peacock's train ;
Study the best and highest things that are,
But of thyself an humble thought retain. *Davies.*

OVER-WEE'NINGLY, *adv.* With too much arrogance ; with too high an opinion.—Till he himself had been infallible, like him whose peculiar words he *over-weeningly* assumes. *Milton's Eiconoclast.*

To *OVER-WEIGH*, *v. a.* To preponderate.—Sharp and subtle discourses of wit procure many times very great applause ; but, being laid in the balance with that which the habit of sound experience delivereth, they are *over-weighed*. *Hooker.*

My unfoil'd name, the auftereness of my life,
Will so your accusation *over-weigh*,
That you shall stifle in your own report. *Shakespeare.*

OVER-WEIGHT, *f.* Preponderance.—Sinking into water is but an *over-weight* of the body, in respect of the water. *Bacon's Nat. Hist.*

OVER-WENT, [used by Spenser for] Overthrown :
But he, like hound full greedy of his prey,
Being impatient of impediment,
Continued still his course, and by the way
Thought with his spear him quight have *over-went*.
Fairy Queen.

To *OVER-WING'*, *v. a.* To out-reach the wing of an army ; to out-flank.—Agricola, doubting to be *over-winged*, stretches out his front, though somewhat of the thinnest. *Milton's Hist. of Eng.*

OVER-WISE, *adj.* Wise to affectation.—Make not thyself *over-wise*. *Ecc. vii. 16.*

OVER-WISENESS, *f.* Pretended wisdom ; science falsely so called :

Tell wit how much it wrangles
In tickle points of niceness ;
Tell wisdom the entangles
Herself in *over-wiseneſſe*. *Sir W. Raleigh.*

To *OVER-WOR'D*, *v. a.* To say too much.—Describing a small fly, he extremely *over-worded* and *over-spake* himself in his expression of it ; as if he had spoken of the Nemean lion. *Hales.*

To *OVER-WOR'K*, *v. a.* To tire.—It is such a pleasure as can never cloy or *over-work* the mind. *South's Sermons.*

OVER-WOR'N, *part.* Worn out ; subdued by toil :
With watching *over-worn*, with cares oppress'd,
Unhappy, I had laid me down to rest. *Dryden.*
Spoiled by time :

The jealous *o'er-worn* widow and herself
Are mighty gossips in this monarchy. *Shakespeare.*

To *OVER-WRES'TLE*, *v. a.* To subdue by wrestling :
Life recover'd had the raine,
And *over-wrestled* his strong enemy. *Spenser.*

OVER-WROU'GHT, *part.* Laboured too much.—Apelles said of Protogenes, that he knew not when to give over. A work may be *over-wrought* as well as under-wrought : too much labour often takes away the spirit, by adding to the polishing ; so that there remains nothing but a dull correctness, a piece without any considerable faults, but with few beauties. *Dryden's Duſſynoy.*—Worked all over :

Of Gothic structure was the northern side,
O'er-wrought with ornaments of barbarous pride. *Pope.*
It has in Shakespeare a sense which I know not well how to reconcile to the original meaning of the word, and therefore conclude it misprinted for *over-raught* ; that is, *over-reached*, or cheated. *Johnson.*

By some device or other,
The villain is *o'er-wrought* of all my money :
They say this town is full of cozenage. *Shakespeare.*

OVER-YE'ARED, *adj.* Too old.—A maid whose fruit was ripe, not *over-yeared*. *Fairfax.*

OVER YS'CHIE, a town of France, in the department of the Dyle, on the river Yſche : ten miles south-east of Brussels.

OVER-ZE'ALED, *adj.* Ruled by too much zeal. *Not in use.*—Thus was the good king's judgment *over-zealed*. *Fuller's Holy War.*

OVER-ZEAL'OUS, *adj.* Too zealous.—It is not of such weighty necessity to determine one way or the other, as some, *over-zealous* for or against the immateriality of the soul, have been forward to make the world believe. *Locke.*

OVERA. See *AWERI.*

OVERAC'KEN, a small island on the west side of the gulf of Bothnia. Lat. 63. 50. N. lon. 20. 29. E.

OVERALL (John), a celebrated prelate of the church of England in the seventeenth century, was born about the year 1599. From the grammar-school he was sent to St. John's College, in the university of Cambridge, of which society he was elected a scholar. Afterwards he removed to Trinity College, where he was chosen a fellow. In the year 1596, he was nominated regius professor of divinity, and took the degree of doctor in that faculty. About the same time he was elected master of Catharine-hall. In 1601-2, queen Elizabeth, on the recommendation of sir Fulke Greville, afterwards lord Brooke, his patron, promoted him to the deanery of St. Paul's ; London. Soon after the accession of king James I. he was chosen prolocutor of the lower house of convocation ; and in 1612 he was appointed one of the first governors of the Charter-house, then recently founded. In 1614, he was nominated to the see of Lichfield and Coventry ; from which he was translated, in 1618, to that of Norwich ; where he died in 1619, about the age of sixty. He is ranked among the best divines of his time, and is said to have particularly excelled in scholastic theology. He maintained a correspondence with Gerard Vossius and Grotius, to whom letters from him may be seen in the collection, entitled "*Præstantium et eruditorum Viro-rum Epistolæ ecclesiasticæ et theologicæ.*" In this correspondence he declares himself in favour of Arminianism ; however, he thinks that St. Augustine's opinion of grace may be tolerated, but absolutely condemns the doctrine of confining grace to the elect alone. Indeed, he seems to have paved the way for the reception of Arminianism in England, where it was within a few years generally embraced by the clergy of the established church, chiefly by the authority and influence of archbishop Laud. He laboured zealously to conciliate the differences which had been occasioned in Holland, by what is known by the name of the *quinquarticular controversy*, and expressed great concern for the unjust and cruel treatment which the efforts and proposals of Grotius for peace had met with ; as appears in part from the correspondence above mentioned. But our prelate is chiefly known in England, by the controversy occasioned by Dr. afterwards bishop, Sherlock's attributing his conversion from nonjuring principles, to a passage in our author's "*Convocation Book.*" Of the history of this work we shall lay before our readers the following account from bishop Burnet. "There was a book drawn up by bishop Overall, four-score years ago, concerning government ; in which its being of a divine institution was very positively asserted. It

It was read in convocation, and passed by that body, in order to the publishing it, in opposition to the principles laid down in that famous book of Parsons the Jesuit, under the name of *Dollman*. King James I. did not like a convocation entering into such a theory of politics; so he wrote a long letter to Abbot, who was afterwards archbishop of Canterbury, but was then in the lower house. I had the original, writ all in his own hand; in my possession. By it he desired that no further progress should be made in that matter, and that this book might not be offered to him for his assent. Thus that matter slept; but Sancroft had got Overall's own book into his hands. So, in the beginning of this reign, he resolved to publish it, as an authentic declaration that the church of England had made in this matter; and it was published, as well as licensed by him, a very few days before he came under suspension for not taking the oaths. But there was a paragraph or two in it that they had not considered, which was plainly calculated to justify the owning the United Provinces to be a lawful government. For it was there laid down, that, when a change of government was brought to a thorough settlement, it was then to be owned and submitted to, as a work of the providence of God; and a part of king James's letter to Abbot related to this. When Sherlock observed this, he had some conferences with the party, in order to convince them by that which he said had convinced himself. Soon after that, he took the oaths, and was made dean of St. Paul's." *Biog. Brit.*

OVERBEKE (Bonaventure Van), a draughtsman and antiquary, was born at Amsterdam in 1660. Having imbibed a passion for antiquities, he made three journeys to Rome, where he designed all the relics of ancient magnificence in that capital. He first copied all the monuments which subsist in an entire state; and then all the mutilated ones, exactly in their present condition, and with the greatest accuracy of proportions. On his return to his own country he engraved all these designs with his own hand, and subjoined the descriptions of the best antiquaries to each subject. He also added the names and medals of the popes who have renovated any of them, and the ancient and modern descriptions relative to them. He died at Amsterdam in 1706. His collection, which was first written in Dutch, was translated into Latin and French. In the former language it was published under the title of "*Reliquæ antiquæ Urbis Romanæ, &c.*" 3 vols. folio, Amst. each volume containing fifty plates and descriptions. It was also published in French, in three volumes, folio, 1709, 1763. *Gen. Biog.*

O'VERBURY (Sir Thomas), a learned English gentleman and miscellaneous writer, was descended from an ancient family at Ashton-under-Edge in Gloucestershire. He was born in 1581, at the house of a maternal relation in Warwickshire; and, after having laid the foundation of his grammar learning in that country, he was entered as a gentleman commoner of Queen's college, Oxford. From this place he removed to the Middle Temple for the study of the law, to which profession his father belonged; but, not having a taste for legal pursuits, he endeavoured to push his fortune at court. About the year 1604 he contracted an intimacy with Robert Carr, the favourite of king James, who was afterwards created earl of Somerset, and by whose means Mr. Overbury was knighted, and his father raised to the honour of being a Welsh judge. This was in the year 1603; and in the following year Sir Thomas made a tour on the continent; and, on his return, published "*Observations*" on what he had seen. It was not likely that his principles should be pure while connected with a licentious court; and, accordingly, it appears that he assisted his friend and patron Carr in his amorous correspondence with the countess of Essex, but, after her divorce, he as earnestly opposed the marriage of the two adulterers, for which he incurred the hatred of them both. The consequences have been detailed under the article ENGLAND, vol. vi. p. 663, 4. Sir Thomas, though by no means a blameless character, was

lamented as a victim to the passions of a most abandoned pair. He was author of several pieces in prose and verse. The poem entitled "*The Wife*," describing the character of a woman qualified to render the marriage-state happy, was extremely popular. The tenth edition of his works was published in 8vo. in 1753. In the *Biog. Brit.* there is a long and very detailed account of the methods used to destroy Sir Thomas Overbury.

O'VERBURY, in geography. See SHIPSTON-UPON-STOUR.

TO OVERCOME, *v. a.* pret. *I overcame*; part. pass. *overcome*; anciently *overcomen*, as in Spenser. [*overcomen*, Dut.] To subdue; to conquer; to vanquish.—Of whom a man is *overcome*, of the same is he brought in bondage. 2 *Pet.* ii. 19.

They, *overcomen*, were deprived
Of their proud beauty, and the one moiety
Transform'd to fish, for their bold surquedry. *Spenser.*
To surmount.—Miranda is a constant relief to poor people in their misfortunes and accidents; there are sometimes little misfortunes that happen to them, which of themselves they could never be able to *overcome*. *Law.*—To overflow; to surcharge:

The unfallow'd glebe
Yearly *o'ermoves* the granaries with stores. *Philips.*
To come over or upon; to invade suddenly. *Not in use.*

Can such things be,
And *overcome* us like a summer's cloud,
Without our special wonder? *Shakespeare's Macbeth.*

TO OVERCOME, *v. n.* To gain the superiority.—That thou mightest be justified in thy sayings, and mightest *overcome* when thou art judged. *Rom.* iii. 4.

OVERCOMER, *f.* He who overcomes.—Great rewards and rich gifts were appointed for the *overcomers*. *Powell's Hist. of Wales*, 1584.

OVERCOM'INGLY, *adv.* With superiority; in the manner of a conqueror.—That they should so boldly and *overcomingly* dictate to him such things as are not fit. *More's Conf. Cab.* 1653.

OVERFLAK'EE, or Zuid Voorn, an island of the Netherlands, in the province of South Holland, in the Meuse, about thirteen miles long from east to west, and four in its greatest breadth. The first name it receives from a sand-bank, named *Flaque*, or *Flakee*, which lies in the stream north of the island; the last, from its situation with respect to the isle of Voorn, from which it is about two miles to the south. Lat. 51. 43. N. lon. 4. 24. E.

OVERFLAX, a town of Sweden, in the government of Wasa: six miles north of Wasa.

TO OVERFLOW, *v. n.* To be fuller than the brim can hold.—Had I the same consciousness that I saw Noah's flood, as that I saw the *overflowing* of the Thames last winter, I could not doubt, that I, who saw the Thames *overflowed*, and viewed the flood at the general deluge, was the same self. *Locke.*

While our strong walls secure us from the foe,
E'er yet with blood our ditches *overflow*. *Dryden.*

To exuberate; to abound.—A very ungrateful return to the author of all we enjoy, but such as an *overflowing* plenty too much inclines men to make. *Rogers.*

TO OVERFLOW, *v. c.* To fill beyond the brim.—Suppose thyself in as great a sadness as ever did load thy spirit, wouldst thou not bear it cheerfully, if thou wert sure that some excellent fortune would relieve and recompense thee so as to *overflow* all thy hopes. *Bp. Taylor.*

New milk that all the winter never fails,
And all the summer *overflows* the pails. *Dryden.*

To deluge; to drown; to over-run; to over-power.—The Scythians, at such time as the northern nations *overflowed* all Christendom, came down to the sea-coast. *Spenser.*—*Clanlus overflow'd th' unhappy coast. Dryden.*—Do not the

the Nile and the Niger make yearly inundations in our days, as they have formerly done? and are not the countries so *overflowed* still situate between the tropics? *Bentley*.—Sixteen hundred and odd years after the earth was made, it was *overflowed* and destroyed in a deluge of water that overspread the face of the whole earth, from pole to pole, and from east to west. *Burnet*.

Thus oft by mariners are shown
Earl Godwin's castles *overflowed*.

Swift.

The participle *overflowed* is, among the examples, used, we see, by such excellent writers as Swift and Bentley; yet *flowu* is not the participle of *flow*, but of *fly*. *Todd*.

O'VERFLOW, *f*. Inundation; more than fulness; such a quantity as runs over; exuberance.—Where there are great *overflows* in fens, the drowning of them in winter maketh the summer following more fruitful; for that it keepeth the ground warm. *Bacon's Nat. Hist.*—It requires pains to find the coherence of abstruse writings: so that it is not to be wondered, that St. Paul's Epistles have, with many, passed for disjointed pious discourses, full of warmth and zeal and *overflows* of light, rather than for calm, strong, coherent, reasonings, all through. *Locke*.—After every *overflow* of the Nile, there was not always a mensuration. *Arbuthnot on Coius*.—The expression may be ascribed to an *overflow* of gratitude in the general disposition of Ulysses. *Brome*.

Did he break out into tears?—

In great measure.—

—A kind *overflow* of kindness.

Shakespeare.

O'VERFLOWING, *f*. Exuberance; copiousness.—When men are young, they might vent the *overflowings* of their fancy that way. *Denbau's Dedie*.—When the *overflowings* of ungodliness make us afraid, the ministers of religion cannot better discharge their duty of opposing it. *Rogers*.

O'VERFLOWINGLY, *adv*. Exuberantly; in great abundance. *A word not elegant, nor in use*.—Nor was it his indigence that forced him to make the world; but his goodness pressed him to impart the goods which he so *overflowingly* abounds with. *Boyle*.

O'VERISSEL, or **O'VER YSSEL**, the seventh of the northern provinces of the new kingdom of the Netherlands, so called from its situation beyond the river Issel, is bounded on the north by Friesland and the lordship of Groningen, on the east by the territory of Munster, on the south by Guelderland, and on the west by the Issel, or Yssel, and the Zuyder Sea. Its greatest length, from north to south, is more than twenty leagues; its breadth, from east to west, about eighteen. The island of Schokland, in the Zuyder Sea, belongs to this province: it contains 600 inhabitants, and the whole province 148,000. The number of towns and villages is 55. The chief towns are Zwol, Deventer; and Campen.

The chief rivers of this province are the Vecht and the Aa.—The Vecht rises near Coesfeld in Westphalia; is increased by the waters of some marshes as it enters the province of Overissel; washes the village of Ommen, beyond which it receives the Regge; crosses the town of Zwol, beyond which it receives the Aa, (the second river of that name;) it then takes the name of *Swaarte-water*, or Black-water, and empties itself into the Zuyder Sea.—The Aa (the third of that name), after washing the village of Staenwylch, runs into the Zuyder Sea near Blackzyl.

This province sends four deputies to the second chamber of the states-general. The provincial states consist of sixty-three members; of whom twenty-one are chosen by the equestrian order, twenty-one by the towns, and twenty-one by the peasantry. The soil, in that part of the province which is near Friesland, consists chiefly of marshy ground, and is productive of heath. There is little arable land, but much pasturage, and a good deal of wood and turf. It produces little corn, but plenty of fruit and ve-

getables. The cattle are fine, and the butter excellent. *Géographie du Royaume des Pays Bas*, 1819.

TO OVERLOOK, *v. a*. To view from a higher place.—I will do it with the same respect to him, as if he were alive, and *overlooking* my paper while I write. *Dryden*.

The pile o'er-look'd the town, and drew the sight,
Surpris'd at once with reverence and delight. *Dryden*.

To view fully; to peruse.—Would I had *overlook'd* the letter. *Shakespeare*.—To superintend; to over-see.—In the greater out-parishes, many of the poor parishioners, through neglect, do perish, for want of some heedful eye to *overlook* them. *Graunt*.—To review:

The time and care that are requir'd,
To *overlook* and file, and polish well,
Fright poets from that necessary toil.

Roscommon.

To pass by indulgently.—This part of good-nature, which consists in the pardoning and *overlooking* of faults, is to be exercised only in doing ourselves justice in the ordinary commerce of life. *Addison*.—To neglect; to slight.—The happiest of mankind, *overlooking* those solid blessings which they already have, set their hearts upon somewhat they want. *Atterbury*.—They *overlook* truth in the judgements they pass on adversity and prosperity. The temptations that attend the former they can easily see, and dread at a distance; but they have no apprehensions of the dangerous consequences of the latter. *Atterbury*.

OVERLOOK'ER, *f*. The original word signifies an *overlooker*, or one who stands higher than his fellows, and overlooks them. *Watts*.—The Holy Ghost hath made you overseers, *overlookers*, and watchmen, over the flock of Christ. *Bp. of Chichester's Two Sermons*, 1576.—God then is present, and his angel seeth thee: O wicked and damnd man, if thou contemne such *overlookers*! *Woolton's Chr. Manual*, 1576.

OVERLOOP, *f*. The same with *orlop*.—In extremity we carry our ordnance better than we were wont, because our nether *overloops* are raised commonly from the water; to wit, between the lower part of the port and the sea. *Raleigh*.

OVERLY, *adj*. [oueplice, Sax. negligently.] Careless; negligent; inattentive; slight.—This is also a Scottish adjective; and Dr. Jamieson, noticing it, observes, that *overly* must have been formerly used in English, as Somner mentions it in rendering the Saxon word. I will satisfy him that it was a very common word, though Dr. Johnson has wholly overpassed it. *Todd*.—Not fearing the frowns of that *overly* host, she thrusts herself into Simon's house to find Jesus. *Bp. Hall's Contempl.*—A kind of *overly* desire. *Mountagu's App. to Caesar*.—Not to content themselves with a slight and *overly* examination. *Saunders's Sermons*, Pref.

The courteous citizen bade me to his feast,
With hollow words, and *overly* request. *Bp. Hall's Sat.*

OVERMOST, *adj*. Highest; over the rest in authority. *Ainworth*.

O'U'ERO, a river of Mexico, which runs into the bay of Honduras in lat. 15. 43. N. lon. 87. 45. W.

O'VERPLUS, *f*. Surplus; what remains more than sufficient.—A great deal too much of it was made, and the *overplus* remained still in the mortar. *L'Estrange*.—It would look like a fable to report, that this gentleman gives away all which is the *overplus* of a great fortune. *Addison*.

O'VERSALL, a small island in the Caledonian Sea, near the west coast of Scotland. Lat. 55. 44. N. lon. 38. 6. W.

O'VERSBRIDGE, a village near Gloucester. Here was formerly an abbey, moated round; it was destroyed in the civil wars.

TO OVERSEE, *v. a*. To superintend; to overlook:

She without noise will *oversee*
His children and his family.

Dryden.

Y

To

To overlook; to pass by unheeded; to omit:

I, who resolve to *oversee*
No lucky opportunity,
Will go to council to advise
Which way to encounter, or surprise.

Hudibras.

OVERSEER, *part.* Mistaken; deceived.—A common-received error is never utterly overthrown, till such times as we go from signs unto causes, and shew some manifest root or fountain thereof common unto all, whereby it may clearly appear how it hath come to pass that so many have been *overseen*. *Hooker*.—Such overseers, as the overseers of this building, would be so *overseen*, as to make that which is narrower contain that which is larger. *Holyday*.

OVERSEER, *f.* One who overlooks; a superintendent.—Jehiel and Azariah were *overseers* unto Cononiah. *2 Chron.* xxxi. 13.—There are in the world certain voluntary *overseers* of all books, whose censure would fall sharp on us. *Hooker*.

To entertain a guest, with what a care
Would he his household ornaments prepare;
Harass his servants, and as *overseer* stand,
To keep them working with a threatening wand.
Clean all my plate, he cries.

Dryden.

An officer who has the care of the parochial provision for the poor.—Then the churchwardens and *overseers* of the poor might find it possible to discharge their duties; whereas now, in the greater out-parishes, many of the poorer parishioners, through neglect, do perish, for want of some heedful eye to overlook them. *Graunt's Bills of Mortality*.

OVERSEERS of the POOR are public officers, who must be substantial householders, and they must be generally resident in the parish. They were created by the stat. 43 Eliz. cap. 2. and nominated yearly in Easter-week, or within one month after Easter, under the hand and seal of two or more justices of the peace in the same county, and dwelling in or near the parish, whereof one is to be of the quorum, who must meet together for this purpose; to provide for the poor of every parish; and are sometimes two, or three, or four, according to the largeness of the parish: but not more than four, nor less than two, can be appointed. By 17 Geo. II. c. 38. in every township or place where are no churchwardens, the overseers alone may act in all respects as churchwardens and overseers may do in other places by virtue of this or any former act; and, if any overseer shall die, or remove, or become insolvent, before the expiration of his office, two justices (on oath thereof made) may appoint another in his stead; and, if in any place there shall be no such nomination of overseers as is before appointed, every justice of the division shall forfeit 5*l.* to the poor of such place, to be levied by the churchwardens and overseers, or one of them, by distress, by warrant from the sessions. This forfeiture supposes that the justices are obliged to divide; for, in that case, the appointment was to be by the justices in or near the division, and not otherwise; but now the justices at large are all equally concerned; and therefore it seems, that this penalty cannot be levied on any particular justice. But, if in any place no overseer shall be appointed, a mandamus will go to the justices at large, to compel them to appoint. Parishioners, as well as overseers appointed, may appeal to the sessions against the appointment. Overseers refusing to take the office may be indicted for it; nor will the court quash an indictment against an overseer. The overseers thus appointed, and taking upon them the office, shall, within fourteen days, receive the books of assessment and accounts from their predecessors, and what money and materials shall be in their hands, and reimburse them their arrears. 17 G. II. cap. 28.

Their office and duty, according to stat. 43 Eliz. are principally these: first, to raise competent sums for the

necessary relief of the poor, impotent, old, and blind, and such as are not able to work; and, secondly, to provide for such as are able, but cannot otherwise get employment: for these joint purposes, they are empowered to make and levy rates upon the several inhabitants of the parish, by the same act of parliament, which has been farther enforced and explained by several subsequent statutes. And, by 17 Geo. II. cap. 38. if any person shall be aggrieved by any thing done or committed by the churchwardens and overseers, or by any of his majesty's justices of the peace, he may, giving *reasonable notice* to the churchwardens or overseers, appeal to the next quarter-sessions, when the same shall be heard and finally determined; but, if reasonable notice be not given, then they shall adjourn the appeal to the next quarter-sessions; and the court may award reasonable costs to either party. By 43 Eliz. c. 2. the churchwardens and overseers shall, within four days after the end of their year, and other overseers nominated, make and yield up to two justices a true and perfect account of all sums by them received, or rated and assessed and not received, and also of such stock as shall be in their hands, or in the hands of any of the poor to work, and of all other things concerning their office; and such sums of money as shall be in their hands shall pay and deliver over to their successors; and the subsequent churchwardens or overseers, by warrant from two such justices, may levy by distress and sale of the offender's goods the said sums or stock which shall be behind on any account to be made; and, in defect of such distress, two such justices may commit him to the common gaol, there to remain, without bail or mainprize, until payment of the said sum and stock: and, also any such two justices may commit to the said prison every one of the said churchwardens and overseers, which shall refuse to account, there to remain, without bail or mainprize, until he have made a true account, and satisfied and paid so much as upon the said account shall be remaining in his hands.

And, by the 17 Geo. II. c. 38, it is enacted as follows: The churchwardens and overseers shall yearly, within fourteen days after other overseers shall be appointed, deliver in to the succeeding overseers a just account in writing, fairly entered in a book to be kept for that purpose, and signed by them, of all sums by them received, or rated and not received; and also of all materials that shall be in their hands, or in the hands of any of the poor to be wrought, and of all money paid by such churchwardens and overseers so accounting, and of all other things concerning their office; and shall also pay and deliver over all sums of money and other things, which shall be in their hands, to the succeeding overseers; which account shall be verified by oath before one justice, who shall sign and attest the taking of the same at the foot of the account, without fee; and the said books shall be preserved by the churchwardens and overseers in some public or other place within the parish or township; and they shall permit any person assessed, or liable to be assessed, to inspect the same at all seasonable times, paying 6*d.* for such inspection; and shall, upon demand, give copies at the rate of 6*d.* for every three hundred words, and so in proportion. And, if they shall refuse or neglect to make and yield up such account, verified as aforesaid, within such time, or shall refuse or neglect to pay over the money and other things in their hands; any two justices may commit them to the common gaol, till they shall have given such account, or shall have paid and yielded up such money and other things in their hands as aforesaid.

And, if any overseer shall remove, he shall, before his removal, deliver over to some churchwarden or other overseer his accounts, verified as aforesaid, with all assessments, books, papers, money, and other things, concerning his office; and, if any overseer shall die, his executors or administrators shall, within forty days after his decease, deliver over all things concerning his office to some churchwarden or other overseer, and shall pay out of the assets

all money remaining due, which he received by virtue of his office, before any of his other debts are paid.

In case of an overseer becoming a bankrupt, the balance of his account is not due till fourteen days after his year is expired.

Overseers, neglecting their duty, shall forfeit for every default 20s. to the poor, to be levied by distress, or be committed to the common gaol. (43 Eliz.) And, by 17 Geo. II. any parish officer, neglecting to observe the directions of that act, shall forfeit, on conviction within two calendar months after the offence committed, a sum not exceeding 5l. nor less than 40s. to the poor, by distress. By 33 Geo. III. c. 55. neglect of duty, or disobedience to any lawful warrant or order of any justice, by any overseer of the poor or other parish-officer, upon complaint on oath, shall incur a fine, imposed by two justices at any special or petty sessions, not exceeding 40s. to be levied by distress, and applied to the use of the poor. Overseers are indemnified in the performance of their duty by 43 Eliz. 1 Jac. c. 5. and 21 Jac. c. 12. the benefit of which latter statute is extended by 26 Geo. II. c. 44.

Churchwardens (by 43 Eliz.) are called overseers of the poor, and they join with the overseers in making a poor-rate, &c. But the churchwardens, having distinct business of their own, usually leave the care of the poor to the overseers only; though anciently they were the sole overseers of the poor.

It seems not to have been determined whether a justice of the peace may be appointed overseer. But it appears to be a prevalent opinion, that the offices of justice of the peace, and overseers of the poor, are incompatible, because the accounts of the latter are subject to the controul of the former.

By 1 W. and M. c. 18. dissenting teachers, qualifying themselves according to the toleration-act, are exempted from being chosen or appointed to serve as overseers. By 18 Geo. II. c. 15. freemen of the corporation of surgeons in London are also exempted; so is an alderman of London. The same is the case with respect to attorneys and practising barristers. It seems also that a clergyman is not liable to serve the office of overseer, even though he have no cure of souls. An officer of the customs is also exempted; and it is said, in Gibson's Codex, 215, that all peers of the realm by reason of their dignity, all clergymen by reason of their order, and all parliamentary men by reason of their privilege, are exempted from the office of churchwarden. See POOR.

TO OVERSET', v. a. To turn bottom upwards; to throw off the basis; to subvert.—Would the confederacy exert itself as much to annoy the enemy as they do for their defence, we might bear them down with the weight of our armies, and *overset* the whole power of France. *Addison on the War.*

The tempests met,
The sailors master'd, and the ship *o'erfet*. *Dryden.*

To throw out of regularity.—His action against Cataline ruined the consul, when it saved the city; for it so swelled his soul, that ever afterwards it was apt to be *overset* with vanity. *Dryden.*

TO OVERSET', v. n. To fall off the basis; to turn upside down.—Part of the weight will be under the axle-tree, which will so far counterpoise what is above it, that it will very much prevent the *oversetting*. *Mortimer.*

O'VERSIGHT, f. Superintendence.—They gave the money, being told, unto them that had the *oversight* of the house. 2 Kings xii. 11.—Feed the flock of God, taking the *oversight* thereof, not by constraint, but willingly. 2 Pet. v. 2.—Mistake; error.—Amongst so many huge volumes as the infinite pains of St. Augustine have brought forth, what one hath gotten greater love, commendation, and honour, than the book wherein he carefully owns his *oversights*, and sincerely condemneth them. *Hooker's Pref.*—They watch their opportunity to take advantage of their adversaries' *oversight*. *Kettlewell.*

Not so his son, he mark'd this *oversight*,
And then mistook reverse of wrong for right. *Pope.*

OVERT', adj. [*ouvert*, Fr.] Open; public; apparent.—My repulse at Hull, was the first *overt* essay to be made how patiently I could bear the loss of my kingdoms. *K. Charles.*

To vouch this, is no proof,
Without more certain and more *overt* test,
Than these thin habits and poor likelihoods. *Shakespeare.*

OVERT ACT, an open act, which, by law, must be manifestly proved. 3 Inst. 12.—Some overt act is to be alleged in every indictment for high treason. And no evidence shall be admitted of any overt-act, that is not expressly laid in the indictment by stat. 7 Will. III. c. 3. *Jacob's Law Dict.*—The design of their destruction may have been projected in the dark; but, when all was ripe, their enemies proceeded to so many *overt acts* in the face of the nation, that it was obvious to the meanest. *Swift.*

TO OVERTAKE, v. a. To catch any thing by pursuit; to come up to something going before.—The enemy said, I will pursue, I will *overtake*, I will divide the spoil. *Exod. xv. 9.*—How must he tremble for fear vengeance should *overtake* him before he has made his peace with God? *Rogers.*

If I had given you this at over-night,
She might have been *o'ertaken*; and yet she writes
Pursuit would be but vain. *Shakespeare.*

I shall see
The winged vengeance *overtake* such children. *Shakesp.*

To take by surprise.—If a man be *overtaken* in a fault, ye which are spiritual restore such a one in the spirit of meekness. *Gal. vi. 1.*—If it fall out that, through infirmity, we be *overtaken* by any temptation, we must labour to rise again, and turn from one sin to God by new and speedy repentance. *Perkins.*

TO OVERTHROW, v. a. preter. *overthrew*; part. *overthrown*.—To turn upside down.—Pittacus was a wife and valiant man, but his wife *overthrew* the table when he had invited his friends. *Bp. Taylor.*—To throw down:

The *overthrown* he rais'd, and as a herd
Drove them before him. *Dryden.*

To ruin; to demolish:
When the walls of Thebes he *overthrew*;
His fatal hand my royal father slew. *Dryden.*

To defeat; to conquer; to vanquish.—Our endeavour is not so much to *overthrow* them with whom we contend, as to yield them reasonable causes. *Hooker.*

To Sujah next your conquering army drew;
Him they surpris'd, and easily *o'erthrew*. *Dryden.*

To destroy; to subvert; to mischief; to bring to nothing.—Thou walkest in peril of thy *overthrowing*. *Ecc. xiii. 13.*—God *overthroweth* the wicked for their wickedness. *Prov.*

O loss of one in heav'n, to judge of wise,
Since Satan fell, whom folly *overthrew*. *Milton's P. L.*

O'VERTHROW, f. The state of being turned upside down.—Ruin; destruction.—Of those Christian oratories the *overthrow* and ruin is desired, not by infidels, pagans, or Turks, but by a special refined sect of Christian believers. *Hooker.*

I serve my mortal foe,
The man who caus'd my country's *overthrow*. *Dryden.*
Defeat; discomfiture.—From these, divers Scots feared more harm by victory than they found among their enemies by their *overthrow*. *Hayward.*

Quiet soul, depart;
For I have seen our enemies' *overthrow*. *Shakespeare.*
Degradation:
His *overthrow* heap'd happiness upon him;
For then, and not till then, he felt himself,
And found the blessedness of being little. *Shakespeare.*

OVERTHROWER,

OVERTHROWER, *f.* He who overthrows.
OVERTHWART, *adj.* Opposite; being over-against.—We whisper, for fear our *overthwart* neighbours should hear us, and betray us to the government. *Dryden*.—Crossing any thing perpendicularly.—Perverse; contradictory; cross.—Without benygnyte, traitouris, *overthwarte*. *Wicliffe*, 2 *Tim.* iii.—Alas, what ayle you to be so *overthwart*? *Skelton*.—Two or three acts disposed them to cross and oppose any proposition; and that *overthwart* humour was discovered to rule in the breasts of many. *Clarendon*.
OVERTHWART, *f.* A cross or adverse circumstance. *Obsolete*:

A heart, well stay'd, in *overthwart's* deep
 Hopeth amends.

Ld. Surrey.

OVERTHWART, *prep.* Across; as, He laid a plank *overthwart* the brook. *This is the original use.*

To **OVERTHWART**, *v. u.* To oppose.—All the practice of the church rashly they break and *overthwart*. *Stapleton's Fort. of the Faith*, 1565.

OVERTHWARTLY, *adv.* Across; transversely.—The brawn of the thigh shall appear, by drawing small hair strokes from the hip to the knee, shadowed again *overthwart*. *Peacham on Drawing*.—Pervicaciously; perversely.

OVERTHWARTNESS, *f.* Posture across.—Pervicacity; perverseness.—My younger sister indeed might have been married to a far greater fortune, had not the *overthwartness* of some neighbours interrupted it. *Ld. Herbert*.

OVERTLY, *adv.* Openly.—Good men are never *overtly* despised, but that they are first calumniated. *Dean Young's Sermons*.

OVERTON, a small town and parish in the Kingsclere-division of the county of Southampton, is situated on the great western road, at the distance of three miles east-north-east from Whitechurch, and fifty-four miles west-south-west from London. It was formerly a borough, and sent two members to parliament; but lost this privilege by neglect. The parish contains the tythings of Pollhampton, Quidhampton, and Southington; and, according to the population-returns of 1811, the houses were computed at 231, and the inhabitants at 1178, in number.

The market, if it subsists, is on Monday; but Wilkes's Directory says that it is discontinued; that the market-house is entirely taken away; and that part of Sapley-farm, which is half a mile from the town, is built with some of the materials. The church is about a quarter of a mile from the heart of the place, and stands upon a rising ground.

The soil about Overton for miles every way is extremely good for barley; and large quantities of excellent malt are made here and in the neighbouring villages and towns; particularly at Kingsclere, which sends a great deal to London every season. Here is a fine stream for trout, which rises in a marshy ground in the parish of Ashe, about a mile from Overton. It drives three corn-mills, and a very large silk-mill. The silk-mill was built in the year 1769 by Thomas Streetwells and Thomas Adkins, esqrs. It is a curious piece of building, in the form of a long square, and employs a great number of men, women, and children. Here is also a paper-mill. There are four fairs in a year, viz. the 4th of May, Whit-Monday, the 18th of July, and the 22d of October, all principally for sheep and lambs; that on the 18th of July is the most capital fair for lambs in the county.

OVERTON, a village in Flintshire, North Wales, eight miles south of Wrexham; it has four fairs, on Monday before Holy Thursday, June 11, August 29, and October 18.

OVERTON, a village in Gloucestershire, near Arlingham.

OVERTON, a county of North America, in West Tennessee; containing 5643 inhabitants, of whom 355 are slaves.

OVERTURE, *f.* [*overture*, Fr.] An opening; an aperture; an open place.—The foundations, the walls, the apertions or *overtures*. *Wotton on Architecture*.—In the center of the earth there is nothing but perfect darkness; nearer the upper region of that great body, where any *overture* is made, there is a kind of imperfect twilight. *Bp. Hall's Remains*.

Under its base there is an *overture*,
 Which summer-weeds do render so obscure,
 The careless traveller may pass, and ne'er
 Discover. *Cotton's Wonders of the Peak*.

Opening; disclosure; discovery:

I wish you'd in your silent judgment try'd it.
 Without more *overture*. *Shakespeare's Wint. Tale*.

Proposal; something offered to consideration.—Withstand the *overtures* of ill, and be intent and serious in good. *Fell*.

We with open breast
 Stand ready to receive them, if they like
 Our *overture*, and turn not back perverse. *Milton's P. L.*

A musical composition played at the beginning of an oratorio, concert, or opera.—The *overture* disposes the mind to that mood which fits it for the opening of the piece. *A. Smith on the Imt. Arts*.

To **OVERTUR'N**, *v. a.* To throw down; to topple down; to subvert; to ruin.—He is wise in heart and mighty in strength; which removeth the mountains, and *overturneth* them in his anger. *Job*.—If we will not encourage public works of beneficence, till we are secure that no storm shall *overturn* what we help to build; there is no room left for charity. *Atterbury*.

A monument of deathless fame

A woman's hand *o'erturns*.

Rowe.

To overpower; to conquer.—Pain excessive *overturns* all patience. *Milton*.

OVERTUR'N, *f.* State of being turned upside down; an overthrow.—No awkward *overturns* of glasses, plates, and salt-cellar. *Ld. Chesterfield's Letters*.

OVERTUR'NABLE, *adj.* That may be overturned.—Sir W. Petty gave an account of a commodious land-carriage he had lately contrived, far more secure than any coach; not being *overturnable* by any high on which the wheels can possibly move. *Hist. Royal Soc.*

OVERTURNER, *f.* Subverter.—I have brought before you a robber of the public treasure, an *overturner* of law and justice, and the destruction of the Sicilian province. *Swift*.

To **OVERWHELM**, *v. a.* To crush underneath something violent and weighty.—How trifling an apprehension is the shame of being laughed at by fools, when compared with that everlasting shame and astonishment which shall *overwhelm* the sinner when he shall appear before the tribunal of Christ. *Rogers*.

Back do I tofs these treasures to thy head,
 With the hell-hated lie *o'erwhelm* thy heart. *Shakespeare*.

Blind they rejoice, though now, even now, they fall;
 Death hastes amain; one hour *o'erwhelms* them all. *Pope*.

To overlook gloomily.—In tatter'd weeds, with *overwhelming* brows. *Shakespeare*.

Let the brow *o'erwhelm* it,
 As fearfully as doth a galled rock
 O'erhang and jutty his confounded base. *Shakespeare*.

To put over.—Then I *overwhelm* a broader pipe about the first. *Dr. Papin's Hist. R. Soc.*

OVERWHELM, *f.* The act of overwhelming. *Not received*:

An *overwhelm*
 Of wonderful on man's astonish'd sight. *Young*.

OVERWHELMINGLY, *adv.* In such a manner as to overwhelm. *Inelegant, and not in use*.—Men should not tolerate

tolerate themselves one minute in any known sin, nor impudently betray their souls to ruin for that which they call light and trivial; which is so indeed in respect of the acquiescent, but *overwhelmingly* ponderous in regard of the pernicious consequence. *Decay of Chr. Piety.*

OUESS'ANT. See USHANT.

OUE'ZE, a river of France, which runs into the Sorgue four miles north-north-east of Avignon.

OUGEIN, or OOEJIN, a city of India, the capital of the Mahratta chief Dowlut Rao Scindia, in the province of Malwa, his hereditary territory. See MAHRATTAS and MALWA, vol. xi.

The present city of Ougein is of an oblong form, about six miles in circumference, and surrounded by a stone wall with round towers. Within this space there is some waste ground, but the inhabited part occupies by far the greatest portion; it is much crowded with buildings, and is very populous. The houses are built partly of brick, partly of wood. Of the brick houses the frame is first constructed of wood, and the interstices filled up with brick. They are covered either with lime, tarra, or tiles. The principal bazar, or market, is a spacious and regular street, paved with stone. The houses on each side are of two stories; the lower, to which you mount from the street by five or six steps, are mostly built of stone, and taken up with shops; the upper, of brick or wood, serve for the habitations of the owners. The most remarkable buildings are four mosques, erected by private individuals, and a great number of Hindoo temples. Of the latter the most considerable is a little way out of the town, at a place called Unk-pat, held in great veneration, as being that where Krishna and his brother received the rudiments of their education. Here is a stone tank, with steps leading down to the water's edge, said to be of great antiquity; but it has been of late years enclosed with a stone wall, and two temples have been erected within the inclosure. These temples are square, with pyramidal roofs. That on the right, as you enter the gate, contains the images of Rama, Lakshman, and Sita, in white marble; and that on the left, those of Krishna and Radha, the first in black, the second in white, marble. All these figures are well executed. Scindia's palace is an extensive and sufficiently commodious house, but without any claim to magnificence; and it is so closely surrounded by other buildings, as to make but little appearance on the outside. Near it is a gate, the only remains of a fort, said to have been built soon after the overthrow of the ancient city, which affords a good specimen of the old Hindoo architecture.

Within the city, and near the eastern wall, is a hill of a considerable height, on the top of which is a Hindoo temple of Mahadeva, and adjoining to it the tomb of a Mussulman saint. This hill is conspicuous from a distance, and a spectator from the top of it commands an extensive prospect on every side. To the northward he sees, at the distance of four miles, the rude and massy structure of Kalideh, or Calydeh, an ancient palace, built on an island in the river Sipparah, by a king of the family of Gour. A description of this extraordinary fabric is inserted in the Oriental Repertory, vol. i. from a letter of sir C. W. Malet, dated Oujein, 13th of April, 1785. By an extract from a history of Malwa, or Malava, these buildings appear to have been constructed by, or in the reign of, sultan Nasir ud-deen Gilgee, who ascended the throne of Malava in the year of the Hegira 905, (A. D. 1500,) and reigned eleven years. These singular buildings, we may judge from their name, were erected or consecrated to the honour of Kali, consort of Mahadeva, (see those articles,) to whom the temple on the hill within the city appears above to be dedicated. There are two square buildings, each covered with a hemispherical cupola, and divided below into eight apartments, besides the space in the centre. The communication to the island is by a stone bridge over one of the branches into which the river Sipparah is here divided. Below the bridge are several

apartments constructed on a level with the water; and the rocky bed of the river is cut into channels of various regular forms, such as circles, spirals, squares, &c. to which, in the dry season, the current is confined. Turning to the westward, the spectator, from the top of the hill above-mentioned, traces the winding course of the Sipparah through a fertile valley, where fields of corn and clumps of fruit-trees, intersecting, diversify the prospect, till his attention is arrested by the fort of Beiroungurh, situated close on the opposite bank. It is about a quarter of a mile in length, surrounded by a rampart of earth; and contains an ancient temple, dedicated to the tutelary divinity of the place, whose name it bears. *Beiroungurh* means the Fort of Beiroun, or Bheroo, a Mahratta pronunciation of Bhairava, the offspring of Mahadeva. In the Sanscrit language Bhairava means *tremendous*. Still farther up the stream, and nearly opposite to the middle of the town, are the gardens of two Mahratta nobles, containing the luxuries of nature, with extensive artificial decorations. Beyond these, at the distance of half a mile from the river, is a grove of trees on a rising ground. It contains the tomb of a Mahometan saint; and is remarkable for having been the scene of a bloody action, fought about the year 1762, between Madajee Scindia and one of his rebellious officers, named Raghu, who marched to Ougein at the head of thirty thousand men to attack his sovereign with only five or six thousand. With this inequality the fight began on the plain near the tomb above-mentioned; but Scindia was joined by a party of six thousand Gofains, (religious mendicants,) and, a chance-shot killing Raghu, the rebel party was wholly routed.

The south wall of Ougein is washed by the Sipparah, which here makes a sudden turning. This extremity of the city is called *Jeyfing-poorah*, that is, the Quarter of Jeyfing, and contains an observatory, built by the enlightened and liberal rajah of that name. He also built observatories at four other cities, viz. at Ambheer, his own capital, (since named from him Jeynagar,) Matra, Benares, and Delhi. He published, in 1728, a set of astronomical tables, which, in compliment to the then reigning emperor, he entitled *Zij Mahommedshahy*. Of these five observatories, and the astronomical tables, and labours in that science, of this illustrious prince the rajah Jeyfing, (or more correctly Jayasinha,) a learned and very interesting account is given in vol. v. of the Asiatic Researches, by Dr. W. Hunter, from whose "Narrative of a Journey from Agra to Oujein," in vol. vi. of that work, this article is chiefly taken. See the article BENARES, vol. ii.

The rajah Jeyfing held the city and territory of Ougein of the emperor, in quality of subahdar; but it soon after fell into the hands of the Mahrattas, and has belonged to the family of Scindia for three generations. The district depending immediately on the city yields a revenue of five lacks of rupees (60,000l.) per annum, and comprehends 175 villages. The officers of government are almost the only Mahratta inhabitants of Ougein. The bulk of the people, both Hindoos and Mussulmans, speak a dialect very little different from that of Agra and Delhi. The Mussulmans form a very considerable portion of the inhabitants; and of these the tribe of *Bohras* amounts to about 1500 families. This singular tribe forms a large society in most of the cities and large towns of Hindoostan and the Deccan. Surat is said to contain 6000 families. The head-quarters of the tribe are Burhanpoor, where their *moulla*, or high-priest, resides. A younger brother of the moulla resides in Ougein. They exercise both a temporal and spiritual authority over their sect, which forms the most useful and industrious class of the inhabitants.

The soil in the vicinity of Ougein, and indeed over the greatest part of the province of Malwa, is a black vegetable mould, which, in the rainy season, becomes so soft, that travelling is hardly practicable. On drying, it cracks in all directions; and the fissures are so wide and deep in many parts by the road-side, that it is dangerous for a traveller to go off the beaten track; as a horse, getting his

foot into one of these fissures, endangers his own limbs, and the life of his rider. The quantity of rain that falls in ordinary seasons is so considerable, and the ground so retentive of moisture, that wells are rarely used for agricultural irrigation. A great part of the labour, incident to cultivation in other parts of India, is thus saved. But this very circumstance makes the suffering more severe on a failure of the periodical rains; for the husbandman, accustomed to depend on the spontaneous bounty of heaven, is unprovided with wells, and is with difficulty brought to undertake the unusual labours of irrigation, especially as they must commence with digging the sources. There are, as in other parts of Hindoostan, two harvests in Malwa; the first in March and April, the second in September and October. Wheat, pease, and various sorts of vetches, ripen in the first. Barley is not cultivated, nor rice, otherwise than in small detached low spots. Grapes are abundant. Ougein is first supplied from Burhanpoor, a very large and flourishing town, more than 100 miles to the southward. By the time the Burhanpoor grapes are exhausted, in April, those of Ougein ripen, but are inferior to the former. The vines produce a second crop in the rainy season, but of an acidulous and much inferior grape. The other fruits are the mango, guava, plantain, melon, water-melon, two species of annona (squamosa and reticulata), several varieties of oranges and limes, the falfah (Grewia Asiatica), from which is made a most refreshing sherbet.

The principal articles of export trade are cotton, which is sent in large quantities to Guzerat for the Bombay and China market, coarse printed cloths, and opium. From Bombay, through Surat, are received various kinds of European and China goods, many of which are sometimes to be purchased cheaper at Ougein than in the English settlements; also pearls, which are partly used here, and partly forwarded to Hindoostan. Assafetida, which is produced in Sind and provinces beyond it, comes hither, on its way to the eastward, to Mirzapoor, &c. and diamonds, from Bundelcund to Surat.

The situation of this city is of importance, because it is considered as the first meridian by Hindoo geographers and astronomers. By the medium of eleven observations of Jupiter's first and second satellites, Dr. Hunter determined its lon. to be 75. 51. E. from Greenwich; its lat. by a medium of eight observations, he made 23. 11. 13. N. It may be roundly reckoned about 300 miles north-east from Surat, and something more south from Agra. Indore, the capital of the Mahratta family of Holkar, is about twenty miles in a southerly direction, and Bopal (properly Bhupala) about 100 to the eastward.

The ancient city of Ougein was situated about a mile to the northward; and now lies, and has for many centuries lain, buried in the earth to the depth of from fifteen to eighteen feet. On digging, its walls are said to be found entire, pillars erect and unbroken, pieces of wood of extraordinary hardness, &c. The bricks thus dug up are now applied to the purposes of building, but are much larger than any made in the present or late ages. Utensils of various kinds have been found, and ancient coins. Very little, however, has been yet done towards developing the present state of this submerged city; the interesting Herculaneum of India. Dr. Hunter noticed a large quantity of wheat that was found while he was there; it was in a charred state; a potter's kiln he also saw, filled with broken earthen vessels. Tradition imputes the destruction of the city to a shower of earth, an idea likely to have originated in superficial observation; for, although Dr. Hunter observed no volcanic hills nor scoria in the neighbourhood, and thinks the state and position of the walls and pillars militate against the supposition of an earthquake having effected the submergence of the city, it is yet difficult to impute it to any other than a volcanic cause, operating perhaps with less violence and convulsion than have attended similar phenomena in other countries, and combined with, or rather causing, an inun-

dation of the river. A change in the course of the river is said to have taken place at the time; and an ancient bed is now traceable. A destructive inundation was witnessed and recorded by Dr. Hunter; and it would appear that the neighbourhood of Ougein is particularly subject to inundation; and, when the loose friable nature of the soil is considered, it seems most reasonable to resort to an alluvial hypothesis, to account for the submergence of the ancient city. But, whatever may have been the real cause of the catastrophe, it cannot be supposed that the wild fancies of Hindoo historians would suffer the fact to be simply told. It must be dressed up in a mythological allegory. In fable or fact the interventions of the gods cannot be dispensed with. The following story is accordingly related.

A certain Gandharva, or celestial chorister, was condemned, for an affront to the god Indra, to be born on earth in the shape of an ass; but, on entreaty, the sentence was mitigated, and he was allowed at night to assume the form and functions of a man. This incarnation took place at Ougein in the reign of rajah Sadavafena, whose daughter was demanded in marriage by the ass; and his consent was obtained, on learning the divine origin of his intended son-in-law, confirmed, as he witnessed, by certain prodigies. All day he lived in the stable like an ass; at night, secretly slipping out of his skin, and assuming the appearance of a handsome and accomplished young prince, he repaired to the palace, and enjoyed the conversation of his beauteous and happy bride. In due time the princess became pregnant; and, her chastity being suspected, she revealed to her inquisitive parents the mystery of her spouse's delectable nocturnal metamorphosis; which the rajah, (or, by other accounts, the mother,) being conveniently concealed, himself beheld; and, unwilling that his son should return to his uncouth disguise, set fire to, and consumed, the vacant ass's skin. Rejoiced at his release, for this event appears to have broken the spell, the incarnate Gandharva warned his beloved wife to quit the city, which he foresaw was about to be overwhelmed with a shower of earth, from the resentment of Indra, thus disappointed of his vengeance in the termination of the banishment of his insolent servant. She fled accordingly to a village at a safe distance, and brought forth a son named *Vikramaditya*; and a shower of *cold earth*, poured down by Indra, buried the city and its inhabitants.

It may be here noticed that this fable, wild as it is, affords still some confirmation of the supposition of an inundation during the rainy season having destroyed the city. For Indra is the god of showers; and such an event would of course be attributed to the vengeance of the Jupiter Pluvius of the Hindoo Pantheon, in the same manner as we frequently find the case in the natural phenomena mythologized in the Iliad.

The seeming fable has also another feature of historic truth; for *Vikramaditya*, so distinguished in his origin and birth, is no less so as a monarch and an astronomer. His name marks an era much used all over India, of which the 1869th year corresponds with 1813 of our's. Several monarchs of Malwa of this name are however recorded; and differences of opinion exist on some chronological points connected with this era. (See *As. Res.* vol. ix.) The *Vikrama* in question is, however, particularly distinguished by the surname of his putative parent, who is called *Gardha-rupa*, or the Ass-faced; and his era is hence to be ascertained with more accuracy than is usually obtainable on remote points of Hindoo chronology. He was the third *Vikramaditya*; and appears, by several historical coincidences, to have ascended the throne of Malwa in the year of Christ 441. It hence appears that the city sunk about 1400 years ago. The story of the ass, variously modified, is widely spread in the popular tales of India, Persia, Turkey, Arabia, and other oriental countries; and has found its way even into the literature and legends of Europe.

The

The classical name of this city is *Ujjaini*, not materially altered in its present designations. It is also called *Avanti* in the Puranas, is much venerated by the Hindoos, and is one of the most celebrated for producing great and learned men among the cities of India. If Benares has been thought to deserve the name of the Athens, Oujein may lay claim to the honour of being the Florence, of Hindoostan. From this circumstance we have been induced to be more diffuse than is usual with us in like cases, in our account of this city, which, and the legends connected with it, furnish ample subjects for the descriptive and fabulous details of Puranic romance. From this source we shall notice one more tale, or rather a variation of that already given, accounting for one of the ancient names of the city; premising, however, that such tales being found in the Puranas, fully prove those books, a portion of them at least, to have been written subsequent to the catastrophe that they describe. The varied legend to which we advert, says that, the curse having expired in the consumption of his asinine disguise, the Gandharva ascended to the heaven of Indra; and that his wife, resolving to die, ripped open her belly, took out the child, and gave it to a *mahini* (gardener's wife) to nurse. She took it to Ujjaini; and, from the signal preservation of the child in that city, it obtained the name of *Avanti*, from the Sanscrit *ava*, to preserve.

The city of Oujein appears evidently, both as to name and position, in the Periplus of the Erythrean Sea as well as in Ptolemy, under the name of *Ozœna*. *Asiatic Researches*, vol. vi.

OUGH, *f.* [aphr̥, that is, a whit, Sax. This word is therefore more properly written AUGHT.] Any thing; not nothing.—He asked him if he saw *ought*. *Mark* viii. 23.

O Universal Lord! be bounteous still
To give us only good; and, if the night
Have gather'd *ought* of evil, or conceal'd,
Disperse it, as now light dispels the dark. *Milton's P.L.*

OUGH, *verb imperfect*; in the second person *oughtest*. This word the etymologists make the preterite of *owe*, but it has often a present signification. [Preterite of *owe*.] Owed; was bound to pay; have been indebted.—Apprehending the occasion, I will add a continuance to that happy motion, and besides give you some tribute of the love and duty I long have *ought* you. *Spelman*.

This blood which men by treason sought,
That followed, sir, which to myself I *ought*. *Dryden*.

[Preterite of *owe*, in the sense of *own*.] Had a right to.—The knight, the which that castle *ought*. *Spenser*.

Where is the booty,
And where is eke your friend which half it *ought*?
Spenser.

To be obliged by duty.—Know how thou *oughtest* to behave. 1 *Tim.* iii. 15.—Judges *ought* to remember, that their office is to interpret law, and not to make or give law. *Bacon*.—We *ought* to profess our dependance upon him, and our obligations to him for the good things we enjoy. We *ought* to publish to the world our sense of his goodness with the voice of praise, and tell of all his wondrous works. We *ought* to comfort his servants and children in their afflictions, and relieve his poor distressed members in their manifold necessities; for he that giveth alms sacrificeth praise. *Nelson*.

She acts just as he *ought*,
But never, never, reach'd one gen'rous thought. *Pope*.

To be fit; to be necessary.—These things *ought* not so to be. *James* iii. 10.—If grammar *ought* to be taught, it must be to one that can speak the language already. *Locke*.—Applied to persons, it has a sense not easily explained. To be fit or necessary that he should.—*Ought* not Christ to have suffered? *Luke*.—*Ought* is both of the present and past tenses, and of all persons except the second singular.

OUGH'TER LOUGH. See LOUGH, vol. xiii.

OUGH'TERARD, a small post-town of Ireland, in the county of Galway, situated on Lough Corrib. The rocks here are of black and white marble. It is 120 miles west by north from Dublin, and about 14 north-west from Galway.

OUGH'TRED (William), an English divine and very eminent mathematician, was born at Eton in Buckinghamshire, about the year 1573. Having been educated upon the foundation of that school, he was elected thence, in 1592, to King's College, Cambridge, of which, after the regular time of probation, he was admitted fellow. Here he applied with great assiduity to the different branches of academical learning, and particularly that of the mathematics, to which the bent of his genius most powerfully directed him. He read all the ancient authors in this science, examining diligently the sagacity of their invention, and careful to comprehend the peculiar force and elegance of their demonstrations. While he was yet an under-graduate, he invented "An easy Method of Geometrical Dialling," which was not given to the public before the year 1647, but was privately received with so much esteem, that Mr. (afterwards Sir Christopher) Wren, at that time a scholar of Wadham-college in Oxford, immediately translated it into Latin. This piece was added to the second edition of the author's "Clavis." In 1596 Mr. Oughtred was admitted to the degree of B. A. and in 1599 he commenced M. A. In the year 1600, he projected "A Horizontal Instrument" for delineating dials upon any kind of plane, and for working most questions which could be performed by the globe. An account of this invention he gave to be published in 1633, together with his "Circles of Proportion," by William Foster, who had been one of his pupils. About the year 1603, Mr. Oughtred was ordained priest, and presented to the rectory of Aldbury, near Guildford in Surrey; upon which he quitted the university, and resided upon his living, distinguishing himself by the faithful and diligent discharge of his pastoral duties. Here he led a retired and studious life, seldom travelling so far as London once a-year, his principal recreation consisting in a diversity of studies. "As oft," says he, "as I was toiled with the labours of my own profession, I have allayed that tediousness by walking in the pleasant and more than Elysian fields of the diverse and various parts of human learning, and not of the mathematics only." So high was his reputation for mathematical knowledge, that his house was continually filled with young gentlemen who came thither for his instructions, and many of the chief mathematicians of that age owed much of their skill to him. He also maintained a correspondence with some of the most eminent scholars of his time upon mathematical subjects. In the year 1614, Mr. Briggs, professor of geometry at Gresham-college, having met with lord Napier's newly-published account of his invention of logarithms, and desiring to perfect his lordship's plan, consulted Mr. Oughtred upon the subject, who probably wrote his treatise on Trigonometry about this time, since it is evidently formed upon the plan of lord Napier's work. It was not published, however, before the year 1657, when it appeared under the title of "Trigonometria; hoc est modus computandi Triangulorum Latra et Angulos, ex canone mathematico traditus et demonstratus. Una cum Tabulis Sinum, Tangent. et Secant." &c. 4to. and in the same year, an English edition of it was also published at London, in 4to. In prosecuting the same subject, he invented, not many years afterwards, his instrument called "The Circles of Proportion," mentioned above, by which all such questions in arithmetic, geometry, astronomy, and navigation, as depended upon simple and compound proportion, might be worked; and it was the first sliding-rule that was projected for those uses, as well as those of gauging. About the year 1628, Mr. Oughtred being engaged by the earl of Arundel to become mathematical tutor to his son lord William Howard, for the

use of his noble pupil he drew up "Arithmetica in Numero et Speciebus Institutio: quæ tum Logistica, tum Analytica, atque adeo totius Mathematica, quasi Clavis est," which he published in 1631, 8vo. This work was intended by the author to serve as a general key to the mathematics; and was found to contain so many excellent theorems, several of which were entirely new, both in algebra and geometry, that it met with a favourable reception from the first mathematicians of the age, both at home and abroad; and the general plan of it has been since followed by the best authors upon the subject. An English version of it was published in 1647, 8vo. under the title of "The Key of the Mathematics new forged and filed; together with a Treatise of the Resolution of affected Equations in Numbers; with the Rule of Compound Usury; and a Demonstration of the Rule of False Position; and a most easy Art of delineating all Manner of plain Sun Dials, geometrically taught." In the following year, it was reprinted in Latin, with the additional tracts in the English version, under the title of "Gulielmi Oughtredi Zetonensis, quondam Collegii Regalis in Cantabrigia, Socii, Clavis Mathematica denuo limata sive potius fabricata," &c. 8vo. A third edition of it in Latin was published in 1652, with still further additions, consisting of a treatise on the use of logarithms; a declaration of the tenth book of Euclid's Elements; a treatise of regular solids; and the theorems contained in the books of Archimides. This work of our author had now become a standard-book with tutors in the instruction of mathematical pupils at the universities, especially at Cambridge; and some parts of it were made the subjects of the geometrical lectures at Gresham-college in London. In the year 1636, Mr. Oughtred published a treatise, entitled "Description and Use of the double Horizontal Dial," 8vo. The pieces which he published at subsequent dates, have already been introduced to our readers in the preceding narrative.

Notwithstanding all his mathematical merit, he was in danger, about the year 1646, of a sequestration by the committee for plundered ministers, several articles having been deposed and sworn against him, material enough, as it is said, to have sequestered him. But, upon his day of hearing, William Lilly, the famous astrologer, applied to sir Bulstrode Whitlocke, and all his old friends, who appeared in such numbers on his behalf, that, though the chairman and many other members were active against him, he was acquitted by the majority. "The truth is," says Lilly, in the History of his own Life and Times, where he styles Mr. Oughtred the most famous mathematician then in Europe, "he had a considerable personage; and that alone was enough to sequester any moderate judgement: besides, he was also well known to affect his majesty." In these times, when, as David Lloyd observes in his Memoirs, "he was little observed in England, he was much requested to have lived in Italy, France, and Holland." The same writer gives us this character of him: that he was "as facetious in Greek and Latin, as solid in arithmetic, astronomy, and the sphere of all measures, music, &c. exact in his style as in his judgment; handling his cube and other instruments at eighty as steadily as others did at thirty; owing this, he said, to temperance and archery; principling his people with plain and solid truths, as he did the world with great and useful arts; *advancing new inventions in all things but religion, which, in its old order and decency, he maintained secure in his privacy, prudence, meekness, simplicity, resolution, patience, and contentment.*" He died in 1660, at the great age of eighty-six; and his death is said to have been occasioned by a sudden ecstasy of joy, upon hearing of the vote which passed at Westminster for the restoration of Charles II.

Oughtred had a son, whom he put apprentice to a watchmaker; and he wrote for his use a book of instructions in that art. He left behind him a great number of manuscripts upon mathematical subjects; and most of

his Greek and Latin books contained notes in his own hand-writing, with an abridgment of almost every proposition and demonstration in the margin. These books and manuscripts came into the possession of Mr. William Jones, the father of the late excellent sir William Jones; and afterwards into the hands of his friend sir Charles Scarborough, the physician, who carefully selected such of the manuscripts as were found fit for the press, and printed them at Oxford in 1676, under the title of "Opuscula Mathematica hætenus inedita," 8vo. In the year 1660, sir Jonas Moore annexed to his Arithmetic, then printed in 8vo. a treatise, entitled "Conical Sections, or, the several Sections of a Cone; being an Analysis or methodical Contraction of the two first Books of Mydorgius, and whereby the nature of the Parabola, Hyperbola, and Ellipsis, is very plainly laid down. Translated from the Papers of the learned William Oughtred." We cannot conclude this article without observing, that, though our author was undoubtedly a very great mathematician, yet he was far from having the happiest method of treating the several subjects on which he wrote. His style and manner were very concise, obscure, and dry; and his rules and precepts so involved in symbols and abbreviations, that his mathematical writings were rendered very troublesome to the reader, and very difficult to be understood. *Gen. Biog. Martin's Biog. Phil. Hutton's Math. Dict.*

OU'GLY. See HOOGLY.

OU'GLY, a town of Hindoostan, in the circar of Sanore: fourteen miles north-east of Konapour, and seventy-five west of Sanore.

OUGUE'LA, a town of Portugal, in the province of Alentejo: four miles north-north-east of Campo Mayor, and six south of Albuquerque in Spain. Lat. 38. 54. N. lon. 6. 43. W.

OUGUE'LA, a town of Africa, in the country of Tripoli.

OVID, a town of New York: 160 miles north-west of New York.

OVID, or PUBLIUS OVIDIUS NASO, one of the most celebrated of the Roman poets, was born in the consulate of Hirtius and Pansa, B.C. 43, at Sulmo, in the territory of the Peligni, the present Abruzzo. He was of an ancient equestrian family; and was sent in his youth to Rome, together with a brother, a year older, to be educated in liberal studies under the best masters. A propensity to poetry was his earliest and ruling passion; and it was not without difficulty that his father could prevail upon him to relinquish the unproductive culture of the muses for the thriving pursuits of the law. He appears, however, to have made a good progress in forensic eloquence and judicial knowledge; for he mentions having pleaded causes successfully in the centumviral court, and having as a judge decided private affairs, and sat as one of the triumvirs to whom criminal jurisdiction was committed. His brother died at the age of twenty; and Ovid, probably no longer obliged to follow the law as a gainful profession, deserted the courts, and gave himself up to pleasure and poetry. His talents and amiable qualities introduced him to the politest society in Rome; and he has recorded his intimacy with several of the brightest ornaments of the court of Augustus. He was thrice married: the first time, when scarcely arrived at years of maturity, to one whom he represents as an unsuitable partner; the second, to a blameless spouse, but not capable of inspiring a lasting attachment; and from these two he seems to have been divorced, according to the loose practice of that age. His third wife, Perilla, of whom he speaks with great affection, and by whom he had a daughter, adhered to him in all fortunes, and probably survived him. From the licentiousness of some of his poems, and the acquaintance he displays with the arts of intrigue, there can be little doubt that he also indulged in transitory amours. He seems to have lived in ease and affluence, possessing a house in Rome near the capitol,

capitol, and pleasant gardens on the Appian way, as well as a villa in his native country.

A lively genius and a fertile imagination gained him many admirers; Virgil, Propertius, Tibullus, and Horace, honoured him with their correspondence, and Augustus patronised him with the most unbounded liberality. He had rendered himself famous by several poetical compositions, when, at about the age of fifty, he suddenly incurred a sentence of banishment, which was never revoked, and which made him an exile for the remainder of his life. The true cause of this circumstance has never been known. Few incidents in classical biography have more excited the discussion of the curious than this; still a mystery hangs upon it which no elucidation can thoroughly clear. He has himself assigned two reasons for the anger of Augustus: one, and that the ostensible cause, though certainly not the true reason, the licentiousness of his juvenile poems; the other, he says, was "an error not a crime," something of which his eyes had been guilty, not his intentions:

Cur aliquid vidi? Cur noxia lumina feci?

Cur imprudens cognita culpa mihi est?

Inscius Aetæon vidit sine veste Dianam,

Præda fuit canibus non minus ille suis.

Again,

Inscia quod crimen viderunt lumina plector,
Peccatumque oculos est habuisse meum.

And in another place,

Perdiderunt cum me duo crimina, carmen et error,
Alterius facti culpa silenda mihi est.

It was something in which the emperor's feelings were particularly concerned; some attribute it to an amour of Ovid with Livia, the wife of Augustus; while others suppose it arose from the knowledge which the poet, involuntarily, had of the shocking incest of the emperor with his daughter Julia.

The place of Ovid's exile was Tomi, a town in Scythia, near the Euxine Sea, and not far from the mouths of the Danube. His elegiac epistles from that place are full of complaints of the severity of the climate, the wildness of the scenery, and the savage manners of the surrounding people. In his banishment he betrayed his pusillanimity in a great degree; and, however affected and distressed his situation was, yet the flattery and impatience which he showed in his writings are a disgrace to his pen, and lay him more open to ridicule than to pity. Though he prostituted his pen and his time to adulation, yet the emperor proved deaf to all entreaties, and refused to listen to his most ardent friends at Rome who wished for his return. Ovid, who really wished for a Brutus to deliver Rome of her tyrannical Augustus, still continued his flattery even to meanness; and, when the emperor died, he was so mercenary as to consecrate a small temple to the departed tyrant on the shore of the Euxine, where he regularly offered frankincense every morning. Tiberius proved as regardless as his predecessor to the entreaties which were made for the poet, and he died in the seventh or eighth year of his banishment, in the fifty-seventh year of his age. He was buried at Tomi, the people of which place are said to have mourned publicly for him, and to have erected a stately monument to his memory without the walls of their city.

Ovid was a copious writer, and the greater part of his works has come down to our times. Those which we possess are his "Heroical Epistles," composed in the characters of distinguished lovers in the heroical ages; his elegies, entitled "*Amorum*," and books on the "Art of Love;" his fifteen books of "*Metamorphoses*;" his six books of "*Fasti*" on the Roman calendar, which are only half the number that he composed; his elegiac lamentations entitled "*Tristia*," and "*Epistolæ ex Ponto*." Besides these, there is his "*Ibis*," written in imitation of a

VOL. XVIII. No. 1226.

poem of Callimachus of the same title, which is a satirical performance: there are also fragments of other poems; among these, some of a tragedy entitled "*Medea*." The loss of half the *Fasti* is to be greatly regretted, as it is probable it contained much valuable and interesting information respecting the religious antiquities of the Romans. The tragedy of *Medea* was regarded as one of the best productions of the Roman theatre.

It is unnecessary here to enter into the particular merits of works so well known to the classical reader as those of Ovid. In general it may be said of him, that, in the qualities of faculty and ingenuity, he probably surpassed every other poet, ancient and modern. There is no subject which, in his hands, does not turn into poetry, or, at least, into elegant verse. His vein is inexhaustible; and his principal faults arise from that superabundance of wit and fancy which is apt to run him out of breath, while he chafes one thought or image after another. He abounds, beyond any other ancient, with points and turns of expression, sometimes really beautiful and striking, often deviating into trifling puerility. In his happiest moods, he describes with wonderful force and vivacity; sometimes splendid and picturesque, sometimes elegantly chaste and simple. With all his tendency to superfluity, no one has exceeded him in the neat and energetic brevity with which he occasionally gives a moral sentiment; so that his works are an admirable store of mottoes and sentences. He is sometimes, though rarely, sublime; often brilliant, frequently pathetic, and almost always amusing. If he does not rank with the very first class of poets, he certainly is one of the most agreeable. He possessed great erudition, as well as imagination; and poetical history is indebted to him for some of its choicest ornaments. The editions of the whole and of parts of his works have been extremely numerous. Among the most valuable of the whole may be mentioned Heinſius's, Elzev. 3 vol. 12mo. 1629, frequently reprinted; Burman's, Amst. 4 vol. 4to. 1727; Wetſtein's, Amst. 3 vol. 12mo. 1751; Barbou's, Paris, 3 vol. 12mo. 1762; and Fischer's, Lips. 4 vol. 8vo. 1773. *Gen. Biog. Ency. Brit.*—It is to be lamented that there is no good complete translation of the works of this elegant poet.

OVIDUCT, *f.* [from the Lat. *ovum*, an egg, and *ductus*, a passage.] A passage for the egg from the ovary to the womb.—The torpedo's ovarium is near the liver and double *oviduct* and womb, wherein the young ones swim free, and have no communication with the womb. *Hist. R. Soc.*

OVIEDA, *f.* [named by Linnæus in honour of Gonzalvo Ferdinando d'Oviedo, otherwise de Valde, a Spanish divine, who, in the reign of Ferdinand V. was superintendent of the gold-mines of South America, and resided at Santa Maria in Darien, of which he was rector. He wrote a History of the West Indies, containing an account of many American plants; which may be seen in the Collection of Voyages published by the Giunti at Venice in 1556, and which is taken from the Spanish edition printed at Toledo in 1526. Of this there are English, Italian, and French, translations. Plumier, who first established the present genus, called it *Valdia*, which Linnæus properly corrected.] In botany, a genus of the class didynamia, order angiospermia, natural order of personate, (caprifolia, *Juss.*) Generic characters—Calyx: one-leafed, five-cleft, bell-shaped, acute, erect, broadish, short, permanent. Corolla: one-petalled, ringent; (funnel-form, trifid, *Gartner.*) Tube very long, narrow, subcylindric; border short, three-lobed, almost equal. Stamina: filaments four, longer than the corolla; anthers roundish. Pistillum: germ inferior, globular; style filiform, the length of the stamens; stigma bifid, acute. Pericarpium: berry globular, one-celled, quadripartite, placed upon the calyx, enlarged, bell-shaped, erect. Seeds four, gibbous on one side, angular on the other, one-celled.—*Essential Character.* Calyx five-cleft; A a corolla,

corolla, tube subcylindric, superior, very long; border three-lobed or three-cleft; berry globular, one-celled, quadripartite, four-seeded. There are but two very distinct species.

1. *Ovieda spinosa*, spinous, or West-Indian, ovieda: leaves oval, toothed, broad. A shrub, with opposite, petioled, oblong, toothed, leaves; the teeth terminated by spines, rigid; flowers terminating, corymbed, subsessile among the terminating leaves; berries black. Native of South America, in the mountains of Hispaniola. The fruit is ripe in May. Very rare.

2. *Ovieda mitis*, smooth, or East-Indian, ovieda: leaves lanceolate, subrepand, narrow. This also is a shrub. Leaves opposite, petioled, smooth, five or six inches long, less than one inch wide. Berry succulent, covered by the acutely-triangular segments of the calyx, subglobular, one-celled, having four stones when ripe, drying up and divisible into four parts. Cuticle, when ripe, somewhat spongy, wrinkled, fastened to the back of the stones; which are regularly four, but two only commonly ripen, coriaceous-crustaceous, gibbous on one side, wrinkled, concave or angular on the other, one-celled. There is one seed in each stone, of the same shape with it, fastened to its base, rufescent. Inhabits Java.

OVIE'DO, a city of Spain, and capital of the province of Asturias, situated on a plain between two small rivers, the Ovia or Ove, and Nora; the former of which runs into the Nora, and this into the Nalon, the first running to the north, and the second to the south, of Oviedo. Some, without sufficient authority, have made Oviedo the *Lucus Asturum*; others have deduced its name from the Ovia, after Froila, the grandson of Pelagius, had built it in 757; and, according to others again, it was so considerable in the time of Pelagius, that, after his accession, he made it the chief place of his states, and transferred to it the episcopal see of a neighbouring town called Emerita. However this be, Oviedo, in the ninth century, was honoured throughout Christendom with the singular title of "the City of Bishops," because a number of them, exiled and persecuted by the Saracens, took refuge in this place. In 901 a council was held here; and, while it was convened, the bishopric was elevated into an archbishopric by the pope, which dignity was afterwards transferred to the church of St. Jago de Compostella; and Oviedo again became a bishopric.

Oviedo contains an episcopal palace, a cathedral, a collegiate chapter, three parishes, three convents of monks, three of nuns, three colleges, three hospitals, an university founded in 1580, a drawing-school, a royal audience, an alcade-mayor, &c. Its population is estimated at about 6400 inhabitants. The streets are tolerably straight, regular, and well paved; the principal square is handsome and large, and almost all the streets open into it, and the market is held there. The public edifices are a Gothic cathedral, said to be built by Froila in 760, and containing a rich treasury of valuable vases, relics, and ornaments, and the bones of fourteen kings and queens; the beautiful church of San Salvador, built by a prince named Sito, who flourished in 774, and enriched by a great number of relics; the university, which is considered one of the handsomest ornaments of the town; and the aqueduct of forty arcades. Oviedo has little commerce; it has two tan-yards, a manufactory of hats, one of horn-combs and bone-buttons, and a grand magazine of arms for the army. It is forty-seven miles north of Leon. Lat. 43. 19. N. lon. 5. 57. W.

OVIE'DO (Gonzalo Fernandez de), one of the earliest historians of the New World, was born at Madrid in 1478. He spent his youth about the court, and became page to Ferdinand king of Arragon, and Isabella queen of Castile. He accompanied Columbus on his first voyage to Hispaniola, where he resided many years, and wrote the "Historia General de las Indias," in fifty books. Twenty-one of these were printed at Seville in 1535, and at Salamanca in 1547. A summary of this work, which Oviedo

drew up for the emperor Charles V. is inserted in Barcia's Collection of the *Historiadores Primitivos de las Indias Occidentales*. This summary contains the most decisive passage concerning the importation of syphilis from America that is any-where to be found. Oviedo also wrote two tracts concerning the "Palo de Guayacan," and the "Palo Santo," translations of which are in the first volumes of his collection "Scriptorum de Morbo Gallico." This office of chronicler was given to him by Charles V. when he was in the seventieth year of his age. He left behind him many unpublished works, besides the sequel of his great history. *Moreri. Gen. Biog.*

OVIE'DO (Andres de), bishop of Hieropolis and patriarch of Ethiopia. He was born at Ilhescas, a town about half-way between Madrid and Toledo, graduated at Alcalá, and then went to Rome, where, in the year 1541, he entered the company of Jesuits, then in its infancy. When Joam III. founded the first Jesuit-college at Coimbra, he, with eight Flemish companions, was sent to colonize it by Peter Faber. Oviedo soon distinguished himself by his devotion, humility, and self-austerity; and, when Francisco de Borja established a college at Gandia, he was thought a fit person to be nominated rector. A fitter could not be found: he never wore a shirt, he flogged himself every day, and vociferated so loudly in his single combats with the devil at night, that they who were within hearing frequently ran to his assistance. There was no trick in all this: flagellation was among the good works of his belief. Such a man was well chosen to foster the zeal of the duke, and he went with him to Rome. He was then made rector of the college at Naples.

Thus far (says Mr. Southey) his talents had been well employed; but, when Loyola nominated him as coadjutor and successor to Joam Nunez Baretto, in the Abyssinian mission, he mistook the character of Oviedo. A statesman was wanting, not a fanatic.

Previous to his departure, he was consecrated bishop of Hieropolis; but still, with the ostentatious humility which then distinguished his brethren, he used to fetch water for the college, and carry the pitcher upon his rocquet. Wherever he travelled, he took up his lodging in the hospital. At length, in 1556, he and Baretto set sail, and reached Goa after one of the shortest voyages that had then ever been remembered, being four months and ten days, of which four weeks had been lost at Mozambique. The affairs of Abyssinia at this time were in so unprosperous a state, that it was not thought expedient for the patriarch to proceed thither; he was therefore detained at Goa, while Oviedo, with five companions, was sent forward on the mission. They landed at Arkeeko five days only before that fort was taken possession of by the Turks. Claudius, or Atzenaf Segued, (in Abyssinian names Bruce is the best authority to follow,) was at that time reigning. On his way to court, Oviedo was welcomed by the Portuguese, and regaled so plentifully, that he might well have thought his lot had fallen unto him in a goodly land. Claudius received him with great honour, and made him an ample allowance for himself and all his followers. It was not long before he had a conference with him upon matters of religion, at which no person was present. What passed is not known; but Oviedo came away in a passion, and said the king was a great heretic. Other disputes followed: he then tried what a controversial letter would do; and, finding the king would not change his creed, and acknowledge the supremacy of the pope, the Jesuit, who was equally bigoted and far more brutal, excommunicated all the Portuguese who should remain in his service. He himself would have returned to India in disgust; but some of his countrymen, who were settled in Abyssinia and had families there, besought him so earnestly to stay, and not leave their souls in such imminent danger, that he yielded to their entreaties.

After the defeat and death of Claudius, his brother Menas (or Adamas Segued), who succeeded him, was reconciled

reconciled to Oviedo. This reconciliation was of little avail; the old dispute was revived. The new king's Latin was not intelligible; an interpreter was called in, who falsified all Oviedo said; and, upon discovering this, he and his companions began to learn the language of the country, which it is marvellous that they had not done sooner. Oviedo had better have remained ignorant of it, as, by making his insolence intelligible, it only served to widen the breach. "Bishop," said the king to him one day, "do you know why I am circumcised?—it is for cleanliness." The surly Jesuit answered, "Then you and your cleanliness will go to hell." It was not to be supposed that any sovereign, or any man, would hear such language without resenting it. Menas, however, seems to have borne his brutality with exemplary patience; and Abyssinia was at that time in such a state, that, had this missionary been really a statesman, and the government of India in the hands of Albuquerque, Gondar might have been this day the capital of a civilized empire. Oviedo, however, once more forbade all the Portuguese to serve him, on pain of excommunication. His great hope seems to have been that the king would make him a martyr; and in this hope, one day, in one of their disputes, when he had, as he thought, sufficiently exasperated him, he threw off his cloak, and knelt down to receive the blow. Menas was satisfied with giving him a good thrashing; and then, turning to the Portuguese, who still continued to serve him, he said, "You see what a fellow my brother the king of Portugal has sent me! had he no Portuguese whom he could have sent?" This question should imply that they were ashamed of him, and had repented to the king that he was a Castilian, not their countryman.

Oviedo and the other Jesuits now secretly abetted a rebellion in the country; and, though they were successful in their attempts to injure and harass the existing government, yet their stay in the country was thought so fruitless, that orders came from Rome for them to go to Japan. By the death of Bareto, Oviedo had now succeeded to the vain title of patriarch; it was not, however, the pride of rank, nor the fear or hope of martyrdom, which made him remain in Abyssinia: he had no possible means of getting out of it; and, so destitute was he of all European conveniences, that the letter which he contrived to send to Rome in reply was written upon slips of paper cut from the margin of his breviary. Sertza Denghel, the successor of Menas, did not think him worthy of persecution, and wisely left him to linger out the remainder of his days in obscurity. He died in 1577, having been twenty years employed in a mission for which he was in every respect unqualified. His head was some years afterwards removed to Goa as a relic. *Gen. Biog.*

OUJE'IN. See OUGEIN.

O'VIFORM, *adj.* Having the shape of an egg.—This notion of the mundane egg, or that the world was *oviform*, hath been the sense and language of all antiquity. *Burnet.*

OVIL'IA, in ancient Rome, a place in the Campus Martius, at first railed-in like a sheep's pen; whence its name. Afterwards it was mounted with marble, and beautified with walks and galleries; as also with a tribunal, or seat of justice. Within this precinct, or inclosure, the people were called to give their suffrages for the election of magistrates.

The ascent into the ovilia was not by stairs, but by *pontes*, a sort of bridges made for the time; every curia, tribe, and century, as the assembly was centuriate or tribuate, &c. having its proper bridge. Whence the proverb, *de ponte deficiendus*, where a person is to be debarred from giving his vote.

OUIL'LY, a town of France, in the department of the Calvados: six miles west of Falaise, and eighteen south of Caen.

OU'INEASKE, or SHELBURNE BAY, a bay on the east side of Lake Champlain, which sets up southerly, through

the town of Burlington in Vermont, into the northern part of Shelburne.

OUINICHTAGAN', a lake of Lower Canada: 183 miles north of Quebec. Lat. 50. 0. N. lon. 70. 56. W.

OVIP'AROUS, *adj.* [from the Lat. *ovum*, an egg, and *pario*, to bring forth.] Bringing forth eggs; not viviparous. —Birds and *oviparous* creatures have eggs enough at first conceived in them to serve them for many years' laying. *Ray.*

OVIPAROUS ANIMALS stand in opposition to those which bring forth their young alive, called viviparous animals, as man, quadrupeds, &c. They may be defined to be such as conceive eggs, which they afterwards bring forth, and from which, by the incubation of the parent, or some other principle of warmth and fermentation, at length arise animals; which, after they have spent the moisture or humour they were surrounded withal, and are grown to a sufficient bulk, firmness, and strength, break their shell, and come forth. The oviparous kind, besides birds, includes divers species of animals; as serpents, lizards, tortoises, crabs, lobsters, frogs, &c.

The distinction between oviparous and viviparous creatures, seems, in the insect-world, to be much less fixed and determinate than is supposed. It is evident, that some flies, which are naturally oviparous, if they are kept from the finding a proper nidus for their eggs, be it meat, or any thing else, will retain them so long beyond their due time of exclusion, that they will hatch into worms in the body of the parent, and be afterwards deposited alive in flesh, or in the manner of the young of the viviparous insects. Bartholine gives an account, in his Medical Observations, of a hen, which, instead of eggs, brought forth no less than five living chickens; but she died of it.

O'VIS, *f.* the LAMB and SHEEP; a genus of quadrupeds of the class mammalia, order pecora. Generic characters—Horns hollow, wrinkled, turned backwards and outwards into a circular or spiral form; eight lower fore-teeth, tusks none. The animals of this genus are gentle, harmless, and useful; they supply food and raiment; they are not very active, but fight by butting each other with the head reclined; they drink little; the females are gravid five months, bring one or two, rarely three, young at a time. According to the Linnæan system there are four species; but Dr. Shaw includes the whole genus in three species, placing the *strepsiceros*, or Cretan sheep, among the numerous varieties of the *O. aries*, or common sheep; and in this particular we are disposed to agree with him.

1. *Ovis Ammon*, the argali, or wild sheep: horns arched, semi-circular; wrinkled above, flattish beneath; dewlaps hairy, loose.

As the *Capra ægagrus*, or Caucasian ibex, is supposed to be the original of the domestic goat, so the *Ovis Ammon*, argali, or musimon, is believed to be the chief primeval stock from which all the kinds of domestic sheep have proceeded; and, on that account, we have followed Dr. Shaw, in placing that species first, though Linnæus begins with the common sheep. We shall, moreover, dispatch what little we have to say of the other species, and leave the *O. aries*, with its varieties and sub-varieties, to the last.

The *argali*, which in the Siberian language means "wild sheep," is called by the Russians *kanenoi barann*, or "sheep of the rocks," from its ordinary place of abode. According to Pallas, it is the same with the *musimon* of Pliny, and the *ophion* of the Greeks. It is found, in all its native wildness, vigour, and activity, inhabiting the vast chain of mountains which run through the centre of Asia to the Eastern Sea, and the various branches of this chain, extending through Great Tartary, China, the north of Hindoostan, and Persia. The argali delights to bask in the sun on the bare rocks, but avoids the woods and shade; it feeds on alpine plants and shrubs; it prefers a temperate climate, but is found also amongst the rocks

rocks of Asiatic Siberia. This animal loves a state of solitude, and flees the haunts of men. According to professor Pallas, nothing but the surrounding sea can account for the argali being found on an inhabited island, as is sometimes the case. But it is said, that these animals also inhabit California. The Jesuits, who visited that country in 1697, say, that they found a species of sheep as big as a calf of a year or two old, with a head like that of a stag, enormous horns like those of a ram, and tail and hair shorter than that of a stag. This is very likely, as the migration from Kamtschatka to America is far from being difficult. They were once inhabitants of the British isles. Boethius mentions a species of sheep in St. Kilda, larger than the biggest he-goat, with tail hanging to the ground, and horns longer and as thick as those of an ox. "This account," says Mr. Pennant, "like the rest of his history, is a mixture of truth and fable: I should have been silent on this head, had I not better authority; for I find the figure of this animal on a Roman sculpture, taken out of Antoninus's wall near Glasgow. It accompanies a recumbent female figure, with a *rota*, or wheel, expressive of a *via*, or way, cut possibly into Caledonia, where these animals might, in that early age, have been found. Whether they were the objects of worship, as among the ancient Tartars, I will not pretend to say; for, among the graves of those distant Asiatics, brazen images and stone figures of their *argali*, or wild sheep, are frequently found."

The argali is about the size of the fallow-deer, but its make is more robust, being less elegant than the deer, and its neck and legs are shorter. Its head resembles that of a ram, with long straggling hairs about the mouth, but no beard like the goat. The colour is a greyish ferruginous, brown above, and whitish beneath; the face is also whitish, and behind each shoulder is often observed a dusky spot or patch; the legs, at least in the European kind, are commonly white. The head strongly resembles that of a ram; but the ears are smaller in proportion; the neck more slender; the body large; the limbs slender, but strong; the tail very short, being hardly more than three inches in length: the horns, in the full-grown or old animals, are extremely large, placed on the top of the head, and stand close at their base, rising first upwards, and then bending down, and twisting outwards, as in the common ram. The body is covered with hair instead of wool; in which particular consists its chief difference from the general aspect of a sheep; but in winter the face, and particularly the part about the tip of the nose, becomes more white, the back of a more ferruginous cast, and the hair, which in summer is close, like that of a deer, becomes somewhat rough, wavy, and a little curled; consisting of a kind of wool intermixed with hair, and concealing at its roots a fine white woolly down: the hair about the neck and shoulders, as well as under the throat, is considerably longer than on other parts. The female is inferior in size to the male, and has smaller and less-curved horns.

In Siberia, the argali is chiefly seen on the tops of the highest mountains, exposed to the sun, and free from woods. The animals generally go in small flocks; they produce their young in the middle of March, and have one, and sometimes two, at a birth. The young, when first born, are covered with a soft grey curling fleece, which gradually changes into hair towards the end of summer. From spring to autumn the argalis feed in the little valleys among the upper regions of the mountains, on the young shoots of the alpine plants, and are said to grow very fat. As winter approaches, they descend lower, and eat grass and other vegetables. They are fond of frequenting spots of a saline nature, and will excavate the ground in such places, in order to get at the salt. The horns of the old males grow to a vast size, and have been found of the length of two Russian yards, measured along the spires; weighing fifteen pounds each. We are assured by Rubruquis, a traveller in the thirteenth

century, that he had seen some of the horns so large that he could hardly lift a pair with one hand, and that the Tartars made great drinking-cups of them. A more modern traveller has asserted, that young foxes occasionally shelter themselves in such as are here and there found in the deserts.

The argali is a very timid animal, and, when closely pursued, does not run in a directly-progressive course, but obliquely, from side to side, in the manner of other sheep, ascending the rocky mountains with great agility, and, like the wild goat, going over the narrowest and most dangerous passes with perfect safety. The males are said to fight frequently among themselves, and will sometimes precipitate each other down the rocks in their contests. Their chase is dangerous and difficult, but is an important object with some of the Asiatics, since the animal furnishes a great number of necessary articles; the skin being used for clothing, and the flesh for food. Pallas informs us, that the flesh of the lamb is excellent; that of the old animals good; but more particularly when roasted.

In Corsica the argali is known by the name of *musfro*; where it is so wild as to be rarely taken alive, but is shot by the hunters, who lie in wait for it among the mountains. When the young are taken, however, which is sometimes the case when the parent is shot, they are observed to be very readily tamed. The Corsican argali, or *moufflon* of Buffon, is of a darker colour than the Asiatic kind.

From the above description it will sufficiently appear, that the wild sheep is by no means that seemingly-helpless animal which we view in a state of confinement and artificial life; but in the highest degree active and vigorous. It is supposed to live about fourteen years. It is remarkable that Linnæus, in the twelfth edition of the *Systema Naturæ*, places this animal in the genus *Capra* instead of *Ovis*; appearing rather to consider it as the parent of the goat than the sheep. In fact, these two genera are so closely allied, that the line of separation is not very easily discoverable. The present animal, however, whether we consider its figure or manners, seems rather to be the parent or stock of the sheep than of the goat race; and it seems, therefore, peculiarly proper to place it at the head of the genus.

β. *O. tragelaphus*, the bearded sheep. There can be little doubt of this being a variety of the preceding, differing only in the length of the hair on the breast, and in having a beard. Its description and character is thus given by Mr. Pennant, who, in his *Synopsis of Quadrupeds*, referred it to the genus *Capra*: "Sheep with the hair on the lower part of the cheeks and upper jaws extremely long, forming a divided or double beard; with hairs on the sides and body short; on the top of the neck longer, and a little erect. The whole under part of the neck and shoulders covered with coarse hairs, not less than fourteen inches long. Beneath the hairs, on every part, was a short genuine wool, the rudiments of a fleecy clothing: the colour of the breast, neck, back, and sides, a pale ferruginous. Tail very short. Horns close at their base, recurved; twenty-five inches long; eleven in circumference in the thickest place; diverging, and bending outwards; their points being nineteen inches distant from each other." Mr. Pennant observes, that the learned Dr. Kay, or Caius, gives a good description of this animal, from a specimen brought into England from Barbary in the year 1561. Dr. Caius says, that it inhabited the mountainous and rocky parts of Mauritania; and seemed in confinement to be very gentle, full of play, and frolicsome, like a goat: the horns were like those of a ram. This appears to be the *tragelaphus* of Pliny, not only on account of its beard and the great length of hair on its shoulders, but likewise of the place where that Roman naturalist says it was found, near the river Phasis; for Pallas says, that an animal with a divided beard, probably the same, has lately been discovered by professor

professor Guildenfaedt, on the mountains of Caucasus; from whose foot arises the very river on whose banks were its ancient haunts.

This is by Dr. Turton marked as a var. (12.) of the common sheep.

His var. 13. which he calls the *morvant*, belongs no doubt to this species also, being another bearded variety of it: beard long, (not from the cheeks, but) on the forehead of the breast; a short mane on the neck.

2. *Ovis pudu*, the Chili sheep: horns smooth, round, divergent; tail none. This is a newly-discovered species, having been first described by Molina, in his Natural History of Chili. He informs us that it is a native of the Andes; that it is of a brown colour; about the size of a kid of half a year old; with very much the appearance of a goat, but with small smooth horns, bending outwards, and without any appearance of beard. It is of a gregarious nature; and, when the snow falls on the upper parts of the mountains, descends into the valleys in large herds, to feed in the plains of Chili, at which time it is easily taken, and readily tamed. The female is without horns.

3. *Ovis aries*, the common sheep: horns compressed and lunate.

Of all the animals with which Divine Providence has stored the world for the use of man, none is to be found more innocent, more useful, or more valuable, than the SHEEP. The sheep supplies us with food and clothing, and finds ample employment for our poor at all times and seasons of the year, whereby a variety of manufactures of woollen cloth is carried on without interruption to domestic comfort and loss to friendly society, or injury to health, as is the case with many other occupations. Every lock of wool that grows on its back becomes the means of support to the staplers, dyers, pickers, scourers, scriblers; carders, combers, spinners, spoolers, warpers, queers, weavers, fullers, tuckers, burlers, shearmen, pressers, clothiers, and packers, who, one after another, tumble and tofs, and twist, and bake, and boil, this raw material, till they have each extracted a livelihood out of it; and then comes the merchant, who, in his turn, ships it (in its highest state of improvement) to all quarters of the globe, and thence brings back every kind of riches to his country, in return for this valuable commodity which the sheep affords.

Beside this, the useful animal, after being deprived of his coat, produces another against the next year; and, when we are hungry, and kill him for food, he gives us his skin to employ the fellmongers and parchment-makers, who supply us with a durable material for securing our estates, rights, and possessions; and, if our enemies take the field against us, supplies us with a powerful instrument for rousing our courage to repel their attacks. When the parchment-maker has taken as much of the skin as he can use, the glue-maker comes after, and picks up every morsel that is left, and therewith supplies a material for the carpenter and cabinet-maker, which they cannot do without, and which is essentially necessary, before we can have elegant furniture in our houses; tables, chairs, looking-glasses, and a hundred other articles of convenience; and, when the winter-nights come on, while we are deprived of the cheering light of the sun, the sheep supplies us with an artificial mode of light, whereby we preserve every pleasure of domestic society, and with whose assistance we can continue our work, or write, or read, and improve our minds, or enjoy the social mirth of our tables. Another part of the slaughtered animal supplies us with an ingredient necessary for making good common soap, a useful store for producing cleanliness in every family, rich or poor. Neither need the horns be thrown away; for they are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many useful ornaments. From the very trotters an oil is extracted useful for many purposes, and they afford good food when baked in an oven. Even the bones are useful also; for, by a late invention of Dr.

VOL. XVIII. No. 1226.

Higgins, they are found, when reduced to ashes, to be an useful and essential ingredient in the composition of the finest artificial stone in ornamental work for chimney-pieces, cornices of rooms, houses, &c. which renders the composition more durable by effectually preventing its cracking. Any curious person would be much entertained to see the manufactory of bone-ash, carried on in White-chapel-road, wherein the bones of sheep and cows undergo many ingenious processes. 1. There is a mill, to break them; 2. A cauldron, to extract their oil, marrow, and fat; 3. A reverberatory, to heat them red-hot; 4. An oven, for those bones to moulder to ashes; 5. A still, to collect the fumes of the burnt bones into a brown fluid, from whence hartshorn is made; 6. Furnaces for making parts thereof into Glauber's salts; 7. A sand-heat, containing twelve jars, for collecting a crystallizing vapour into sal-ammoniac.

If it be objected to this meek inoffensive creature, that he is expensive while living, in eating-up our grass, &c. it may be answered, that it is quite the contrary; for he can feed where every other animal has been before him, and grazed all they could find; and that, if he takes a little grass on our downs, or in our fields, he amply repays us for every blade of it, in the richness of the manure which he leaves behind him. He protects the hands from the cold wintry blast, by providing them with the softest leather for gloves. Every gentleman's library is also more or less indebted to him for the binding of his books, for the sheath of his sword, and for cases for his instruments; in short, not to be tedious in mentioning the various uses of leather, there is hardly any furniture or utensil of life, but the sheep contributes to render either more useful, convenient, or ornamental.

The domestic sheep, in its most valuable or woolly state, exists hardly any-where in perfection, except in Europe, and some of the temperate parts of Asia. When transported into very warm climates, it loses its peculiar covering, and appears coated with hair, having only a short wool next the skin. In very cold climates also, the exterior part of the wool is observed to be hard and coarse, though the interior is more soft and fine. In England, and some other European regions, the wool acquires a peculiar length and fineness, and is best adapted to the various purposes of commerce. That of Spain is still finer, but less proper for using alone; and is mixed with the English for the superior kinds of cloth. "England," says Mr. Pennant, "once the envy of Europe, for its vast commerce in the productions of this creature, now begins to be rivalled by others, through the neglect, the luxury, and the too-great avidity, of our manufacturers."

The sheep is proverbially a timid, simple, and harmless, animal; yet, as is well observed by Mr. Smellie, in his edition of Buffon, "Though the talents of the sheep are not so brilliant as those of other quadrupeds, yet he appears not to be that stupid defenceless creature painted by the French naturalist." "Sheep," says Mr. Smellie, "when enslaved by man, tremble at the voice of the shepherd or his dog; but, on those extensive mountains where they are allowed to range almost without controul, and where they seldom depend on the aid of the shepherd, they assume a very different mode of behaviour. In these situations, a ram or a wedder will boldly attack a single dog, and often come off victorious; but, when the danger is more alarming, they have recourse to the collected strength of the whole flock. On such occasions they draw up into a complete body, placing the young and the females in the centre, while the males take the foremost ranks, keeping close by each other. Thus an armed front is presented on all quarters, and cannot easily be attacked, without danger of destruction to the assailant. In this manner they wait with firmness the approach of the enemy; nor does their courage fail them in the moment of attack; for, when the aggressor advances within a few yards of the line, the rams dart upon them with such impetuosity as to lay him dead at their feet, unless

B b

he

he save himself by timely flight. Against the attacks of single dogs or foxes, when in this situation, they are perfectly secure. A ram, regardless of danger, will often engage a bull; and, his forehead being much harder than that of any other animal, he seldom fails to conquer; for the bull, by lowering his head, receives the stroke of the ram between his eyes, which usually brings him to the ground."

We are now to enumerate the varieties which have sprung from the *Ovis aries*, or rather (as it is said) from the *O. ammon*:

α. *O. Anglica*, the English sheep. The various breeds and cross-breeds of the sheep in this country have been sufficiently explained under the article *HUSBANDRY*, vol. x. 497-502. and the management of them, their diseases excepted, at p. 522-5.

The Linnæan character of the *O. Anglica* is—hornless, with the scrotum hanging as low as the knees. Some of our English sheep, however, have horns; and we shall give a delineation of each sort. Fig. 1. on the annexed Plate, a hornless sheep of the South-Down polled kind, from the flock of the late duke of Bedford at Woburn; and fig. 2. is one of the horned Norfolk breed, from Mr. Coke's farm at Holkham. We refer to the before-cited article, p. 497, 498, for the description.

In Ireland, sheep are kept on account of their milk; the same thing is common in Caermarthenshire; and less frequent in other parts of Great Britain.

The native Irish sheep are of a small size, and have a great resemblance to the mountain-sheep in South Wales, being covered with nearly as much hair as wool. They are thin in the fore-quarters, narrow in the loins, and exhibit the same activity as the Norfolk breed. Some of this species are still to be met with, and are purchased from the mountains by gentlemen for their own use. They are not bought till they have attained the age of three or four years, and, when properly fed, they make delicious mutton; but the importation of English sheep has long ago altered the general breed, as has been the case in regard to the native Irish cattle. Whether this change was effected by admixture with the Tweed-side or the Leicestershire sheep, cannot easily be determined; but it is certain that the English and Irish breeds were intermixed long before Bakewell's day; and, considering the appearance of the Irish sheep at present, they seem to participate in the characters, as to wool and carcass, of the Romney-marsh species, though there can be none of these in Ireland. *Wakefield's Account of Ireland*, 1813.

The following are instances of extraordinary fecundity in this useful animal.—In the month of May, 1810, Mr. Meeds, of Mavis Enderby, Lincolnshire, bought a Norfolk ewe and lamb; in March 1811, the ewe yealed three lambs; in 1812, four lambs; 1813, three lambs; 1814, two lambs; 1815, four lambs; 1816, two lambs; 1817, three lambs; 1818, five lambs; total, 26 lambs in 8 years.—May 12, 1818, a South-Down ewe, the property of Mr. James Nixon, a farmer, residing at Knockhalt, near Sevenoaks, Kent, brought forth five lambs, all alive, three of which she suckled, and the whole five were brought up.—William Barton, who resides near Ashford in Kent, had an ewe, which, before it was a year old, yealed a lamb; at two years old, two lambs; at three years old, three lambs; at four years old, four lambs; and, when the animal died, in Feb. 1818, at the age of five years, her body contained five perfect lambs.

Monsters are not uncommon among the sheep kind.—In 1805, a lamb was yealed at Mr. Brown's, of High Winder, Westmoreland, with eight legs, two bodies, two necks, but only one head.—In 1809, a long Scotch ewe, on Mr. Lowthian's farm, at Briscoe, near Carlisle, yealed a tup-lamb with five perfect legs; the fifth leg was situated near the navel: this animal lived to be brought up, as did the following more-extraordinary monster.—In 1811, an ewe belonging to Mr. C. Shoubridge, of Withdean, near Brighton, brought forth a lamb with three

shoulders, five legs, and six feet. This extraordinary little animal was seen gamboling about with the rest of the flock, as healthy and nimble as the most perfect amongst them.

The consumption of sheep and lambs in London is estimated (1818) at 1,620,700, of horned cattle 164,000.

β. *O. rustica*, the Spanish coarse-woolled sheep: horned; tail short; wool short and coarse.

γ. *O. Hispanica*, the Spanish fine-woolled sheep: horns spiral, lengthened outwards; wool fine, and plentiful. The general mode of managing the Spanish flocks is detailed under the article *MESTA*, vol. xv. p. 192. but, to what has been said in the article *HUSBANDRY*, vol. x. p. 497, on the subject of the *merino* breed, we must add a few particulars.

Merino Sheep.—In this breed of sheep, the males have horns, but the females are without them. They have, according to lord Somerville, white faces and legs; the body not very perfect in shape; rather long in the legs; fine in the bone; a degree of throatiness, or production of loose pendulous skin under the neck; and the pelt fine and clear; weight, when tolerably fat, per quarter, in the rams about 17lbs. in the ewes 11lbs. the wool very fine. See the Plate, fig. 2 and 3.

His late majesty took the lead in the introduction of the merino breed into this country, and his first flock was imported in 1792; but other nations seem to have got the start in this respect, as Sweden had them even in 1723, where they have since greatly increased; and in France, Germany, and some other states, they were probably known long before. They have lately spread much in this country, and been greatly improved in different respects, by judicious crossing with other sorts. The horns in the true merino rams are now of a middle size; the faces and legs darkish-white, the latter rather inclined to be too long. The wool is uncommonly fine, and weighs about 3½lbs. to the fleece, not being liable to deteriorate in this climate. The fleeces have a dark-brown tinge in their surfaces, formed by dust sticking on the greasy yolk property of its pile; the contrast between which and the rich white-coloured wethers, and the rosy hue of the skin, is very striking on the first view.

The interest which the merinos had excited, was greatly increased by the sales from his late majesty's stock, which began in the year 1804. The desirable object of spreading them widely over the country, and subjecting them to the experiments of the most eminent professional breeders, has been greatly promoted by the institution of the Merino Society, in 1811, which now comprehends some of the greatest landholders, and the most eminent breeders, in the kingdom.

Here we cannot help digressing, to introduce a quotation from old Stowe. In his Chronicle, under the year 1464, he has the following passage: "*Shepe transported into Spain*. This yere king Edward IV. gave a license to pas over certain Cottewolde shepe into Spain; by reason whereof, it has come to pass, at this day, that the staple of wolls of Spain, kept at Brydges in Flanders, is so great, that our staple is nothing comparable to it." From which it appears, that the wool which we have for centuries imported from Spain, and upon which our finest fabrics of woollen are manufactured, is the produce of sheep originally bred in our own country. It appears, therefore, worthy of enquiry, whether the Cottewold breed has degenerated, and from what cause; whether the breed of 1464 is extinct; how it was improved in Spain, and still holds its value above British wool in countries whose agricultural improvements have not kept pace with ours; and how far it is possible to produce the finest wool in this country, without the importation of merino-rams as a cross to the offspring of their ancestors.

We now return to the particular subject of this variety of sheep.—The term *merino*, in the Spanish language, is an adjective, derived from the corrupt Latin *merinus*, or *majorinus*; when united with *ovejás*, it signifies the royal judge

OVIS

1. South Down Sheep. 2. Norfolk breed. 3. 4. Merinos. 5. Iceland Sheep.
6. Four-horned Sheep. 7. 8. Head of Cretan Sheep.

judge or superintendant of the sheep-walk. At the period when the *trashumantes*, or travelling flocks in Spain, were established, they became the objects of police, and were placed under the exclusive jurisdiction of mayors, with public walks and large districts allotted for their sustenance, and were termed *merinos ovejas*, or "the sheep under the care of the merino or mayor." The names peculiar to the establishment of these flocks, such as *mesa*, *cavana*, &c. are derived, not from the Morisco, but from the provincial Latin that prevailed in Spain before and after it was subdued by the Goths. The management of the flocks is peculiarly Roman; the merino, or mayor, corresponds exactly with the *magister pecoris* of Varro and Columella, and was superior to the *opiliones* and *pastores*. The practice of destroying half the sheep at their birth, and of suckling each of the survivors on two ewes; of sweating the sheep before they were shorn, to increase the softness of the fleece; and of conducting them from their winter to their summer stations by long journeys through public sheep-walks; has been derived from Roman institutions, with this difference, that in Italy their migrations were confined to the coarse-woolled sheep, while the *molles oves*, or fine-woolled flocks of antiquity, were always housed.

The experiment of Columella's uncle, ascertains the early introduction of fine-woolled sheep into Spain. Having procured some wild African rams at Cadiz, of a coarse fleece, but of an admirable colour, he gave them to some fine-woolled ewes, and the male progeny being again given to Tarentine ewes, the offspring, with their descendants, united the paternal colour with the peculiar softness of the maternal fleece. Columella's uncle resided in Bœtica, which comprehended the modern Estremadura; and, as Columella flourished under the emperor Claudius, the Tarentine breed must have been introduced into that province at the commencement of the Christian era. Whatever was the peculiar colour which the elder Columella introduced by means of African rams into his Tarentine flock, we may conclude that the same successful expedient was employed by other agriculturalists of Bœtica, to convert these coarse into fine woolled breeds, and to communicate the purest white to the black or part-coloured native flocks, which, according to Pliny, were common in Spain. The original intermixture of distinct breeds of native Spanish sheep with the Tarentine in different parts of Spain, may be inferred from other circumstances: each *cavana*, or flock, forms a distinct breed; and the Nigrette no more resembles the Paulac, than the Merino South-Down resembles the Merino Cheviot. The genuine unmixed descendants of the Tarentine breed would have preserved one uniform character; but the native flocks crossed with Tarentine rams would retain their distinctive varieties, and transmit them to each *cavana*.

That the merino is a mixed race, seems to be further indicated by the more tender constitutions of the fine-woolled flocks of antiquity. Of these, the Tarentine were most celebrated in Italy, and the Milesian in Asia Minor. They were termed *pellitæ* and *tectæ oves*, from the coverings of skin with which they were clothed to defend the fleece. They were denominated also *molles oves*, not only from the softness of the fleece, but from the delicacy of the constitution. They were always fed in the house; and, though satisfied with brambles, or the coarsest food, they are described as a most voracious breed; a diminution of their allowance from the fraud of servants, or the parsimony of the owner, was attended with certain destruction to the flock. (Plin. lib. viii. cap. 47.) As there was no sale for the lambs, nor any profit from the milk of a Tarentine flock, half the lambs were destroyed at the birth. The ram-lambs were chiefly reared, and were killed at two years, when their pelts sold to the merchant at an advanced price, on account of the beauty of the pile. This breed demanded constant care, when in the fields, to preserve their coverings from being torn,

and the fleeces injured. At home they required even greater care than abroad, as they were not daily conducted to their pastures. They were frequently uncovered and cooled for refreshment. The staples of the fleece were opened and disparted, and were frequently moistened with wine and oil. The whole flock was washed three times a-year, when the weather was warm. The stables were frequently swept, cleaned, and fumigated. For these different offices two shepherds were constantly required for every hundred sheep.

The excessive care bestowed on these flocks by the nations of antiquity, shows in what estimation their fleeces were held; and, though such attention is remote from modern practice, we are fully convinced that, by selecting the very finest and softest merino flocks, and covering the wool, and frequently anointing and washing, it would give to the pile that degree of softness which is so much wanted in the manufacture of shawls, and other costly articles of luxury, but which we seek for in vain in the finest fleeces of modern Europe. However expensive such attention might prove, we have no doubt that, on a limited scale, it would well repay the labour of the judicious experimentalist, as the wool would be worth more than 30s. per pound, could it be made to equal that of India in softness. It would appear, that the Tarentine breed were selected with much care for breeding, and every expedient adopted which was proved by experience to attenuate and soften the pile. The transition of these delicate animals into the merinos of Spain, which are a hardy race, can only be explained by supposing that other agriculturalists had imitated Columella, and obtained a fine-woolled race by crossing their native breeds with the more delicate animals from Italy. The beginning of this improvement is indeed described by Strabo, in the reign of Tiberius: he informs us that the inhabitants of Truditania had formerly imported many garments, but that their wool in his time surpassed that of the Coraxi, and excelled it in beauty so much, that a talent, equal to two hundred guineas, was the stated price of a ram to breed from; and that they excelled also in the fabrics which the Saliatæ manufactured. Truditania, according to Strabo, comprehended the province of Bœtica, from the Guadiana to the confines of Lusitania, and southward to Gibraltar, and eastward to Toledo. The wool of the Coraxi, with which Strabo compares that of this part of Spain, we are informed, in his account of Pontus, was from the soft-woolled Milesian sheep. Such high prices as a talent must have been produced by a very general demand for rams; not for the use of the Tarentine flocks, which could occasion no such competition, but for the purpose of crossing the indigenous breeds of the province, which, from the earliest period, appears to have abounded in sheep.

The travelling-flocks were not at that time introduced, as the mountainous regions had been till then infested by native as well as Lusitanian robbers, whom the Romans dislodged from their villages, and dispersed into cantons. (Diodorus Siculus, lib. v. cap. 32.) The Moorish looms of Andalusia and Catalonia, and those of the Christians at Segovia, in the 13th century, must have been supplied by the fine-woolled flocks introduced by the Romans. The vacant mountains, when cleared of banditti, offered a vast range of pasture from Estremadura northward, towards Galicia and the Asturias. A similar opportunity occurred to establish or renew the institution of travelling flocks, when the Christians descended, in the middle of the 13th century, to occupy the conquered provinces of Andalusia and Murcia. After that time, the travelling-flocks became so well established, that the *mentargo*, or tolls, on their passage through the mountains from province to province, the *servicio*, or tax to the crown, and the laws of the *mesa*, were imposed or ratified by government in the middle of the 15th century, before the Moorish kingdom of Grenada had been finally reduced.

We

We are thus enabled, from history, to trace the introduction and establishment of the merino race of sheep in Spain, from which, or from their descendants, nearly all the manufactories of fine cloth in Europe are at present supplied with wool.

The native breeds of Bœtica were originally and gradually converted into fine-woolled animals, by repeated crosses with the Tarentine flocks; and thus an immense number of hardy sheep, producing a most valuable pile, were spread over the country, and survived the successive conquests of the Goths and Vandals, and the protracted warfare of many centuries. The pure Tarentine breed in Greece and Italy being more delicate, is said to have become extinct with the destruction of the Roman empire; but the mixture of this race with the original flocks of Italy may still be distinctly traced, particularly in the middle and southern parts. The Italian wool was finer than that of any other country in Europe, except Spain, prior to the improvements which have recently taken place by the introduction of the merinos. It is not improbable, that the fine-woolled flocks of England, though greatly inferior to the merinos in the quality of the wool, were also originally descended from crosses with the Tarentine breed, introduced by the Romans when they established a manufacture of woollen cloth at Winchester.

The destruction or deterioration of the improved flocks in the ages of barbarism which succeeded the fall of the Roman empire, was the natural consequence of the decay of the manufactures, and of a total inattention to prevent the intermixture with coarser breeds. In Spain alone, the improved race had taken such complete possession of the mountainous districts, that it remained unmixed and unimpaired till the revival of commerce and the arts, when that country supplied the neighbouring nations with fine wool, and was supposed to possess some peculiar advantages of soil and climate, which it would be vain to seek for elsewhere. The opinion that the superior fineness of the Spanish fleeces was derived entirely from some peculiarity of the soil and climate, had obtained so generally, and was so firmly believed, even twenty-five years since, in this country, that he who asserted the contrary, was regarded by agriculturalists and clothiers as a speculative theorist, only deserving their pity.

It is not a little remarkable, that this prejudice continued undiminished nearly a century after the merino sheep had been introduced into Sweden and Saxony, and had continued to produce wool in those countries equally fine with that of their parent flocks in the Spanish peninsula. It might have been previously supposed that the climate of Sweden, being much colder than that of Great Britain, and more remote from the annual mean temperature of Spain, would render that country peculiarly unfriendly to the merino race and to the production of fine wool. This prejudice respecting the influence of climate would have been removed by considering that almost all the finest furs are the production of cold climates, and that the growth of fine wool and fur is a provision of nature, to defend animals against the severe cold of the districts nearer the poles. Mr. Alstroemer, who had previously endeavoured to ameliorate the breed of sheep in Sweden, by importations from England and Germany, obtained a flock of merinos, which he introduced into that country (as we have said) in the year 1723. In the year 1739, the Swedish government, for the promotion of this race, instituted a *school of shepherds*, under the direction of Mr. Alstroemer, and public funds were appointed for granting premiums to those who sold rams of the Spanish breed; and, from the same period to 1780, a premium of twenty-five per cent. was also granted on the sale of fine wools of a good quality. These premiums were afterwards reduced, and finally discontinued in 1792, being no longer necessary. From exact accounts, it appears that the fine wool sold from 1751 to the year 1790, amounted to 3,402,961 francs: but

the quantity of fine wool actually produced was much greater than what had been sold to receive the premium, a considerable part having been consumed in domestic manufactures by the growers and others; and the distance of the public magazines, where the wools were sent to receive the premium, prevented the public returns from including the real quantity of fine wool grown. In the year 1764, there were in Sweden 65,369 sheep of the pure merino race, and 23,384 of a mixed breed producing fine wool. The Swedish merinos preserve their primitive form; their fleeces are very close, and the wool has not deteriorated in fineness, length, or elasticity; and the sheep produce as great a weight of fleece as in Spain, wherever they are supplied with a sufficient quantity of food. This race, now naturalized in Sweden, are larger and stronger than the Spanish sheep. These facts prove decidedly that the Spanish sheep do not lose the good qualities of their wool by a removal to cold countries. At the same time it must be observed, that those sheep degenerated which had been neglected, or treated in the same wretched manner as the native flocks, by confining them in damp, infected, and dirty, stables during a part of the year, and omitting the requisite quantity of food; or pasturing them in summer in forests and marshes, or in low moist situations, where they could neither find the proper kind nor due quantity of herbage.

The introduction of the merinos into Saxony took place in 1765, and again in the year 1778. The first flock consisted of one hundred rams and two hundred ewes, chosen for the elector of Saxony from the best flocks in Spain; they were placed under the care of a Spanish majorinus or mayor, at Stolpen, six leagues from Dresden, on the frontiers of Bohemia. After ten years' experience, it was found that they had preserved all the original good qualities of the fleece, and the wool from the mixed breed had also acquired a degree of fineness which did not yield to that from Spain. As soon as it was ascertained by experience that it was easy to naturalize the Spanish sheep in Saxony, and that the crosses from this race with the native flocks were so greatly ameliorated, the attention of the agriculturalist was directed to the general improvement of the flocks; and such has been the success, that their produce is at present one of the greatest sources of profit to the cultivator. During the last fifteen years, a very considerable quantity of fine wool has been imported from Saxony into England, and the price of the best sort is greater than that of the finest Spanish wool; a sufficient proof of the estimation in which it is held by the manufacturers. It is better suited for the finest kerseymeres, and the more delicate articles of the woollen trade, as it can be spun to a greater length than any other kind of carded wool grown in Europe; it is also superior in fineness; but, owing to the scarcity of winter-food, it is generally less found than the best Spanish, and not so well suited for stout cloths.

The merino race has since been introduced into Denmark, the Prussian states, Austria, France, Holland, Italy, the Cape of Good Hope, and the United States of America.

As France is perhaps the most formidable rival which our manufacturers of fine cloths will meet in foreign markets, the progress made in the amelioration of her native flocks becomes an object of interest to the English agriculturalist and clothier. The celebrated minister Colbert first formed the design of improving the breeds of French sheep, by importations from England and Spain. But his intentions were at that time opposed. It was not till the year 1776 that the Spanish breed was introduced into France, by M. M. Trudaine, intendant of finances, under the direction of the celebrated naturalist Daubenton. The experiments which he made on these sheep, and numerous crosses from them, with seven distinct breeds, which he had on his estate in Auxors, demonstrated to the government that it was easy to introduce and preserve a race of sheep in France, producing super-
fine

fine wool; and, in the year 1786, a selection of 376 rams and ewes, from the finest flocks in Spain, was conducted, under the care of a mayor, to the farm of Rambouillet. They consisted of individuals of extraordinary beauty, superior to any previously introduced into France; but, having been chosen from a number of distant flocks, they presented great varieties of shape and size, which have since disappeared by intermixture; and a new race has been formed, differing from any of the primitive flock, but which equals the best of them in form and constitution, and in the fineness, length, softness, elasticity, and quantity, of wool.

It is to be observed, that the wool-dealers and manufacturers in France were at first disposed to depreciate the value of the wool; but, numerous accurate experiments having proved that the cloths manufactured from it were in every respect equal to those made from the best Spanish wool, these prejudices disappeared; and the republican government, as well as that of the emperor Napoleon, interested themselves in the further introduction of Spanish sheep into France. In the year 1802, it was calculated that there were one million sheep in France, either of pure merinos, or of an ameliorated mixed breed. Since that time many large flocks have been imported from Spain, the temporary command which the French obtained of that country having afforded them facilities for their introduction. In the course of a very few years, France will, in all probability, produce a sufficient supply of superfine wool for her extensive woollen manufactories. The following is an account of the annual sale of sheep from the merino flock at the royal establishment at Rambouillet in France, on the 16th and 17th of June, 1818, extracted from a letter of M. Huzard, director of the establishment, to sir Joseph Banks. "Eighty-one ewes sold by auction at 6l. 5s. sterling each. The highest-priced lots were sold at 22l. 12s. 1d. each, charges included. The average price of the ewes sold, 13l. 5s. each. Eighty rams were sold at, from 98l. 15s. each, to 29l. 5s. 10d. Average price of the rams, 52l. 11s. 8d. The flock was in the best possible state of health."

The experiments which have been made by the introduction of the merino sheep into the United States of America, the Cape of Good Hope, and New Holland, prove that fine wool may be grown wherever there are intelligent cultivators, and that it is not the gift of a peculiar soil or climate. We are, however, fully convinced, that very elevated temperatures will require greater care to prevent deterioration. The specimens of wool which we have seen from New Holland, appear to have been affected by an arid sandy soil, and by the great heat of the sun, which has in some degree injured the softness of the fleece. Between the tropics, elevated mountains and shade would be essentially requisite to preserve a race of fine-woolled sheep from degenerating.

The advantages which the merino sheep possesses as wool-bearing animals, over the native breeds of English fine-woolled sheep, consist in three important peculiarities: 1st, the wool is much finer; 2dly, it is more regularly fine over the body; and 3dly, it is grown in a larger quantity from the same surface of skin. That the merino wool is finer than the best English, is proved from this circumstance; the best sorted Spanish wool, or the "R wool" as it is called, from the finest flocks, sells at nearly double the price of the best English sorted wool, or what the wool-staplers call the *prime* and *picked lock*. Those English fleeces which yield a portion of the best sort, generally contain a larger portion of inferior sorts: sometimes eight sorts will be found in one fleece, and the finest will not constitute one-eighth of the whole. On the contrary, the fleeces of the merino sheep are so regularly fine over the whole body, as generally to yield from two-thirds to three-fourths of the superfine or "R wool." The second sort, called the "F wool," is also fine; and, with the "T wool," or third sort, bears a higher price than the best English wool. The quantity of wool on a me-

rine sheep is considerably greater than on an English sheep of the same size; this is not owing to the greater length of the wool, but to the animal being more fully clothed over the body and legs; and the wool is also grown closer than on English sheep; that is, there are more filaments on the same surface. A moderate-sized well-clothed merino sheep will yield a fleece which, when brought to the same state of purity as the English wool, will weigh 3lbs. A Ryeland, Norfolk, or South-Down, sheep, of the same size, will produce a fleece only weighing about 2lbs. The value will be nearly as five to two in favour of the merino fleece. In this state, however, the merino fleece is not clean; as the wools imported from Spain are scoured after they are shorn, and before they are sorted, by which means it is much cleaner than it can be made by washing on the back of the animal.

The shape of these animals by no means corresponds with the symmetry of form which an English grazier considers as the criterion of excellence. The legs are rather long, the neck curved, and from the throat there hangs a pendulous skin, or dewlap, which is very offensive to those who are only accustomed to view the improved breeds of English sheep. This appendage is valued in Spain, as indicating a tendency to produce wool. The colour of the skin beneath the wool, on the back and sides, is of a rose-red colour: this is also considered by the Spaniards as a sign of a robust constitution and an abundant fleece. The only English sheep which have the same coloured skin, with the pendulous dewlap, are the Ryeland, which produces also the finest English wool. These circumstances, with the ancient practice of housing the sheep, continued in Herefordshire, where it is called *cotting*, confirm the opinion before advanced, that the Ryeland sheep were descended from the Tarentine race introduced by the Romans into this country.

The Spanish breed of sheep were first introduced into Great Britain in the year 1787. Some individuals of the black and spotted sheep had indeed been procured, and kept in the parks of noblemen previously, but without any regard to the wool; nor was much interest excited by the flock introduced in 1787. The sheep however lived, though treated in the English manner; and the wool had not deteriorated. These facts having proved that the merino race might be naturalized in England, his majesty George III. obtained from the marquis of Campo Alarico five rams and thirty-five ewes of the Nigrette race. They were imported in the year 1792; and next followed that large importation which has naturalized the merinos among us.

The *cavana*, or flock, of Paular, to which the animals presented to his majesty belonged, consisted of 36,000 sheep; and the selection was so made as to render the gift peculiarly valuable. "The number sent from Spain to the king was 2000, equal to two subdivisions of the original *cavana*: to make the present the more valuable, these were selected by the shepherds from eight subdivisions, in order to choose young, well-shaped, and fine-wooled, animals. The whole number embarked was 2214; of these, 214 were presented by the Spaniards to some of his majesty's ministers, and 427 died on the journey, either at sea, or on their way from Portsmouth to Kew. His majesty was graciously pleased to take upon himself the whole of the loss, which reduced the royal flock to 1573. As the time of giving the ram in Spain is July, the ewes were full of lamb when they embarked; several of them cast their lambs when the weather was bad at sea, and were rendered so weak and infirm by abortion, that several more died soon after their arrival, notwithstanding the great care taken of them by his majesty's shepherds." Letters and Papers of the Bath Agricultural Society, vol. xii. 1820.

Hence it is clear, that we possess the complete and unmixed race of that flock of the Spanish breed which is most esteemed for prime piles. The sheep went on very well in this country; and the quantity and quality of the

wool were greatly admired. But the prejudices of the manufacturers were not so speedily to be surmounted as the difficulties attending the naturalization of the merino sheep. Though the wool was admitted to be equally fine with the best imported wool from Spain, they would not offer a proportionate price, fearing that it might not prove equally good when manufactured. It ought however to be stated, that the condition in which the English merino-wool was offered for sale, either very imperfectly washed, or entirely in the grease, prevented the manufacturer from forming a just comparison with the wools from Spain, which came to this country clean scoured, and regularly sorted; nor could they appreciate the loss it would sustain in scouring, which is not less than from 60 to 70 per cent. We are well persuaded that this uncertainty respecting the loss in scouring has, more than any other circumstance, retarded the sale of the English merino-wool, from the year 1792 to the present time. Nor will our manufacturers ever greatly encourage the growth of this wool, until it be brought to market, either sorted and scoured like the wools from Spain, or in the same state of purity in the fleece as the fine English or Saxon wool. Many manufacturers who have purchased it have been greatly disappointed, not in the quality, which was excellent, but in the small quantity which remained after scouring. In consequence of the manufacturers declining to purchase his majesty's wool, it became necessary to have it manufactured on his majesty's account, to demonstrate its fitness for superfine cloths. This was done till the year 1796, when it was resolved to sell the wool at the price which was offered, that the manufacturers might have a fair trial. The clip was sold that year for 2s. a-pound, and the following year for 2s. 2d. In the years 1797 and 1798 the wool was sorted in the Spanish manner, and scoured, after having been previously washed on the sheep's back.

The prices after that time progressively increased with the price of Spanish wool, and have been nearly equal to that of the best piles from Spain. In the year 1801, lord Somerville took a voyage to the peninsula, for the purpose of selecting such sheep as united in the greatest degree the excellence of the fleece with a good carcase. His efforts were in a considerable degree successful, and, as far as related to the fleece, completely so. Since that time, peace has increased the facility of procuring merino sheep from the various Spanish flocks; and the stock of these sheep in England at present is sufficiently great to change, in a few years, the whole race of fine-woolled sheep in Great Britain, were such a change desirable.

The facility of procuring a thing generally causes it to be slighted. Merinos, therefore, got out of fashion. Mr. Coke of Norfolk gave them up before the year 1816. But the peace had made them less necessary to us, at the same time that they were more easily obtained. We ought to bear in mind the peculiar time and circumstances under which the merinos were first introduced into this country. The French were then masters of the whole peninsula; and it followed, as a natural consequence of the war, that superfine wools should be withheld from this country. Of course they soon rose enormously in value, and the merinos flourished. But no man could foresee events. The valour of our soldiers prevailed; peace followed; and by it more injury was done to the merino cause than by all the events of war! As soon as peace was established, a vast importation followed of any thing and every thing that bore the name of a Spanish sheep; and such was the avidity with which these wretched animals were sought after, that immense sums were forthwith expended; and every cockney who had a patch of grass before his house turned merino-breeder.

It was stated, however, at the Holkham sheep-shear of July 1816, that the merino-breed was gaining ground in the west of England, where they are best known; and that, in the preceding year, the Bath and West of England Agricultural Society had awarded their premium for

the best and most profitable breed of sheep to the merinos. The Society of Arts in the Adelphi, London, bestowed their gold-medal premium, in 1817, on J. G. Hall, esq. of Mexbury, near Buckingham, for communicating his method of winter-protection and shelter to 1160 pure merino-sheep. We have already spoken of the advantage of covered sheep-folds under the article *HUSBANDRY*, vol. x. p. 584. and we therefore refer to that article; and also to the Transf. of the Soc. of Arts, 1817, for the particular management of Mr. Hall, which is well deserving of attention.

We conclude this section with the latest intelligence; namely, an account of the Merino Society's annual show of sheep, wool, and cloth, May 12, 1819. "Like last year's, the present show was thinly attended, and the number of sheep exhibited not many above two score. The size of the wedders was fully sufficient, granting them pure merinos, as they were described, weighing upwards of 11 stone per carcase, and one of them yielding 17lbs. of tallow. One whole flock averaged 8lbs. of wool each. It was remarked that, in form, they strongly resembled the South-Downs, and that one ram approximated to that of the New-Leicesters. The prize-fleece weighed 11lbs. 14oz. The prize-cloth combined extraordinary fineness with substance. It has been said that Anglo-merino superfine cloth possesses too great durability to please the London tailors. The funds of the society were re-established by the munificent liberality of individual members, the example of which was set by Mr. Ghorme, draper, of London, who made an offer of 25l. C. C. Western, esq. on receiving two prizes of 10l. 10s. each, delivered his conviction on experience, that the merinos were an improving and profitable breed of sheep; at the same time, on account of the difficulties under which the society laboured, making a tender of two premiums equal in value to those which he had received, towards the next year's distribution. This example was seconded by the president, lord Dundas, who tendered two premiums; also by C. T. Tower, John Tharp, and John Fane, esqrs. one premium each, making the gratuitous premiums equal in number to those heretofore given by the society." In this great sheep-breeding and manufacturing country, it will be strange to reject a breed, which of all others produces the finest and heaviest fleece, covering also a good carcase of mutton; and more especially as our continental neighbours use the same breed with the utmost success, supplying us with their wool, and boasting their superior knowledge as shepherds. Should not some comparative experiment be immediately instituted, between pure merinos and various other English fine-woolled sheep, and the results published at the annual merino-shows?

So serious is the depression in the price of wool in general, that the farmers who sold that article this time last year for 2s. a-pound, can obtain only 1s. 1d. this year. *Bristol Paper*, May 21, 1820.

d. *O. polycerata*, the many-horned sheep: horns more than two. Of this there are many sub-varieties; but they occur in the northern parts of Europe, rather than elsewhere.

In the *Iceland sheep*, the horns are either three, four, or five, in number; sometimes placed with the greatest regularity, and sometimes differing in proportion and situation. See the head of one, at fig. 5.

A *four-horned* variety is very common in Siberia, and among the Tartarian flocks about the river Jenisei. In the ram of this breed, the two largest horns are straight, and nearly upright on the top of the head; while the smaller pair are seated on each side of the head, and turn downwards. The body is covered with wool, the fore-part of the neck with yellowish hair about fourteen inches long. They are very mischievous and quarrelsome. See the Plate, at fig. 6.

e. *O. Africanus*, the African sheep: short hair, instead of wool.

ζ. *O. Guineensis*, the Guinea sheep: ears pendulous; dewlaps lax, hairy; hind part of the head prominent. This, which is sometimes termed the Cape sheep, and which is erroneously mentioned in Buffon's Natural History as of Indian extraction, is supposed to be most frequent in Guinea, and is distinguished from others by its remarkably meagre appearance, length of neck and limbs, pendent ears, and long arched or curved visage. It is covered with hair rather than wool, and has a pair of pendent hairy wattles beneath the neck, as in goats. The horns are small; and the tail long and lank. This variety is also considered as a distinct species in the twelfth edition of the *Syſtema Naturæ*.

η. *O. laticaudata*, the broad-tailed sheep. This extraordinary and awkward variety occurs in Syria, Barbary, and Ethiopia. It is also found in Tartary, Thibet, &c. Its general appearance, as to other parts of the body, scarcely differs from that of the European sheep; and in Thibet it is remarkable for the exquisite fineness of its wool. The tails of these sheep sometimes grow so large, long, and heavy, as to weigh, according to some reports, from fifteen to fifty pounds; and, in order to enable the animal to graze with convenience, the shepherds are obliged to put a board, furnished with small wheels, under the tail. This part of the sheep is of a substance resembling marrow, and is considered as a great delicacy. Mr. Pennant has remarked, that both the broad and long tailed varieties of this kind of sheep were known to the ancients; being mentioned by Aristotle and Pliny; the former mentioning the first, and the latter the second, sort. One says the tails were a cubit broad, the other a cubit long. There are many intermediate races of these sheep; and some have the tails ending in a point; others rather square, or rounded; but, in every case, their fleeces, in fineness, beauty, and length, are equal even to those of Caramania. The Cachemirians engross this article, and have factories in all parts of Thibet for buying up the wool, which is sent into Cachemir, and worked into shawls, superior in elegance to those woven even from the fleeces of their own country. This manufacture is a considerable source of wealth. Bernier relates, that in his days, shawls made expressly for the great omrahs, of the Thibetian wool, cost a hundred and fifty rupees; whereas those made of the wool of their own country never cost more than fifty. These articles of luxury have, till of late, been supposed to have been made with the hair of a goat, till we were undeceived by Mr. Bogle, a gentleman sent by Mr. Hastings on a commission to the Tayshoo Lama of Thibet.

θ. *O. Bucharica*, the Bucharian fat-rumped sheep: ears large and pendulous; fatty cushions on the hips; tail long and flat.

There is another fat-rumped variety, of which the character is, that the cushions on the hips are larger, and that there is no tail, or, if there be a tail, it is so enveloped with fat as to be scarcely visible. The fat-rumped sheep without tails have arched noses, wattles, pendulous ears, and curled horns, like the common sheep. The wool is coarse, long, and in flocks; the legs slender, and the head black: the ears are of the same colour, with a bed of white in the middle. The wool is generally white, sometimes black or reddish, and often spotted. The buttocks appear like two hemispheres, quite naked and smooth, with the os coccygis between scarcely sensible to the touch. These are composed only of suet; whence Dr. Pallas properly styles this variety *Ovis ſteatopyga*. These sheep grow very large, even to two hundred pounds weight, of which the posteriors weigh forty. Their bleating is short and deep, more like that of a calf than a sheep. They abound in all the deserts of Tartary, from the Volga to the Irtis, and the Altaic chain; but are more or less fat according to the nature of the pasture, and most so where the plants are of a saline nature. These monstrous varieties are supposed to originate from disease, arising from an excess of fat in the hind parts, which in-

volved, and at length destroyed, the tail. By breeding between animals similarly affected, the race was probably continued in those parts where food and climate have concurred to support the same appearances. Those with fat tails, are rather in the way to exhibit such a singular variety, or a mixed breed between the common and tailless kind. All abound so greatly in Tartary, that one hundred and fifty thousand have been sold annually at the Orenburg fairs, and a much greater number at Troinkaja, in the Irkutsk government, bought from the Kirgizian Tartars, and dispersed through Russia. They are very prolific; usually bring two at a time, and often three.

ι. *O. longicaudata*, the long-tailed sheep: tail long and woolly.

κ. *O. Capensis*, the Cape sheep: ears large, pendulous; tail large and broad.

λ. *O. strepsiceros*, the Cretan sheep: horns upright, carinated, spirally contorted. This variety is principally found in the island of Crete, and is kept in several parts of Europe for the singularity of its appearance; the horns being very large, long, and twisted in the manner of a screw. Those of the male are upright, as at fig. 7. and those of the female at right angles to the head, as at fig. 8.

μ. *O. ankon*, the elbow-sheep: fore-legs short, bent like an elbow. A paper in the Phil. Trans. for 1813 gives an account of this new and permanent variety in the sheep, which was produced, without any assignable cause, on a farm a few miles from Boston in North America. It acquired the popular name of the *otter-breed*, from the shortness of its legs and the length of its back; and it received the more appropriate title of *ankon-sheep*, from the Gr. *ανκον*, an elbow. The characteristic was, very short legs, particularly the fore-legs, which were bent somewhat like an elbow. The skeleton brought to this country was compared by Sir Everard Home with the smallest Welch sheep that could be procured. The bone of the fore-leg of an ankon-sheep weighing 45lbs. was thicker, but not so long, as that of a Welch sheep scarcely one-fourth of the weight. The joints of the ankon-sheep were looser knit than usual, and the animal was feebler. Its mutton was as good as usual; its fleece rather worse. In New England the farms are surrounded only with low wooden or stone fences; the ankon-sheep was propagated because it could not easily get over these fences and injure the corn.

DISEASES OF SHEEP.—The sheep is more subject to disorders than any of the domesticated animals; giddiness, consumption, scab, dropsy, and worms, frequently seizing upon it, and destroying it. The diseases may be enumerated in the following order: rot, red-water, flux, pining, tag-sore, scab, foot-rot, leg-evil, staggers, sturdie-evil, hove, and fly. Of each of these we shall give the best description in our power, with the most approved remedies.

The *rot*, which is a very pernicious disease, has very much engaged the attention of scientific farmers. Some valuable and judicious observations have been made upon it, which ought to be circulated, as they may perhaps, in many cases, furnish an antidote for this malignant distemper. Some have supposed the rot owing to the quick growth of grass or herbs that grow in wet places. Without premising that all-bounteous Providence has given to every animal its peculiar taste, by which it distinguishes the food proper for its preservation and support, if not vitiated by fortuitous circumstances, it seems very difficult to discover, on philosophical principles, why the quick growth of grass should render it noxious, or why any herb should at one season produce fatal effects, by the admission of pure water only into its component parts, which at other times is perfectly innocent, although brought to its utmost strength and maturity by the genial influence of the sun. Besides, the constant practice of most farmers in the kingdom, who with the greatest security feed their meadows in the spring, when the grass shoots quick and is full of juices, militates directly against this

this opinion. Mr. Arthur Young, to whom agriculture is so much indebted, ascribes this disease to moisture. In confirmation of this opinion, which has been generally adopted, we are informed, in the Bath Society Papers, that there was a paddock adjoining to a park which had for several years caused the rot in most of the sheep which was put into it. In 1769 it was drained; and from that time the sheep were free from this malady. But there are facts which render it doubtful that moisture is the sole cause. We are told, the dry-limed land in Derbyshire will produce the rot as well as water-meadows and stagnant marshes; and that in some wet grounds sheep sustain no injury for many weeks.

On dissecting sheep that die of this disorder, a great number of insects, called *flukes*, or *slounders*, are found in the liver. That these flukes are the cause of the rot, therefore, is evident; but to explain how they come into the liver is not so easy. It is probable that they are swallowed by the sheep along with their food while in the egg-state. The eggs deposited in the tender germ are conveyed with the food into the stomach and intestines of the animals, whence they are received into the lacteal vessels, carried off in the chyle, and pass into the blood; nor do they meet with any obstruction until they arrive at the capillary vessels of the liver. Here, as the blood filtrates through the extreme branches, answering to those of the vena porta in the human body, the secreting vessels are too minute to admit the impregnated ova, which, adhering to the membrane, produce those animalcules that feed upon the liver and destroy the sheep. They are sometimes as large as a silver twopence, and are found both in the liver and in the pipe (answering to that of the vena cava) which conveys the blood from the liver to the heart. It is a singular fact, "that no ewe ever has the rot while she has a lamb by her side." The reason of this may be, that the impregnated ovum passes into the milk, and never arrives at the liver. The rot is fatal to sheep, hares, and rabbits, and sometimes to calves; but never infects animals of a larger size.

Miller says that parsley is a good remedy for the rot in sheep. Perhaps a strong decoction of this plant, or the oil extracted from its seeds, might be of service. Salt is also a useful remedy. It seems to be an acknowledged fact, that salt marshes never produce the rot. Salt indeed is pernicious to most insects. Common salt and water expel worms from the human body; and sea-weed, if laid in a garden, will drive away insects; but, if the salt be separated, by steeping it in the purest spring water for a few days, it abounds with animalculæ of various species. Lisle, in his Book of Husbandry, informs us of a farmer who cured his whole flock of the rot by giving each sheep a handful of Spanish salt five or six mornings successively. The hint was probably taken from the Spaniards, who frequently give their sheep salt, to keep them healthy. On some farms perhaps the utmost caution cannot always prevent this disorder. In wet and warm seasons, the prudent farmer will remove his sheep from the lands liable to rot. Those who have it not in their power to do this may give each sheep a spoonful of common salt, with the same quantity of flour, in a quarter of a pint of water, once or twice a-week. When the rot is recently taken, the same remedy, given four or five mornings successively, will in all probability effect a cure. The addition of the flour and water (in the opinion of Mr. Price, of Salisbury, to whose excellent paper in the Bath Society's Transactions the public are much indebted) will not only abate the pungency of the salt, but dispose it to mix with the chyle in a more gentle and efficacious manner. A farmer of a considerable lordship in Bohemia, visiting the hot-wells of Carlsbad, related how he preserved his flocks of sheep from the mortal distemper which raged in the wet year 1769, of which so many perished. His preservative was very simple and very cheap: "He fed them every night, when turned under a shed, cover, or stables, with washed fodder-straw; and, by eating it greedily, they all escaped."

That experienced agriculturist, lord Somerville, has used salt on his farm in Somersetshire for about ten years; and attributes the health of his flock of merino-sheep, which he purchased in Spain, chiefly to this circumstance. As these sheep had been accustomed to the use of salt, his lordship considered that, in our damp climate, and in the rich land of Somersetshire, it would be absolutely necessary to supply them with it regularly. He used at the rate of a ton of salt for every thousand sheep annually; and gave it them in the morning, to counteract the ill effect of the dew. A handful of salt is put on a flat stone, or slate, ten of which, set a few yards apart, are enough for a hundred sheep. Twice a-week has usually been found sufficient. Of a flock of near a thousand, there were not ten old sheep which did not take kindly to it, and not one lamb that did not consume it greedily. Salt is likewise a preventive of disorders in stock fed with rank green-food, as clover, or turnips, whereby excessive wind is generated in the stomachs of animals.

On the other hand, we must observe that, when the shepherds, who came with his late majesty's last flock of merinos from Spain, were questioned on the subject of giving salt to their sheep, they declared that this is only done in the hottest season of the year, when the sheep are on the mountains; that in September it is left off; and that they dare not give salt to ewes forward with lamb, being of opinion that it causes abortion.

A remedy for the rot in sheep, said to be infallible, has been lately offered to the public under sanction of letters-patent, by Mr. Thomas Fleet, an eminent farmer, near Basingstoke, in Hampshire. He calls it a "medicine for preventing the rot in sheep, and checking the farther progress of the said disease in those already infected with it; and also to render them capable of being fattened on the herbage of the same land which produced or occasioned the disease!" The ingredients of which the medicine is compounded, he declares on oath to be, turpentine, bole-armoniack, turmeric, quicksilver, brimstone, salt, opium, alkanet-root, bark, antimony, and camphor, mixed up in distilled water. What progress has been made in the prevention and cure of the rot in sheep by this medicine, we have not yet been able to learn. A correspondent in the Monthly Magazine gives us the following, which he says he never knew to fail, although the animal should have appeared in the last stage. "A strong decoction of elderberry well sweetened with honey, and given every morning, in about a gill at a time, or, if very bad, night and morning, will speedily bring about amendment; their pasture, if possible, should be changed; however, by the above means, I have reared fine flocks where it was said, in consequence of that complaint, sheep could not have been kept." Monthly Mag. for May 1813.

When land subject to the rot is lightly stocked, as with only half the number of sheep it would keep, they frequently escape the disease, which is a strong proof that they instinctively reject the spots that are unwholesome, and will never eat of them but from scarcity. The egg, or animalcule, must be very abundant, as a flock of sheep has been known to take the infection in a few minutes. A flock of one thousand was driven from the high downs, where sheep never take the rot, once only into a valley to drink, after a heavy shower of rain, and suffered to eat grass there for about fifteen minutes, when two hundred died rotten in the winter following.

It is matter of great surprise, that, when a sheep affected with the rot from strength of constitution survives and fattens, yet the flukes still exist in the liver: when the sheep is killed, these reptiles appear to be dead; but, at the moment the liver is taken out, and cut into, they are as lively as fresh-caught flat-fish, and much resemble them. See a figure of the *Fasciola hepatitis*, on the Plate of FERONIA, at fig. 1. vol. vii. p. 328. but a more correct representation on the HELMINTHOLOGY Plate II. fig. 19. vol. ix.

The *red-water* is another disorder most prevalent on

wet grounds; or otherwise to be caused by taking too much watery food, such as turnips, clover, rape, &c. Its removal has been attempted by the use of common salt, a tea-spoonful of elixir of vitriol, and the frequent driving the animal about; and it is asserted, that the disease may be wholly prevented by having-recourse to the use of dry food in the night-time, while the sheep are feeding upon these juicy kinds of food in the day. "I have heard (says Mr. Arthur Young) that it has sometimes been cured by tapping, as for a dropsy: this operation is done on one side of the belly towards the flank, just below the wool."

The *flux* is also produced by too much damp and moisture. The best remedy is said to be, to house the sheep immediately when the distemper appears; to keep them very warm, and feed them on dry hay, giving them frequent clysters of warm milk and water. The cause of the distemper may be either their feeding on wet lands, or on grafs that is become mossy, by the lands having been fed many years without being ploughed. When the farmer perceives his sheep-walks to become mossy, or to produce bad grafs, he should either plough or manure with hot lime, making kilns either very near or in the sheep-walks, because the hotter the lime is put on, the sweeter the grafs comes up, and that early in the year.

Contrary to this is the disease called *pinning*, which afflicts sucking-lambs. These animals, before they begin to eat grafs, are liable to have a discharge from the bowels, of a glutinous adhesive quality, which is apt to stick to the tail and buttocks, and, when hardened by the sun, sometimes to glue them together in so close and firm a manner as to prevent all possibility of their having any evacuations, and thereby soon to mortify and burit the intestines. The complaint is discovered by the lambs appearing swelled and sick, with the upper and middle parts of their tails closely glued down; and they are as readily cured, by separating their tails from their buttocks, when the retained excrement will be discharged with a disagreeable smell: and the immediate recurrence of it will be prevented by rubbing the parts over with sand, friable clay, mud, or, what is better, a little tallow. But they must be well looked after for eight or ten days, until they begin to eat grafs, when all danger from these obstructions is over. It is said to be most dangerous when the season is dry and backward; and seldom or ever to appear when the mothers are lean, and the weather disposed to be wet.

The *tag-fore* is a disease in sheep, which consists, as stated in a paper in the third volume of the Transactions of the Highland Society, of scabs and fores situated on the under side of the tail; arising, in warm weather, from its being fouled with purging and other discharges. The matter hardens there, irritates the tender vessels, and produces fores, which, if not attended to, run into mortification, and prove fatal. It is shown by the sheep turning frequently round to bite the tail. As this complaint arises principally from purging, and the nastiness caused by it, &c. the first thing to be done is the restraining and cure of this evacuation: after which the tail of the animal is to be clipped, and the fore part laid bare, washed carefully with milk and water, blood-warm, and then with lime-water. The sheep is then to be turned out into a dry pasture, and looked at again in two or three days; and, if not then well, the washing must be repeated, and the parts anointed with grease and tar mixed together in equal proportions.

The *foot-rot* mostly commences between the claws of the fore-foot, with a slight inflammation and swelling. In this way the sheep becomes lame, and some moisture oozes out between the claws, which has a disgusting smell; and, in proportion as the disease becomes more inveterate, it gets under the hoof, producing proud flesh. It has been commonly supposed to be infectious, on account of its spreading with such rapidity when not promptly removed. Most of the long-wooled and merino

breeds of sheep are said to be very subject to this disease; but other sorts of sheep are likewise found to frequently suffer from it. For its removal, the part affected should be pared and well cleaned without touching the quick, and then a caustic solution of the following kind dropped upon it, the foot being kept well wrapped up from the dirt: Two ounces of blue vitriol, the same quantity of roach-alum, and one ounce of verdigris, with a quarter of an ounce of muriated quicksilver, should be dissolved in a quart of good distilled vinegar. But there are many who make use of butter of antimony, applying it to the part by means of an iron skewer, after being pared in the manner stated above. It is always a proper precaution to separate the sheep that are thus affected from the rest of the flock; and it has been stated, that the change of the sheep into a more short dry pasture, is of great use in obviating the complaint.

The *leg-evil* is a disorder which affects sheep chiefly, as its name imports, in the legs. It is said, in a paper in the third volume of the Transactions of the Highland Society, that, for the most part, it begins at the knee, which swells and enlarges to a considerable degree, causing so much lameness as to prevent the sheep so affected from following the rest of the flock. The swelling is of a bluish or livid colour; sometimes, indeed frequently, having small blisters scattered over the leg affected, of a red colour, and filled with a bluish-coloured watery fluid. When the skin bursts, it leaves below it a loose flabby substance of the same colour, or rather darker, which extends even to the bone. It commonly first begins in one of the hind-legs, but, as it advances, affects all the four. It occasionally spreads from the hind-legs to the belly, and in every case the kidneys are affected, being loose and flabby, having some resemblance to the swelling of the legs, and being sometimes of a livid colour. In some cases, the disease proves very quickly fatal, while at other times it will continue in a mild state for weeks. It spreads very rapidly after appearing in a flock; and, if not speedily attended to, will injure them materially. It is, in general, very dangerous, cutting off the greater proportion of those which are affected with it. Indeed, many sheep-farmers kill the diseased sheep whenever they are seen to be affected with it, in order to prevent its spreading. In this disease, too, the eye of the sheep is languid, its tongue dry, it cannot eat, and, in general, is soon cut off by the complaint.

It commonly appears about the latter end of summer, but at times in the beginning of the autumn; arising at first, it is supposed, from such sheep as have unhealthy constitutions being too much exposed to wetness during rainy warm weather. Scratches in the legs, it is said, will produce it in such sheep as have bad constitutions. The sheep most subject to take the disease are, it is thought, those of the South-Down and Leicester breeds. It has seldom appeared to the north of the Tweed, although it has been pretty common on its southern banks, in the shires of Selkirk, Roxburgh, and part of that of Peebles.

As this is a very dangerous disease, the sheep affected with it should be brought home as soon as possible, to prevent it from infecting the flock, and its legs be well washed with soap and water; afterwards bathed with lime-water, or a solution of alum in water, and then anointed with what in the shops is known by the name of *citrine* ointment, which is made with mercury dissolved in aqua-fortis, and mixed with hog's-lard. If this be not at hand when the legs break out and run, a little quick-lime may be dusted on the sloughs, and the leg dressed with a cloth spread with fresh butter and a little tar. These dressings should be changed every second day: care should also be taken that the sheep have good and dry pasture during the time of the cure; and water, in which moss or peat-earth has been soaked or steeped, may sometimes be preferred, in cases where it can be had, on account of its astringent or antiseptic quality, to common water, for their drink, as well as for washing the legs

D d with.

with. This disease has sometimes the name of *black-leg* given to it. There is a disease somewhat similar to this affecting the *tails* of sheep.

The *scab* is a cutaneous disease, owing to an impurity of the blood, and is most prevalent in wet lands or in rainy seasons. It is cured by tobacco-water, brimstone, and alum, boiled together, and then rubbed over the sheep. If only partial, tar and grease may be sufficient. But the simplest and most efficacious remedy for this disease was communicated to the Society for the Encouragement of Arts, &c. by sir Joseph Banks. "Take one pound of quicksilver, half a pound of Venice turpentine, half a pint of oil of turpentine, and four pounds of hog's-lard. Let them be rubbed in a mortar till the quicksilver is thoroughly incorporated with the other ingredients; for the proper mode of doing which, it may be proper to take the advice, or even the assistance, of some apothecary, or other person used to make such mixtures. The method of using the ointment is this: Beginning at the head of the sheep, and proceeding from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the skin can be touched; and, as the furrow is made, the finger, slightly dipped in the ointment, is to be drawn along the bottom of it, where it will leave a blue stain on the skin and adjoining wool: from this furrow similar ones must be drawn down the shoulders and thighs to the legs, as far as they are woolly; and, if the animal is much infected, two more should be drawn along each side parallel to that on the back, and one down each side between the fore and hind legs. Immediately after being dressed, it is usual to turn the sheep among other flock, without any fear of the infection being communicated; and there is scarcely an instance of a sheep suffering any injury from the application. In a few days the blotches dry up, the itching ceases, and the animal is completely cured: it is generally, however, thought proper not to delay the operation beyond Michaelmas. The *Hippobosca ovina*, called in Lincolnshire *sheep-fagg*, an animal well known to all shepherds, as it lives among the wool, and is hurtful to the thriving of sheep, both by the pain its bite occasions, and the blood it sucks, is destroyed by this application; and the wool is not at all injured. Our wool-buyers purchase the fleeces on which the stain of the ointment is visible rather in preference to others, from an opinion that, the use of it having preserved the animal from being vexed either with the scab or fagg, the wool is less liable to the defects of joints or knots; a fault observed to proceed from every sudden stop in the thriving of the animal, either from want of food or from disease. This mode of curing was brought into Lincolnshire by Mr. Stephenson of Mareham; and is so generally received, that the scab, which used to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of pasturing their sheep in the fertile and extensive commons, is no longer regarded with any apprehension: by far the most of them have their flock anointed in autumn, when they return from the common, whether they show any symptoms of scab or not; and, having done so, conclude them safe for some time from either giving or receiving infection."

The *sluggers* is a disease, the name of which explains the nature of it. It shows itself by the reeling, wavering, staggering, and imperfect gait, of the animal; by the heavy, dull, and sluggish, motion and appearance of it; and an inclination to become drowsy, and the resting or reclining of the head upon any convenient place near it. It sometimes, however, puts on a more local inflammatory appearance, in which cases the beasts have commonly a less heavy drowsy disposition, with more of the wild raving or raging tendency and quality in their aspects and dispositions.

The remedy for this disorder was formerly to drive them to a change of grounds often, to keep the grounds from tainting: and it has been noticed by Lisle, that

those lambs which die of the staggers do not die till they begin to eat grass, and of those the finest and lustiest; whence he concludes, that it is not the cold weather alone that brings staggers, but their feeding on cold watery grass in the months of March and April. The disease was much prevented by the early folding of the lambs. It mostly appears in the autumn, and is said to be produced by a variety of causes; such as improper food, the leaves of the oak-tree, on account of their astringent quality, cobwebs besprinkled with dew, and different others: and it probably often proceeds from local affections, and water in the brain. Some have likewise supposed that it arises from the operation of a poisonous grass, the *Lolium temulentum*, which is alone met with in those situations of Scotland where the staggers in sheep prevail. The change of pasture is supposed to be the only effectual remedy in such cases; but the use of calomel and bark may often be found of material advantage, as well as other means which have a tendency to remove water from the brain.

Sheep are infested with worms in their nose, produced from the egg of a large two-winged fly called the *gad fly*. The frontal sinuses above the nose, in sheep and other animals, are the places where these worms live and attain their full growth. These sinuses are always full of a soft white matter, which furnishes the worms with a proper nourishment, and are sufficiently large for their habitation; and, when they have here acquired their destined growth, in which they are fit to undergo their changes for the fly-state, they leave their old habitation, and, falling to the earth, bury themselves there; and, when these are hatched into flies, the female, when she has been impregnated by the male, knows that the nose of a sheep or other animal is the only place for her to deposit her eggs, in order to their coming to maturity. See *OESTRUS OVIS*, vol. xvii. p. 416. and the correspondent Engraving.

The *hove* is a very distressing ailment; the remedy for which has been already given under the article *HUSBANDRY*, vol. x. p. 501, 2. with a representation of the instrument by which the cure is effected.

But the most formidable disorder incident to sheep, and with the mention of which we shall conclude this long article, is the *sturdy-evil* as it is called. We call it formidable, equally on account of its frequent occurrence, and because it constantly terminates fatally, unless when relieved by art. There are two varieties of it, as stated by Dr. Duncan, jun. in his useful paper on it, in the third volume of the Transactions of the Highland Society of Scotland; the appearances in each of which are as follow.

When a sheep is attacked with the first of these varieties of the sturdy, it ceases, it is said, to improve, becomes dull, is apt to loiter behind, and separates from the flock. It does not walk straight forward, but often defects on one side, or dozes round in a circle. The eyes glare steadily in its head, and seem enlarged, from the pupil being round instead of oval, which in healthy sheep is always the case in the day-time. Its vision is impaired, and it does not see any object which approaches it, until it be very near, when it starts away, and runs furiously, without any aim. When caught, it is remarkably stupid on being again liberated. In dry weather, it follows eagerly to that quarter from which the wind blows. It has a great reluctance at passing water, as burns or brooks, and cannot easily get through them, but mostly frequents places where it can hear the sound of water. Some time after these appearances have presented themselves, in the course of perhaps about three weeks, there appears, and is found, on examining the head by pressing on it with the thumbs, a remarkable degree of softness at one part of it, where the skull seems to be wanting. In a few instances, no softness is to be discovered in any period of the disease; but, in either case, if not relieved by a proper operation, the animal loses the power of standing, and dies perfectly emaciated. The second, or latter, of these varieties, is, however,

however, much more rapid in its progress, in which, in addition to some of the above appearances, a great degree of stupor comes on in a few days, which is followed by total blindness, and no softness is ever to be found in any part of the skull or bones of the head.

The appearances on opening the head in the first of the above varieties, are an oval or round bag, which is found lying between the brain and the skull, quite unconnected with any of the surrounding parts, generally situated between or beneath the horns. These bags vary much in size, being sometimes no larger than a plum, while at others they are as big as a goose's egg. They are filled with a clear fluid like water, sometimes intermixed with a thin crust, when it is of a glutinous or slimy nature. Within, or in the skins of these bags, are seen, according to some, many little white bodies, nits, or the ova, of insects. In proportion as the disease advances, the bag increases in size, and by its pressure causes the brain to decrease, while the skull immediately over the bag becomes soft and disappears, so that nothing intervenes between it and the integuments of the head. Sometimes, but only in those cases where no attempt has been made to cure or remove it, there are many small bags, unconnected with each other, distributed through the brain or cerebral parts.

In the second sort or variety of the disease, the water is not contained in a bag, but within the substance of the brain, in certain cavities termed its ventricles, and sometimes in the hinder parts, where it joins with the spinal marrow, in which case it is thought to be quite incurable.

Hard substances or excrescences growing out from the inside of the skull, and blows upon the head, occasionally produce all the appearances of real sturdy; but, in these cases, no water is to be found in the parts. The cause of the appearances in this disease is therefore, unquestionably, pressure on the brain, whether it arise from accidental contusion, from a bony excrescence, as in false sturdy, or from a collection of water, as in the legitimate varieties of it, as seen above. What however gives rise to these collections of water, is not by any means so well ascertained. Inflammation of the brain probably precedes its effusion in the latter variety of the disease; but the generation of the hydatids, or water-bags, in the former sort or variety, is not at all understood. The disease is not contagious; neither is it peculiar to any soil. It generally affects sheep of the hog kind in the beginning months of the spring and summer, and is commonly ascribed to exposure to tempestuous weather, without sufficient shelter.

In regard to the cure of the disease, as the natural termination of it is invariably fatal, unless those rare recoveries which are sometimes the consequence of accidental blows on the head, that probably rupture the bags, be excepted; and more especially as the mutton in this disease is good, the sooner an attempt is made to relieve the animal by the proper operation the better; for want of which relief, although it is extremely simple, and not unfrequently successful, thousands of sheep are suffered to perish through carelessness or ignorance. The cure in these cases may be attempted in three different ways; by tapping, by trepanning, or by wiring.

1. Where the bag is seated any-where in the crown of the head, some suppose that the most ready and the gentlest method is to tap it in the place where the skull is soft, and to let the water run out. This is most commonly performed by means of an awl, or large corking-pin, though an instrument with a small tube in it, termed a trocar in surgery, might be easily contrived and formed, which would drain it off in a more complete manner. By this operation, if the instrument be not pushed too far, the animal is nothing the worse, it is said, whether it recover or not. But, what is very remarkable, this plan is not, it is said, successful on all farms alike, of which many instances are known. An old shepherd has often been heard to remark, that, in the course of thirty years' experience, not one sheep out of twenty which he had tapped

on his own farm had died, while it was very rare that he could cure any on some of the neighbouring ones. He constantly performs it with a corking-pin. Others assert, that, in their neighbourhoods, more sheep have been cured by this operation than by any other, in performing which, the sheep is advised to be laid on its back, and the pin to be inserted in an oblique manner; if water follow, the cure is said to be certain; but, even though it should not follow, provided the bag be pricked into, it is often successful in removing the disease.

2. In the mode of cure by means of *trepanning*, and extracting the bag or cyst, there are several circumstances to be carefully attended to. The animal being properly secured, and the head placed in the most convenient position, the part to be cut being uppermost, the skin is to be divided by an incision an inch and a half in length, crossed by another of the same length at right angles to it. The skull, which is quite soft, is then to be cautiously divided in the same manner, until the bag with the fluid in it appear clear at the bottom of the incision, which it commonly does. The soft skull is now to be turned back, or a bit cut out of it, so as to render the bag completely visible. It should then be taken hold of by a pair of blunt forceps, and gently moved backwards and forwards, to loosen it from its connections, which are generally very slender. This may also be done by means of a crow-quill, or any blunt-pointed instrument, carried frequently round it. The nose of the animal is now to be held, so as to restrain its breath, which may force the bag from its situation. The operator is to continue moving and pulling it, stopping the breathing of the sheep at intervals, until it is quite extracted. The skin after this is to be laid neatly down again, and a cloth spread with tar placed and tied over the wound above the dry lint, which is folded and laid on it, to prevent either cold in the spring, or flies in the summer, from injuring it. This is to be allowed to remain for two days, when the dressings may be changed, and a bit of cloth spread with hog's-lard, fresh butter, tar, or some other ointment, applied on the wound. The dressings should be changed every second day for ten days or a fortnight; after which time, in ordinary cases, it will require no more attention, being generally healed up. The skull grows over it in about a month, and it then becomes of the usual hardness; and the animal is equally healthy as if no disease had previously existed. It is said that the senses return after the operation in a few hours, and that the next day the sheep seems to be quite relieved.

3. In respect to the operation of *wiring*, it is described in this manner by Mr. J. Hog. In case the skull should feel soft in the forehead, then the operation must be performed by thrusting a thick sharpened wire up each nostril, until it stop against the upper part of the skull. If this mode of cure were not well authenticated by experience and observation, it might, it is said, appear a very severe and dangerous operation or practice, as the wire goes quite through the brain in two different places; yet a far greater number of sheep are cured in this way than by any other.

OUISCON'SIN. See OUISCONSIN, vol. xvii. to which account it is proper to add, that this river has a communication with Fox-river, which, passing through Winnebago-lake, enters Puan-bay in Lake Michigan. On this river and its branches reside the Indians of its name, furnishing 300 warriors.

OUITA'NOU, a town and fort of North America, on the river Wabash: six miles south-west of Kathrippacanuck.

OUJULDIN'GA, a town of Bengal: twenty-five miles north-east of Kishenagur.

OUJULIN'KE, a town of Thibet, near Lake Jamdro: forty-two miles east-south-east of Kiang-fee.

OUKAKE'E, a lake of Canada. Lat. 50. 20. N. lon. 86. 30. W.

OU'KE-SI'MA, an island in the Chinese Sea, near the coast

coast of Tonquin, about thirty miles in circumference. Lat. 18. 44. N. lon. 105. 42. E.

OU'KE-TANAC'SA, a town of Thibet: ninety miles south-east of Lassa.

OU'KERCK, a town of Holland: seven miles south of Naarden.

OULA'IS, a town of Sweden, in the government of Ulea: twenty-five miles south-south-east of Brahestadt.

OULAN HO'TUN, a town of Chinese Tartary, in the country of the Monguls: 120 miles north of Pekin.

OULAN TABALAN', a town of Thibet: fifty-eight miles south of Cha-tcheou.

OULARD, a town of Ireland, in the county of Wexford: five miles north of Wexford.

OULBARA'YA, a town of Bengal: forty-eight miles south-south-east of Burdwan.

OU'CHY LE CHATEAU, a town of France, in the department of the Aisne: ten miles south of Soissons, and three north of Château Thierry.

OUL'LER, or TAL, a lake of Hindoostan, which lies near Sirinagur, and receives the river Behut. This lake is said to be of great extent, no less than fifty-three British miles in circuit, and perhaps sixteen or seventeen acres; according to which statement, it may reach to the frontiers of Little Thibet. The course of the Behut is to the north-west from Sirinagur to the lake; but the length of its course in this direction is not ascertained, any more than the length and direction of its course from the lake to its entry between the mountains at Barchmooleh.

OU'LENEY. See OLNEY, vol. xvii. p. 638.

OULOUSTOU', a lake of Chinese Tartary, in the country of the Monguls. Lat. 43. 23. N. lon. 114. 42. E.

OULSTEEN, an island near the coast of Norway, of a triangular form, twenty-four miles in circumference: 120 miles north of Bergen.

OULTON, a village in the West Riding of Yorkshire, with 1223 inhabitants: six miles south-east of Leeds.

OULTON, a village in Suffolk, two miles west of Lowestoft, is a large parish. The church is an old building dedicated to St. Michael: the steeple contains five bells, and is situated between the chancel and the church, which has two transepts, one in ruins. The house of industry for the hundred of Lothinland and Mutford stands in this parish.

OULU'A, a town of Hindoostan, in Bahar: twenty miles south-south-east of Bettiah.

OULX, a town of Italy, in Piedmont, situated in a valley to which it gives name: five miles north of Sezanne, and nine south-west of Sufa.

OU'LY. See WOOLLY.

OU'MA, a river of Congo, which runs into the Bokian fifteen miles south of Pango.

OUMARY, a town of Hindoostan, in Goondwana: sixteen miles south of Nagpour.

OUNCE, *f.* [*once*, Fr. *uncia*, Lat.] A name of weight of different value in different denominations of weight. In troy-weight, an ounce is twenty penny-weight; a penny-weight, twenty-four grains.—A sponge dry weigheth one ounce twenty-six grains; the same sponge, being wet, weigheth fourteen ounces six drams and three quarters. *Bacon*.

The blood he hath lost,
Which I dare vouch is more than that he hath
By many an ounce, he dropt it for his country. *Shakespeare*.

OUNCE, *f.* [*once*, Fr. *onza*, Sax.] A beast of prey. See FELIS uncia:

The ounce,
The libbard, and the tiger, as the mole
Rising, the crumbled earth above them threw. *Milton*.

OUNDED, or OUNDING, *adj.* [*ondé*, Fr. from *unda*, Lat.] Waving; imitating waves. *Not in use*; except, perhaps, in the heraldic term *oundy* for *wavy*.—Endenting,

or barring, *ounding*, paling, winding. *Chaucer's Parson's Tale*.

Her *owndid* hair, that sunnifish was of hew,
She rent. *Chaucer's Tr. and Cress.*

OU'NDLE, a market-town and parish in the county of Northampton, situated on the north bank of the river Nen, which, making a horse-shoe bend in its course here, almost environs the town. Camden, and the author of *Magna Britannia*, assert that its proper name is *Avondale*, as standing in the Vale of *Avon*, the original appellation of the Nen. But this opinion seems extremely doubtful, as we find this place mentioned in the *Domesday-book* under the designation of *Undele*. The market-day is Saturday; and there are fairs annually on the 25th of February, Whit-Monday, and August 21. Here is an excellent free grammar-school, founded by sir William Laxton, a native of the town, and who was lord-mayor of London in 1544. The same beneficent person likewise erected and endowed the alms-house, and placed both it and the school under the patronage of the Grocers' Company of London, of which he was a member. The charity-school, established in 1620, owed its origin to the munificence of Nicholas Latham, who was for more than fifty years rector of Barnwell St. Andrew's, a village near Oundle. This person also founded a guild, or hospital, here for the reception of sixteen aged women, who have a weekly allowance for their support.

The church is a spacious edifice, consisting of a nave, north and south aisles, transept and chancel, with a square tower, surmounted by a hexagonal crocketed spire. The tower displays a series of five stories, and is terminated at each angle by a small octagonal turret. Over the river here are two large bridges; one on the road towards Thrapston, and the other on that leading to Yaxley in Huntingdonshire. The former, called North-bridge, is generally much admired, not only on account of the number and forms of its arches, but also for its causeway, which is formed on an arcade, and secures a passage to and from the place during the time of floods. Peter Hausted, author of the *Rival Friends*, *Senile Odium*, &c. and Dr. John Newton, a celebrated divine and mathematician, were natives of this town.

In 1811, the parish of Oundle contained 362 houses, and 1833 persons, i. e. 821 males and 1012 females; 62 families were employed in agriculture, and 302 in trade, manufacture, and handicraft.

About three miles to the south-east of Oundle, the Roman road called the *Via-Devana* crosses the country in an oblique direction from south-east to the north-west. Adjoining to this road is the parish and village of Aldwinckle All-Saints, distinguished as the birth-place of the poet Dryden. Aldwinckle St. Peter's, to the west of this parish, is likewise noted as the birth-place of Dr. Thomas Fuller, author of *A History of the Worthies of England*, and various other works. See FULLER.

At Barnwell St. Andrew's stand the ruins of a castle, erected by Reginald le Moine in 1132, and described by Leland under the title of "*Berengarius Moynes Castel*." It was long the baronial residence of the Montacute and Montague families, but has been for many years uninhabitable. It still forms, however, a very noble and curious specimen of ancient architecture, much of the original structure having survived the attacks of time and of alteration. The present remains consist of four round masonry bastion-towers, one standing at each angle of a quadrangular court, which is inclosed by a wall three feet in thickness. Three of these connecting curtains are nearly entire, but that on the western side is considerably dilapidated. The grand gateway, at the south-east front, still remains, and is flanked by similar circular bastion-towers of smaller dimensions. This village contains a charity-school.

In the *Gentleman's Magazine* for April 1737, we have
an

an account, that "There was lately discovered on Mr. Campion's estate, at Coddlestock, near Oundle in Northamptonshire, a beautiful Roman pavement twenty foot square, and very little defaced by time; near it were found bones, ashes, and pieces of urns; an indication that the body of some noted heathen had been buried there. Among the rubbish thrown off the pavement five or six Roman medals of brass were discovered, two of which were fair, and seemed to bear the same image on one side, with this inscription; D. N. VALENTINIANUS P. F. AVG. i. e. *Dominus noster Valentinianus Pius Felix Augustus*. On the other sides were different images and mottos. One had the image of *Victory*, stepping from the right to the left; a coronet of laurel in her right hand, and a palm-branch in her left. On the reverse of another was the figure of an emperor in an erect posture, leaning with his right hand on the head of a captive, kneeling on one knee, with his hands tied behind him. His left hand was supported by a staff with a crucifix on the top of it, denoting him to be a *Christian*, as Valentinian was; one of the medals was struck at Constantinople, and the other at Siscia, as appeared by the letters at the bottom of them." *Gent. Mag.* vii. 254. *Beauties of England and Wales.* *Wilkes's British Directory.*

OUNIEH, a town of Asiatic Turkey, in the government of Sivas, on the Black Sea: eighty miles north of Sivas.

OUNSBERRY-TOPPING, a steep, high, verdant, mountain, in Yorkshire, not far from Gisborough, which has a most delightful prospect, and is regarded by the sailors as a sea-mark. From a rock near the top of it there issues a spring, recommended for sore eyes.

OVO, a small island in the Mediterranean. Lat. 35. 39. N. lon. 25. 27. E.

OVOCA, a river of Ireland, in the county of Wicklow, which runs into the sea a little below Arklow.

OVOLO, *f.* in architecture, a kind of moulding so called, because, when carved, it resembles a string of eggs.

OUPHE, *f.* [*alf*, Teut.] A fairy; a goblin:

Nan Page and my little son we'll dress
Like urchins, *ouphes*, and fairies, green and white. *Shakespeare.*

OU'PHEN, *adj.* [from *ouph*.] Elfish:

Fairies, black, gray, green, and white,
Ye moonshine revellers, and shades of night,
You *ouphen* heirs of fixed destiny,
Attend your office. *Shakespeare.*

OU'PLE, a town of Hindoostan, in Dowlatabad: ten miles east of Perinda.

OU'QUES, a town of France, in the department of the Loire and Cher: twelve miles north-west of Mer, and fifteen north of Blois.

OUR, *pron. poss.* [Sax. *pe*, us; quasi *weer, ure, vor*, *oppe*, our. *Lye.*] Pertaining to us; belonging to us.—*Our* soul is the very same being it was yesterday, last year, twenty years ago. *Beattie.*

Our wit is given Almighty God to know;
Our will is given to love him, being known. *Davies.*

When the substantive goes before, it is written *ours*.—Reading furnishes the mind only with materials of knowledge; it is thinking makes what we read *ours*: it is not enough to cram ourselves with a great load of collections; unless we chew them over again, they will not give us strength. *Locke.*

Edmund; whose virtue in this instance
So much commands itself, you shall be *ours*. *Shakespeare.*
Thou hast fashion'd twice this soul of *ours*,
So that she is by double title thine. *Davies.*

OU'RA, a town of Portugal, in the province of Tras os Montes: nine miles south of Chaves.

OU'KAN, or U'KAN SOAN'GUS, the name of an imaginary sect of magicians in the island of Gromboccanore, in the East Indies. The word implies *men-devils*: these

people were ridiculously supposed to have the art of rendering themselves invisible, and passing where they pleased; and, by these means, doing infinite mischief; for which reason the people hate and fear them exceedingly.

OURANOG'RAPHIST, *f.* [from *ouranography*.] An astronomer; one who describes the heavens.

OURANOGRAPHY, *f.* [from the Gr. *ouranos*, heaven, and *γραφω*, to describe.] A description of the heavens.—The ingenious Mr. Hooke, in his animadversions on Hevelius's *ouranography*, had omitted the chief objection Hevelius makes against these kind of sights. *Hist. R. Soc.*

OURDA, a town of Bengal: seventy-two miles north of Dacca.

OURCIE'RES, a town of France, in the department of the Higher Alps: ten miles north of Gap.

OU'REM, a town of Portugal, in Estremadura, situated on a mountain, containing 1800 inhabitants: twelve miles south-east of Leyria, and twelve west of Thomar.

OU'REOS, a small island in the Gulf of Engia: fourteen miles north-west of Engia.

OURFA, ROHA, or ROUAH, a town of Asiatic Turkey, in the province of Diarbekir, anciently called *Edeffa*. It is watered by a canal from the Euphrates. Many learned men, and the Jews universally, are of opinion, that it is the Ur of the Chaldees. The latter say that this place is called in scripture *Ourcaslin*, that is, the Fire of Chaldaea, out of which, they say, God brought Abraham; and, on this account, the Talmudists affirm that Abraham was here cast into the fire, and was miraculously delivered. This place seems to have retained its ancient name, as others have done; *Edeffa* being the name given it by the Greeks. However, the name seems to have been changed in honour of one of the kings of Syria of the name of Antiochus, and to have been called *Antiochia*. The famous fountain Callirrhoe being here, distinguished this city from others by the name of *Antiochia ad Callirrhoen*. Ourfa is built on part of two hills, and in the valley between them, at the south-west corner of a fine plain, which appears more beautiful, because all the other parts about it are rocky, or mountainous. The town is about three miles in circumference, encompassed with ancient walls, defended by square towers. On the north side there is a very deep foss, which seems to be the bed of a winter-torrent coming from the west; on the east this foss is not so deep, there being much morassy ground on that side. The hill on which the castle stands is to the south. Some parts of the town are tolerably well built, though it is not well laid out. The great beauty of it consists in some fine springs that rise very plentifully between two hills, and at the very walls of the city. The castle is situated on the south side of the city, at the beginning of a chain of hills which run southward. The ascent is very steep, and there is a deep foss cut into the rock on three sides of it. The castle is about half a mile in circumference; but there is nothing remarkable in it, except two very lofty Corinthian pillars with their bases, the capitals of which are fine; the columns consist of twenty-six stones, each about one foot six inches thick: they are probably the remains of a portico belonging to some large temple. There is a tradition, that the throne of Nimrod stood on these pillars; it is certain, however, that Timur Bec erected some trophies on them. Some ecclesiastical historians mention, that Abgarus king of *Edeffa* sent a letter to Our Saviour; but the truth of this has been much questioned. Ourfa is the residence of a pacha of two tails, who not only commands the greatest part if not all Mesopotamia, but also a considerable tract of country to the west of it, as far as Antab. There is a great trade in this place, as it is the only town in all these parts for a considerable distance, and as it is the great thoroughfare into Persia. They prepare Turkey leather here, especially the yellow sort, for which they were formerly famous. There is a considerable number of Armenian Christians in the city, who have two churches; one large one in the city, the other at some distance from it: in the latter

latter they show the tomb of a great saint, whom they call Ibrahim. As Ephraim Syrus was a deacon of Edeffa, it may be concluded that it is the tomb of that father of the church. This town was first taken by the Saracens in the year 1087. The Christians retook it in the year 1097; and in the year 1142 it was seized by the Turks, in whose power it has continued ever since. It contains about 20,000 inhabitants, and is eighty miles north-east of Aleppo. Lat. 36. 50. N. lon. 38. 25. E.

OURGOOR, a town of Hindoostan, in Golconda: thirty miles north-north-west of Rachore.

OURIGUI, a town of Hindoostan, in Dowlatabad: fifteen miles south-south-east of Kondur.

OURIQUE, a town of Portugal, in Alentejo, containing about 2000 inhabitants. In the year of Rome 606, the Romans were defeated near this town by Viriatus, and their general Claudius Unanimus killed. Near this town, Don Alphonso Henriques obtained a signal victory over the Moors, in the year 1149. It is twenty-four miles south-south-west of Beja, and seventy-five south-south-east of Lisbon. Lat. 37. 39. N. lon. 8. 9. W.

OURISTA, *f.* [from *ερος*, a mountain, in allusion to the natural situation of the plant.] In botany, a genus of the class didynamia, order angiospermia, natural order perfonatæ, *Lin.* (pedicularæ, *Juss.* scrophularinæ, *Brown.*) Generic characters—Calyx: perianthium inferior, in five deep, somewhat unequal, segments; permanent. Corolla: of one petal; tube funnel-shaped, ascending, longer than the calyx; limb in five obtuse nearly-equal lobes. Stamina: filaments four, inserted into the bottom of the tube, curved closely along its upper side, two of them rather the longest; antheræ incumbent, within the tube; some describe the rudiment of a fifth stamen. Pistillum: germen superior, two-lobed; style the length and position of the stamens; stigma of two obtuse lobes. Pericarpium: capsule two-lobed, of two cells, and two valves, the partitions from the centre of the valves. Seeds: numerous, with a lax tunic-like skin.—*Essential Character.* Calyx deeply five-cleft, rather unequal; corolla funnel-shaped; limb five-cleft, nearly-equal, obtuse; stigma two-lobed; capsule of two cells, and two valves; the partitions from the centre of each valve; seeds with a lax tunic-like skin. There are two species.

1. Ourisia ruelloides: leaves roundish-ovate, unequally crenate; flower-stalks axillary, opposite. Native of Terra del Fuego, in the clefts of rocks. Root perennial, creeping, with woolly fibres. Stems procumbent, short, smooth. Leaves on long erect stalks, roundish-ovate, about two inches long, nearly smooth, with one central rib, and two pair of lateral ones, their margin unequally and rather bluntly crenate; the under side palest. Flowering branches decumbent, hardly a span long, smooth, bearing two or three pair of rounded notched leafy bractes; flowers purple, on long, smooth, axillary, solitary, opposite, naked, simple, stalks, from the two uppermost pair of bractes. See CHELONE, vol. iv.

2. Ourisia integrifolia: leaves nearly ovate, entire; flower-stalk terminal, mostly solitary. Gathered by Mr. Brown in Van Diemen's Land. A smooth creeping plant, with a calyx more equally and deeply divided than the first species, as well as a shorter corolla, and a different aspect; so that its discoverer was partly inclined to think it generically distinct.

OU'RO, a river of Africa, which runs into the Atlantic in lat. 23. 30. N.

OU'RO, a river of Africa, which runs into the Indian Sea in lat. 24. 25. S.

OURO'E, a small island of Denmark, near the coast of Zealand, in the Isefiord Gulf: four miles north-east of Holbeck. Lat. 55. 46. N. lon. 11. 50. E.

OUROLOGY, or UROS'COPY, *f.* [from *ερος*, Gr. urine.] The doctrine of diseases, as judged of by the appearances of the urine.

The changes in the sensible qualities of the urine, under different circumstances of disease, are considerable; and

the ancients deduced many pathological inferences from these changes, and wrote ample treatises in explanation of their doctrines. Much of their supposed knowledge on the subject was, however, purely hypothetical, and altogether unworthy of serious attention. Although, doubtless, some indications are to be obtained from the appearances of the urine, both in acute and chronic complaints, yet these are much more limited than was formerly believed; and those who pretend to ascertain the nature of diseases, by *only* inspecting the urine of the patient, are, therefore, impostors of the lowest class; and it is truly discreditable to the general information of the age, that water-doctors still live upon the credulity of a British people.

The medical indications, as well as the chemical properties, of this excretion, will be treated of under the proper head. In the mean time we may observe, that Dr. Blackall, a physician of Exeter, has recently given an importance to uroscopy which it never before possessed, by showing that, in many cases of dropsy, and other chronic diseases, the urine contains much of the coagulable part of the blood; and thence deducing some important practical indications.

OUROUGER'D, a town of Persia, in the province of Irac: 104 miles south-east of Hamadan.

OUROUX, a town of France, in the department of the Nievre: seven miles north of Château Chinon.

OURED, a high hill of the county of Galway, Ireland, in the western district, at the bottom of which is a lake of the same name.

OUR'RY'S ISLAND, or NEW AL'DERNEY, an island in the South Pacific Ocean, discovered by captain Carteret in the year 1767. This is one of those called *Queen Charlotte's Islands*; about ten miles long, and five broad. Lat. 11. 10. S. lon. 165. 19. E.

OUR'SE, a river of France, which runs into the Seine at Bar sur Seine.

OURSELF, *reciprocal pronoun*; [plural of myself.] We; not others; it is added to *we*, by way of emphasis or opposition.—*We ourselves* might distinctly number in words a great deal farther than we usually do, would we but find out some fit denominations to signify them by. *Locke*.—Us; not others; in the oblique cases.—Our confession is not intended to instruct God, who knows our sins much better than ourselves do, but it is to humble *ourselves*; and therefore we must not think to have confessed aright till that be done. *Whole Duty of Man*.

Safe in *ourselves*, while on *ourselves* we stand,
The sea is ours, and that defends the land. *Dryden*.

OURSELF is used in the regal style.—Not so much as a treaty can be obtained, unless we would denude *ourselves* of all force to defend us. *Clarendon*.

To make society
The sweeter welcome, we will keep *ourselves*
Till supper-time alone. *Shakespeare's Macbeth*.

We *ourselves* will follow
In the main battle. *Shakespeare*.

OURTE, or OURTHE, a river of the Netherlands, which rises from two springs; one near St. Hubert, the other near the village of Ourte; both which unite near La Roche; the united stream passes by Durbuy, &c. and runs into the Meuse at Liege.

OURTE, or OURTHE, late one of the departments of France, formed of the greatest part of the country of Liege and of part of Limburg and Luxemburg; taking its name from the above river. Its capital, Liege, is now the capital of the (Southern) Province of Liege, in the kingdom of the Netherlands, to which the whole of this department was made over by the treaty of Vienna, June 1815.

OURTHE, a town of the kingdom of the Netherlands: four miles north of Luxemburg.

OUR'TON-POU'LAC, a town of Thibet: fifteen miles south-west of Yolotou-Hotun.

OURUC'ZE,

OURUC'ZE, a town of Poland, in Volhynia: sixty-eight miles north-north-east of Zytomiers.

OU'RVILLE, a town of France, in the department of the Lower Seine: nine miles west of Fécamp, and six south-west of Cany.

OUSBY, a town of Sweden, in the province of Schonen: twenty-three miles north of Christianstätt.

OUSCOT'TA, a town and fort of Hindoostan, in Mysore, taken by earl Cornwallis in April 1791: fifteen miles north-east of Bangalore.

OUSCOT'TA, a town of Hindoostan, in the circar of Sanore: twenty-five miles north of Sanore.

OUSE, *f.* Tanners' bark; rather *oose*. *Ainsworth.*

OUSE, [Gaelic, *water*.] A river of England, formed by the union of the Eure and the Swale, about four miles from Boroughbridge, in the county of York, which passes by Aldborough, York, Selby, &c. and joins the Trent on the borders of Lincolnshire, where their united streams form the Humber. It is seventeen miles west of Hull.

OUSE, a river of England, in the county of Sussex, which passes by Lewes, and runs into the sea below Newhaven, where it forms a considerable haven.

OUSE (Greater), a river of England, which rises in the county of Northampton, passes through Buckinghamshire, Bedfordshire, Cambridgeshire, and Norfolk, and falls into the German Sea a little below Lynn.

OUSE, (Smaller), a river of England, which runs into the Greater Ouse near Downham in Norfolk.

OUSE, or GRAND RIVER, a river of Canada, which runs into Lake Erie in lat. 42. 50. N. lon. 79. 30. W.

OU'SEBEACH. See WISEBEACH.

OUSE'EL (Philip), a learned German reformed professor of divinity and oriental scholar, was the descendant of an ancient and noble family, originally from France, and born at Dantzic in the year 1671. He became minister of the German church at Leyden; and was afterwards appointed professor of divinity at Frankfort on the Oder. This post he filled with reputation till his death, which took place in 1724, when he was about fifty-three years of age. It is related of him, that when he was upon his death-bed, and his colleague was reciting for his consolation passages of scripture, in Latin or German, he corrected the language of the versions made use of by him, according to the original Hebrew or Greek, with the same accuracy and calm self-possession as if he had been seated in his academical chair. The most important of his works are, 1. *Introductio in Accentuationem Hebræorum Metricam*, 1714, 4to. in the preface to which he maintains that the Hebrew accents and points are as ancient as the books of the sacred scriptures themselves. 2. *Introductio in Accentuationem Hebræorum Prosaicam*, 1715, 4to. 3. *De Lepra*, 1709, 4to. 5. *Several Treatises on the Ten Commandments*, 4to.

He had a relation, called JAMES OUSEEL, who wrote some esteemed notes on the Octavius of Minutius Felix, which were inserted entire, together with those of Meursius, in the variorum edition of 1672, 8vo. *Ladocat's Dict. Hist.*

OU'SEL, *f.* [orle, Sax.] A blackbird.—Thrushes and *oufels*, or blackbirds, were commonly sold for threepence a-piece. *Hakewill on Providence.*

The merry lark her matins sings aloft,

The thrush replies, the mavis descant plays,

The *oufel* shrills, the ruddock warbles soft;

So goodly all agree, with sweet consent,

To this day's merriment. *Spenser's Epithal.*

The *oufel*-cock, so black of hue,

With orange-tawny bill.

Shakespeare.

USERAW', a town of Hindoostan, in Bahar: twenty-five miles west-north-west of Rotasgur.

OUSOUR'I, a town of Chinese Tartary: sixty-seven miles south-south-west of Tondon.

OU'SSON, a town of France, in the department of the Loiret: eight miles south-east of Gien.

OUSSOO'R, a town of Hindoostan, in Mysore. This was an important place, and the fortifications had been strengthened by Tippoo; but was abandoned on the approach of the British troops, on the 15th of July, 1791. In one of the store-houses of the fort, a kind of journal was found, written by an Englishman, who, with two others, his companions, had been confined and put to death here by order of Tippoo. It is sixty-nine miles east-north-east of Seringapatam, and nineteen south-east of Bangalore. Lat. 12. 41. N. lon. 77. 52. E.

OUST, a town of France, in the department of the Arriege: seven miles south of St. Girons.

OUST, a river of France, which runs into the Villaine near Redon.

OUST. See OAST, vol. xvii. p. 354.

To OUST, *v. a.* [*ouster*, *ôter*, Fr.] To vacate; to take away.—Multiplication of actions upon the case were rare formerly, and thereby wager of law *ousted*, which discouraged many suits. *Hale*.—To deprive; to eject.—Though the deprived bishops and clergy went not upon account of the oaths, yet this made no schism; no, not even when they were actually deprived and *ousted* by act of parliament. *Leflie*.

OU'STAD, a town of Norway, in the province of Christianland: thirty-two miles west of Christianland.

OU'STER, *f.* Dispossession.—*Ouster*, or dispossession, is a wrong or injury that carries with it the amotion of possession. *Blackstone*.

OU'STER LE MA'IN, *f.* [or rather *la main*, Fr. to withdraw the hand.] A livery of land out of the king's hand, on a judgment given for him that sued a *monfrans de droit*; for, when it appeared that the king had no title to the land he seized, judgment was given in the chancery that the king's hands be removed; and thereupon an *amoveas manus* was awarded to the escheator to restore the land. See stat. 28 Ed. I. stat. 3. c. 19. When the male heir arrives at the age of twenty-one, or the heir female to the age of sixteen, they might sue out their livery or *ousterlemain*, that is, the delivery of their lands out of their guardian's hands. *Blackstone*.—It was also taken for the writ granted upon a petition for this purpose.—All wardships, liveries, and *ousterlemain*s, are taken away by stat. 12 Car. II. c. 24. *Jacob*.

OUSTIOU'G, a province of the Russian empire, bounded on the north by Dwina, on the east by the forest of Zirani, on the south by Wologda, and on the west by Cargapol and Waga. It is divided into two parts by the river Suchana, is full of forests, and the rivers yield plenty of fish, which the inhabitants dry in the sun, and which make their principal nourishment.

OUSTIOU'G, a town of the Russian empire, and capital of a province of the same name, with an archbishop's see and a castle; seated on the river Suchan, over-against the mouth of the Jug, in lat. 61. 48. N. lon. 43. 25. E.

OUT, *adv.* [ut, Sax. *nyt*, Teut.] Not within:

The gown with stiff embroid'ry shining

Looks charming with a slighter lining;

The *out* of Indian figures stain,

The inside must be rich and plain.

Prior.

It is generally opposed to *in*.—That blind rascally boy, that abuses eyes because his own are *out*, let him be judge how deep I am in love. *Shakespeare*.—In a state of disclosure.—Fruits and grains are half a year in concocting; whereas leaves are *out* and perfect in a month. *Bacon*.—Not in confinement or concealment:

Nature her custom holds,

Let shame say what it will; when these are gone,

The woman will be *out*.

Shakespeare.

From the place or house.—*Out* with the dog, says one. What cur is that? says another. Whip him *out*, says the third. *Shakespeare*.—From the inner part.—This is the place where the priests shall boil the trespass-offering; that they bear it not *out* into the utter court, to sanctify the people. *Ezek.* xlv. 20.—Not at home; as, When you called,

called I was *out*.—In a state of extinction.—Her candle goeth not *out* by night. *Prov.* xxxi. 18.

This candle burns not clear; 'tis I must snuff it,
Then *out* it goes. *Shakespeare's Hen.* VIII.

Thinkst thou the fiery fever will go *out*
With titles blown from adulation. *Shakespeare's Hen.* V.

In a state of being exhausted.—Large coals are properest for dressing meat; and, when they are *out*, if you happen to miscarry in any dish, lay the fault upon want of coals. *Swift*.—Not in employment; not in office:

So we'll live, and hear poor rogues
Talk of court-news; and we'll talk with them too;
Who loses, and who wins, who's in, who's *out*. *Shakespeare*.

Not in any sport or party.—The knave will stick by thee: he will not *out*, he is true bred. *Shakespeare's Hen.* IV.—I never was *out* at a mad frolic, though this is the maddest I ever undertook. *Dryden*.—To the end.—Hear me *out*. *Dryden*.

You have still your happiness in doubt,
Or else 'tis past, and you have dream'd it *out*. *Dryden*.
Loudly; without restraint:

At all I laugh he laughs, no doubt;
The only difference is, I dare laugh *out*. *Pope*.

Not in the hands of the owner.—If the laying of taxes upon commodities does affect the land that is *out* at rack-rent, it is plain it does equally affect all the other land in England too. *Locke*.—Those lands were *out* upon leases of four years, after the expiration of which, tenants were obliged to renew. *Arbutnot*.—In an error.—According to Hobbes's comparison of reasoning with casting-up accounts, whoever finds a mistake in the sum-total, must allow himself *out*, though, after repeated trials, he may not see in which article he has misreckoned. *Swift*.

As he that hath been often told his fault,
And still persists, is as impertinent
As a musician that will always play,
And yet is always *out* at the same note. *Roscommon*.

At a loss; in a puzzle.—This youth was such a mercurial, as the like hath seldom been known; and could make his own part, if at any time he chanced to be *out*. *Bacon's Hen.* VII.

Like a dull actor now:
I have forgot my part, and I am *out*,
Even to a full disgrace. *Shakespeare*.

With torn clothes. The parts being *out*, that is, not covered:

Evidences swore;
Who hither coming, *out* at heels and knees,
For this had titles. *Dryden*.

Away; so as to consume.—Let all persons avoid niceness in their cloathing or diet, because they dress and comb *out* all their opportunities of morning devotion, and sleep *out* the care for their souls. *Bp. Taylor*.—Deficient; as, *Out* of pocket, noting loss.—Upon the great Bible he was *out* fifty pounds, and reimburs'd himself only by selling two copies. *Fell*.—It is used emphatically before *alas*:

Out, alas! no sea, I find,
Is troubled like a lover's mind. *Suckling*.

It is added emphatically to verbs of discovery.—If ye will not do so, be sure your sin will find you *out*. *Num.* xxxii. 23.

OUT, *interj.* An expression of abhorrence or expulsion.—*Out* on thee, rude man; thou dost shame thy mother. *Shakespeare*.—*Out*, you mad-headed ape! a weazel hath not such a deal of spleen. *Shakespeare's Hen.* IV.

Out, out, hyena; these are thy wonted arts
To break all faith. *Milton's S. A.*

It has sometimes *upon* after it.—*Out upon* this half-fac'd fellowship. *Shakespeare*.

Out upon it! I have lov'd
Three whole days together;
And am like to love three more,
If it prove fair weather. *Suckling*.

OUT OF, *prep.* [*of* seems to be the preposition, and *out* only to modify the sense of *of*.] From: noting produce.—Those bards, coming many hundred years after, could not know what was done in former ages, nor deliver certainty of any thing, but what they feigned *out of* their own unlearned heads. *Spenser on Ireland*.—Alders and ashes have been seen to grow *out of* steeples, but they manifestly grow *out of* clefts. *Bacon*.—Juices of fruits are watery and oily: among the watery are all the fruits *out of* which drink is expressed; as the grape, the apple, the pear, and cherry. *Bacon*.—He is softer than Ovid; he touches the passions more delicately; and performs all this *out of* his own fund, without diving into the sciences for a supply. *Dryden*.

So many Neroes and Caligulas
Out of these crooked shores must daily rise. *Spenser*.

Not in: noting exclusion, dismission, absence, or dereliction.—Guiltiness will speak, though tongues were *out of* use. *Shakespeare*.

My retreat the best companions grace;
Chiefs *out of* war, and statesmen *out of* place. *Pope*.

No longer in:
Enjoy the present smiling hour,
And put it *out of* fortune's power. *Dryden*.

Not in: noting unfitness.—He is witty *out of* season; leaving the imitation of nature, and the cooler dictates of his judgement. *Dryden*.

Thou'lt say my passion's *out of* season,
That Cato's great example and misfortunes
Should both conspire to drive it from my thoughts. *Addison*.

Not within: relating to a house.—Court holy-water in a dry house, is better than the rain-waters *out of* door. *Shakespeare's K. Lear*.—From: noting copy.—St. Paul quotes one of their poets for this saying, notwithstanding T. G.'s censure of them *out of* Horace. *Stillingfleet*.—From: noting rescue.—Christianity recovered the law of nature *out of* all those errors with which it was overgrown in the times of paganism. *Addison's Freeholder*.—Not in: noting exorbitance or irregularity.—Using old thread-bare phrases will often make you go *out of* your way to find and apply them. *Swift*.—From one thing to something different.—He that looks on the eternal things that are not seen, will, through those optics, exactly discern the vanity of all that is visible; will be neither frightened nor flattered *out of* his duty. *Decay of Chr. Piety*.—To a different state from; in a different state.—When the mouth is *out of* taste, it maketh things taste sometimes salt, chiefly bitter, and sometimes loathsome, but never sweet. *Bacon*.

They all at once employ their thronging darts,
But *out of* order thrown, in air they join,
And multitude makes frustrate the design. *Dryden*.

Not according to.—That there be an equality, so that no man acts or speaks *out of* character. *Broom's View of Ep. Poem*.—To a different state from: noting separation.—If ridicule were employed to laugh men *out of* vice and folly, it might be of some use; but it is made use of to laugh men *out of* virtue and good sense, by attacking every thing solemn and serious. *Addison*.—Beyond.—The Supreme Being has made the best arguments for his own existence, in the formation of the heavens and the earth, and which a man of sense cannot forbear attending to, who is *out of* the noise of human affairs. *Addison*.

What, *out of* hearing gone? no sound, no word?
Alack, where are you? *Shakespeare*.

Deviating

Deviating from: noting irregularity:

Heaven defend but still I should stand so,
So long as *out* of limit and true rule
You stand against anointed majesty!

Shakespeare.

Past; without; noting something worn-out or exhausted.
—I published some fables which are *out* of print. *Arbuthnot.*

I am *out* of breath.—

How art thou *out* of breath, when thou hast breath
To say to me that thou art *out* of breath? *Shakespeare.*

By means of.—*Out* of that will I cause those of Cyprus to mutiny. *Shakespeare.*—In consequence of: noting the motive or reason.—She is persuaded I will marry her, *out* of her own love and flattery, not *out* of my promise. *Shakespeare's Othello.*—Cromwell accused the earl of Manchester of having betrayed the parliament *out* of cowardice. *Clarendon.*—Make them conformable to laws, not only for wrath, and *out* of fear of the magistrate's power, which is but a weak principle of obedience; but *out* of confidence, which is a firm and lasting principle. *Tillotson.*—What they do not grant *out* of the generosity of their nature, they may grant *out* of mere impatience. *Smalridge.*—Our successes have been the consequences of a necessary war; in which we engaged, not *out* of ambition, but for the defence of all that was dear to us. *Atterbury.*

Not *out* of cunning, but a train
Of atoms juggling in his brain.

Hudibras.

OUT OF HAND. Immediately; as that is easily used which is ready in the hand.—Now gather we our forces *out* of hand. *Shakespeare.*

He bade to open wide his brazen gate,
Which long time had been shut; and *out* of hand
Proclaimed joy and peace through all his state. *Spenser.*

To OUT, v. a. [utian, Sax.] To deprive by expulsion.—The members of both houses who withdrew, were counted deserters, and *outed* of their places in parliament. *K. Charles.*—The French having been *outed* of their holds. *Heylin.*—So many of their orders as were *outed* from their fat possessions, would endeavour a re-entrance against those whom they account heretics. *Dryden.*

OUT, in composition, generally signifies something beyond or more than another; but sometimes it betokens emission, exclusion, or something external.

To OUT-ACT', v. a. To do beyond:

He has made me heir to treasures
Would make me to *out-act* a widow's whining. *Otway.*

To OUT-BAL'ANCE, v. a. To over-weigh; to preponderate:

Let dull Ajax bear away my right,
When all his days *out-balance* this one night. *Dryden.*

To OUT-BA'R, v. a. To shut out by fortifications:

These to *out-bar* with painful pionings,
From sea to sea he heap'd a mighty mound. *Spenser.*

To OUT-BID', v. a. To over-power by bidding a higher price.—Prevent the greedy, and *out-bid* the bold. *Pope.*

If in thy heart

New love created be by other men,
Which have their stocks entire, and can in tears,
In sighs, in oaths, in letters, *out-bid* me,
This new love may beget new fears. *Donne.*

OUT-BID'DER, f. One that out-bids.

OUT-BLOW'ED, adj. Inflated; swollen with wind:

At their roots grew floating palaces,
Whose *out-blown* bellies cut the yielding seas. *Dryden.*

To OUT-BLUSH', v. a. To exceed in rosy colour:

Each rose did in native scarlet appear,
Yet every rose was *out-blushed* by her.

Shipman's Trag. of Hen. III. of France, 1673.

VOL. XVIII. No. 1228.

The fun which gives your cheeks to glow,
And *out-blush* (mine excepted) every fair. *Young.*

OUT-BOR'N, adj. Foreign; not native.

OUT-BOUND, adj. Destinated to a distant voyage; not coming home:

Triumphant flames upon the water float,
And *out-bound* ships at home their voyage end. *Dryden.*

To OUT-BRA'VE, v. a. To bear down and defeat by more daring, insolent, or splendid, appearance.—We see the danger, and by fits take up some faint resolution to *out-brave* and break through it. *L'Estrange.*

I would *out-stare* the sternest eyes that look,
Out-brave the heart most daring on the earth,
To win thee, lady. *Shakespeare.*

Here Sodom's towers raise their proud tops on high;
The towers, as well as men, *out-brave* the sky. *Cowley.*

To OUT-BRA'ZEN, v. a. To bear down with impudence.

OUT-BREAK, f. That which breaks forth; eruption:

Breathe his faults so quaintly,
That they may seem the taints of liberty,
The flash and *out-break* of a fiery mind. *Shakespeare.*

OUT-BREA'KING, f. That which breaks forth; powerful appearance.—Instead of subjecting her, he is, by the fresh *out-breaking* of her beauty, captivated. *Sir T. Herbert's Travels.*

To OUT-BRE'ATHE, v. a. To weary by having better breath:

Mine eyes saw him
Rendering faint quittance, wearied and *out-breath'd*,
To Henry Monmouth. *Shakespeare.*

To expire.—That sign of last *out-breathed* life did seem. *Spenser.*

To OUT-BUD', v. n. To sprout forth:

That renowned snake,
Whose many heads, *out-budding* ever new,
Did breed him endlesse labor to subdew. *Spenser.*

To OUT-BUIL'D, v. a. To exceed in durability of building; to build more durably:

Virtue alone *out-builds* the pyramids;
Her monuments shall last, when Egypt's fall. *Young.*

OUT-CEP'T, conj. Except; changing the Latin *ex* into the English *out*. *Obsolete.*—*Out-take* was another and better form of *except*, as being all English. *Todd.*

Look not so near, with hope to understand,
Out-cept, sir, you can read with the left hand. *B. Jonson.*

To OUT-CLIMB, v. a. To climb beyond:

They must be sever'd, or like palms will grow,
Which, planted near, *out-climb* their native height. *Davenant.*

To OUT-COM'PASS, v. a. To exceed due bounds.—If such be the capacity and receipt of the mind of man, it is manifest that there is no danger at all in the proportion or quantity of knowledge, how large soever, left it should make it swell, and *out-compass* itself. *Bacon's Adv. of Learning.*

To OUT-COMPLY', v. a. To comply too much; to be over-compliant.—*Out-fawn* as much as *out-comply*. *Hudibras.*

To OUT-CRAFT, v. a. To excel in cunning:

Italy hath *out-crafted* him,
And he's at some hard point. *Shakespeare's Cymbeline.*

To OUT-DA'RE, v. a. To venture beyond:

Myself, my brother, and his son,
That brought you home, and boldly did *out-dare*
The dangers of the time. *Shakespeare.*

To OUT-DA'TE, v. a. To antiquate.—Works and deeds of the law, in those places, signify legal obedience,
F f

or circumcision, and the like judaical *out-dated* ceremonies; faith, the evangelical grace of giving up the whole heart to Christ, without any such judaical observances. *Hammond.*

To OUT-DO', v. a. To excel; to surpass; to perform beyond another.—He hath in this action *out-done* his former deeds doubly. *Shakespeare.*

I grieve to be *out-done* by Gay,
In my own humorous biting way.

Swift.

OUT-DO'ING, f. The act of doing beyond others; that which is done beyond others.—Mrs. Oldfield *out-did* her usual *out-doings*. *Cibber.*

To OUT-DRINK, v. a. To exceed in drinking.—*To out-drink* the sea, to out-swear the gallant. *Donne.*—*Out-drink* a Dutchman draining of a fen. *Cleaveland.*

To OUT-DWELL', v. a. To stay beyond:

He *out-dwells* his hour;

For lovers ever run before the clock. *Shakespeare.*

To OUT-FA'CE, v. a. To brave; to bear down by show of magnanimity; to bear down with impudence.—They bewrayed some knowledge of their persons, but were *out-faced*. *Wotton.*

We shall have old swearing
That they did give the rings away to men;
But we'll *out-face* them and out-swear them too. *Shakespeare.*

Dost thou come hither

To out-face me with leaping in her grave?
Be buried quick with her, and so will I. *Shakespeare.*

To stare down.—We behold the sun and enjoy his light, as long as we look towards it circumspectly: we warm ourselves safely, while we stand near the fire; but, if we seek to *out-face* the one, to enter into the other, we forthwith become blind, or burnt. *Raleigh.*

OUT-FALL, f. A canal or ditch to carry off water. *Scott.*

To OUT-FAWN, v. a. To excel in fawning:

In affairs of less import,
That neither do us good nor hurt,
And they receive as little by,
Out-fawn as much and out-comply;
And seem as scrupulously just
To bait the hooks for greater trust.

Hudibras.

To OUT-FE'AST, v. a. To exceed in feasting.—He hath *out-feasted* Anthony or Cleopatra's luxury. *Bp. Taylor.*

OUT-FIELD LAND. A term applied to a sort of land in Scotland, which is similar to the uninclosed common-field lands in this country. Lord Dundonald remarks, that that part of the farm called the out-field land never receives any manure. After taking from it two or three crops of grain, it is left in the state it was in at reaping the last crop, without sowing grass-seeds for the production of any sort of herbage. During the first two or three years, a sufficiency of grass to maintain a couple of rabbits per acre is scarcely produced. In the course of some years, it acquires a sward; and, after having been depastured for some years more, it is again submitted to the same barbarous system of husbandry.

It was a sort of distinction that existed prior to the date of inclosures, and was likewise general throughout England. It is wearing-out fast in Scotland, from the same causes which have operated in England.

To OUT-FLANK, v. a. To out-reach the flank, or wing, of an army.

To OUT-FLY', v. a. To leave behind in flight:

Horoscope's great soul;
Rais'd on the pinions of the bounding wind,
Out-flew the rack, and left the hours behind.

Garth.

To OUT-FOOL', v. a. To exceed in folly:

In life's decline, when men relapse
Into the sports of youth,
The second child *out-fools* the first,
And tempts the last of truth.

Young.

OUT-FORM, f. External appearance:

Cupid, who took vain delight
In meer *out-forms*, until he lost his sight,
Hath chang'd his soul, and made his object you. *B. Jonson.*

To OUT-FROWN, v. a. To frown down; to overbear by frowns:

For thee, oppressed king, am I cast down,
Myself could else *out-frown* false fortune's frown. *Shakespeare.*

OUT-GATE, f. Outlet; passage outwards.—Those places are so fit for trade, having most convenient *out-gates* by divers ways to the sea, and in-gates to the richest parts of the land, that they would soon be enriched. *Spenser.*

To OUT-GENERAL, v. a. To exceed in military skill or manœuvre.—I believe a Russian colonel would *out-general* him. *Ld. Chesterfield.*

To OUT-GIVE, v. a. To surpass in giving.—The bounteous play'r *out-gave* the pinching lord. *Dryden.*

To OUT-GO', v. a. pret. *out-went*; part. *outgone*.—*To surpass*; to excel.—While you practised the rudiments of war, you *out-went* all other captains; and have since found none but yourself alone to surpass. *Dryden.*—Where they apply themselves, none of their neighbours *out-go* them. *Locke on Education.*—*To go beyond*; to leave behind in going.—Many ran afoot thither out of all cities, and *out-went* them, and came unto him. *Mark vi. 33.*—*To circumvent*; to over-reach.—Molleffon thought us to have *out-gone* with a quaint invention. *Denham.*

OUT-GO'ING, f. The act of going out; the state of going forth.—Thou makest the *out-goings* of the morning and evening to rejoice. *Pj. lxxv. 8.*

To OUT-GROW, v. a. To surpass in growth; to grow too great or too old for any thing.—This essay wears a dress that possibly is not so suitable to the graver geniuses, who have *out-grown* all gaieties of style and youthful reliques. *Glanville's Sceptis.*—The lawyer, the tradesman, the mechanic, have found so many arts to deceive, that they far *out-grow* the common prudence of mankind. *Swift.*

When some virtue much *out-grows* the rest,
It shoots too fast and high.

Dryden.

OUT-GUARD, f. One posted at a distance from the main body, as a defence.—As soon as any foreign object presses upon the sense, those spirits which are posted upon the *out-guards* immediately scowre off to the brain. *South.*

These *out-guards* of the mind are sent abroad,
And, still patrolling, beat the neighb'ring road;
Or to the parts remote obedient fly,
Keep posts advanc'd, and on the frontier lie. *Blackmore.*

OUT-HOUSE, f. A barn, stable, coach-house, cow-house, or any other convenience, attached, or belonging to, a dwelling-house.

To OUT-JEST', v. a. To overpower by jesting:

The fool labours to *out-jest*

His heart-struck injuries.

Shakespeare's K. Lear.

To OUT-JUG'GLE, v. a. To surpass in juggling.—He might verily think that I could out-lie the legends, and *out-juggle* a jesuit. *Bp. Hall's Hon. of the Marr. Clergy.*

To OUT-KNAVE, v. a. To surpass in knavery.—The world calls it *out-witting* a man, when he's only *out-knaved*. *L'Estrange.*

To OUT-LANCE, v. a. To push out:

Therein two deadly weapons fixt he bore,
Strongly *out-lanced* towards either side.

Spenser.

To OUT-LAST, v. a. To surpass in duration.—Good housewives, to make their candles burn the longer, lay them in bran, which makes them harder; inasmuch as they will *out-last* other candles of the same stuff, almost half in half. *Bacon's Nat. Hist.*

This with the fabric of the world begun,
Elder than light, and shall *out-last* the sun.

Waller.

To

To OUT-LE'AP, v. a. To pass by leaping; to start beyond.

OU'T-LEAP, f. Sally; flight; escape.—Since youth must have some liberty, some *out-leaps*, they might be under the eye of a father, and then no very great harm can come of it. *Loche on Education.*

To OUT-LEARN, v. a. To learn faster; to learn more than another.

OU'T-LICKER, f. A naval word: a small piece of timber fastened to the top of the poop.

To OUT-LIE, v. a. To surpass in lying.—He might verily think that I could *out-lie* the legends. *Bp. Hall's Hon. of the Marr. Clergy.*

With royal favourites in flattery vie,
And Oldmixon and Burnet both *out-lie*.

Pope.

OU'T-LIER, f. One who lies not, or is not resident, in the place with which his office or duty connects him.—The party sent messengers for all their *out-liers* within twenty miles of Cambridge to come at their election. *Bentley's Letters.*

To OUT-LIVE, v. a. To live beyond; to survive.—His courage was so signal that day, that too much could not be expected from it, if he had *out-lived* it. *Clarendon.*—The soldier grows less apprehensive, by computing upon the disproportion of those that *out-live* a battle, to those that fall in it. *L'Estrange.*

He that *out-lives* this day, and comes safe home,
Will stand a-tiptoe when this day is nam'd. *Shakespeare.*

Thou must *out-live*

Thy youth, thy strength, thy beauty, which will change
To wither'd, weak, and gray. *Milton's P. L.*

Time, which made them their fame *out-live*,
To Cowley scarce did ripeness give.

Denham.

OUT-LIVER, f. A survivor.

To OUT-LOOK, v. a. To face down; to brow-beat.—Fictions and mormoes too weak to *out-look* a brave glittering temptation. *Hammond.*

I cull'd these fiery spirits from the world,
To *out-look* conquest, and to win renown,
Ev'n in the jaws of danger and of death. *Shakespeare.*

To look out; to select:

Away to the brook,
All your tackle *out-look*;
Here's a day that is worth a year's wishing:
See that all things be right,
For it would be a sight,
To want tools when a man goes a-fishing.

Cotton.

OU'T-LOOK, f. Vigilance; foresight:

From nobler recompense above applause,
Which owes to man's short *out-look* all its charms. *Young.*

OU'T-LOPE, f. [from *out*, and *loopen*, Dut. to run.] An excursion. *Not in use.*

Out-lobes sometimes he doth assay,
But very short. *Florio's Tr. of Montaigne, 1613.*

To OUT-LUSTRE, v. a. To excel in brightness.—She went before others I have seen, as that diamond of yours *out-lustres* many I have beheld. *Shakespeare's Cymbeline.*

OUT-LY'ING, part. adj. Not in the common course of order. Removed from the general scheme.—The last survey I propos'd of the four *out-lying* empires, was that of the Arabians. *Temple.*

To OUT-MARCH, v. a. To leave behind in the march.—The horse *out-marched* the foot, which, by reason of the heat, was not able to use great expedition. *Clarendon.*

To OUT-MEASURE, v. a. To exceed in measure.—The present age hath attempted perpetual motions and engines, and those revolutions might *out-last* the exemplary mobility, and *out-measure* time itself. *Brown.*

To OUT-NUMBER, v. a. To exceed in number.—The

ladies came in so great a body to the opera, that they *out-numbered* the enemy. *Addison.*

To OUT-PACE, v. a. To out-go; to leave behind.—Orion's speed could not *out-pace* thee. *Chapman's Iliad.*

To OUT-PAR'AMOUR, v. a. To exceed in keeping mistresses.—Wine loved I deeply; dice dearly; and in woman *out-paramour'd* the Turk. *Shakespeare's K. Lear.*

OU'T-PARISH, f. Parish not lying within the walls.—In the greater *out-parishes*, many of the poorer parishioners, through neglect, do perish, for want of some heedful eye to overlook them. *Graunt.*

OU'T-PART, f. Part remote from the centre or main body.—He is appointed to supply the bishop's jurisdiction, and other judicial offices in the *out-parts* of his diocese. *Ayliffe.*

OU'T-PARTERS, f. A kind of free-booters in Scotland. *Phillips.*

To OUT-PA'SS, v. a. To go beyond; to excel.

To OUT-PEE'R, v. a. To surpass in nobleness:

Great men,

That had a court no bigger than this cave,
Could not *out-peer* these twain. *Shakespeare.*

To OUT-POISE, v. a. To out-weigh.—If your parts of virtue, and your infirmities, were cast into a balance, I know the first would much *out-poise* the other. *Howell.*

OU'T-PORCH, f. An entrance.—Coming to the bishop with supplication into the salutatory, some *out-porch* of the church. *Milton.*

OU'T-PORT, f. A port at some distance from the city of London.

OU'T-POST, f. A military station without the limits of the camp, or at a distance from the main body of the army.—Men placed at such a station.

To OUT-POU'R, v. a. To emit; to send forth in a stream: He looked, and saw what number numberless
The city-gates *out-pour'd*; light armed troops
In coats of mail and military pride. *Milton.*

To OUT-PRA'Y, v. a. To exceed in earnestness of prayer:

Meantime he sadly suffers in their grief;
Out-weeps a hermit, and *out-prays* a saint. *Dryden.*

To OUT-PRE'ACH, v. a. To exceed in the power of preaching.—You would be very eloquent; able to *out-preach* all the orators you ever heard from the pulpit, to write more pathetic descriptions of the madness of a carnal life, than from any more innocent speculator could be hoped for. *Hammond.*

To OUT-PRI'ZE, v. a. To exceed in the value set upon it:

Either your unparagon'd mistress is dead, or
She's *out-prized* by a trifle. *Shakespeare.*

To OUT-RA'ZE, v. a. To root out entirely:

Yet shall the axe of justice hew him down,
And level with the root his lofty crown:
No eye shall his *out-raz'd* impression view,
Nor mortal know where such a glory grew. *Sandys.*

To OUT-RE'ACH, v. a. To go beyond.—This usage is derived from so many descents of ages, that the cause and author *out-reach* remembrance. *Carew.*—Our forefathers could never dream so high a crime as parricide, whereas this *out-reaches* that fact, and exceeds the regular distinctions of murder. *Brown.*

To OUT-RE'ASON, v. a. To excel in reasoning; to reason beyond.—They step forth men of another spirit, great linguists, powerful disputants, able to cope with the Jewish sanhedrim, to baffle their profoundest rabbies, and to *out-reason* the very Athenians. *South.*

To OUT-REC'KON, v. a. To exceed in assumed computation.—The Egyptian priests pretended an exact chronology for some myriads of years, and the Chaldeans and Assyrians far *out-reckon* them. *Pearson on the Creed.*

To

To OUT-REIGN, v. a. To reign through the whole of:
In wretched prison long he did remaine,
Till they *out-reigned* had their utmost date. *Spenser.*

To OUT-RIDE, v. a. To pass by riding.—It boots
not to persuade your majesty to betake yourself to your
chariot, to *out-ride* the shower. *Bp. Hall's Way of Peace.*

If you will send me to the farthest sea

To fetch you pearls, the sun shall not *out-ride*
My restless course; nor any jewels be

Treasure'd so deep in the profoundest main,
But I will dig them thence, and come again. *Beaumont.*

To OUT-RIDE, v. n. To travel about on horseback,
or in a vehicle.—By distance of place being rendered inca-
pable of paying our respects to him, I am become a suitor
to you to constitute an *out-riding* lion, or (if you please)
a jackall or two, to receive and remit our homage in a
more particular manner than is hitherto provided. *Addi-
son's Guardian*, N^o 118.

OUT-RIDER, f. A summoner, whose office is to cite
men before the sheriff.—One who travels about on horse-
back, or in a vehicle.—There is needful to be an *out-rider*,
or riding-surveyor, whose business should be to visit the
ports and fleets. *Maydman's Naval Speculat.* 1691.

OUT-RIG'GER, f. A naval word, signifying both a
strong beam of timber fixed on the side of a ship to secure
the mast in the act of careening, and a small boom occa-
sionally used on the tops.

To OUT-RISE, v. a. To rise earlier than another. *Scott.*

To OUT-RIVAL, v. a. To surpass in excellence.—
There have been finer things spoken of Augustus than
of any other man; all the wits of his age having tried to
out-rival one another upon that subject. *Addison's Guar-
dian*, N^o 138.

OUT-ROAD, f. Excursion.—He set horsemen and
footmen, to the end that, issuing out, they might make
out-roads upon the ways of Judea. *1 Mac. xv. 41.*

To OUT-RO'AR, v. a. To exceed in roaring:

O that I were
Upon the hill of Bafan, to *out-roar*
The horned herd! *Shakespeare's Ant. and Cleop.*

To OUT-ROO'T, v. a. To extirpate; to eradicate:

Pernicious discord seems
Out-rooted from our more than iron age;
Since none, not ev'n our kings, approach their temples
With any mark of war's destructive rage,
But sacrifice unarmed. *Rowe's Amb. Stepmother.*

To OUT-RUN, v. a. To leave behind in running.—
When things are come to the execution, there is no se-
crecy comparable to celerity; like the motion of a bul-
let in the air, which lieth so swift as it *out-runs* the eye.
Bacon.

The expedition of my violent love
Out-runs the pauper reason. *Shakespeare's Macbeth.*

We may *out-run*,
By violent swiftness, that which we run at. *Shakespeare.*
To exceed.—We *out-run* the present income, as not
doubting to reimburse ourselves out of the profits of some
future project. *Addison.*

To OUT-SAIL, v. a. To leave behind in sailing.—She
may *out-sail* me; I am a carvel to her. *Beaumont and
Fletcher's Wit without Money.*

OUT-SCAPE, f. Power of escaping:

It pass'd our powres to lift a log so vast
As barr'd all *out-scape*. *Chapman.*

To OUT-SCOR'N, v. a. To bear down or confront by
contempt; to despise; not to mind:

Strives in his little world of man t' *out-scorn*
The to-and-fro conflicting wind and rain. *Shakespeare.*

To OUT-SELL, v. a. To exceed in the price for which a
thing is sold; to sell at a higher rate than another.—It
would soon improve to such a height as to *out-sell* our
neighbours, and thereby advance the proportion of our
exported commodities. *Temple.*—To gain a higher price:
Her pretty action did *out-sell* her gift,
And yet enrich'd it too. *Shakespeare's Cymbeline.*

To OUT-SHINE, v. a. To emit lustre:

Witness my son, now in the shade of death;
Whose bright *out-shining* beams thy cloudy wrath
Hath in eternal darkness folded up. *Shakespeare's Rich. III.*
To excel in lustre.—Homer does not only *out-shine* all
other poets in the variety, but also in the novelty, of his
characters. *Addison.*

By Shakespeare's, Jonson's, Fletcher's, lines,
Our stage's lustre Rome's *out-shines*. *Denham.*

To OUT-SHOOT, v. a. To exceed in shooting:

The forward youth
Will learn to *out-shoot* you in your proper bow. *Dryden.*
To shoot beyond.—Men are resolved never to *out-shoot*
their forefathers' mark, but write one after another; and
so the dance goes round in a circle. *Norris.*

To OUT-SHUT, v. a. To exclude.—He *out-shuts* my
prayer. *Dante.*

To OUT-SIT, v. a. To sit beyond the time of any thing.
—He that prolongs his meals, and sacrifices his time, as
well as his other conveniences, to his luxury, how quickly
does he *out-sit* his pleasure! *Smith.*

OUT SKER'RIES, a cluster of rocky islets among the
Shetland islands. Lat. 60.43. N. lon. 0.45. W.

To OUT-SKIP, v. a. To avoid by flight:

Thou lost thyself, child Drusus, when thou thought'st
Thou could'st *out-skip* my vengeance, or out-stand
The power I had to crush thee into air. *B. Jonson.*

To OUT-SLEEP, v. a. To sleep beyond:

Lovers, to bed; 'tis almost fairy-time:
I fear we shall *out-sleep* the coming morn. *Shakespeare.*

To OUT-SO'AR, v. a. To soar beyond.—Let them clog
their wings with the remembrance of those who have
out-soared them, not in vain opinion, but true worth.
Gov. of the Tongue.

To OUT-SOUND, v. a. To exceed in sound.—The
hammers and melody of the instruments might *out-found*
the din within him. *Hammond.*

To OUT-SPEAK, v. a. To speak something beyond;
to exceed:

Rich stuffs and ornaments of household
I find at such proud rate, that it *out-speaks*
Possession of a subject. *Shakespeare's Hen. VIII.*

To OUT-SPORT, v. a. To sport beyond:

Let's teach ourselves that honourable stop,
Not to *out-sport* discretion. *Shakespeare's Othello.*

To OUT-SPREAD, v. a. To extend; to diffuse.—With
sails *out-spread* we fly. *Pope.*

To OUT-STAND, v. a. To support; to resist.—Each
could demolish the other's work with ease enough, but
not a man of them tolerably defend his own; which was
sure never to *out-stand* the first attack that was made.
Woodward.—To stand beyond the proper time:

I have *out-stood* my time, which is material
To th' tender of our present. *Shakespeare's Cymbeline.*

To OUT-STAN'D, v. n. To protuberate from the main
body.

To OUT-STARE, v. a. To face down; to brow-beat;
to out-face with effrontery:

I would *out-stare* the sternest eyes that look,
To win thee, lady. *Shakespeare's Merch. of Ven.*

OUT-

OUT-STREET, *f.* Street in the extremities of a town.

To OUT-STRETCH, *v. a.* To extend; to spread out.
—*Out-stretch'd* he lay on the cold ground. *Milton.*

Make him stand upon the mole-hill,
That caught at mountains with *out-stretched* arms.

Shakespeare.

To OUT-STRIDE, *v. a.* To surpass in striding.—*Out-riding* the colossus of the sun. *B. Jonson.*

To OUT-STRIP, *v. a.* [This word Skinner derives from *out* and *spritzten*, to *sprout*, Germ. I know not whether it might not have been originally *out-trip*, the *f* being afterward inserted. *Dr. Johnson.*—It can hardly have been *out-trip*; and I should think the derivation of Skinner, plausible as it is, might give place to *out*, and the Sax. *springan*, to *shoot out*, to *sprout*; and thence to spring forward, or beyond, might easily be adopted. *Todd.*] To out-go; to leave behind in a race.—A fox may be outwitted, and a hare *out-stript*. *L'Estrange.*—He got the start of them in point of obedience, and thereby *out-stript* them at length in point of knowledge. *South.*

With such array Harpalice bestrode
Her Thracian courser, and *out-strip'd* the rapid flood.

Dryden.

To OUT-SWEAR, *v. a.* To over-power by swearing:

We shall have old swearing,
But we'll out-face them, and *out-swear* them too. *Shakefp.*

To OUT-SWEE'TEN, *v. a.* To excel in sweetness:

The leaf of eglantine, which, not to slander,
Out-sweeten'd not thy breath. *Shakespeare's Cymbeline.*

To OUT-SWELL, *v. a.* To overflow.—A sad text in a sadder time; in which the rivers of Babylon swelled not so high with inundation of water in the letter, as the waters in the metaphor, *out-swelling* and breaking-down their banks, have overflowed both our church and state. *Hewyt's Sermons*, 1658.

OUT-TAKE, *prep.* Except. *Obsolete*:

Of every witte fomewhat he can,
Out-take that hym lacketh rule
His own estate to guyde.

Gower.

All that was golde men myght se,
Out-take the fethers and the tre.

Chancer.

To OUT-TALK, *v. a.* To overpower by talk.—This gentleman will *out-talk* us all. *Shakespeare.*

OUT-TERM, *f.* [from *out*, and *terminus*, Lat.] Outward figure:

Not to bear cold forms, nor men's *out-terms*,
Without the inward fires and lives of men. *B. Jonson.*

To OUT-TONGUE, *v. a.* To bear down by noise:

Let him do his spite:
My services which I have done the signiory
Shall *out-tongue* his complaints. *Shakespeare.*

To OUT-TOP, *v. a.* To over-top; to make of less importance; to obscure.—The treasurer began then to *out-top* me; and appeared to my thoughts likely enough, by his daring and boldness, in time to do as much to your grace. *Ld. Keeper Williams's Lett.* 1624.

To OUT-VALUE, *v. a.* To transcend in price.—He gives us in this life an earnest of expected joys, that *out-values* and transcends all those momentary pleasures it requires us to forsake. *Boyle.*

To OUT-VENOM, *v. a.* To exceed in poison:

'Tis slander;
Whose edge is sharper than the sword, whose tongue
Out-venoms all the worms of Nile. *Shakespeare's Cymb.*

To OUT-VIE, *v. a.* To exceed; to surpass; to out-strip.—One of these petty sovereigns will be still endeavouring to equal the pomp of greater princes, as well as to *out-vie* those of his own rank. *Addison.*

VOL. XVIII. No. 1228.

For folded flocks on fruitful plains
Fair Britain all the world *out-vies*.

Dryden.

Bp. Hurd has the following observation upon Addison's use of this word: "To *vye* is to contend with; to *out-vye*, to *out-do* any one in *vying* with him. But the word seems to be of an ill composition, and should not, I think, be used thus *absolutely*. If employed at all, it should be in some such way as this: 'in the affectation of pomp and pageantry he *out-vied* others, i. e. in *this respect*, he strove or contended beyond them.' I know not if Addison had any authority for the use of it: he had, perhaps, done better to use the common word *out-strip*." Note on Addison's Remarks on Italy.

To OUT-VILLAIN, *v. a.* To exceed in villainy.—He hath *out-villain'd* villainy so far, that the rarity redeems him. *Shakespeare's All's Well.*

To OUT-VOICE, *v. a.* To out-roar; to exceed in clamour:

The English beach
Pales in the flood with men, with wives and boys,
Whose shouts and claps *out-voice* the deep-mouth'd sea.
Shakespeare.

To OUT-VO'TE, *v. a.* To conquer by plurality of suffrages.—They were *out-voted* by other sects of philosophers, neither for fame nor number less than themselves. *South.*

OUT-WAILE, *f.* A very sorrowful thing; an out-cast; the refuse. *Chaucer.*

To OUT-WALK, *v. a.* To leave one in walking.—To exceed the walking of a spectre:

Have I out-watch'd,
Yea, and *out-walked*, any ghost alive
In solitary circle, worn my boots,
Knees, arms, and elbows, out?

B. Jonson.

OUT-WALL, *f.* Outward part of a building.—Superficial appearance:

For confirmation that I am much more
Than my *out-wall*, open this purse, and take
What it contains. *Shakespeare's K. Lear.*

To OUT-WATCH, *v. a.* To surpass in watchfulness.—Have I not *out-watch'd* and outwalked any ghost alive? *B. Jonson's Fortunate Isles.*

Or let my lamp, at midnight hour,
Be seen in some high lonely tower,
Where I may oft *out-watch* the Bear
With thrice-great Hermes. *Milton's Il Pens.*

To OUT-WEAR, *v. a.* To wear-out.—To live, and to encrease his race, himself *out-wears*. *Donne's Progr. of the Soul.*—To pass tediously:

By the stream if I the night *out-wear*,
Thus spent already, how shall nature bear
The dews descending and nocturnal air? *Pope.*

To last longer than something else.

To OUT-WEE'D, *v. a.* To extirpate as a weed:

Wrath is a fire, and jealousy a weed;
The sparks soon quench, the springing weed *out-weed*.
Spenser.

To OUT-WEEP, *v. a.* To exceed in weeping.—His cries *out-wept* his widest wound. *Davenant's Gondibert.*

Meanwhile he sadly suffers in their grief;
Out-weeps a hermit, and out-prays a faint. *Dryden.*

To OUT-WEIGH, *v. a.* To exceed in gravity.—These instruments require so much strength for the supporting of the weight to be moved, as may be equal unto it, besides that other super-added power whereby it is *out-weighted* and moved. *Wilkins's Math. Magick.*—To preponderate; to excel in value or influence.—The marriage of the clergy is attended with the poverty of some of them, which is balanced and *out-weighted* by many single advantages. *Atterbury.*

If any think brave death *out-weighs* bad life,
Let him exprefs his difpofition. *Shakeſpeare's Coriol.*

To OUT-WELL', *v. a.* To pour out. *Not in uſe:*

As when old father Nilus 'gins to ſwell
With timely pride about the Ægyptian vale,
His fattie waves do fertile ſhine *out-well*,
And overflow each plain and lowly dale. *Spencer.*

To OUT-WIN', *v. a.* To get out of:

It is a darkſome delve far under ground,
With thorns and barren breaks environ'd round,
That none the ſame may eaſily *out-win*;
Yet many waies to enter may be found,
But none to iſſue forth, when one is in. *Spencer.*

To OUT-WIND, *v. a.* To extricate; to unloofe.—
When ſhalt thou once *out-wind* thyſelf from this ſad yoke?
More's Life of the Soul.

To OUT-WING', *v. a.* To out-ſtrip; to out-go.—My
ſong the midnight raven has *out-wing'd*. *Young's Night Thoughts.*

His courſer ſprings
O'er hills and lawns, and even a wiſh *out-wings*. *Garth's Ode.*

To OUT-WIT', *v. a.* To cheat; to overcome by ſtratagem.—The truer-hearted any man is, the more liable he is to be impoſed on; and then the world calls it *out-witting* a man, when he is only out-knaved. *L'Eſtrange*.—Juſtice forbids defrauding, or going beyond, our brother in any manner, when we can over-reach and *out-wit* him in the ſame. *Kettlewell*.—Nothing is more equal in juſtice, and indeed more natural in the direct conſequences of effects and cauſes, than for men wickedly wiſe to *out-wit* themſelves; and for ſuch as wreſtle with Providence, to trip up their own heels. *South.*

OUT-WORK, *f.* Parts of a fortification next the enemy; any work raiſed outwardly to fortify or defend.—Take care of our *out-work*, the navy-royal, which are the walls of the kingdom; and every great ſhip is an impregnable fort; and our many ſafe and commodious ports as the redoubts to ſecure them. *Bacon*.—When the ſoul is beaten from its firſt ſtation, and the mounds and *out-works* of virtue are once broken down, it becomes quite another thing from what it was before. *South.*

Death hath taken in the *out-works*,
And now affails the fort; I feel, I feel him,
Gnawing my heart-ſtrings. *Denham.*

OUT-WORN, *part.* Conſumed or deſtroyed by uſe:

Better at home lie bed-rid, idle,
Inglorious, unemploy'd, with age *out-worn*. *Milton.*

To OUT-WORTH, *v. a.* To excel in value.—A beggar's book *out-worths* a noble's blood. *Shakeſp. Hen. VIII.*

To OUT-WREST, *v. a.* To extort by violence:

The growing anguiſh
Rankled ſo ſore and feſter'd inwardly,
Till that the truth thereof I did *out-wreſt*. *Spencer.*

OUT-WROU'GHT, *part.* Out-done; exceeded in efficacy:

In your violent acts,
The fall of torrents and the noiſe of tempeſts,
The boyling of Carybdis, the ſea's wildneſs,
The eating force of flames, and wings of winds,
Be all *out-wrought* by your tranſcendent furies. *B. Jonſon.*

To OUT-ZA'NY, *v. a.* To exceed in buffoonery:

O, run not proud of this: yet, take thy due:
Thou doſt *out-zany* Cokely. *B. Jonſon's Epigr. 130.*

OUTAITANI, a town of Upper Siam: eighty miles north-weſt of Louvo.

OUTANULLA, a town of Bengal, on the Ganges: five miles ſouth of Rajemal.

OUTAPALLAM', a town of Hindooſtan: ten miles eaſt-north-eaſt of Coimbatore.

OUTTARD BA'Y, a bay of Canada, on the north ſide of the river St. Lawrence. Lat. 42. 2. N. lon. 68. 15. W.

OUTCA'ST, *part.* [It may be obſerved, that both the participle and the noun are indifferently accented on either ſyllable. It ſeems moſt analogous to accent the participle on the laſt, and noun on the firſt.] Thrown into the air as reſuſe, as unworthy of notice:

Abandon ſoon, I read, the captive ſpoil
Of that ſame *outcaſt* carcass. *Spencer.*
Banished; expelled:

Behold, inſtead
Of us *outcaſt*, exil'd, his new delight
Mankind created. *Milton's P. L.*

OUTCAST, *f.* Exile; one rejeſted; one expelled.—
He dies ſad *outcaſt* of each church and ſtate. *Pope.*

O blood-beſpotted Neapolitan,
Outcaſt of Naples, England's bloody ſcourge! *Shakeſpeare.*

For me, *outcaſt* of human race,
Love's anger only waits, and dire diſgrace. *Prior.*

OUTCH, a province of Hindooſtan, between the rivers Chunaub and Indus, near their union.

OUTCHACTAL, a town of Thibet: ſixty-ſeven miles eaſt of Harachar-Hotun.

OUTCHOU', a river of Thibet, which runs into the Sampoo.

OUTCHU-MOU'TCHIN, a Tartarian ſtandard, in Chineſe Tartary. Lat. 45. 8. N. lon. 117. 14. E.

OUTCRY, *f.* Cry of vehemence; cry of diſtreſs; clamour.—Theſe *outeries* the magiſtrates there ſhun, ſince they are readily hearkened unto here. *Spencer on Ireland.*

So ſtrange thy *outcry*, and thy words ſo ſtrange
Thou interpoſeſt, that my ſudden hand,
Prevented, ſpares. *Milton's P. L.*

Clamour of deſteſtation.—There is not any one vice incident to the mind of man, againſt which the world has raiſed ſuch a loud and univerſal *outcry*, as againſt ingratitude. *South*.—A public ſale; an auction.—The populace by *outcry* to be ſold. *Southerne.*

That my lords, the ſenators,
Are ſold for ſlaves, their wives for bondwomen,
Their houſes and fine gardens given away,
And all their goods under the ſpear at *outcry*.
B. Jonſon's Catiline.

OUTE'A, *f.* in botany. See TAMARINDUS and MACROLOBIUM.

OUTEIRO, a town and fortrefs of Portugal, in the province of Tra los Montes, on a mountain: nine miles eaſt-fourth-eaſt of Bragança, and twenty-one north-weſt of Miranda de Duero.

OUTER, *adj.* That which is without: oppoſed to *inner*.—The kidney is a conglomerated gland only in the *outer* part; for the inner part, whereof the papillæ are compoſed, is muſcular. *Grew's Coſmol.*

OUTER ISLAND, an iſland on the coaſt of Labrador, in the cluſter called St. Auguſtine's Square: ſouth-weſt of Sandy-iſland.

OUTERLY, *adv.* Towards the outſide.—In the lower jaw, two tuſks like thoſe of a boar, ſtanding *outerly*, an inch behind the cutters. *Grew.*

OUTERMOST, *adj.* Remoteſt from the miſt.—Try, if three bells were made one within another, and air betwixt each, and the *outermoſt* bell were chimed with a hammer, how the ſound would differ from a ſingle bell. *Bacon*.—Many handſome contrivances of drawbridges I had ſeen, ſometimes many upon one bridge, and not only one after, or behind, another, but alſo ſometimes two or three on a breaſt, the *outermoſt* ones ſerving for the retreat of the foot, and the middle for the horſe and carriages. *Brown's Travels.*

OUTFIT, *f.* A naval term, ſignifying the equipment of a ſhip for her voyage.

OUTTIMACKS,

OUTIMACKS. Indians between Lake Michigan and Lake St. Clair.

OUTLAND, *adj.* [utlænde, Sax. a stranger.] Foreign:

The little lamb nurs'd in our bosoms
The outland pagans have depriv'd us of.

Strutt's Q. Hoo Hall.

OUTLANDER, *f.* A foreigner; one of another country.—William Twisse, written and called, by some outlanders and others, Twissius and Tuissius. *A. Wood's Ath. Ox.* ii. 40.

OUTLANDISH, *adj.* Not native; foreign.—Even him [Solomon] did *outlandish* women cause to sin. *Neh.* xiii. 26.—Upon the approach of the king's troops under general Wills, who was used to the *outlandish* way of making war, we put in practice passive obedience. *Addison.*

Yourself transplant

A while from hence: purchase *outlandish* ground
Bears no more wit than ours; but yet more scant
Are those diversions there, which here abound. *Donne.*
Tedious waste of time to sit and hear
So many hollow compliments and lies,
Outlandish flatteries.

Milton's P. R.

OUTLAW, *f.* [utlaga, Sax.] One excluded from the benefit of the law. A robber; a bandit.—Gathering unto him all the scatterlings and *outlaws* out of the woods and mountains, he marched forth into the English pale. *Spenser.*—As long as they were out of the protection of the law, so as every Englishman might kill them, how should they be other than *outlaws* and enemies to the crown of England? *Davies on Ireland.*—A drunkard is *outlawed* from all worthy and creditable converse: men abhor, loath, and despise, him. *South.*

You may as well spread-out the unsunn'd heaps
Of misers' treasure by an outlaw's den,
And tell me it is safe.

Milton's Comus.

To OUTLAW, *v. a.* To deprive of the benefits and protection of the law.—Like as there are particular persons *outlawed* and proscribed by civil laws, so are there nations that are *outlawed* and proscribed by the law of nature and nations. *Bacon.*—The administration of justice (in India) is so loaded with expence, that the great body of the people are actually *outlawed*. *Monthly Rev.* lxxix.

He that is drunken,
Is outlaw'd by himself: all kind of ill
Did with his liquor slide into his veins.

Herbert.

OUTLAWRY, *f.* A decree by which any man is cut off from the community, and deprived of the protection of the law.—Divers were returned knights and burgeses for the parliament; many of which had been by Richard III. attained by *outlawries*. *Bacon's Hen.* VII.

By proscription and bills of *outlawry*,
Octavius, Antony, and Lepidus,
Have put to death an hundred senators.

Shakspeare.

OUTLAWRY is a punishment inflicted for a contempt, in refusing to be amenable to the justice of that court which hath authority to call a defendant before them; and, as this is a crime of the highest nature, being an act of rebellion against that state or community of which he is a member, so it subjects the party to forfeitures and disabilities; for he loseth his *liberam legem*, is out of the king's protection, &c. *Co. Litt.* 128. *Doct. & Stud.* 2. c. 3. *1 Roll. Abr.* 802.

As to forfeitures for refusing to appear, the law distinguishes between outlawries in capital cases, and those of an inferior nature; for, as to outlawries in treason and felony, the law interprets the party's absence a sufficient evidence of his guilt, and, without requiring further proof, accounts him guilty of the fact, on which ensues corruption of blood, and forfeiture of his estate, real and

personal. *Co. Litt.* 128. *3 Inst.* 161. But outlawry in personal actions does not occasion the party to be looked on as guilty of the fact, nor does it occasion an entire forfeiture of his real estate, yet it is very fatal and penal in its consequences; for hereby he is restrained of his liberty, if he can be found; forfeits his goods and chattels, and the profits of his lands, while the outlawry remains in force. *Plow.* 541. *Show. Parl. Ca.* 73.

Outlawry, in civil actions, is putting a man out of the protection of the law, so that he is not only incapable of suing for the redress of injuries, but may be imprisoned, and forfeits all his goods and chattels, and the profits of his lands; his *personal chattels* immediately upon the outlawry, and the *chattels real*, and the profits of his land, when found by inquisition.

If the defendant be a woman, the proceeding is called a *waiver*; for, as women were not sworn to the law, by taking the oath of allegiance in the leet, (as men anciently were when of the age of twelve years or upwards,) they could not properly be *outlawed*, or put out of the law, but were said to be *waived*; that is, left out, or not regarded. *Co. Litt.* 122 b. And, for the same reason, an *infant* cannot be outlawed under the age of fourteen years. *2 Roll. Abr.* 805. Lord Coke says, within the age of twelve years. *1 Inst.* 128 a.

Outlawry is either upon *mesne process* before, or upon *final process* after, judgment. Upon *mesne process*, the plaintiff cannot proceed to outlawry, unless the action be commenced by original writ. *1 Sid.* 159. Nor can the defendant be outlawed after judgment, unless the action were so commenced. After judgment, the plaintiff may have an *exigi facias*, and proceed to outlawry, upon a *capias ad satisfaciendum* without an *alias* or *pluries*. And no writ of proclamation is required upon an exigent after judgment, but only upon *mesne process*. *Cro. Jac.* 277.

It is clear, that the courts at Westminster may issue process of outlawry, and that the court of King's Bench, either upon an indictment originally taken there, or removed thither by certiorari, may issue process of *capias* and exigent into any county of England, upon a *non est inventus* returned by the sheriff of the county where he is indicted, and a *testatum* that he is in some other county. *2 Hale's Hist. P. C.* 198. Also justices of oyer and terminer may issue a *capias* or exigent, and so proceed to the outlawry of any person indicted before them, directed to the sheriff of the same county where they held their sessions at common law; and, by the statute 5 Ed. III. c. 11. they may issue process of *capias* and exigent to all the counties of England, against persons indicted or outlawed of felony before them. But justices of gaol-delivery regularly cannot issue a *capias* or *exigent*. *2 Hale's Hist. P. C.* 199.

If a peer of the realm be *indicted*, and cannot be found, process of outlawry shall be awarded against him, and he shall be outlawed *per judicium coronatorum*. *3 Inst.* 31. *Stawulf.* 130. *2 Hawk. P. C.* c. 44. § 16. But in *civil actions*, between party and party, regularly a *capias* or exigent lies not against a peer; yet, in case of an indictment for treason or felony, or for trespass *vi & armis*, as an assault or riot, process of outlawry shall issue against a peer; therefore, if a rescue be returned against a peer; or if a peer be convicted of a disseisin with force, or denies his deed, and it be found against him, a *capias pro fine* and exigent shall issue, for the king is to have a fine; and the same reason holds upon an indictment of trespass or riot, much more in the case of felony. *2 Hale's Hist. P. C.* 199, 200.

The effect of the writ of *exigi facias*, or exigent as it is commonly called, is, that the defendant be cited at five county-court days, a month between each other; and, if he appear not in that time, *pro exlege tenebitur, eum principi non obediat, nec legi; & extime exlegabitur*; i. e. "he shall be pronounced to be out of the king's protection, and deprived of the benefit of the law." And then, according to Bracton, he may perish without law, &c. But now, to avoid such inhumanity, it is holden that no man is entitled to kill him wantonly or wilfully; but, in so doing,

doing, he is guilty of murder, unless it happens in the endeavour to apprehend him; for any person may arrest an outlaw, either of his own head, or by writ or warrant of *capias utlagatum*, in order to bring him to execution.

But outlawries are frequently reversed by writ of error, the proceeding therein being very nice and circumstantial; and, if any single minute point be omitted or misconducted, the whole outlawry is illegal, and may be reversed. Upon which reversal, however, the party accused shall be put to plead to the indictment, for that still remains good, and he may be tried at the King's Bench bar; or the record may be remitted into the country, if it were removed into the King's Bench by *certiorari*, with a command to the justices below to proceed by the statute of 6 Hen. VI. c. 1. So, if a man be outlawed by process in an information, and comes in and reverses the outlawry, he must plead *instantier* to the information. The law is the same in civil cases; and therefore, if an outlawry in a personal action be reversed, the original remains.

March 9. 3 Lev. 245.

If, after outlawry in civil cases, the defendant appears publicly, he may be arrested by a writ of *capias utlagatum*, and committed till the outlawry be reversed; which reversal may be had by the defendant's appearing personally in court, (and in the King's Bench without any personal appearance, so that he appears by attorney, according to stat. 4 & 5 W. & M. c. 18.) and any plausible cause, however slight, will in general be sufficient to reverse it; it being considered only as a process to compel appearance. But then the defendant must pay full costs, and put the plaintiff in the same condition as if he had appeared before the writ of *exigi facias* was awarded.

In Scotland, outlawry anciently took place in the case of refusal to fulfil a civil obligation, as well as in criminal cases. At present, however, it only takes place in the two cases of flying from a criminal prosecution, and of appearing in court attended by too great a number of followers. But the defender, upon appearing at any distance of time, and offering to stand trial, is entitled *de jure* to have the outlawry reversed, and to be admitted to trial accordingly, and even to bail, if the offence be bailable.

OUTLET, *f.* Passage outwards; discharge outwards; egress; passage of egress.—Colonies, and foreign plantations, are very necessary, as *outlets* to a populous nation. Bacon.

So 'scapes the insulting fire his narrow jail,
And makes small outlets into open air.

Dryden.

OUTLINE, *f.* Contour; line by which any figure is defined; extremity.—Painters, by their outlines, colours, lights, and shadows, represent the same in their pictures. Dryden.

OUTMOST, *adj.* Remotest from the middle.—The generality of men are readier to fetch a reason from the immense distance of the starry heavens, and the outmost walls of the world. Bentley.

Chaos retir'd

As from her outmost works a broken foe.

Milton.

OUTNESS, *f.* That relation of things by which one appears out of, or at a distance from, another. Dr. Berkeley, in his Essay on Vision, makes use of the word; and observes, that we form no notion of outness from the sense of seeing merely, but only from motion.—Supposing all mankind to have an irresistible conviction of the outness and distance of extension and figure, it is very easy to explain, from the association of ideas, and from our early habits of inattention to the phenomena of consciousness, how the sensations of colour should appear to the imagination to be transported out of the mind. Dugald Stewart's *Disf. Ency. Brit. Suppl.* vol. i.

OUTRAGE, *f.* [French. At first *outrage*, both in old French and English; *ultragiūm*, low Lat. from *ultra*, beyond. This word also had formerly the accent on either syllable: it is now constantly on the first.] Open vio-

lence; tumultuous mischief.—He took quarrell of his outrage. Gower.—He wrought great outrages, wasting all the country where he went. Spenser on Ireland.

He doth himself in secret shrowd,

To fly the vengeance for his outrage due. Spenser.

This word seems to be used by Philips for mere commotion, without any ill import, contrary to the universal use of writers:

See with what outrage from the frosty north,
The early valiant Swede draws forth his wings
In battailous array.

Philips.

To OUTRAGE, *v. a.* To injure violently or contumeliously; to insult roughly and tumultuously.—Bafe and insolent minds outrage men, when they have hope of doing it without a return. Atterbury.

Ah heavens! that do this hideous act behold,

And heavenly virgin thus outraged see;

How can the vengeance just so long withhold! Spenser.

To OUTRAGE, *v. n.* To commit exorbitancies. Not in use.—Three or four great ones in court will outrage in apparel, huge hose, monstrous hats, and garish colours. Afscham.

OUTRAGIOUS, or OUTRAGEOUS, *adj.* Violent; furious; raging; exorbitant; tumultuous; turbulent.—Tyranny is feynorye vyolent and outrageous. Caxton's Boke of Good Manners, 1486.—Under him they committed divers the most outrageous villanies that a bafe multitude can imagine. Sidney.

As she went, her tongue did walk

In foul reproach and terms of vile despight,

Provoking him by her outrageous talk,

To heap more vengeance on that wretched wight. Spenser.

They view'd the vast immeasurable abyfs,

Outrageous as a sea, dark, wasteful, wild.

Milton.

Excessive; passing reason or decency.—The outrageous decking of temples and churches with gold and silver.

Homily against Idolatry.—My characters of Antony and Cleopatra, though they are favourable to them, have nothing of outrageous panegyric. Dryden's Dufresnoy.—Enormous; atrocious:

Think not, although in writing I prefer'd

The manner of thy vile outrageous crimes,

That therefore I have forg'd. Shakespeare's Hen. VI.

OUTRAGIOUSLY, *adv.* Violently; tumultuously;

furiouſly.—In labour of her grief outrageouſly diſtract.

Drayton's Polyolb.—Let luſt burn never ſo outrageouſly

for the preſent, yet age will in time chill thoſe heats.

South.—In am not one of thoſe who think that the people

are never in the wrong: they have been ſo, frequently

and outrageouſly, both in other countries and in this.

Burke on the Cauſe of Diſcontents.—Exceſſively.—Diſpende

not too outrageouſly, nor be not too ſcarce, ſo that thou

be not bounde to thy treſour. Have therein attemptance

and meſure, whiche in all thynges is prouffitable. Lord

Rivers's Dictes and Sayings.

OUTRAGIOUSNESS, *f.* Fury; violence.—Outrage-

ouſneſs is not enduryng. Ld. Rivers.—Virgil, more diſcreet

than Homer, has contented himſelf with the partiality of

his deities, without bringing them to the outrageouſneſs of

blows. Dryden.

OUTRAM (William), a learned Engliſh divine, was

a native of Derbyſhire, and born in the year 1625. He

was entered of Trinity-college, Cambridge, where he

took his degree of B. A. and of which he obtained a fel-

lowſhip: he afterwards removed to Chriſt's-college, where

he likewiſe obtained a fellowſhip. In 1649 he took his

degree of M. A. and in 1660 that of D. D. He was pre-

ſented to the rectory of St. Mary Woolnoth in London;

afterwards, in 1669, he was collated to the archdeaconry

of Leiſceſter; and in the following year he was inſtalled

prebendary of St. Peter's church in Weſtmiſter, and

rector.

rector of St. Margaret's. He died in 1679. He had acquired celebrity by his skill in rabbinical learning, as well as by his acquaintance with the fathers and the sacred scriptures. He was a constant and much-admired preacher. As a writer, he is entitled to the praise of nervousness, precision, and accuracy. He was author of a learned work on sacrifices, entitled "De Sacrificiis Libri duo; quorum altero explicantur omnia Judæorum, nonnulla Gentium profanarum Sacrificia; altero Sacrificium Christi. Utroque Ecclesiæ Catholicæ his de rebus Sententia contra Faustum Socinum, et ejus Sectatores defenditur;" 1677. After his death, a volume of his Sermons was published, which are good specimens of pulpit compositions.

OUTRAN'CE, *f.* [French.] Destruction; extremity. *An old word.*

OUTRÉ, *adj.* [French.] Extravagant; over-strained. A most affected and needless introduction of modern times. *Todd.*—Although this panegyric be somewhat outré, I am willing to subscribe to it. *Dr. Geddes's Lett. to the Bp. of London, 1787.*

OUTRE-CUIDANCE, *f.* [French.] Presumption.—God doth often punish such pride and *outré-cuidance* with scorn and infamy. *B. Jonson.*

OUTREDROO'G, a fortress of Hindoostan, in Mysore, taken by the British forces in December 1792: twelve miles west of Saverndroog.

OUTRIGHT, *adv.* Immediately; without delay.—When these wretches had the ropes about their necks, the first was to be pardoned, the last hanged outright. *Arbutnot.*—Completely:

By degrees accomplish'd in the beast,
He neigh'd outright, and all the steed exprest. *Addison.*

OUTTSET, *f.* Opening; beginning.—These masters, at least in the *outset* of their strains, were careful to preserve air. *Mason on Ch. Music.*—A balance; an acquittance for something previously received; as, I sent him those goods by way of *outset* for the money I owed him. In this sense it is accented rather on the last syllable.

OUTSHI-FER'MAN, a town of Little Bukharia: 130 miles east of Kashgar, and 120 north-east of Yarcan.

OUTSHOU', a town of Little Bukharia: thirty miles south of Kashgar.

OUTSIDE, *f.* Superficies; surface; external part.—What pity that so exquisite an *outside* of a head should not have one grain of sense in it. *L'Estrange.*

The leathern *outside*, boisterous as it was,
Gave way and bent. *Dryden.*

Extreme part; part remote from the middle.—Hold an arrow in a flame for the space of ten pulses; and, when it cometh forth, those parts which were on the *outsides* of the flame are blacked and turned into a coal. *Bacon.*—Superficial appearance.—Created beings see nothing but our *outside*, and can therefore only frame a judgment of us from our exterior actions. *Addison's Spectator.*

You shall find his vanities forespent
Were but the *outside* of the Roman Brutus,
Covering discretion with a coat of folly. *Shakespeare.*

The utmost. *A barbarous use.*—Two hundred load upon an acre, they reckon the *outside* of what is to be laid. *Mortimer's Husbandry.*—Person; external man.—Your *outside* promiseth as much as can be expected from a gentleman. *Bacon.*

What admir'st thou, what transports thee so?
An *outside*? fair, no doubt, and worthy well
Thy cherishing and thy love. *Milton's P. L.*

Outer side; part not inclosed.—I threw open the door of my chamber, and found the family standing on the *outside*. *Spectator.*

OUTSIDE, *adj.* Belonging to the superficies; consisting in show.

OUTSKIRT, *f.* Suburb; out-part.—It [the plague] appeared to be only in the *outskirts* of the town, and in the most obscure alleys. *Ld. Clarendon.*

VOL. XVIII. No. 1228.

OU'TVILLE, a town of France, in the department of the Lower Seine: ten miles south-east of Cany, and eight-north-north-west of Rouen.

OUTWARD, *adj.* [utpearb, Sax.] Materially external.—External; opposed to *inward*: visible.—His calls and invitations of us to that repentance, not only *outward*, in the ministry of the word, but also inward, by the motions of the spirit. *Whole Duty of Man.*

Oh what may man within him hide,
Though angel on the *outward* side! *Shakespeare.*

Extrinsic; adventitious:

Princes have their titles for their glories,
An *outward* honour, for an inward toil. *Shakespeare.*

Foreign, not intestine.—It was intended to raise an *outward* war to join with some sedition within-doors. *Hayward.*—Tending to the out-parts:

The fire will force its *outward* way,
Or, in the prison pent, consume the prey. *Dryden.*

[In theology.] Carnal; corporeal; not spiritual.—We may also pray against temporal punishments, that is, any *outward* affliction, but this with submission to God's will, according to the example of Christ. *Whole Duty of Man.*

OU'TWARD, *j.* External form:

I do not think
So fair an *outward*, and such stuff within,
Endows a man but him. *Shakespeare's Cymbeline.*

OU'TWARD, *adv.* To foreign parts; as, a ship *outward* bound.—To the outer parts.

OU'TWARDLY, *adv.* Externally: opposed to *inwardly*.—That which inwardly each man should be, the church *outwardly* ought to testify. *Hooker.*

Griev'd with disgrace, remaining in their fears:
However seeming *outwardly* content,
Yet th' inward touch their wounded honour bears. *Daniel.*

In appearance not sincerely.—Many wicked men are often touched with some inward reverence for that goodness which they cannot be persuaded to practise; nay, which they *outwardly* seem to despise. *Sprat.*

OU'TWARDS, *adv.* Towards the out-parts.—Do not black bodies conceive heat more easily from light than those of other colours do, by reason that the light falling on them is not reflected *outwards*, but enters the bodies, and is often reflected and refracted within them until it be stifled and lost? *Newton's Optics.*

OUVERTURE (Toussaint'), a black who deserves to live in the remembrance of posterity, was born in a state of slavery in or about the year 1745, on the plantation of the count de Noé. His early life was marked by a sedateness and patience of temper which nothing could ruffle or disturb, and by a peculiar benevolence towards children and the brute creation. At the age of twenty-five he attached himself to one negro woman, by whom he had several children, and whom he treated with the most affectionate tenderness and regard. By the kindness of the bailiff of the plantation, M. Bayou de Libertas, as some say, but by his own unassisted efforts according to others, he learned to read and write, and made some progress in arithmetic. These acquirements being noticed by M. Bayou, he took him from the field, and made him his postilion. Toussaint was not ungrateful for his kindness. When the insurrection of the negroes broke out in 1791, he refused, for some time, to join in the revolt: the plantation, however was about to be ravaged by the infuriated blacks; and Toussaint immediately set about the means of rescuing his master from the impending destruction. He procured a passage for him to North America, embarking at the same time a considerable quantity of fugar to support him in his exile. He then joined his countrymen in arms; and, by possessing some little knowledge of simples, was constituted physician to the forces of the king under Jean François. After this he became aide-de-camp, then colonel, next brigadier-general, to

H h which

which rank he was elevated by the governor Laveaux, for his services in reducing the blacks to order, and recovering from the Spaniards the northern parts of the island; and for his successful opposition to the British army. In an insurrection under Villate, a mulatto, Laveaux had been seized and thrown into prison at the Cape. Toussaint, on hearing this, immediately appeared at the head of ten thousand blacks, and released him from his perilous situation; for this Laveaux appointed him his lieutenant-governor, and declared that for the future he would be guided solely by his advice: "It is this black," said he, "this Spartacus, predicted by Raynal, who is destined to avenge the outrages committed against his whole race." From this moment, the condition and the conduct of the blacks were sensibly changed for the better, and the most perfect order and discipline established among them; and it is even admitted by Lacroix, who is not particularly friendly to the blacks, "that, if St. Domingo still carried the colours of France, it must be allowed it was solely owing to an old negro, who seemed to bear a commission from heaven to reunite its dilacerated members."

The French continued to send out commissioners; but Toussaint directed all their movements; and, on the return of general Laveaux to France, the commissioner Santhonax was prevailed on to nominate him commander-in-chief. General Rochambeau, who had been sent out in this capacity, finding himself a mere cipher, began to complain; upon which Toussaint ordered him on-board a corvette in the roads, and sent him home; and nearly at the same time he got rid of Santhonax, by making him the bearer of dispatches to the directory. Aware, however, that the reports of these persons could not fail to make an unfavourable impression on the French government, he sent two of his sons to be educated in France, to prove (as he said) his confidence in the directory, by placing his children in their power, at a moment when the complaints made against him, however groundless, might render his sincerity doubtful.

It was impossible however for the directory to behold without jealousy the rapid career of this extraordinary man; and general Hedouville was sent out to observe his conduct and restrain his ambition. Toussaint, at the first interview, affected to complain of the burden of his command; on which the captain of the ship, meaning to pay him a compliment, observed, how much it would flatter him, after having brought out general Hedouville, to carry back general Toussaint l'Ouverture." "Your ship, sir," replied Toussaint hastily, "is not large enough for a man like me." One of Hedouville's staff having hinted to him that he ought to retire to France, and end the rest of his days in repose: "That (said he) is what I intend, as soon as this (pointing to a small shrub) shall be large enough to construct a vessel to take me there." In short, this general, like Rochambeau, soon found that Toussaint was every thing in the colony, and himself nothing; he therefore determined at once to quit it. There still remained two men of whom it was necessary to get rid, in order to insure the general tranquillity; these were the mulatto generals Rigaud and Petion. Jealous of Toussaint and of the increasing power of the blacks, they headed an insurrection of the people of colour against his authority, and carried on for some time a civil war; but when Bonaparte, now become first consul, had sent out the confirmation of Toussaint as commander-in-chief, the adherents of the mulatto chiefs deserted their cause, and the two leaders embarked for France. The most dangerous and troublesome of his opponents, however, were the English, whose departure he hastened by his consummate skill in diplomacy. General Maitland, on finding the reduction of the island to be utterly hopeless, and that one reinforcement after another, wasted away by fatigue, sickness, and desultory skirmishes with the blacks, availed himself of the "bridge of gold," which Toussaint made for his little army, and signed a

treaty for the evacuation of all the posts which he held. The negro chief then paid him a visit, and was received with military honours. After partaking of a grand entertainment, he was presented by general Maitland, in the name of his majesty, with a splendid service of plate, and put in possession of the government-house, which had been built and furnished by the English. General Maitland, previous to the disembarkation of the troops, returned the visit to Toussaint's camp; and, such was his confidence in the integrity of his character, that he proceeded through a considerable extent of country full of armed negroes with only three attendants. Roume, the French commissioner, wrote a letter to Toussaint on this occasion, advising him to seize his guest as an act of duty to the republic: on the route, general Maitland was secretly informed of Roume's treachery; but, in full reliance on the honour of Toussaint, he determined to proceed. On arriving at head-quarters, he was desired to wait. It was some time before Toussaint made his appearance; at length, however, he entered the room with two open letters in his hand. "There, general," said he, "before we talk together, read these; one is a letter from the French commissary—the other is my answer. I could not see you till I had written my reply, that you might be satisfied how safe you were with me, and how incapable I am of baseness."

General Lacroix bears testimony to the order and regularity established in the island among all ranks by the influence and example of this singular man; the duties of morality and religion were strictly enforced, and the decencies of civilized life sedulously studied. His public levees were conducted with the utmost decorum, and his private parties might vie with the best-regulated societies of Paris. Surrounded by the officers of his guards, all magnificently dressed, and living in the utmost profusion, he preserved the strictest sobriety: a few cakes, bananas, or batatas, with a glass of water, were his ordinary food. He was particularly attentive to the means of reforming the loose and licentious manners of the females; and would suffer none of the white ladies to come to his court with the neck uncovered. His maxim was, that women should always appear in public as if they were going to church.

Never, says Lacroix, was an European army subjected to a more severe discipline than that which was observed by the troops of Toussaint. Every officer of rank in it commanded with a pistol in his hand, and had the power of life and death over his subalterns. He set about restoring the public finances with wonderful address. The ancient proprietors of estates had almost wholly disappeared, and frequently all trace was lost of the direct or collateral successor to them. In such cases he established a sort of co-proprietorship, by which the cultivators received a certain portion of the produce, and the rest was appropriated to the public revenue. By this device, the negroes were induced to return cheerfully to the labours of the field, and to submit to regulations under the black officers, more severe (says Lacroix) than those of their ancient masters. Under the new system, the colony advanced as if by enchantment towards its ancient splendour; cultivation was extended with such rapidity, that every day made its progress perceptible. All appeared to be happy, and regarded Toussaint as their guardian angel. In making a tour of the island, he was hailed by the negroes with universal joy: nor was he less a favourite of the whites, whose confidence he studied to gain, and who were always invited to his private parties. The general enthusiasm which he had excited was sufficient to inspire vanity into the strongest mind; and he had some excuse for saying that he was the Bonaparte of Saint Domingo, and that the colony could not exist without him. It is said that no one left his presence dissatisfied, though his request was not granted. Sometimes a negro, or a man of colour, would ask to be appointed a magistrate or a judge: "You shall," he would say,

say, "because I presume you understand Latin?"—"No, general."—"How! wish to be a magistrate without knowing Latin!" and then he would pour forth such a torrent of Latin words which he had got by heart out of his Pfalter, that the black candidate retired with the satisfaction of believing that he might have obtained his object had he understood the language, and the conviction that the general was a portentous scholar.

Such was the man to whom the island was indebted for its prosperity; which however was, unfortunately, not of long continuance. No sooner was the peace of Amiens definitively settled, than Bonaparte, urged on the one hand by the expelled planters, and on the other by mercantile speculators, and probably more strongly than either by his own ambition, which could not suffer a rival, though the Atlantic rolled between them, determined on the recovery of the colony, the reinstatement of the former proprietors, and the subjugation of the emancipated slaves. On the arrival in the bay of Samana of the French fleet, having on-board twenty-five thousand men, the flower of the French army, under the command of general Leclerc, the brother-in-law of Bonaparte, Toussaint hastened to the spot to reconnoitre its movements. Having never before seen so numerous a fleet, "We shall all perish," said he to his officers; "all France is come to St. Domingo." The division under Rochambeau having effected a landing at Fort Dauphin, the negroes, who had assembled in crowds to behold the strange sight, were charged with the bayonet, and numbers of them killed on the spot; but the main body of the fleet and army, on preparing to land at Cape François, received a message from general Christophe, prohibitory of any disembarkation of troops without the orders of his commander-in-chief. Leclerc, on this, sent a letter to Christophe, with mingled expressions of conciliation and menace, to which Christophe replied, with great firmness and moderation, that he was responsible for his conduct only to the governor and commander-in-chief, Toussaint l'Ouverture; that, if he attempted to carry his threats into execution, he should know how to resist as became a general officer; and that he accounted those troops which he threatened to land as so many pieces of card, which the slightest breath of wind would dissipate. Leclerc had sent on-shore printed copies of a proclamation drawn up by Bonaparte, in which the same insidious mixture of cajoling and threatening was used to seduce or intimidate the blacks. "Inhabitants of St. Domingo," it commenced, "whatever be your origin or your colour, you are all French; you are all free, and all equal, before God, and before the republic:" and it concluded, "Rally round the captain-general; he brings you peace and plenty. Whoever shall dare to separate himself from him, will be a traitor to his country, and the indignation of the republic will devour him as the fire devours your dried canes."

This menace, backed by such an overwhelming force, shook the allegiance of the white inhabitants to Toussaint. Christophe perceived the disaffection, and, knowing the town not to be defensible, set fire to it in several places, retreating in good order, and carrying off with him above two thousand of the whites as hostages, not one of whom was injured in the confusion and massacres which followed. This spirited measure, and the active preparations making by Toussaint in the interior, induced Leclerc to make trial of a scheme, which, if resorted to previous to the commencement of hostilities, might have been successful. He had brought out with him the two sons of Toussaint, whom the father was to be permitted to see, in the hope that, through them, he might be prevailed upon to acquiesce in the wishes of the first consul. From the smoking ruins of Cape François, Coisnon, their tutor, was dispatched with his pupils to Toussaint's country residence. The interview was affecting; and the artful pedagogue employed all his eloquence to prevail on Toussaint to relinquish the chief command, and be-

come the lieutenant-general of Leclerc: but it was too late. Toussaint had made his arrangements to oppose the French army; and, after an interview of two hours, left his two sons, to decide between their father and their adopted country.

When Leclerc found that Toussaint was inexorable, he issued a proclamation, declaring the generals Toussaint and Christophe to be put out of the protection of the law, and ordering every citizen to pursue and treat them as rebels to the French republic. The war now raged with great violence; and every artifice was practised by Leclerc to procure the defection of the black troops, in which he was but too successful. The black generals La Plume and Maurepas went over with their forces to the French: and what was their recompense? "Maurepas, a man of mild and gentle manners, and highly esteemed for his integrity, was suddenly carried off to Port de Paix, and put on-board the admiral's vessel, then at anchor in the roads, where, after binding him to the main-mast, they, in derision, with nails such as are used in ship-building, fixed two old epaulettes on his shoulders, and an old general's hat on his head. In that frightful condition, these cannibals, after having glutted their savage mirth, precipitated him, with his wife and children, into the sea. Such was the fate of this virtuous and unfortunate soldier!"

Toussaint, however, had under his immediate command a well-disciplined army; and Dessalines, one of the most courageous, enterprising, and skilful, of all the negro generals, held the strong fortrefs of Crête-pierrot, which had been built by the English. The French army laid siege to this place, which, after a brave defence, was evacuated by Dessalines, who carried off every thing that was valuable, leaving a small detachment to follow him in the morning. Intoxicated with the successful issue of the siege, the French committed all manner of cruelties on the unfortunate negroes who fell into their hands; and Leclerc, with equal baseness and folly, publicly restored to the proprietors of estates all their ancient authority. The consequence was such as might have been foreseen; all the blacks who had adhered to the French now deserted them, and again took up arms. Leclerc perceived his error, and had once more recourse to the delusion of proclaiming "liberty and equality to all the inhabitants of St. Domingo, without regard to colour;" with the reservation, however, of the approval of the French government. The negroes, tired of the war, again deserted their leaders; and at length Christophe negotiated in behalf of himself, his colleague Dessalines, and Toussaint the general-in-chief, a full amnesty for all their troops, and the preservation of the respective ranks of all the black officers. Leclerc was too happy to grant these conditions; and a peace was accordingly concluded, by which the sovereignty of France over the island of St. Domingo was acknowledged by all the constituted authorities.

Toussaint had liberty to retire to any of his estates which he might please to make choice of. He selected that called by his own name, l'Ouverture, situated at Gonaïves; there, in the bosom of his family, he entered upon the enjoyment of that repose of which he had so long been deprived. The *secret instructions*, however, of Bonaparte, were now to be obeyed; and Leclerc lost no time in putting into execution an act, which has entailed everlasting disgrace on his memory. In the dead of night, a ship of the line and a frigate anchored near Gonaïves, and landed a body of troops; they surrounded the house of Toussaint, when Brunet, a brigadier-general, entered the chamber where he slept, with a file of grenadiers, ordered him to surrender without resistance, and hurried him and his whole family on-board the *Hero*, of 74 guns, which proceeded immediately with them to France. Two negro chiefs of the neighbourhood, who attempted to rescue him, were taken, and Leclerc ordered them to be shot. He then caused about one hundred of the confidential

tial friends of Toussaint to be arrested, and sent to the different ships of the squadron: none of them were ever heard of afterwards; and it is supposed that they were thrown overboard. Toussaint, on the passage, was kept a close prisoner, and separated from his wife and family; and, on the arrival of the ship at Brest, he was merely allowed to see them once, and take leave of them for ever. He was conducted to the castle of Joux in Normandy, with a single negro to attend on him; his wife and children were conveyed to Bayonne, and nothing more was ever heard of either. On the approach of winter, Toussaint was subsequently removed to Besançon, and there immured in a cold, damp, gloomy dungeon, which became, as doubtless was intended, his sepulchre, the floor being actually covered with water. Thus did this great and good man perish, by the foul machinations of that remorseless tyrant, who, instead of expiating his numberless cruelties in a living sepulchre, like that to which he consigned the negro chief, is now merely kept from doing more mischief, by a mild banishment to the salubrious and romantic heights of St. Helena.

We shall now avail ourselves of some late publications, to complete the history of St. Domingo, or Hispaniola, or Hayti, up to the present day. It has been seen, under the article HISPANIOLA, vol. x. p. 204. that Dessalines, who succeeded Toussaint in the command of the army, had the good fortune totally to expel the French from the island, and to become himself "Emperor of Hayti," in 1804. We have also noticed the death of this transatlantic Robespierre; and that the government of the island was disputed by two chiefs, Christophe a negro, and Petion a mulatto. The blacks, always jealous of the men of colour, attacked Petion, who, with his people, narrowly escaped into the southern and western districts, where a new constitution was prepared; and, on the 27th of December, 1806, Petion was proclaimed president of the republic of Hayti. A civil war now sprang up between the partisans of the two chiefs; till at length, by a sort of tacit agreement, the mulatto president fixed himself in the south and west, while Christophe established himself in the north, where, on the 2d of June, 1811, the royal crown was placed on his head, and he was proclaimed Henry I. king of Hayti.

The kingdom is separated from the republic by an uninhabited line of ten leagues in depth. The rich plains of the Boucassin, and the coverts through which the line passes, are at present thick forests, which, by the force of vegetation, grow every day more and more impenetrable.

Petion, the president of the republic of Hayti, a native mulatto of St. Domingo, was educated at the military academy of Paris, where he distinguished himself as a man of very considerable talents, but of shy and reserved manners. His disposition, however, was gentle and conciliatory; and such was the confidence of his own caste in his ability and integrity, that, almost without exertion, he had not only the merit of keeping together, and thus saving, the remains of the people of colour, but of establishing, with about ten or twelve thousand of that caste, a complete controul over a population of 250,000 blacks; more, it is said, by the seasonable application of the two fascinating words, liberty and equality, than by the introduction of them into real practice. The death of Petion, which took place in 1818, was universally lamented; and his funeral was attended by almost the whole population of Port-au-Prince, all exclaiming that they had lost a father and a friend; and when his successor, general Boyer, pronounced his funeral oration, the whole multitude burst into tears. An English merchant, residing at Port-au-Prince, says, "I have been on intimate terms with Petion for years, and a more virtuous and amiable man I never knew. He is the idol of the people, and their confidence in him is unbounded." It was supposed that he was a Frenchman in his heart, and would betray that part of the island over which he ruled to the emissaries of Louis; but his conduct, on that occasion,

shewed his sincerity. The moment he heard of the mission, he caused every preparation to be made for setting fire to all the houses on the coast, and torches to be placed in all the arsenals ready to be lighted. "If," says the English merchant above alluded to, "a suggestion is whispered at the government-house as to the policy of the measure, the answer is, Look at Moscow." It would appear, if Lacroix be correct, that he just died in time to save his reputation; that, disgusted with the things of this world, he had fallen into an absolute apathy, and no longer possessed that activity of mind so necessary for the founder and the director of a political system; that, finding he could not advance the fabric he had reared according to his philanthropic views, annoyed at the idea of being fixed to a spot of the earth where the surrounding mass was so barbarous as not to comprehend those views, he launched forth into the imaginary world of Plato; and, in the aberration of his faculties, had nevertheless preserved a sufficient degree of firmness to suffer himself to die of hunger.

Christophe, now Henry I. king of Hayti, was born a slave in that island of the West Indies from which he takes his name, and was still a slave in St. Domingo in the year 1791. The early friend and the faithful adherent of Toussaint, he bore a considerable resemblance to him in character. His military talents were very respectable, and his courage unshaken; his disposition humane and benevolent. In the exercise of all the social virtues he has been eminently distinguished; he is a good husband, a good father, a steady friend, and strict in the observance of all the duties of religion and morality. Contrary to the common custom among his black countrymen, he attached himself in early life to one woman, whom he never forsook; and that woman is now queen of Hayti, beloved by all ranks and conditions. Henry is said to possess a propriety and dignity of manner seldom attained by an uneducated man. Gifted with strong natural talents, he soon acquired the habit both of speaking and writing well. His proclamations, said to be generally dictated by himself, are compositions of which the most civilized cabinets of Europe might not be ashamed. Of his good faith and moderation, the British merchants resident under his protection have had frequent and ample proofs. His colour and features are completely negro; but his countenance is represented as very intelligent, agreeable, and expressive. In person and appearance, he is said to bear a strong resemblance to our late venerable sovereign; and the respect felt for him by the British merchants is not, on that account, diminished: his common dress, which is that of the Windward uniform, but without lace or star, adds to the likeness. When commander-in-chief of Cape François, he used to give public dinners, to which the officers of the British navy were frequently invited; and on these occasions his conversation was in the English language, in which he expresses himself with great ease. At the head of all his public institutions he is ambitious to place Englishmen, professing his cordial detestation of every thing French. Dr. Stuart has the care of his military hospital, which is constantly visited by the king, who goes round daily and talks with the patients, most of whom he knows by name and character; to some he gives good advice, others he scolds, and with others he laughs and jests, and they all appear happy to see him. His good-humoured disposition is manifested by the number of orphans, children of deceased officers, whom he keeps in his palace, and whom he suffers to run about him and feel his pocket for *bons-bons*, which he carries with him for the gratification of the little urchins.

The two governments, under the superintendence of the negro king and the mulatto president, have proceeded in very different ways, and without any common principle, in the progress of civilization, the cultivation of their respective territories, and the general improvement of the people. Petion, the late president, endeavoured to adhere to the revolutionary government of France, under

under which he received a part of his education. While every thing was apparently carried on by tribunals or departments, the president, in fact, was invested with absolute power; he was the Bonaparte of Hayti, surrounded by inefficient and useless machinery. The lands in the republic are partitioned among the officers and public functionaries, according to a fixed scale; and the negroes may work on hire, or live in idleness, as they feel disposed. Henry, on the contrary, lays claim to all the vacant lands, and partitions them out among his generals and other officers, as he thinks fit; and a kind of feudal system is established, each having on his estate a set of retainers, who receive one-fourth of the produce for their labour, and are generally soldiers by profession. The administration of affairs in the republic is conducted by a president, three secretaries of state, thirty representatives of the commons, and twenty-four senators. These affect to ridicule the acts of Henry, by saying, that "his hands are less fit to wield the sceptre than the frying-pan at the inn of the Cape," where he was formerly a slave; while Henry contents himself with publishing every year the whole organization of the two governments in the "Royal Almanac of Hayti," and tempts the republicans, by showing the vacancies he has to dispose of in the civil and military functions of the monarchy. All honours flow from the crown, which is hereditary in the family of Christophe, who affects to trace his pedigree to the house of Dahomey in Africa. His hereditary nobles consist of two princes, exclusive of the blood royal, eight dukes, eighteen earls, thirty-two barons, and eight knights. Six grand-marshal of Hayti, eight lieutenant-generals, fifteen field-marshal, six major-generals, and one hundred field-officers, compose the staff of the army. There is besides a Royal and Military Order of St. Henry, which confers personal nobility on those who are decorated with it: in 1818 it consisted of six grand-crosses, sixteen knights-commanders, and 165 knights-companions. The staff of the army of the republic is less numerous, consisting only of six generals of divisions, and nine brigadier-generals; there are, of course, no honours or distinctions but what are conferred by offices. Lacroix seems to think that the republic is more firmly established, because property is more divided, and because there are more points of contact between authority and obedience, and consequently a greater number interested in maintaining the present government. Both, however, depend solely for internal tranquillity, and repelling external attack, on force of arms. If you will preserve yourselves free, said Toussaint, be careful to preserve your arms. Petion inculcates the same sentiment; and the baron de Vastey re-echoes it, lamenting the fate of the ancient inhabitants of the island, who were exterminated because ignorant of their use.

The regular army of king Henry consists of about 25,000 men, of which 4600 form the royal guard; they are of all arms, exceedingly well, indeed splendidly, dressed and equipped in all respects, and in an excellent state of discipline. According to the testimony of several British officers, no European troops are better trained than the black regiments of Hayti. Among them are about 4000 blacks from the coast of Africa, formed into separate companies, which bear the name of Royal Dahomeys. They are placed under officers of tried attachment to the king, and are in fact the national guards, to whom the general police of the country is entrusted; and such, according to Lacroix, is the strictness of this police, that the cultivators are not permitted to leave their houses without a written permission from the commanding-officer of the Dahomeys. The army of the republic is also about 25,000 men, of which 3600 men compose the president's guard. They are not so well dressed nor disciplined as the king's army, and the greater part are placed in cantonments among the planters. The police of the towns is not so strict in the republic as in the monarchy; the people of colour, who are chiefly in power, are more difficult to bring under subordination than the blacks. They are

more loose in their morals, particularly the women, who transact almost all the business of the towns. The bonds of marriage can scarcely be said to exist in the republic. Henry, on the contrary, compels his soldiers to marry; and woe be to him that violates the nuptial tie! Aware that much depends on appearances, Henry suffers no one to appear before him who is not decently clothed; and the consequence is, that, instead of naked blacks of both sexes strolling about the streets as heretofore, every one now puts on a becoming habit. The republicans are less attentive in this respect; but here too the natural vanity of the blacks has induced them, to clothe themselves better than heretofore. Petion himself affected an indifference to dress, but his great officers made as brilliant an appearance as those of Henry. "By a singular fate," says Lacroix, "dresses of velvet magnificently embroidered, which not long ago arrayed the senators of the most powerful empire of the world, have found their way to Hayti, and now clothe the senators of this little republic. This circumstance, (he adds,) insignificant in itself, is a new example of the nothingness and the decay of human grandeur in the age of revolutions in which we live."

The population of the two governments, according to Lacroix, consists of 480,000 blacks, 20,000 persons of colour, and 1000 whites, chiefly Germans, making all together 501,000 souls; of whom 261,000 are republicans, and 240,000 royalists. Each may be considered to consist of three classes. The first embraces all the civil and military officers, who possess a great part of the property of the island. The second class is composed of those who exercise the various mechanical arts, the trades-people of the towns, and the soldiers. The third is composed of the actual labourers of the estates, or the husbandmen, who are mostly blacks. These people are in fact but a little removed from their former condition of slavery, being completely at the mercy and caprice of the civil and military authorities of the two governments.

The finances of each are stated to be so flourishing, that, after paying all expenses, there is a surplus of at least fifteen millions of livres, entirely disposable by the king and the president. The system of policy is the same. The king and the president have both declared, that, on the first appearance of an enemy on the coast, every town shall disappear, and the whole nation take up arms. "The last of the Haytians," says king Henry in his manifesto, "will breathe out his last sigh sooner than renounce his independence. Free by right, and independent in fact, we will never renounce these blessings; nor witness the subversion of the edifice which we have raised and cemented with our blood. Faithful to our oath, we will rather bury ourselves beneath the ruins of our country, than suffer the smallest infringement of our political rights." And, in order to avoid giving any umbrage to other powers, king Henry has lately (1819) issued a proclamation, declaring that no asylum shall be granted in Hayti to any disaffected or runaway negroes from any of the West-India islands, and especially from those belonging to his Britannic majesty.

The most recent advices (Jan. 1820.) state, that at length the long rivalry of Christophe and Boyer had subsided into so friendly an understanding, that the intercourse with neutral vessels, between their respective courts, could be carried on without molestation. And the same accounts add, that king Henry Christophe has taken the prudent course of securing the attachment of his troops, by conceding to them grants of land, and advancing to them the means of cultivating them; while they are still within the reach of a summons to military duty. Conscious of his strength, he rejects all overtures from France that shall not come to him with the recognition of his independence, "as from one brother-king to another."

As the president Boyer partakes in these sentiments, though not so royally, we are assured that both governments are well prepared for any attempts that may be

made against them. A regular system of defence has been established by fortifying the brows of the hills and the defiles of the interior; the means of subsisting the troops have been provided for by carrying on cultivation in the vicinity of their strong-holds and places of arms; and the fort and citadel of Henry at Sans Souci are said to yield to none of the fortresses of Europe in strength. In this fortress are from three to four hundred brass cannon regularly mounted; and it is seen from the sea towering like another Windsor Castle. France, it is to be hoped, will recollect the fate of Leclerc's army before the embarks in another expedition hostile to St. Domingo. "Of the 35,131 men," says Lacroix, "carried out, more than 25,000 had fallen before Leclerc into the grave. At his death, 2200 only were fit to bear arms; about 7500 sick crowded the hospitals. These wrecks, (he continues,) and 20,000 other victims landed on St. Domingo in the last thirteen months of our agonizing dominion, as well as the unfortunate creole population, perished after the death of Leclerc, in proportions still more deplorable than those which are presented in the following mournful table." This table gives a total of those who were destroyed by a violent death during the command of general Leclerc, amounting to 62,481!

Under every point of view, any fresh attempt of the French government to disturb the island would deserve the reprobation of mankind. The progress made by the inhabitants in agriculture, and all the arts, is quite extraordinary; but more particularly in education and general literature. Parochial schools have been established on the Madras system in every part of Henry's dominions, and primary schools at all the principal towns, under the direction of English instructors; in these the English language is taught, and is now read and written by the children of all the functionaries of the government. A royal college has also been established, and annual prizes given to the most distinguished students. Henry has also endowed an academy for music and painting, and built a regular theatre. All these are erected at Sans Souci, the royal residence, which, we understand, for elegance and chasteness of design, is not inferior to many of the palaces of Europe. Here too he has established various manufactories, and among others that of carriages. Three gaudy ones purchased for him in this country gave him great offence; and he asked if the English considered him as a king of Congo? The Catholic religion is declared to be that of the state: the hierarchy consists of an archbishop, three bishops, and a rector in each parish. At Sans Souci there is a royal and parochial church. It was erected by Henry, and is mentioned in the Royal Almanac as "a monument of his royal munificence and piety." The archbishop, whom the pope has hitherto refused to consecrate, has a chapter, a seminary, and a college, attached to the metropolitan see, all well endowed. He has also three archiepiscopal palaces assigned to him; and the bishops have each a chapter and a seminary, endowed with considerable revenues.

Schools are also established in the republic, over which are placed four or five Frenchmen, as professors of languages, mathematics, &c. At Port-au-Prince there is also a college of physicians, and several French medical men are employed to superintend it. The church-establishment, like all the rest in the republic, wears a more humble character, being confined to an apostolical prefect, with curates under him; but, as we before observed, the duties of religion and morality sit looser on the republicans than the royalists.

Such is the present state of the northern part of Hayti. It presents, in truth, an imposing and an awful spectacle; and very firm must be the nerves of that politician who can contemplate it *sicis oculis*, whether for good or for evil. We do not wish to despond; and it is yet, we fear, too early to triumph; but we cannot conceal from ourselves how much depends upon the personal character of the future rulers of this emancipated race. A third, wor-

thy of Toussaint l'Ouverture and Henry I. the Numa and the Ancus of Hayti, may not arise in immediate succession; and we have yet to learn, whether habits of obedience, and a love of order and discipline, will succeed to the influence of individual character, and perpetuate the action of that admirable system of polity which these two wonderful men have constructed and set in motion. Spain yet retains the larger, and we believe the more fertile, part of this noble island; but she retains it as an unproductive desert. We know not with what composure she contemplates the state of things beyond the immense *llanos* that separate her from a free and active population; but it becomes ourselves not to forget that the Blue Mountains of Jamaica are visible from St. Domingo. We would not, and indeed cannot, anticipate what is yet in the womb of time; but in the lap of peace and security it may not perhaps be unwise to meditate on an event which sooner or later must surely come to pass—we speak of the general emancipation of the negro race. With timely precautions, such a circumstance would not, in our humble opinion, be very deeply to be deprecated; and one of the most effectual of those precautions would be the extension of the present humane and judicious plan of giving the slaves some kind of education, and imbuing their minds with the principles of our holy religion. They would then be in a favourable state of preparation for the adoption of that system by the planters which has so happily succeeded in the two governments of Hayti, and might cultivate the soil as free labourers, receiving from the proprietor one-fourth of the produce. However this may be, we cannot but rejoice in the good which has already been wrought, and express our ardent hopes that no attempts will be made to rivet afresh the chains of this meritorious people, and that the independence which they have acquired, at the expense of so many sufferings, will defend unimpaired to their posterity.

The publications we alluded to in the former part of this article are—1. History of the Island of St. Domingo, from its first Discovery by Columbus to the present period; London, 1818. 2. Réflexions sur les Noirs et les Blancs, la Civilisation de l'Afrique, le Royaume d'Hayti, &c. par le Baron de Vastey, Secrétaire du Roi au Cap Henry. 3. Almanach Royal d'Hayti, 1818. 4. Mémoires pour servir à l'Histoire de la Révolution de Saint Domingue; par le Lieutenant-général Baron Pamphile de Lacroix; 2 tom. Paris, 1819. Quarterly Review, N° xlii. Apr. 1819. Monthly Mag. Nov. 1819. Gent. Mag. Jan. 1820. And, should any thing worthy of notice occur hereafter in this infant state, as most probably it will, we shall resume the subject under the article SAINT DOMINGO.

O'VUM, *f.* [Latin.] An egg; any thing resembling an egg.

OUVRA'RD (René), a celebrated canon of Tours, was a native of Chinon, in the Touraine, and flourished after the middle of the seventeenth century. He was intimately conversant in the belles-lettres, poetry, the mathematics, divinity, controversy, the art of music, and ecclesiastical antiquities. For ten years he filled the post of master of music at the holy chapel at Paris, before his promotion to the canonry of Tours. He died at that city in 1694, respected for his piety, and beloved on account of the excellence and amiableness of his moral and social character. On his tomb the following verses are inscribed, composed by himself:

Dum vixi, divina mihi Laus unica Cura :
Post obitum sit Laus divina mihi unica Merces !

He was the author of a variety of works, among which are the following: 1. A new and secret Method of composing in Music, 1660. 2. Studiosis sanctarum Scripturarum Biblia Sacra in Lectiones ad Singulos Dies, per Legem, Prophetas, et Evangelium, distributa, et 529 Carminibus mnemonicis comprehensa, 1668; the same in French, 1669. 3. Motives for a Re-union with the Catholic Church, addressed to the pretended Reformed in France,

France, &c. 1668. 4. The Reasons which produced the Conversion of the Count de Lorges Montgommery, 1670. 5. A Defence of the ancient Tradition in the French Churches relative to the Mission of the first Preachers of the Gospel among the Gauls, in the Time of the Apostles and their immediate Disciples, with Considerations on the Use and the Abuse of the Writings of Sulpicius Severus and St. Gregory of Tours, on this and similar Topics, 1678. 6. The Art and Science of Numbers, in French and Latin, with a Preface on the Excellence of Arithmetic, 1677. 7. Harmonic Architecture; or, the Application of the Doctrine of Proportions in Music to Architecture, 1679, 4to. 8. Calendarium novum, perpetuum, et irrevocabile, 1682; which M. Arnauld, who entertained a great regard for the author, and proved that many of the notions in it were untenable, prevailed upon M. Ouvrard to suppress. 9. Breviarium Turonense, renovatum, et in melius restitutum anno 1685. And he left behind him manuscripts on scientific, controversial, and other subjects. *Moreri*.

OVUTSI, or OUVUSTI, a town of Japan, in the island of Xicoco. Lat. 34. 8. N. lon. 135. 20. E.

OU'Y, a town of China, of the third rank, in Pe-tche-li: thirty-eight miles east-south-east of Chun-te.

OU'Y, a town of China, of the third rank, in Pe-tche-li: eighteen miles south of Ching.

OU'Y, a town of China, of the third rank, in Tcheking: twenty-eight miles south of Tchu-tcheou.

OUZOU'ER sur CRESCE, a town of France, in the department of the Loiret: twenty-one miles south of Montargis, and six south-east of Gien.

OUZOU'ER LE DOYEN, a town of France, in the department of the Loire and Cher: fifteen miles north of Mer.

OUZOU'ER sur LOIRE, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Gien: six miles south-east of Gien. The place contains 686 inhabitants.

OUZOU'ER LE MARCHE, a town of France, in the department of the Loire and Cher: twelve miles north of Mer, and twenty-one north of Blois.

OUZOU'M CUPRI. See TRAJANOPOLI.

OW, or AWE (Loch), a lake in Argyleshire, Scotland, slightly mentioned in vol. xii. It extends almost thirty miles in length; and is in some places two miles broad, but its usual width does not exceed one mile. It is an uncommonly-fine expanse of water, and little inferior to Loch Lomond in the beauty of its scenery. A great part of its banks exhibits lofty mountains covered with wood; and within its bosom are many little islands ornamented with trees and picturesque ruins. On Inish-Chonnel are the remains of an ancient castle belonging to the Argyle family; and on Troach-Elan are vestiges of another fortress, which was granted, with some contiguous lands, to the chief of the clan of Mac-Naughton, by king Alexander III. on condition that he should entertain the Scottish monarch whenever he passed that way. At a more remote period this latter island was the Hesperides of Scotland; and the fatal attempt of Troach, to gather its delicious fruit for his beloved Mego, is handed down from age to age in a beautiful Celtic tale, after the manner of Ossian. "The fair Mego longed for the delicious fruit of the isle guarded by a dreadful serpent. Troach, who had long loved the maid, goes to gather the fruit. By the rustling of the leaves the serpent was awaked from his sleep. It attacked the hero, who perished in the conflict. The monster was also destroyed. Mego did not long survive the death of her lover."

The surface of Loch-Awe is 108 feet above the level of the ocean. Numerous rivulets discharge themselves into it on both sides; and, what is unusual, it receives a large stream at each extremity, emptying itself laterally by the river Awe into Loch Etive, an arm of the sea to the north, at a place called Bunaw. This lake abounds with salmon, trout, char, and eels. On a rocky point, projecting into

the lake, near its eastern end, are seated the venerable ruins of Castle-Kilchurn, which was built in 1440 by the lady of sir Colin Campbell, knight of Rhodes, and ancestor of the Breadalbane family, while her husband was engaged in the holy wars. Since that period, however, many additions have been made to its original extent, by successive possessors. In 1745 it was fitted-up for the reception of a royal garrison to secure the peace and tranquillity of the country; but its massive walls are now rapidly falling to ruin, and offer to the contemplative mind a melancholy monument of the mutability of earthly grandeur, and of the unavoidable decay of the most durable works of human art. *Beauties of Scotland*, vol. v.

OWA'RI, a town of Japan, in the island of Nippon, situated in a bay to which it gives name. Lat. 35. 30. N. lon. 137. 50. E.

OWANTY, a town of Lithuania, in the palatinate of Wilna; sixteen miles east of Wilkomierz.

OWASCO, a lake of United America: twenty-five miles south of Lake Ontario.

OWCH, a town of Turkestan, on a river which runs into the Sihon: thirty miles south-south-east of Andagan.

OWCHE. See OUCHE.

OW'CZE, a town of Poland, in the palatinate of Podolia: forty miles west of Kaminiec.

To OWE, *v. a.* [*eg aa*, I owe, or I ought, Icel.] To be obliged to pay; to be indebted.—A son *owes* help and honour to his father; and is a subject less indebted to the king? *Holyday*.—It, upon the general balance of trade, English merchants *owe* to foreigners one hundred thousand pounds, if commodities do not, our money must, go out to pay it. *Locke*.

I *owe* you much, and, like a witless youth,
That which I *owe* is lost. *Shakespeare's Merch. of Ven.*

Thou hast deserv'd more love than I can show,
But 'tis thy fate to give, and mine to *owe*. *Dryden*.

To be obliged to ascribe; to be obliged for:

By me upheld, that he may know how frail
His fall'n condition is, and to me *owe*
All his deliverance, and to none but me. *Milton*.

To have from any thing as the consequence of a cause:

O deem thy fall not *ow'd* to man's decree,
Jove hated Greece, and punish'd Greece in thee. *Pope*.

To possess; to be the right owner of. For *owe*, which is in this sense obsolete, we now use *own*.—Thou dost here usurp the name thou *ow'st* not. *Shakespeare*.

Nor poppy nor mandragora,
Not all the drowsy syrups of the world,
Shall ever med'cine thee to that sweet sleep
Which thou *ow'dst* yesterday. *Shakespeare's Othello*.

If any happy eye
This roving wanton shall descry,
Let the finder surely know
Mine is the wag; 'tis I that *owe*
The winged wand'rer. *Cryshaw*.

To OWE, *v. n.* To be bound or obliged.—The ryche man *oweth* of duty to doo his mercy upon the poore creature. *Bp. Fisher*.

OWE'GO, a town of the state of New-York, on the east branch of the Susquehanna; 150 miles north-west of New-York: inhabitants, 1284.

O'WEN, a town of Wurtemberg: eighteen miles south-east of Stutgard, and twenty-eight east of Nagold.

O'WEN (Thomas), a judge of the Common Pleas, son of Richard Owen, esq. of Conover in Shropshire, was educated at Oxford. Having taken a degree in arts, he left the university, and entered himself of Lincoln's Inn, London, where, in process of time, he became an eminent counsellor. In 1583 he was elected Lent-reader to that society. In 1590 he was made serjeant-at-law, and queen's serjeant soon after. He arrived at length at the dignity

dignity of judge of the Common Pleas; which office he is said to have executed, during five years, with great abilities and integrity. He died in 1593; and was buried on the south side of the choir in Westminster-abbey, where a monument was erected to his memory. He had the reputation of a learned man, and a patron of literature. He was the author of "Reports in the Common Pleas; wherein are many choice cases, most of them thoroughly argued by the learned serjeants, and after argued and resolved by the grave judges of those times, with many cases wherein the difference of the year-books are reconciled and explained." Lond. 1656, folio.

O'WEN (John), a distinguished writer of Latin epigrams, was a native of Caermarthenhire, and received his education at Winchester-school under Dr. Bilson. In 1584 he was admitted a fellow of New College, Oxford, where he continued till 1591, when he became master of a school near Monmouth. In 1594 he obtained the mastership of the free-school at Warwick, where he made himself celebrated by his skill in Latin poetry, especially of the epigrammatic kind. He is said to have experienced the poet's fate of perpetual indigence; but he met with a kind patron in bishop and lord-keeper Williams, his countryman and relation; by whom he was chiefly supported in the latter years of his life. He underwent a severe disappointment in being struck out of the will of an uncle, who was offended with his attacks upon popery, to which religion that relative was inclined. One of his epigrams to this purpose may serve as a specimen of that play upon words in which much of his wit consists:

An Petrus fuerit Romæ, sub iudice lis est:
Simonem Romæ nemo fuisse negat.

Owen died in 1622, and was buried at bishop Williams's expense in St. Paul's cathedral. His epigrams have been collected in twelve books, and have been several times published. In some of his pieces he imitates the pointed turn of Martial with success; but the greater number have little to recommend them, except the purity and elegant simplicity of the language. Several have been translated both into French and English.

O'WEN (John), a learned and eminent English non-conformist divine of the independent denomination, was descended from a respectable family in North Wales, and born in the year 1616 at Hadham in Oxfordshire, of which place his father was vicar. As he afforded early indications of extraordinary natural abilities, his friends resolved to give him the advantage of a liberal education; and with that view placed him under the tuition of Mr. Edward Sylvester, a celebrated schoolmaster at Oxford. In this seminary he made such a rapid proficiency in grammar-learning, that he was admitted into Queen's-college, in that university, when he was only about twelve years of age.

The circumstances of his father, who had a large family, not permitting him to afford his son an adequate maintenance, young Owen was liberally supplied with college-expenses by an uncle, who possessed a good estate in Wales, and, having no children of his own, intended to make his nephew his heir. Thus supported, he pursued his studies with incredible diligence, allowing himself for several years, it is said, not more than four hours sleep in a night; and by such incessant application, under the able direction of the learned Dr. Barlow, afterwards bishop of Lincoln, he made a very considerable progress in academical learning. At the same time he did not neglect the care of his health, but occasionally indulged in such recreations as were proper for so robust a constitution as his was; such as leaping, throwing the bar, ringing of bells, and similar exercises. He was admitted to the degree of B.A. in 1632; and commenced M.A. in 1635. Soon afterwards, archbishop Laud, the chancellor of the university, having enjoined the observance of some new regulations with which Mr. Owen was dissatisfied, he refused submission to them. This refusal greatly offended

his uncle; and induced many of his friends to forsake him, as infected with puritanism. The resentment of the Laudean party also by degrees rendered his situation in the college so uneasy, that he found himself obliged to leave it in the year 1637. Soon after this, he was ordained priest by the bishop of the diocese, and became chaplain to sir Robert Dormer, of Ascot in Oxfordshire, as well as tutor to his eldest son. Afterwards he became chaplain to lord Lovelace, of Hurley in Berkshire, in whose family he resided at the commencement of the civil wars, when he openly avowed the cause of the parliament. This conduct was so highly resented by his uncle, who was a zealous royalist, that he immediately discarded him, settled his estate upon another person, and died without bequeathing him any thing. Lord Lovelace, however, though he had joined the king's party, continued to treat his chaplain with great civility; but, that nobleman going at length to the king's army, Mr. Owen left his house, and went to London, where he soon became a perfect convert to the principles of the nonconformists.

In the year 1642 Mr. Owen first made himself known to the public as an author, by publishing his book entitled "A Display of Arminianism;" which met with so favourable a reception, that it laid the foundation of his future advancement. Such was the impression which it made on the committee for dismissing from the church scandalous ministers, that they sent him a presentation to the living of Fordham in Essex; where he settled, and married a lady whose excellent qualities greatly contributed to the happiness of his life. When he had been at Fordham about a year and a half, the sequestered incumbent died; upon which the patron, who was not friendly to Mr. Owen, presented another person to the living. Care was soon taken, however, to repair his loss by another benefice in the same neighbourhood; for the earl of Warwick, who was patron of the church of Coggeshall, a market-town about five miles from Fordham, very readily gave him that living.

Hitherto Mr. Owen had connected himself with the Presbyterians; but he had not been long at Coggeshall, before he declared himself in favour of the principles of the Independents: and he formed a church there according to the discipline of that sect, which continued many years in a flourishing condition. Mr. Owen's fame now became widely spread; and, upon the prevalence of the independent party, he was sent for to preach before the parliament on one of the fast-days in 1646. When Colchester was besieged, in 1648, Fairfax, whose head-quarters were for some days at Coggeshall, became acquainted with him; and, upon the surrender of that town to the parliamentary forces, our divine preached the thanksgiving-sermon there on that occasion. He was again called upon to preach before the house of commons, on the next day after the execution of king Charles I. but he kept his sentiments on that subject in such reserve, that his friends could not justly make exceptions against him, nor his enemies take advantage of his words another day. Mr. Owen's services were so acceptable to the commons, that he was afterwards frequently appointed to preach before them; particularly on the 28th of February 1649, being the day of humiliation and prayer on occasion of the intended expedition to Ireland. At this discourse, Cromwell, who had never heard Mr. Owen preach, was present, and was greatly pleased with his performance. Within a day or two, while Mr. Owen was waiting for admission to pay his respects to Fairfax, before his intended return to Coggeshall, Cromwell came into the room, and directly advancing to him, and laying his hand familiarly on his shoulder, said, "Sir, you are the person that I must be acquainted with." Mr. Owen replied, "That, sir, will be much more to my advantage than yours." "We shall soon see that," said Cromwell; and, taking him by the hand, led him into Fairfax's garden, where he conversed with him about the intended expedition to Ireland, and desired that he would accompany him,

him, for the purpose of regulating and superintending the college of Dublin. Mr. Owen objected that his charge of the church at Coggeshall would not permit him to comply with his request. Cromwell, however, would have no denial; and Mr. Owen, after consulting with several ministers, who agreed in their advice for his going, prepared for his journey, not with the army, but in a more private manner.

Having arrived at Dublin, Mr. Owen took up his residence at the college, preaching there, and arranging the affairs of that seat of learning. After he had staid here half a year, he returned, by Cromwell's leave, to England, and resumed the discharge of his pastoral duties at Coggeshall. Scarcely, however, had he time to breathe there, before he was called upon to preach again at Whitehall. In the year 1650, when Cromwell went commander-in-chief into Scotland, he procured an order of parliament that Mr. Owen should accompany him; who, after he had spent six months at Edinburgh, obtained leave to return once more to his flock in Essex. He was finally called away from them in the following year, in consequence of his being promoted, by an order of parliament, on the 18th of March, to the deanery of Christ-church College in Oxford; and soon afterwards he received a letter from the principal students of that seminary, signifying their great satisfaction in the choice which had been made by the parliament, and their wishes for his presence among them. When he went to reside at Oxford, Cromwell was the chancellor of the university; and, in the year 1652, he nominated our dean his vice-chancellor. In 1653 Mr. Owen was created D.D. by diploma; and, upon the nomination of commissioners, in the following year, for ejecting scandalous, &c. ministers and schoolmasters, he was appointed one of that number for the county of Oxford. In these situations commendations has been bestowed on Dr. Owen for the care which he displayed in maintaining good discipline in the university, and on the moderation which he exercised towards the king's party. As instances of this disposition, it has been observed, that, though often urged to it, he never molested the meetings of the royalists at the house of Dr. Willis the physician, not far from our vice-chancellor's lodging at Christ-church, where divine service was performed according to the Liturgy of the Church of England; and that, in his office of commissioner for ejecting scandalous ministers, he frequently over-ruled his brethren in favour of such royalists as were eminently deserving, and particularly in the case of Dr. Edward Pococke.

Dr. Owen was continued in the office of vice-chancellor for five years, during which, notwithstanding the many hours necessarily devoted to the duties of his public appointments, he found time to prosecute his studies with great assiduity, and to write many learned, and some excellent, books; besides preaching every other Sunday at St. Mary's, and often at Stadham, and some other places in the country.

In the year 1657, upon Richard Cromwell's succeeding his father in the chancellorship of the university, Dr. Owen was removed from the post of vice-chancellor; as he was also from Richard's favour, when he became protector, upon the death of Oliver, in the following year. This change in the disposition of the court towards him, is attributed to the hostility of the presbyterian party; who are also said to have procured his exclusion from the pulpit at St. Mary's. The measure last mentioned he resented so highly, that he set up a lecture in another church, saying, "I have built seats at St. Mary's, but let the doctors find auditors; for I will preach at St. Peter's in the East;" which he accordingly did, and drew after him crowded auditories. In the meantime, he was one of the leading men in the assembly of the Independents which met at the Savoy in October 1658; and he had a principal share in drawing up a Confession of their Faith and Discipline, in opposition to the Presbyterians. While

VOL. XVIII. No. 1229.

steps were pursuing to bring about the reformation, in 1659, he was ejected from his deanery of Christ-church; upon which he retired to Stadham, where he had lately purchased a good estate with a handsome house. Here he lived for some time, preaching in private to many friends who came to hear him from Oxford, and other places; till the interruptions which he met with from the soldiery of the militia, and their menaces, broke up his congregation; and he, after removing from place to place, at length went to London.

In these several situations, while he was debarred from the open exercise of the ministry, he did not spend his time in inactivity, but wrote several books. One of these, entitled "*Animadversions on Fiat Lux*," written in reply to a work under that name by a Franciscan friar, having fallen into the hands of the lord-chancellor Clarendon, he was so well pleased with it, that he sent for the author by sir Bulstrode Whitlocke, and, acknowledging the great service done to the protestant cause by that book, offered to prefer him in the church if he would conform; but the doctor's principles obliged him to decline his lordship's proposal. He now continued to preach whenever an opportunity offered, and met with so much trouble, that he made preparations for removing to New-England, whence he had received an invitation; but he was stopped by an express order of council. He also received an offer of a professorship of divinity in the United Provinces, which he declined.

In the year 1665, the dreadful calamities of the plague and of the fire of London so wholly engaged the public attention, that the laws against nonconformists were for some time suffered to lie dormant; and, not long afterwards his majesty's Declaration of Indulgence came out, and licences were granted to all who desired them, for public assemblies. While this liberty lasted, Dr. Owen was very assiduous in preaching, and was attended by many people of quality and eminent citizens. The jealousy of the church of England, however, taking an alarm, these assemblies were suppressed, by a proclamation issued against unlawful conventicles in 1667; upon which Dr. Owen went to pay a visit to his old friends at Oxford, and to settle some affairs of his estate at Stadham. In this neighbourhood he ventured to preach privately to some of his friends; but, intelligence of it having transpired, endeavours were used to apprehend him, which he narrowly escaped, and returned to London. He now received fresh invitations to remove to New-England, which his attachment to his native country would not permit him to accept. In the year 1671, when the bill to prevent and suppress what were called seditious conventicles was depending before the lords, our author was desired to draw up some reasons against it, which were laid before the lords by several eminent citizens and gentlemen of distinction; but the bill was, notwithstanding, passed into a law. However, the doctor's moderation and learning procured him the respect and esteem of several persons of honour and quality, who took delight in his conversation; particularly the earls of Orrery and Anglesey, lord Willoughby of Parham, lord Berkeley, and sir John Trevor, one of the secretaries of state. What is more, even the king himself, and the duke of York, paid him particular attention. When Dr. Owen was at Tunbridge Wells, the duke of York, being there, sent for him into his tent, and held several conversations with him on the subjects of conventicles and dissent; and, after the doctor's return to London, the king sent for him, and conversed with him for more than two hours together, assuring him of his favour, and telling him that he might have access to him at all times. His majesty also assured Dr. Owen that he was a friend to liberty of conscience, and was sensible that the dissenters had met with injurious treatment. At the same time the king gave him a thousand guineas, to distribute among those who had suffered most by the late severities; which

K k

royal

royal bounty the doctor received with proper acknowledgments, and faithfully applied it to the objects intended. Dr. Owen had likewise some friends among the bishops, particularly Dr. Wilkins of Chester, and Dr. Barlow of Lincoln, who had been formerly his tutor. In the latter part of his life, Dr. Owen's health became very infirm, and he was often confined to his bed, or chamber; yet, whenever he was able to sit up, he would be continually writing, when not prevented by company. Finding himself grow worse, he went to Kensington for the benefit of the air, and lived there some time. From Kensington he removed to a house of his own at Ealing, where he died, on the 24th of August, 1683, in the sixty-seventh year of his age.

Dr. Owen was tall and graceful in person, of a grave and majestic countenance, and possessed a genteel deportment and manners. His temper was serene and even; his disposition liberal, generous, and friendly; and his conduct in the domestic relations was peculiarly amiable and affectionate. Of his ardent and unaffected piety, and of his firm integrity, his whole history affords sufficient evidence. To his great learning and industry his works bear abundant witness, as well as the testimonies of his biographers. Dr. Calamy says, "he was a man of universal reading, and had digested it. He was especially conversant in those sciences that are assiduous to divinity, and master of them in an unusual degree. He was reckoned the brightest ornament of the university of Oxford." The writer of his life referred to below, observes, that "he was a perfect master of the Latin, Greek, and Hebrew, tongues. He was a great philosopher; and also well read in the civil law. A great historian; having a perfect comprehension of church-history in particular. He was thoroughly versed in all the Greek and Latin poets; well skilled in the rabbis, and made great use of them as there was occasion." And Anthony Wood, though he treated his memory with the most opprobrious language, yet acknowledges that "he was a person well skilled in the tongues, rabbinical learning, Jewish rites and customs; that he had a great command of his English pen, and was one of the most genteel and fairest writers who have appeared against the church of England, as handling his adversaries with far more civil, decent, and temperate, language, than many of his fiery brethren, and by confining himself wholly to the cause, without the unbecoming mixture of personal slanders and reflection." He also adds, "he had a very graceful behaviour in the pulpit, an eloquent elocution, a winning and insinuating deportment, and could, by the persuasion of his oratory, in conjunction with some other outward advantages, move and wind the affections of his admiring auditory almost as he pleased." Dr. Owen's works are very voluminous, amounting to seven volumes in folio, twenty in quarto, and about thirty in octavo. In this number are, 3. An Exposition on the Epistle to the Hebrews, 1668, 4 vols. folio. 4. A Discourse of the Holy Spirit, 1674, folio. 5. Θεολογικα; five de Natura, Ortu, Progressu, et Studio, veræ Theologiæ, 1661, 4to. 6. An Enquiry into the Original, Nature, Institution, Power, Order, and Communion, of Evangelical Churches, 1681, 4to. 7. A Vindication of the Nonconformists from the Charge of Schism, in reply to Dr. Stillingfleet, 1686, 4to. 8. An Account of the Nature of the Protestant Religion, 4to. 9. The Divine Original and Authority of the Scriptures, 1659, 8vo. 10. A Complete Collection of Sermons, and several Tracts, with Memoirs of the Author prefixed, published in 1721, folio; from which most of the above particulars are collected. See also Wood's Athen. Oxon. vol. ii. Calamy's Account of Ejected Ministers, vol. ii. and Granger's Biog. Hist. England, vol. ii.

O'WEN (Henry), a learned divine of the church of England, was the son of a gentleman in North Wales, and born at his father's house, near Dolgelly in Merionethshire, in the year 1716. He was instructed in grammar-learning at Ruthin-school in Denbighshire; and at the

age of nineteen he entered of Jesus-college, Oxford. Among the favourite subjects of his pursuit, on his first entrance upon academic studies, was that of the mathematics, which he prosecuted with great ardour and application. Having taken his degrees in arts at the statutable periods, he turned his attention to the study of physics, and was admitted to the degree of bachelor of medicine in the year 1746. For three years he practised as a physician; but being compelled, both by his feelings and his health, to relinquish that profession, his views were entirely directed to the clerical calling. We are not informed when he was admitted into holy orders; but we are told that, early in life, he was made chaplain to sir Matthew Featherstonehaugh, who presented him to the living of Torling in Essex. In the year 1748 he sent into the world his first publication, entitled "*Harmonia Trigonometrica*; or a short Treatise on Trigonometry," 8vo. In 1750, he was presented to the rectory of St. Olave, Hart Street, in the city of London, when he resigned his living of Torling. Soon after this he was appointed chaplain to the bishop of Landaff, afterwards bishop of Durham. In the year 1753, our author proceeded doctor of physics at Oxford. Dr. Owen's next publication appeared in 1755, and consisted of some excellent "Observations on the Scripture Miracles." In 1760, he entered into the matrimonial connexion with a daughter of Dr. Butts, who had been first bishop of Norwich, and afterwards of Ely. Four years after this, he published "Observations upon the Four Gospels," 8vo. which were followed, in 1766, by some valuable "Directions to young Students in Divinity." In 1769, he published his "Enquiry into the State of the Septuagint Version;" a work that afforded satisfactory evidence of the diligence and judgment with which he had prosecuted the study of sacred literature, and of the very respectable abilities which he possessed for engaging in the department of scripture criticism. He was now appointed to preach the lecture founded by the Hon. Robert Boyle; and in 1773 published the discourses which he delivered, under the title of "The Intent and Propriety of the Scripture Miracles considered and explained, in a Series of Sermons preached in the Parish Church of St. Mary-le-Bow," &c. in two volumes, 8vo. During the course of the following year, he published his "*Critica Sacra*; or a short Introduction to Hebrew Criticism," which was afterwards followed by "A Supplement," in answer to some remarks on it by Mr. Raphael Baruh, a learned Jew. In the year 1775, Dr. Owen was presented by bishop Barrington to the vicarage of Edmonton in Middlesex. In 1778, he conferred an obligation upon the learned world by the attention and accuracy which he bestowed in editing the collation of the valuable Cotton MS. of the Book of Genesis with the Vatican copy which was made by the learned Grabe in 1703, but left unpublished at his death. It is entitled "Collatio Codicis Cottoniani Geneseos cum Editione Romana, a viro Clarissimo Joanne Ernesto Grabe jam olim facta; nunc demum summâ curâ edita ab Henrico Owen, M. D. &c." What renders this collation the more important, is the circumstance, that the MS. in question, which perhaps is the most ancient in Europe, was almost entirely destroyed by the fire that happened in the Cotton library in 1731.

In 1785, Dr. Owen rendered a fresh service to the learned reader, by the care and labour which he employed in publishing the octavo edition of Xenophon's Memorabilia, left unfinished by Dr. Edward Edwards, of Jesus-college, Oxford, who had only lived to print the text and version. Some time before the appearance of the work last mentioned, he had published two "Critical Disquisitions;" the first containing some remarks on Masius's edition of the Book of Joshua; and the second, on Origen's celebrated Hexapla; which are acute and sensible, and contributed to increase the reputation of the author among biblical scholars. This piece, and his Enquiry mentioned above, proved introductory to another work

on the subject of the Old Testament scriptures; which was given to the public in 1737, under the title of "A brief Account, Historical and Critical, of the Septuagint Version of the Old Testament; to which is added, a Dissertation on the comparative Excellency of the Hebrew and Samaritan Pentateuch." In this little work, the author has concentrated much valuable information concerning the time when, the persons by whom, and the manner in which, this version was made; the evidence of its accuracy and fidelity, and of the general estimation in which it was held during a long period of years; the causes of the alterations which at different times have been made in it, &c. The last of Dr. Owen's publications, which was another useful and acceptable present to scriptural students, made its appearance in the year 1789, under the title of "The Modes of Quotation used by the Evangelical Writers explained and vindicated," 4to. In this work, the author chiefly examines those quotations which have been introduced by the evangelists, in order to point out the intimate connection between the events of the life of Christ and the prophecies recorded in the Old Testament; and he concludes with proving, that the prophecies in question were justly applied to Christ, or that they are to be considered as referring to him, rather than to subjects more nearly connected with the times and the situations of the prophets. The numerous and respectable list of subscribers by which this work was honoured, fully showed the sense entertained of Dr. Owen's merits by some of the most eminent literary characters of the age.

In the latter part of his life Dr. Owen was afflicted with a lingering illness, which carried him off on the 15th of October, 1795, in the eightieth year of his age. The proofs which he has left behind him of his solid learning, sound critical talents, and zeal for promoting the cause of sacred literature and maintaining the credit of divine revelation, as well as his piety and personal worth, entitle his name to respectful notice, and will transmit it with honour to posterity.

Besides the articles already mentioned, Dr. Owen was the author of, 12. A Collation of the Account of the Dedication of the Temple, in Bowyer's and Nichols's Origin of Printing. 13. Remarks on the Time employed in Cæsar's two Expeditions into Britain, in the second volume of the *Archæologia*. 14. He published the second edition of Rowland's *Mona Antiqua*, corrected in language and matter, and the addition of notes by the ingenious Mr. Lewis Morris. Most of these books were printed by Mr. Bowyer, who, in remembrance of the connexion between him and our author, left the doctor a legacy of a hundred pounds, and such of his Hebrew books and critical books upon the New Testament as he pleased to take. 15. Dr. Owen, likewise, had no small share in preparing for the public eye Mr. Bowyer's Conjectures on the New Testament; for the editor assures us, "that he should not have presumed to venture on a task of such importance as well as difficulty, if he had not been encouraged throughout by the unremitting labour and friendship of Dr. Owen, whose regard for the memory of Mr. Bowyer, and distinguished zeal for the interests of sacred literature, prompted him not only to enrich the volume with a considerable number of new notes, but also kindly and attentively to superintend the correction of the whole." 16. Our author also assisted Mr. Nichols in editing the quarto edition of Mr. Bowyer's Greek Testament, in 1783, as we learn from this expression in the inscription of it to Dr. Owen, "Ipsius auxilio concinnatam." *Gent. Mag.* 1778 and 1795. *New Annual Register* for 1784, 1787, and 1789.

O'WEN'S BAY (St.), a bay on the west coast of the island of Jersey, with a town or village of the same name: six miles west-north-west of St. Helier.

O'WEY, a small island of the Atlantic, near the north-west coast of Ireland. Lat. 55. 3. N. lon. 6. 21. W.

OWHARRE'E, a harbour on the west coast of Hua-

heine, one of the Society Islands, in the South Pacific Ocean. Lat. 16. 54. S. lon. 151. 8. W.

OWHYHE'E, an island in the North Pacific Ocean, discovered by Capt. Cook, Nov. 30, 1778. This is the easternmost, and by far the largest, of the group called Sandwich Islands; it is of a triangular shape, and nearly equilateral. The following particulars relating to this island are extracted from the account of it by Capt. King, who visited it again after the death of Capt. Cook, in March 1779. (See Cook's Third Voyage, vol. iii.) The angular points make the north-east and south extremities, of which the northern is in lat. 20. 17. N. lon. 204. 2. E. the eastern in lat. 19. 34. N. lon. 205. 6. E. and the southern extremity in lat. 18. 54. N. lon. 204. 15. E. and its greatest length, which lies in a direction nearly north and south, is 85 miles, its breadth is 72 miles; and it is about 255 geographical, or 293 English, miles in circumference.

The whole island is divided into six large districts: Amakooa and Aheedoo, which lie on the north-east side; Apooana and Kaoo, on the south-east; Akona and Koarra on the west. The districts of Amakooa and Aheedoo are separated by a mountain called *Mouna Kaah*, or the Mountain Kaah, which rises in three peaks, perpetually covered with snow, and may be clearly seen at forty leagues distance; its height is estimated at no less than 18,400 feet. To the north of this mountain the coast consists of high and abrupt cliffs, down which fall many beautiful cascades of water. The country rises inland with a gentle ascent, is intersected by deep narrow glens, or rather chasms, and appeared to be well cultivated, and sprinkled over with a number of villages. The Snowy Mountain is very steep, and the lower part of it covered with wood. The coast of Aheedoo, which lies to the south of Mouna Kaah, is of a moderate height, and the interior parts appear more even than the country to the north-west, and less broken by ravines. The coast to the north-east of Apooana, which forms the eastern extremity of the island, is low and flat; the acclivity of the inland parts is very gradual, and the whole country covered with cocoa-nut and bread-fruit trees. At the south-west extremity the hills rise abruptly from the sea-side, leaving but a narrow border of low ground towards the beach. We were pretty near the shore at this part of the island, and found the sides of the hills covered with a fine verdure; but the country seemed to be very thinly inhabited.

On doubling the east point of the island, we came in sight of another snowy mountain, called *Mouna Roa*, or the Extensive Mountain, which continued to be a very conspicuous object all the while we were sailing along the south-east side. It is flat at the top, making what is called by mariners table-land: the summit was constantly buried in snow; and we once saw its sides also slightly covered for a considerable way down, but the greatest part of this disappeared again in a few days. According to the tropical line of snow, as determined by Mr. Condamine, from observations taken on the Cordilleras, this mountain must be at least 16,020 feet high, which exceeds the height of the Pico de Teyde, or Peak of Teneriffe, by 724 feet, according to Dr. Heberden's computation; or 368c, according to that of the chevalier de Borda. The peaks of Mouna Kaah appeared to be about half a mile high; and, as they are entirely covered with snow, the altitude of their summits cannot be less than 18,400 feet. But it is probable that both these mountains may be considerably higher; for, in insular situations, the effects of the warm sea-air must necessarily remove the line of snow, in equal latitudes, to a greater height than where the atmosphere is chilled on all sides by an immense tract of perpetual snow.

The coast of Kaoo presents a prospect of the most horrid and dreary kind; the whole country appearing to have undergone a total change from the effects of some dreadful convulsion. The ground is every-where covered with cinders, and intersected in many places with black streaks, which seem to mark the course of a lava that has flowed,

not

not many ages back, from the mountain Roa to the shore. The southern promontory looks like the mere dregs of a volcano. The projecting head-land is composed of broken and craggy rocks, piled irregularly on one another, and terminating in sharp points. Notwithstanding the dismal aspect of this part of the island, there are many villages scattered over it, and it certainly is much more populous than the verdant mountains of Apooa. Nor is this circumstance hard to be accounted for. As these islanders have no cattle, they have consequently no use for pasturage, and therefore naturally prefer such ground as either lies more convenient for fishing, or is best suited to the cultivation of yams and plantains. Now amidst these ruins there are many patches of rich soil, which are carefully laid out in plantations; and the neighbouring sea abounds with a variety of most excellent fish, with which, as well as with other provisions, we were always plentifully supplied. The whole east side of the island, from the northern to the southern extremity, does not afford the smallest harbour or shelter for shipping.

The south-west parts of Akona are in the same state with the adjoining district of Kaoo; but farther to the north the country has been cultivated with great pains, and is extremely populous. In this part of the island is situated Karakakoo Bay. Along the coast nothing is seen but large masses of slag, and the fragments of black scorched rocks; behind which the ground rises gradually for about two miles and a half, and appears to have been formerly covered with loose burnt stones. These the natives have taken the pains of clearing away, frequently to the depth of three feet and upwards; which labour, great as it is, the fertility of the soil amply repays. Here, in a rich ashy mould, they cultivate sweet potatoes, and the cloth-plant. The fields are inclosed with stone fences, and are interperfed with groves of cocoa-nut trees. On the rising ground beyond these the bread-fruit trees are planted, and flourish with the greatest luxuriance. Koara extends from the westernmost point of the northern extremity of the island; the whole coast between them forming an extensive bay, called Toe-yah-yah, which is bounded to the north by two very conspicuous hills. Toward the bottom of this bay, there is foul corally ground, extending upwards of a mile from the shore, without which the soundings are regular, with good anchorage, in twenty fathoms. The country, as far as the eye could reach, seemed fruitful and well inhabited, the soil being in appearance of the same kind with the district of Kaoo; but no fresh water is to be got here.

A party advanced into the land, to the distance of three or four miles from the bay; they found the country as before described; the hills afterwards rose with a more sudden ascent, which brought them to the extensive plantations that terminate the view of the country, as seen from the ships. These plantations consist of the tarrow or eddy-root, and the sweet potatoe, with plants of the cloth-tree, neatly set-out in rows. The walls that separate them are made of the loose burnt stones which are got in clearing the ground; and, being entirely concealed by sugar-canes, planted close on each side, make the most beautiful fences that can be conceived. The party stopped for the night at the second hut they found amongst the plantations, about six or seven miles, as they estimated the distance, from the ships. The prospect from this spot was very delightful; they saw the ships in the bay before them; to the left a continued range of villages, interperfed with groves of cocoa-nut trees, spreading along the sea-shore; a thick wood stretching out of sight behind them; and to the right an extent of ground laid out in regular and well-cultivated plantations, as far as the eye could reach. Near this spot, at a distance from any other dwelling, the natives pointed out to them the residence of an hermit, who, as they said, had formerly been a great chief and warrior, but had long ago quitted the shores of the island, and now never stirred from his cottage. They prostrated themselves as they approached

him, and afterwards presented to him a part of such provisions as they had brought with them. His behaviour was easy and cheerful; he scarcely showed any marks of astonishment at the sight of our people; and, though pressed to accept of some of our curiosities, he declined the offer, and soon withdrew to his cottage. He was described as by far the oldest person any of the party had ever seen, and judged to be, by those who computed his age at the lowest, upwards of 100 years old.

The party still proceeded, and entered a thick wood, through which their progress was slow; and, after they had advanced about ten miles in the wood, they found themselves on a sudden within sight of the sea, and at no great distance from it. They therefore retraced their steps for six or seven miles to an unoccupied hut, where they had left three of the natives and two of their own people, and the small stock that remained of their provisions. Their provisions being exhausted, they found it advisable to return to some of the cultivated parts of the island, and quitted the wood by the same path by which they had entered it. Having obtained a fresh supply, they marched along the skirts of the wood for six or seven miles, and entered it again, pursuing their course for the first three miles through forests of lofty spice-trees. In passing through the woods, they found many canoes half finished, and here and there a hut; but saw none of the inhabitants. In their farther progress, they experienced the want of water, as, in a course of twenty miles, they had met with no springs. At length they determined to return to the ships, after taking a view of the country from the highest trees which the place afforded. From this elevation they saw themselves surrounded on all sides with wood towards the sea; they could not distinguish, in the horizon, the sky from the water; and between them and the Snowy Mountain, which they had once intended to ascend and examine, was a valley about seven or eight miles broad, above which the mountain appeared only as a hill of a moderate size. Finding themselves about nine miles north-east of the ships, they directed their march toward them through the plantations. As they passed along, they did not observe a single spot of ground that was capable of improvement left unplanted; and, indeed, it appeared, from their account, hardly possible for the country to be cultivated to greater advantage for the purposes of the inhabitants, or made to yield them a larger supply of necessaries for their subsistence. They were surprised to meet with several fields of hay; and, on enquiring to what use it was applied, were told it was designed to cover the young tarrow grounds, in order to preserve them from being scorched by the sun. They saw a few scattered huts among the plantations, which served for occasional shelter to the labourers; but no villages at a greater distance than four or five miles from the sea. Near one of them, which was situated about four miles from the bay, they discovered a cave forty fathoms in length, three in breadth, and of the same height. It was open at each end; its sides were fluted as if wrought with a chisel; and the surface was glazed over, perhaps by the action of fire. There are supposed to be on this island about 150,000 inhabitants. So long as the name of Capt. Cook shall be remembered, this island will not be forgotten; for he here fell a victim to a strange concatenation of events. See Cook, vol. v.

We have the following account of the inhabitants of this island in Ellis's Authentic Narrative. "The men are above the middle-size, stout, well-made, and fleshy, but not fat. Corpulency is not altogether so great a mark of distinction in these as in the Society Isles; and tallness, for which the Otaheiteans have great partiality, is also overlooked. Their colour is mostly of a brown-olive. The women are in general masculine, though there are some delicately made; and the voice of them all is soft and feminine. The hair, both of the head and beard, is black; that of the head, the men wear in the form of a helmet, that is, a long frizzled ridge from the forehead to the

the neck, the sides being much shorter. This fashion seems to prevail only among the principal people, that of the inferior sort being of an equal length in every part. Most of them were very desirous of parting with their beards, which, they said, were disagreeable and troublesome; and were fond of being shaved by our people. Some of the priests wore their beards long, and would not on any account part with them. The women wear their hair long before, but very short behind, which is not the most becoming mode; and, like those of the Friendly Isles, they have a way of rendering it of different colours, red, yellow, and brown. 'The features of both sexes are good, and we saw some of the females who might really be called fine women. Their teeth are even, and perfectly white. In general, they seem to be very healthy, and we observed several who appeared to be of great age.'

In the year 1812, we saw at Plymouth a native of Owhyhee, son of a man of rank there, who came over to see this country. He came in the Isaac Todd free ship, from Nootka Sound, with peltry, for London. He much amused the Plymouth audience at the theatre, by the expressive astonishment he evinced while the performance was going on. He has the exact countenance, and bushy hair, described above, and as expressed in the plates of Capt. Cook's last voyage.

"The custom of tattooing prevails greatly among these people, but the men have a much larger share of it than the women; many have one half their body, from head to foot, marked in this manner, which gives them a most striking appearance. It is done with great regularity, and looks remarkably neat: some have only an arm marked in this manner, others a leg; some again have both arm and leg, and others only the hand. The women are, for the most part, marked upon the tip of their tongue; but of these we saw but few. Both sexes have a particular mark, according to the district in which they live; or it is rather the mark of the *arce*, or principal man, under whose jurisdiction they more immediately are.

"Both men and women are very cleanly in their persons; the latter wash their whole body in fresh-water twice, and sometimes three times, a-day. There are no people in the world who indulge themselves more in their sensual appetites; in fact, they carry it to a most scandalous and shameful degree, and in a manner not proper to be mentioned.

"Their clothing consists of cloth of different kinds: that worn by the men, which is called *marro*, is about half a yard wide, and four yards long; that of the women three quarters of a yard wide, and of the same length as the men's: this they call *pah-ouwa*; they both wear it round their middle, but the men pass it between their legs. The principal ornaments of the men are the feather caps and cloaks; some of the latter reach down to their heels, and have a most magnificent appearance. They are made for the most part of red and yellow feathers, which are tied upon fine net-work. The women too have their share in the ornamental way; that which they value most is the *orai*; this is a kind of ruff or necklace, made of red, green, black, and yellow, feathers, curiously put together, and in most elegant patterns. They never think themselves dressed without one or two of these round their necks, and those who can afford it wear many. Others again are composed of small variegated shells, disposed in a very neat manner; and some consist of several rows of twisted hair, with a piece of carved wood or bone, highly polished, the bottom part forming a curve. The higher the quality of the wearer, the greater is the size of the wood or bone, and the quantity of the twisted hair. The next thing is the *poo-remah*, or bracelet; the most valuable are made of boar's tusks fastened together side by side with a piece of string, by means of a hole drilled through the middle; the larger the tusks, the greater the value. Sometimes two shells tied round the wrists, with twisted or braided hair, serve the purpose

of bracelets; but even in this case they show great nicety, being particularly careful to match them as near as possible. They were prodigiously fond of those we gave them, which were only a few beads, secured by thread upon a strip of scarlet cloth, and made to button round the wrist. So much did they at first value them, that a small hatchet and one of these would purchase a hog, which without it could not have been bought for three large hatchets. The women were perpetually teasing the men to accept of their various articles for these bracelets; at least one of them was always to make a part of the price."

While Capt. Vancouver was at Owhyhee, a formal cession of the island was made to the British. This strange story is related at great length in the 3d vol. of his Voyage round the World. On the 25th of February, the king, with the chiefs of many of the districts of the island, assembled "in grand council" on-board the Discovery; all the officers of the two ships being present. "The king, Tamaahmaah, opened the business in a speech, which he delivered with great moderation and equal firmness. He explained the reasons that had induced him to offer the island to the protection of Great Britain; and recounted the numerous advantages that himself, the chiefs, and the people, were likely to derive by the surrender they were about to make." Several other chiefs likewise spoke. In all their speeches, their religion, government, and domestic economy, were noticed; and it was clearly understood that no interference was to take place in any of these respects; that the chiefs and priests were to officiate with the same authority as before, and that no alteration in these particulars was in any degree thought of or intended. The preliminaries being fully discussed, the king repeated his former proposition, which was now unanimously approved; and the whole party declared their assent by saying that they were no longer *Tanato no Owhyhee*, but *Tanato no Brittanee*; "no longer men of Owhyhee, but men of Britain." This being made known to the people in the surrounding canoes, the same expressions were repeated by them. Some officers were then sent on-shore, who "displayed the British colours, and took possession of the island in the name of his majesty." The ships now fired a salute, and the following inscription on copper was deposited at the royal residence: "On the 25th of February, 1794, Tamaahmaah, king of Owhyhee, in council with the principal chiefs of the island assembled on-board his Britannic majesty's sloop Discovery in Karakakooa-bay, and in the presence of George Vancouver, commander of the said sloop; Lieut. Peter Puget, commander of his said majesty's armed tender the Chatham; and the other officers of the Discovery; after due consideration, unanimously ceded the said island of Owhyhee to his Britannic majesty, and acknowledged themselves to be subjects of Great Britain."

How far captain Vancouver was authorized or empowered, by circumstances, to receive these islanders into the protection of the British empire, or what obligations his having so done has imposed on this country, does not appear to us. We have related the business as it happened, and shall leave the reader to make his own comment.

It was not till the present year that we heard any thing of an intention to convert these subjects of his Britannic majesty to the national religion. The following is from the Times newspaper of Jan. 6, 1820. "A missionary-establishment is about to be made on the island of Owhyhee, &c. The natives have already made very considerable advances in civilization. Their king wrote a very legible hand, a specimen of which we have seen. His prime-minister was named Mr. Pitt; his minister of justice was tattooed in one half of his body, the other half was of a bright and shining colour, the natural complexion of the natives. He would sit with great dignity and hear the parties, plaintiff and defendant; and to whichever of the parties he turned the sable side of his countenance judgment was given. The king, in imitation

tion of European monarchs, gave a pompous entertainment on his birth-day. An American ship having been seen off the island, a canoe came alongside, and the captain and hands were all much astonished to hear the natives speak the English language. The canoe contained no less a personage than Mr. Pitt. He came on-board, and informed the captain of the character of his guest; he stated, that he came by the orders of his royal master, in whose name he demanded the donation of a bottle of rum, which was to be drank upon his birth-day."

The above is probably copied from an American paper: the following (*Times*, Apr. 1.) is confessedly from the Boston Centinel: "We have seen letters from Owhyhee, which confirm the death of the celebrated king Tamaah-maah, and that the event had occasioned so much disunion among his successors and officers as to threaten a revolution and civil war. The old king left upwards of 150,000 dollars in specie in his coffers; the division of which was also a bone of contention. We have had reports, that Capt. Downes, in the Macedonian, would visit this island. Would to heaven he would, and take possession as an arbiter of the differences which so unhappily reign here. It ought to be a colony of the United States." We are sorry we cannot complete this article, by informing our readers what measures have been taken by the ministers of George the Fourth, for the defence and preservation of this most valuable colony!

The French navigator, Perouse, describes, in his voyage, a reef of shoal-banks, a few degrees north of Owhyhee, where he suggested that a pearl-fishery might be established to advantage; and he states, that the French frigates sailed over them. Some commercial persons, in consequence, lately (1813) engaged divers, and visited the spot; but were astonished to find not only that no vessel can now sail over these banks, but that, though of large extent, they afford but two or three feet water, and in many places exhibit verdant spots above water. This change has been ascribed solely to the unremitting labours of polype and coral insects; and confirms the hypothesis, that many other of the groupes of islands that stud this vast ocean derive their origin from similar causes.

O'WING, *part.* [from *owe*. A practice has long prevailed among writers; to use *owing*, the active participle of *owe*, in a passive sense, for *owed* or *due*. Of this impropriety some writers were aware; and, having no quick sense of the force of English words, have used *due* in the sense of consequence or imputation, which by other writers is only used of *debt*. We say that money is *due* to us; they say likewise, the effect is *due* to the cause. *Johnson*.] Consequential.—This was *owing* to an indifference to the pleasures of life, and an aversion to the pomps of it. *Atterbury*.—Due as a debt. Here *due* is undoubtedly the proper word.—The debt, *owing* from one country to the other, cannot be paid without real effects sent thither to that value. *Locke*.

You are both too bold;
I'll teach you all what's *owing* to your queen. *Dryden*.
Imputable to, as an agent.—If we estimate things, what in them is *owing* to nature, and what to labour, we shall find in most of them $\frac{22}{100}$ to be on the account of labour. *Locke*.—The custom of particular impeachments was not limited any more than that of struggles between nobles and commons; the ruin of Greece was *owing* to the former, as that of Rome was to the latter. *Swift*.

OWL, *f.* [ule, Sax. *hulote*, Fr. and Scott. *Johnson*.—Icel. *yla* or *ylgia*, an owl, from *yla*, to cry out. *Todd*.] A bird that flies about in the night and catches mice.—Sick was the fun, the *owl* forsook his bower. *Pope's Dunciad*.

Return to her!
No! rather I abjure all roofs, and chuse
To be a comrade with the wolf and *owl*. *Shakespeare*.
Then lady Cynthia, mistress of the shade,
Goes, with the fashionable *owls*, to bed. *Young*.

OWL's HEAD', a cape on the south-east coast of Nova Scotia. Lat. 44. 42. N. lon. 62. 50. W.

OWL-LIGHT, *f.* Glimmering light; twilight.—Church-history making an important part of our theological studies, the antiquarian, who delights to solace himself in the benighted days of monkish *owl-light*, sometimes passes for the divine. *Warburton's Charge to the Clergy*, 1761.

OWL-LIKE, *adj.* Resembling an owl in look or quality.—Now like an *owl-like* watchman he must walk. *Donne's Sat. 2.*

At this deep Sidrophel look'd wife;
And, staring round with *owl-like* eyes,
He put his face into a posture
Of sapience, and began to bluffer. *Hudibras*.

OWL'LAH, a town of Hindoostan, in Rohilcund: twelve miles east of Biffowia.

OWL'LET, *f.* An owl; a little owl:
Adder's fork, and blind-worm's sting,
Lizard's leg, and *owl's* wing. *Shakespeare's Macbeth*.

OW'LER, *f.* One who carries contraband goods: in the legal sense, one that carries out *wool* illicitly. Perhaps from the necessity of carrying on an illicit trade by night: but rather, perhaps, a corruption of *wooller*, by a colloquial neglect of the *v*, such as is often observed in *woman*, and by which *goodwife* is changed to *goody*. *Wooler*, *owler*.—By running goods, these graceless *owlers* gain. *Swift*.

OW'LING, *f.* in law, is the offence of transporting wool or sheep out of the kingdom, to the detriment of its staple manufacture. This was forbidden at common law, and more particularly by stat. 11 Edw. III. c. 1. when the importance of our woollen manufacture was first attended to; and there are now many later statutes relating to this offence, the most useful and principal of which are those enacted in the reign of queen Elizabeth, and since. The stat. 8 Eliz. c. 3. makes the transportation of live sheep, or embarking them on-board any ship, for the first offence forfeiture of goods, and imprisonment for a year, and that at the end of the year the left hand shall be cut off in some public market, and shall be there nailed up in the openest place; and the second offence is felony. The statutes 12 Car. II. c. 32. and 7 & 8 Will. III. c. 28. make the exportation of wool, sheep, or fullers-earth, liable to pecuniary penalties, and the forfeiture of the interest of the ship and cargo by the owners, if privy; and confiscation of goods, and three years imprisonment to the master and all the mariners. And the stat. 4 Geo. I. c. 11. (amended and farther enforced by 12 Geo. II. c. 21. and 19 Geo. II. c. 34.) makes it transportation for seven years, if the penalties be not paid.

OW'LISH, *adj.* Resembling an owl.—Every one, while it lasted, was very gay and busy in the morning, and very *owlish* and very tipsy at night. *Gray to Dr. Warton*, 1749.

OWN, *f.* [aȝen, Sax. *eygen*, Dut. *aigan*, Icel. from *eigia*, to possess.] This is a word of no other use than as it is added to the possessive pronouns, my, thy, his, our, your, their. It seems to be a substantive; as, *my own*, *my peculiar*: but is, in reality, the participle passive of the verb *owe*, in the participle *owe* or *own*: *my own*; the thing *owned* by, or belonging to, me:

Inachus, in his cave alone,
Wept not another's losses, but his *own*. *Dryden*.

It is added generally by way of emphasis or corroboration.—Every nation made gods of their *own*, and put them in high places. 2 *Kings*, xvii. 29.

I yet never was forsworn,
Scarcely have coveted what was *my own*. *Shakespeare*.
Will she thy linen wash, or hosen darn,
And knit thee gloves made of her *own* spun yarn. *Gay*.
Passion and pride were to her soul unknown,
Convinc'd that virtue only is our *own*. *Pope*.
Sometimes

Sometimes it is added to note opposition or contradistinction; domestic, not foreign: mine, his, or your's; not another's.—There's nothing sillier than a crafty knave out-witted, and beaten at his *own* play. *L'Estrange*.

These toils abroad, these tumults with his *own*,
Fell in the revolution of one year. *Daniel*.

King's or *Queen's own*, a term which has been attached to some particular regiments ever since the Revolution in 1688. Thus the Fourth, which landed with William III. is always called the Fourth, or King's Own, and the Second Regiment of Foot, the Queen's Own. We have had instances, during the late war, of militia battalions having adopted the term of King's Own. This occurred when his late majesty visited Portsmouth after the battle of the 1st of June, 1794. The marquis of Buckingham (who was colonel of the militia of that name, and which was doing duty there) solicited permission for his corps to become royal, and to bear the appellation of King's Own. The facings, which before were yellow, were consequently changed to garter-blue. By which circumstance, the county of Buckingham sends out a very fine corps of men, who, being called the King's Own, and thereby approaching the regulars without actually being so, seem to have left their ancient comrades of the militia, without obtaining any footing in the line. The Staffordshire militia regiment (which had often done duty at Windsor, and was humorously called his majesty's yellow guards) also changed its facings to royal blue, with the same mark of distinction. The emblem of these corps (says Mr. James) ought to be Mahomet's coffin, and the motto *Medio tutissimus*. The marines have also had their facings changed from white to blue, but they are not called the King's Own. *James's Mil. Dict.*

To O'WN, *v. a.* To acknowledge; to avow for one's own:

When you come, find me out,
And *own* me for your son. *Dryden's Cleom.*

To possess; to claim: to hold by right.—Tell me, ye Trojans, for that name you *own*. *Dryden*.

Others on earth o'er human race preside;
Of these the chief the care of nations *own*,
And guard with arms divine the British throne. *Pope*.

To avow.—Nor hath it been thus only amongst the most civilized nations; but the barbarous Indians likewise have *owned* that tradition. *Wilkins*.

I'll venture out alone,
Since you, fair princess, my protection *own*. *Dryden*.

To confess; not to deny.—Make this truth so evident, that those who are unwilling to *own* it may yet be ashamed to deny it. *Tillotson*.—It must be *owned*, that, generally speaking, parents are never more fond of their daughters than when they see them too fond of themselves. *Law*.

O'WNER, *f.* One to whom any thing belongs; master; rightful possessor.—A freehold, though but in ice and snow, will make the *owner* pleased in the possession, and stout in the defence of it. *Addison's Freeholder*.—Victory hath not made us insolent, nor have we taken advantage to gain any thing beyond the honour of restoring every one's right to their just *owners*. *Atterbury*.

What is this wit, which must our cares employ?
The *owner's* wife, that other men enjoy. *Pope*.

O'WNERSHIP, *f.* Property; rightful possession.—In a real action, the proximate cause is the property or *ownership* of the thing in controversy. *Ayliffe's Parergon*.

OW'RAM (North), a township of Yorkshire, in the West Riding, with 4887 inhabitants, including 1332 employed in trade and manufactures: three miles south-east of Bradford.

OW'RAM (South), a township of Yorkshire, in the West Riding, with 3148 inhabitants, including 1404 em-

ployed in trade and manufactures: two miles south-east of Halifax.

OW'RE, a village of Dorsetshire, in the Isle of Purbeck, four miles north-east of Corfe. This was formerly the chief, if not the only, quay for exporting stone, now enjoyed by Swanwich. Near it are several stone-quarries. Two islands in the bay of Pool belong to this hamlet; viz. Furfley, and St. Helen's, or Green-Island; the latter of which was formerly joined to it by a bridge, whose ruins are visible. It consists of about twenty acres; and on it formerly was a chapel.

OW'RE, a village in Hampshire, near Calshot-castle, I. W.—A village in Shropshire, north-east of Atherley.

OW'RESBY, a village in Lincolnshire, between Normanby and the river Ankaam.

OWRUC'ZE, a town of Lithuania, in the palatinate of Kiev: 96 miles north-west of Kiev, and 310 west of Warsaw.

OW'RUM (North and South), villages in the parish of Halifax, Yorkshire.

OW'SCRAW, a town of Hindoostan, in Bahar: twenty miles west of Rotas.

OWSH, a town of Turkestan, on a river which runs into the Sihon: thirty miles south-south-east of Andegan.

OW'THORN, a village near Hull in Yorkshire. The tower of the church, better known by the name of the Sister Churches, an ancient landmark on the coast of Holderness, being undermined by the sea, fell with a tremendous crash, on the night of Feb. 16, 1816; at which time the river Humber had risen to an height unequalled since Jan. 25, 1788. The body of the church had been taken down and rebuilt at Rimswell in 1801.

OX, *f.* plur. *oxen*, [oxa, Sax. *oxe*, Dan.] The general name for black cattle. See the article BOS.—I saw the river Clitumnus, celebrated by the poets for making cattle white that drink of it. The inhabitants of that country have still the same opinion, and have a great many *oxen* of a whitish colour to confirm them in it. *Addison*.

Sheep run not half so tim'rous from the wolf,
Or horse or *oxen* from the leopard,
As you fly from your oft-subdued slaves. *Shakespeare*.

A castrated bull.—Although there be naturally more males than females, yet artificially, that is, by making geldings, *oxen*, and wethers, there are fewer. *Graunt*.

The field is spacious I design to sow
With *oxen* far unfit to draw the plough. *Dryden*.

OX'-BANE, *f.* A plant. *Ainsworth*.

OX'-BOW, *f.* The yoke in which oxen are confined to labour.

OX-CHEEK, *f.* One half of an ox's head.

OX-EYE, *f.* in sea-language, a name given by seamen to those dreadful storms that are sometimes met with on the coast of Guinea; for at first it appears in the form of an ox's eye, and not much bigger; but it descends with such celerity, that in a very little space of time, and often before they can prepare themselves for it, it seems to them to overspread the whole hemisphere; and, at the same time, forces the air with so much violence, that the ships are sometimes scattered several ways, and sometimes are sunk downright.

OX'-EYE, *f.* A plant. See BUPHTHALMUM.

Bring corn-flax, tulips, and Adonis' flower,
Fair *ox-eye*, goldy-locks, and columbine. *B. Jonson*.

OX-EYE of old Authors. See ANTHEMIS.

OX-EYE DAISY. See CHRYSANTHEMUM.

OX-EYED, *adj.* Having large or full eyes, like those of an ox.—Homer useth that epithet of *ox-eyed*, in describing Juno, because a round black eye is the best. *Burton's Anat. of Mel.*

OX'-FEET, *f.* A term applied to the feet of horses, when the horn of the hind-feet cleaves just in the middle of the fore-part of the hoof, from the coronet to the shoe; they

they are not common, but very troublesome, and often make a horse halt.

OX'-FLY. See *TABANUS bovinus*.

OX'-GALL, f. The gall, or bile, of the ox; a substance much used by painters, and occasionally for other purposes.

It had been long a desideratum to find out a method of preparing ox-gall for the use of painters, so as to avoid the disagreeable smell which it contracts by keeping in a liquid state, and at the same time to preserve its useful properties. Mr. Richard Cathery, of Mead's Row, near the Asylum, has invented a method of doing it with very little expense, which will be to those who use gall a great saving, as it will prevent it from putrifying, or breeding maggots. Mr. C. communicated his process to the Society of Arts in the Adelphi, who, at their session in May 1810, voted him a gratuity of ten guineas.

The following is Mr. Cathery's process for preparing the ox-gall in a concentrated state: Take a gall fresh from the ox, and put it in a basin: let it stand all night to settle; then pour it off from the sediment into a clean earthen mug, and set it in a saucepan of boiling water over the fire, taking care that none of the water gets into the mug. Let it boil till it is quite thick; then take it out, and spread it on a plate or dish, and set it before the fire to evaporate; and, when as dry as you can get it, put it into small pots, and tie papers over their tops to keep the dust from it. One gall, thus prepared, will serve an artist a long time, as it will keep a great number of years. It will be a convenient article for use, as a small cup of it may be placed in the same box which contains other colours, where it will be always ready. The qualities of gall are well known to artists in water-colours, particularly to those who colour prints, as many colours will not, without gall, work free on such paper, on account of the oil that is used in the printing-ink. The artists who make drawings in water-colours also use gall in the water which they mix their colour with, as it clears away that greasiness which arises from moist hands upon paper, and makes the colour to work clear and bright. This preparation is ready for use in a few minutes, all that is necessary being to dissolve about the size of a pea of it in a table-spoonful of water. It is also of great use to house-keepers, sailors, and others, to clean woollen clothes from grease, tar, &c. and will be found advantageous for many other purposes.

Accompanying the communication to the Society, there were certificates from Mr. Bayfield and Mr. Edwards, both botanical colourers; stating, that they have used the ox-gall prepared by Mr. Cathery, and find it to answer better than gall in a liquid state; that this preparation is free from disagreeable smell, and is much cheaper, as one ox-gall thus prepared will last one person for two years, and be as fresh as if just taken from the ox. A certificate was received also from Mr. James Stewart, St. Martin's-street, Leicester-square, stating, that he lately belonged to the *Vestal* frigate, and that he took out with him, in a voyage to Newfoundland, a large pot of the prepared ox-gall for the purpose of washing his greasy clothes for two years; that he found it very serviceable, and to keep its virtue as well as the first day.

OX'-GANG of Land, f. Ordinarily taken for fifteen acres. It is sometimes called *oxgate*; and, in the north, corruptly, *oxfen*.—A carucate of land contains 100 acres; eight *ox-gangs* make a carucate; and every *ox-gang* contains 15 acres. *Kelham's Domesday Book Illustr.*

OX'-GOAD, f. The pointed rod with which oxen are driven in their work.—Shamgar slew of the Philistines six hundred men with an *ox-goad*. *Jud.* iii. 31.

Mr. Maundrell observes, that in the Holy Land they use, in ploughing, goads of an extraordinary size. Upon measuring of several, he found them about eight feet long, and at the bigger end six inches in circumference. They were armed at the smaller end with a sharp prick

for driving the oxen, and at the other end with a small spade, or paddle of iron, strong and massy, for cleansing the plough from the clay that encumbers it in working. "May we not from hence conjecture, (says he,) that it was with such a goad as one of these that Shamgar made that prodigious slaughter related of him in the above quotation. I am confident that whoever should see one of these instruments, would judge it to be a weapon, not less fit, perhaps fitter, than a sword for such an execution. Goads of this sort I saw always used hereabouts, and also in Syria: and the reason is, because the same single person both drives the oxen, and also holds and manages the plough; which makes it necessary to use such a goad as is above described, to avoid the encumbrance of two instruments." *Journey from Aleppo to Jerusalem*, p. 110.

OX'-HARROW, f. A very large harrow, called in some counties a *drag*.

OX'-HEAD, f. The head of an ox:

I'd set an *ox-head* to your lion's hide,
And make a monster of you.

Shakespeare.

OX'-HEAL, f. A plant.

OX'-HIDE, f. The skin of an ox. On the artifice connected with an ox's hide, by which plenty of land was said to have been obtained for the founding or building of Carthage and other places, see the Gentleman's Magazine for 1771. p. 500.

OX'-LIKE, adj. Resembling an ox in look or quality.—With *ox-like* eyes. *Pope's Dunciad*.

I made the mighty elephant,
Who, *ox-like*, feeds on every herb and plant. *Sandys.*

OX'-LIP, f. [*oxan-rhippa*, Sax. this word should therefore be written *ox-slip*.] The same with *cow-slip*. See *PRIMULA*.—The cowslip then they couch, and the *ox-slip*, for her meet. *Drayton's Polyolb.*

A bank whereon the wild-thyme blows,
Where *ox-lip* and the nodding violet grows. *Shakespeare.*

OX MOUNTAIN, a mountain of Ireland, in the county of Sligo: ten miles west-south-west of Sligo.

OX'-STALL, f. A stand for oxen.

OX'-TONGUE, f. A plant. See *PICRIS*.

OX'ALATS, f. in chemistry, are combinations of the oxalic acid with the bases of salts.

OXALIC ACID, a vegetable acid, naturally formed in the *Oxalis acetosella*, or wood-sorrel, from which it takes its name. See the article *CHEMISTRY*, vol. iv. p. 165, 329.

OXALIDI AFFINIS. See *OXALIS*.

OX'ALIS, f. [from *αλς*, Gr. acid.] **WOOD-SORREL**; in botany, a genus of the class decandria, order pentagynia; natural order of grinales, (gerania, *Juss.*) Generic characters.—Calyx: perianthium five-parted, acute, very short, permanent. Corolla: five-parted, often cohering by the claws, erect, obtuse, emarginate: border spreading. Stamina: filaments ten, capillary, (awl-shaped, *Jacquin*.) erect; the outer ones shorter. Antheræ roundish, grooved. Pistillum: germen five-cornered, superior; styles five, filiform, the length of the stamens; stigmas blunt. Pericarpium: capsule five-cornered, five-celled, ten-valved, (five-valved, *Jacquin*.) gaping at the corners longitudinally. Seeds roundish, flying out-covered with a fleshy elastic aril. Capsule in some short, with solitary seeds: in others long, with many seeds: the filaments of most coalesce at the base.—*Essential Character*.—Calyx five parted; petals five; often connected at the base; capsule five-celled, five-cornered, opening at the corners. Seeds arilled.

This curious and pretty genus, of which only thirteen species are found in the first edition of the *Species Plantarum*, is augmented to twice that number in the *Syst. Veg.* ed. 14. The discoveries of recent botanists, at the Cape of Good Hope, have added a much greater number to the original stock. *Jacquin*, in a valuable quarto monograph on the genus, describes 96. Willdenow reduces them

them to 93, and of these 58 are, or have been, cultivated in the Royal Gardens at Kew. The fruit in many of the species is unknown; but in those that are known, the capsule is more or less quinqueangular, seldom five-winged, cylindric or ovate, generally villose, five-celled, and longitudinally five-valved. The seeds in some very few, in others many, in a longitudinal row lying over each other, roundish, somewhat compressed, and transversely wrinkled. Each seed is inclosed in a white coriaceous pellucid and very-shining pellicle, which is a sort of aril. This aril becomes dry in the ripe seed, and then separates with a considerable elastic force into two cohering valves, sets the seed free, and, together with it, is violently cast forth at the opening angles of the capsule. The capsules then dry and contract. The aril retains the wrinkles of the seed impressed upon it. Linnæus first gave the name of *Oxalis* to this genus, in his *Hortus Cliffortianus*; and the name has been adopted by most modern botanists. The *oxalis* of Pliny, however, seems to be a species of *rumex*, *lapathum*, or dock; and probably *Rumex acetosella*, or common sorrel. The older botanists, and Haller, Scopoli, and Allioni, among the moderns, name the genus, with more judgment, *Oxys*, Pliny having described the *Oxys* as having ternate leaves; he probably means our *Oxalis corniculata*, which is a native of Italy. In deference, however, to Linnæus and his followers, the name of *Oxalis* is here adopted.

Of the ninety-six species here set down from Jacquin's fine work on this genus, two only are natives of Europe, one of the East Indies, thirteen of America, and all the rest of the Cape of Good Hope, that inexhaustible treasury of beautiful plants.

I. With many-flowered peduncles. 1. Caulescent.

1. *Oxalis pentantha*, or five-flowered wood-forrel: stem upright; leaflets obovate; styles very short. Root branched. Stem a foot and a half high, round, branched, the thickness of a pigeon's quill; when old, brownish, smooth; when young, pubescent. Branches the same. Leaves alternate, approximating at the ends of the branches, ternate. Petiole not jointed at the base, slender, hirsute, about an inch in length. Leaves obovate or oval, rounded, villose at the edge, dotted on both sides, and rough with very short hairs, petioled; the lateral ones generally emarginate; the middle one larger, on a longer petiole, and for the most part quite entire. Peduncles not jointed at the base, axillary, solitary, filiform, hirsute, the length of the leaves, twice bifid at top, five-flowered; corolla three times as long as the calyx, bell-shaped, spreading very much at top, rounded, yellow. Native of the Caraccas in South America.

2. *Oxalis rhombifolia*, or rhomb-leaved wood-forrel: stem upright; leaflets rhomboid; styles very long. Resembles the preceding, except in the length of the style; and inhabits the same place.

3. *Oxalis Plumieri*: stem upright; leaflets oblong; peduncles umbelliferous. Stem round, a foot high. Jacquin has changed Linnæus's name of *frutescens*, this species having the appearance perhaps of becoming something shrubby at bottom only in common with the two former and the next succeeding species; but it does not seem that any *Oxalis* is really frutescent. This is a native of the Caribbee islands and Guiana; discovered by Plumier; and afterwards found growing plentifully at Vera Cruz by Dr. Houttoun, who sent it to England. Miller says it rises with a shrubby stalk a foot and a half high, sending out several slender branches. Leaves in pairs or threes, on short petioles; peduncles near two inches long; each sustaining four or five yellow flowers, with the petals not much longer than the calyx: each flower, being on a crooked pedicel, hangs down.

4. *Oxalis barrelieri*: stem upright; leaflets oblong; peduncles bifid, racemed; styles equal. Root branched, annual. Stem somewhat villose, round, the thickness of

a reed at the base, dusky at bottom, a foot and half high, putting forth many alternate branches below. It flowers in the stove from May to October. Native of the Caraccas and Guiana. Mr. Miller says it grows naturally in the Brazils; plants having come up in plenty, in a tub of earth which came thence. According to him, it seldom rises more than three or four inches high; the leaflets are large and hairy, on long foot-stalks: the flowers rise immediately from the root, on scapes the same length with the leaves, bifid, and supporting two pretty-large red flowers.

5. *Oxalis rosea*, or rose-flowered wood-forrel: stem upright; leaflets obcordate; peduncles divided, racemed. Native of Chili, in moist places.

6. *Oxalis conorrhiza*, or conic-rooted wood-forrel: stem upright; leaflets obcordate; peduncles subbiflorous. Root perennial, turbinate, putting forth capillary fibrils from the side, near an inch thick at top, ending in a sharp point at bottom, fleshy, dusky-ash coloured. Stem round, somewhat scaly, putting forth from the top several leaves and several branches or stems, erect, round, slender, white, villose, pale-green, about nine inches long. Leaves alternate, ternate. Native of Paraguay, in the vast plain to the northward of the Rio de la Plata. Observed by Feuillée with the preceding and two next species.

7. *Oxalis crenata*, or notch-petalled wood-forrel: stem upright; leaflets obcordate; peduncles umbelliferous; petals crenate. Root annual, fusiform, putting forth many fibrils, half an inch thick at top, pale-green. Stem round, two feet high, branched, half an inch thick at the base, pale-green, full of an acid juice. Leaves alternate, ternate. Native of Peru. It seems to be wholly smooth. About Lima it is generally cultivated in gardens, and is used as sorrel.

8. *Oxalis Dillenii*: stem upright; leaflets obcordate; peduncles subumbelliferous; petals emarginate. Stem round, branched, half a foot high, villose. Leaves scattered, ternate. Native of Carolina. It flowers here in June and July. Cultivated in Sherard's garden at Eltham, before 1732.

9. *Oxalis stricta*, or upright wood-forrel: stem upright; leaflets obcordate; peduncles umbelliferous; petals quite entire. Root perennial, creeping, round, putting out capillary fibres at the knots, branched. Stems from the root, as it creeps along, several, roundish, slender, somewhat villose, purplish, finally branched, half a foot high and more, upright; but, being weak, often lying down; annual. Swartz observes, that it varies with a stiffer and weaker stem, upright or declining; so that it is scarcely any thing more than a variety of *O. corniculata*.

Mr. Salisbury describes his *O. ambigua* (which is the name he gives to this species) as having a creeping stem, ternate leaves, on half-round petioles without stipules, emarginate leaflets, the petals obovate, quite entire; styles the height of the longer filaments, and spreading. Mr. S. remarks, that, though the primary stems in some degree answer to the definition which Linnæus has given of the term *strictus*, yet the branches which break out near the root are constantly creeping; there is, however, an obvious difference to the eye between this and the following. Browne recommends it as a pleasant cooler and diuretic, and says that it was formerly administered in inflammatory cases, but has been little used since the more agreeable acid fruit-trees have been so much cultivated in the West Indies. Native of North America, Jamaica, and Piedmont. Cultivated in the botanic garden at Oxford in 1658. It flowers from June to October. Mr. Miller remarks, that, wherever this plant has been suffered to ripen its seeds, it has become a common weed.

10. *Oxalis corniculata*, or yellow wood-forrel: stem prostrate, rooting; peduncles two-flowered; styles almost equal. Root branched, fibrous, brownish, annual. Stems several, wholly prostrate, rooting, branched, slender, round,

round, villose, often tinged with purple, growing to half a foot in height or more. Leaves alternate, collected in a small number at the rooting-parts of the stems, ternate. Corolla twice as long as the calyx, subcampanulate, yellow; antheræ oblong, incumbent, yellow; germ oblong, very-minutely villose, pale-green.

According to Mr. Miller, the root is long and slender, the trailing-stalks spread out eight or nine inches wide on every side, dividing into small branches; the leaves are on pretty long foot-stalks, and the leaflets are more deeply emarginated than in *O. acetosella*. The capsules are near an inch long: seeds brown, scored transversely, inclosed in a semitransparent aril or seed-coat, which, being pressed, opens with a jerk, and throws out the seed to some distance.

Jacquin is of opinion that the *O. corniculata* of Pollich and other Germans is rather his *O. stricta*, which he affirms to be always upright, except when it is beat down by the wind or any accident; whereas the former is always procumbent, the very extremities of the stems and branches being close to the ground, like the runners of the strawberry; the short flowering-branches only being upright: the stem also creeps, but not the root, which is annual; whereas, in *stricta*, the root is perennial, and it is that which creeps, not the stem. Retzius indeed affirms that *O. corniculata*, protected from frost, is perennial; but that it always continues to be procumbent.

Mr. Salisbury has altered the trivial name to *pufilla*, because it is of much dwarfer growth than the preceding, and the old epithet of *corniculata* is applicable to the whole genus. He describes the stem as creeping, the petioles as roundish, and stipuled at the base, with emarginate leaflets: the segments of the corolla obcuneiform, gnawn a little at the tip, and the styles scarcely the height of the longer filaments, and fastigate; perennial, but liable to be destroyed by severe frost: flowers from May to October. It is a native of Spain, Italy, Sicily, Greece, Austria, Switzerland, England, Japan, China, Cochinchina. Cultivated in 1656 by Mr. John Tradescant, jun. It was not then known to be a native of England, and perhaps it may have established itself since that time in the mild climate of Devonshire; for it increases very abundantly, and with great facility. It is said to have been first discovered here by Mr. J. Turner, in the neighbourhood of Exeter. In 1781 it was found near Dawlish in Devonshire, and since that, in several other places of the same county. Mr. Salisbury remarks, that it is a proof of the mildness of the climate in Devonshire, that this and other southern plants occur in it, as *Pinguicula lusitanica*, *Sibthorpia europæa*, *Lobelia urens*, and *Erica vagans*. This circumstance, together with that of the *Arbutus uredo* and *Andromeda Daboecii*, which last grows also in Teneriffe, being found wild in Ireland, seems to strengthen the conjecture, that some violent concussion of the globe has formerly removed these plants from warmer latitudes. The soil in which the above-mentioned plants severally are found, and the structure of their seeds, render it exceedingly improbable that the sea should have transported them. To future geologists, who may have other data to ascertain so very doubtful a matter, possibly the facts recorded by the humble botanists of the present age may be of no small consequence, and serve, among many others, to rescue their labours from that reproach of inutility which is too often thrown upon them by those who are foolish. *Linn. Transf.* ii. 243.

11. *Oxalis repens*, or creeping wood-forrel: stem prostrate, rooting; peduncles subbiflorous; styles nearly middling. Root fibrous, slender, branched. Stems radical, several, herbaceous, filiform, leafy, villose, purplish, some inches in length; branchlets alternate, like the stem. Leaves alternate, ternate, like most of the species. Native of the Cape of Good Hope, Madagascar, and Ceylon.

2. Stipitated.

12. *Oxalis megalorrhiza*, or great-rooted wood-forrel;

leaves ternate; root many-stumped. Root perennial, round, an inch in diameter, about eight inches long, having several heads, divided below into branching legs, full of clefts, covered with a double bark, the outer very thin, brownish ash-coloured, the inner two lines in thickness, red, watery, acrid; the substance of it is white, watery, acrid, having red fibres in it running from the centre to the circumference. Leaves radical, several. Native of Peru, on mountains. This species is singular for the great size of the root, whence its trivial name. The heads of it resemble so many suffruticose stems.

13. *Oxalis fericia*, or silky wood-forrel: leaves ternate, tomentose; styles of middling length. Bulb deep in the ground. Stipe standing out, villose, having one or two scales, about an inch in length, terminating in an umbel of leaves and scapes. Leaves several. Native of the Cape of Good Hope.

14. *Oxalis violacea*, or violet-coloured wood-forrel: leaves ternate, obsoletely villose; styles very short; interior filaments equal; flowers, when closed, drooping; when expanded, upright. Bulb roundish-ovate, covered with a black coat, the size of a hazel-nut or less, very prolific, consisting of whitish fleshy scales, and having one or two red lines running through them. The bulb sometimes produces fleshy roots, the thickness of a finger. The stipes may be considered as nothing but the lower part of the petioles and scapes, and then this species has no stipe. Native of Virginia; introduced in 1772 by Samuel Martin, M.D. It flowers in May and June: Jacquin says, the whole summer.

15. *Oxalis caprina*, or goat's-foot wood-forrel: leaves ternate, smooth, half two-lobed; styles very short; interior filaments unequal; flowers upright. Native of the Cape of Good Hope. The next species is considered as the *caprina* in the generality of the European gardens, and is perhaps the *caprina* of Linnaeus; but this is the *caprina* of Thunberg and Jacquin.

16. *Oxalis cernua*, or nodding wood-forrel: leaves ternate, smooth; styles very short; interior filaments equal; flowers, when closed, drooping; when expanded, upright. Bulb acuminate-ovate, smooth, covered with a brown coat, nine lines in length. Stipe standing out, sometimes only a very little, sometimes an inch or two, often procumbent, round, the thickness of a pigeon's quill, smooth, having a few scales, terminated by an umbel of leaves and flowers; the longer one putting forth also other umbels that are leafy, and at the same time bulbiferous; then without interruption it proceeds from the bulb, penetrates the ground in various directions, and forms either a radical filiform fibre, or a capillary one, some inches long, with fibrils, and generating little bulbs its whole length. Native of the Cape of Good Hope. Thunberg gave it the name of *cernua*, from its drooping flowers.

17. *Oxalis dentata*: leaves ternate; petioles round; styles very long. Bulb oblong, half an inch long, covered with a brown striated coat. Stipe under ground for an inch in length, then rising above ground from one to four inches, round, smoothish, brownish-purple, more slender than a pigeon's quill, having a few scales, commonly leafless, except that it has now and then a single leaf at top, almost upright or declining, terminated by an umbel of leaves and flowers. Leaves several, upright, and spreading a little. Native of the Cape of Good Hope. It flowers here in November.

18. *Oxalis livida*, or livid wool-forrel: leaves ternate, smoothish; scapes two-flowered; styles middling. Bulb ovate, half an inch long, covered with a brown striated coat. Stipe partly subterranean, and from one to three inches long; partly standing out, two or three inches, round, nearly the thickness of a pigeon's quill, smooth, leafless, upright, terminating in an umbel of many leaves, and fewer scapes, then elongated beyond this, and ending in another leafy umbel. Native of the Cape of Good Hope. It flowers with us in October and November.

19. *Oxalis compressa*: leaves ternate, hirsute underneath; petioles compressed; styles very long. Stipe subterranean,

terraneous, terminating in an umbel of leaves and scapes. Leaves very many. Corolla four times as long as the calyx, bell-shaped, yellow. Native of the Cape of Good Hope.

20. *Oxalis Burmanni*, or digitate-leaved wood-forrel: leaves digitate. Bulb oblong. Stipe subterraneous, terminating in an umbel of leaves and scapes. Corolla five times as long as the calyx, bell-shaped, yellow. Native of the Cape of Good Hope. Linnæus unites it with *cernua*, from which it is very different in the leaves.

21. *Oxalis sensitiva*, or sensitive wood-forrel: leaves pinnate. Root fibrous, brown. Stipe standing out, round, about the thickness of a pigeon's quill, from half an inch to six inches in height, obscurely-jointed below, variegated with red or brown and green, filled with a white pith, terminating in a close umbel of leaves and flowers. Leaves numerous, abruptly pinnate, spreading; they contract on the slightest touch; hence the trivial name. Capsule pentagon-ovate, five-celled, five-valved, opening at the angles. It is a very beautiful plant. Native of Malabar, Ceylon, the Molucca-islands, and other parts of the East Indies; in China and Cochin-china.

II. With one-flowered peduncles. 1. Caulescent.

22. *Oxalis macrostylis*, or long-styled wood-forrel: corollas caryophylleous; styles very long. Bulb ovate, covered with a ferruginous shining coat, the size of a hazel-nut. Stem round, hirsute, purple, slender, somewhat branched, from six to nine inches high, almost upright. Leaves subsessile, scattered, approximating, spreading very much, ternate. Antheræ oblong, twin, erect, yellow; germen oblong, villose at top, pale greenish-yellow, callos. Styles remarkable for their length; whence the trivial name; all these parts are hirsute, with simple hairs. Native of the Cape of Good Hope. It flowers in Europe in October.

23. *Oxalis tubiflora*, or tube-flowered wood-forrel: corollas caryophylleous; styles very short; filaments unequal. Bulb roundish, covered with a brownish coat, the size of a hazel-nut, or larger. Stem round, very hirsute, almost all leafy, sometimes, but seldom, having a single branchlet, half a foot high, almost upright, weak, about half the thickness of a pigeon's quill. Calycine leaflets lanceolate, sharpish, ciliate, villose, pale-green, with blood-red edges, erect; claws of the corolla yellow within, dirty without and villose, erect, forming a cylindric tube an inch long; borders obovate, sharpish, spreading very much, less than half the length of the claws, red-purple within, a little paler on the outside, with one side dirty-yellow and somewhat villose; antheræ incumbent, yellow; styles smooth. Native of the Cape of Good Hope. It flowers in Europe in October and November.

24. *Oxalis canescens*, or hoary wood-forrel: corollas caryophylleous; styles very short; filaments equal. Bulb roundish or ovate, from the size of a pea to that of a hazel-nut, with the scales a little loose; the outer ones brown, the inner whitish dotted with red. Stem round, villose, half the thickness of a pigeon's quill, upright, half a foot high, scaly at the base, either quite simple, or branched from the axils of the leaves. Native of the Cape of Good Hope. In Europe it flowers in September and October.

25. *Oxalis secunda*: corollas caryophylleous; styles of a middling length. Bulb roundish, covered with a brown coat, larger than a hazel-nut. Stem round, the thickness of a pigeon's quill, extremely villose, brownish, only at bottom scaly and leafless; weak, about a foot high, upright for some inches, and then more or less reclining. Native of the Cape of Good Hope. It flowers in Europe in October and November.

26. *Oxalis hirta*, or hairy wood-forrel: corollas bell-shaped; styles very long; filaments toothless, equal. Stem round, slender, smooth at bottom, the rest villose, about eight inches in length, purplish-brown, weak, flaccid, hence it is sometimes almost upright, sometimes decumbent or ascending, putting forth from the axils branch-

lets that seldom flower. Native of the Cape of Good Hope. It flowers in Europe in September and October. This species is remarkably rough in its wild state, but puts off much of its roughness when cultivated.

27. *Oxalis hirtella*: corollas bell-shaped; styles very long; filaments toothletted, unequal. Resembles the preceding: it is also a native of the Cape of Good Hope; and, in Europe, flowers in October and November.

28. *Oxalis multiflora*, or many-flowered wood-forrel: corollas bell-shaped; styles very short; leaflets wedge-shaped. Stem round, almost upright, brownish-purple, from the thickness of a pigeon's quill to only half the size, from six inches to a foot in height, branched. Native of the Cape of Good Hope. In Europe it flowers in October and November. A very large specimen is figured in Jacquin's Rare Plants, as a variety of *O. hirta*; in his Monographia, it is represented smaller, and more branched.

29. *Oxalis rubella*: corollas bell-shaped; styles middling; filaments toothless. Stem round, slender, somewhat hirsute, fleshy, weak, so that it is seldom really upright; scaly at the base; brownish-purple, about half a foot high. Native of the Cape of Good Hope. In Europe it flowers from October to December. Jacquin at first took this for *O. hirta*, and it is figured under that name in his Rare Plants, with larger leaves and flowers. Another specimen is figured in his Monographia.

30. *Oxalis rosacea*: corollas bell-shaped; styles middling; filaments gibbosity-toothletted. Stem round, slender, very hirsute, leafless to the middle, with minute wandering scales, sometimes, but very seldom, having an axillary flowering branchlet at top, weak, prostrate, rising up towards the top, from six inches to near a foot in height. Leaves on very short petioles, alternate, ternate, the upper ones collected into a close hoary rose. Native of the Cape of Good Hope. In Europe it flowers from September to November. This species is easily distinguished from all the rest, by having its leaves at the ends of the stem, and branches very closely collected into a form like a double rose.

31. *Oxalis disticha*: corollas bell-shaped; styles middling; petioles wingedly-stipuled. Bulb elongated-ovate, half an inch long or more, covered with a brown skin, putting forth a long thick fibre from the base. Stem round, the thickness of a pigeon's quill, smooth, pale-green or dirty-purple, half a foot long or more, almost upright at the base, then reclining and ascending, branched at the base, having distant scales at bottom, in other parts leafy, at all the scales and leaves jointed. Leaves alternate, distich, smooth, ternate. Native of the Cape of Good Hope. In Europe it flowers in December and January.

32. *Oxalis tenella*: subcaulescent; corollas bell-shaped; filaments toothless; leaflets obovate. Bulb ovate, acute, the size of a pea, often several inclosed in one brown skin. Stem filiform, weak, an inch or a little more in length, round, appearing villose when magnified. Native of the Cape of Good Hope. In Europe flowering in November and December. This and the following species connect the caulescent with the stemless Oxalides.

33. *Oxalis reptatrix*: subcaulescent; corollas bell-shaped; filaments toothletted; leaflets roundish. Bulb roundish, about the size of a hazel-nut, with a black hard skin, and commonly a double nucleus, putting forth a slender white jointed root, with a scale at each joint, having fibres on every side, here and there bulbiferous, creeping horizontally, from one to six inches in length. Stem round, the thickness of a pigeon's quill, somewhat villose, upright, below the leaves scaly, and about an inch long, and then two or three inches more in length. Leaves alternate, ternate; petiole jointed at the base, round, villose, weak, red or green, from three to six inches long; leaflets sessile, slightly emarginate, appearing dotted with a magnifier on both sides; somewhat villose at the edges and along the dorsal nerve; in other parts smooth, green; but, when old, variegated with red and yellow. Scapes axillary,

axillary, jointed at the base, round, somewhat villose, red, flaccid, the length of the leaves, with alternate green bracts below the middle. Calycine leaflets oblong, sharpish, ciliate, hirsute, erect, green. Corolla six times as long as the calyx; claws upright, twice as long as the calyx, yellowish; borders obovate, rounded, wide, spreading very much, pale with a blush of purple, somewhat villose at the back on one side; antheræ oblong, incumbent, yellow. Germen oblong, pale-green, villose at top; styles very short, very hirsute, with simple hairs. Native of the Cape of Good Hope. In Europe it flowers in November and December. This species increases abundantly by its creeping roots generating many bulbs in their course, so that the pots are in a short time full of plants, all thus caulescent. These numerous plants have flowered only once in four years that they have been cultivated.

2. Stipitated. *a.* With simple leaves.

34. *Oxalis lepidula*: styles very long. Bulb roundish, twice as large as a pea, and of a brownish straw-colour. Stipe subterraneous, from a line to an inch in length, having a few scales at top, terminating in an umbel of a few leaves and flowers. Leaves few, green on both sides, and appearing dotted in the microscope; hirsute at the edges, and on the midrib, with capitate hairs, in other parts smooth; about an inch long. Scapes from one to four, not jointed at the base, weak, hirsute, with capitate hairs, longer than the leaves, yellowish-green, without bracts. Calycine leaflets oblong, bluntish, erect, hirsute, with capitate hairs, and ciliate, pale-green at bottom, variegated at top with blood-red spots and orange dots, whitish at the edges; corolla six times as long as the calyx, bell-shaped; claws upright, villose, yellow; borders obovate, rounded, pale-purple, with the back on one side villose; antheræ oblong, incumbent, yellow. This and the two next species are so alike in habit, leaves, bulb, and flowers, that they can scarcely be distinguished.

35. *Oxalis monophylla*, or simple-leaved wood-forrel: styles of middling length. Leaves spreading, from oblong obovate, almost entire, half an inch long, jointed below the leaf, but not at the base. In other respects it agrees with the preceding.

36. *Oxalis rostrata*, or beaked wood-forrel: styles very short. Nearly agrees with the two preceding.

β. With binate leaves.

37. *Oxalis crispata*, or curled wood-forrel: leaflets obovate, curled. Bulb roundish, with a brown skin, the size of a hazel-nut, often loose. Stipe partly subterraneous, about an inch long, and then standing out, shorter, scaly, leaflets, brownish, the thickness of a pigeon's quill, upright, terminated by a thin umbel of leaves and flowers. Leaves few, generally three, upright, wholly smooth, sometimes simple, never ternate; the leaflets from an inch to three inches long.

38. *Oxalis asinina*, or ass's-eared wood-forrel: leaflets lanceolate; styles middling. Bulb ovate, with a brown skin, the size of a hazel-nut. Stipe partly subterraneous, about an inch long, scaly, then standing out, shorter, scaly, leaflets, almost upright, terminated by an umbel of leaves and flowers. Leaves several, erect, smooth, very seldom simple, never ternate. Petiole jointed at the base, half round, about two inches long, winged. Leaflets bluntish, quite entire, or very seldom slightly emarginate, from two to three inches long, green on both sides, appearing dotted in the microscope, along the edges together with the wings cartilaginous-crenulate, erect. It has the trivial name from its long binate leaflets, resembling ass's ears.

39. *Oxalis leporina*, or hare's-eared wood-forrel: leaflets lanceolate; styles very long; filaments toothletted. Bulb roundish, pale flesh-colour, with a brown skin, the size of a hazel-nut. Stipe, the part under-ground about an inch, above shorter, scaly, leaflets, brownish, almost upright, terminated by a thin umbel of leaves and flowers.

Leaves few, commonly two only, upright, smooth, very seldom simple, never ternate. It has the trivial name from the binate leaves resembling a hare's ear.

40. *Oxalis lanceifolia*: leaves binate and ternate; styles very long; filaments toothlets. Bulb ovate, smaller than a hazel-nut; covered with a brown skin. Stipe subterraneous, one or two inches long, almost the thickness of a pigeon's quill, having a few scales at top, and being bulb-bearing at bottom, terminating in an umbel of leaves and a few flowers. Leaves several, the lower ones binate, the rest ternate, almost upright.

γ. With ternate leaves.

41. *Oxalis fabæfolia*, or bean-leaved wood-forrel: leaves obovate, flat; petioles winged. Bulb roundish, with a brown skin, the size of a hazel-nut, often loose. Stipe about an inch, partly under ground, partly above, scaly, leaflets, nearly as thick as a reed at top, almost upright, terminated by a thin umbel of leaves and flowers. Leaves few, upright, wholly smooth.

42. *Oxalis laburnifolia*, or laburnum-leaved wood-forrel: the middle leaflet sublancoate; the side ones obliquely oblong; styles very long; filaments toothletted. Bulb ovate, with a blackish-brown skin, the size of a hazel-nut. Stipe subterraneous, round, white, almost as thick as a pigeon's quill, about an inch in length, terminated by a thin umbel of leaves and flowers. Leaves few, spreading.

43. *Oxalis sanguinea*, or bloody-leaved wood-forrel: the middle leaflet sublancoate; the side ones obliquely oblong; styles middling. Bulb ovate, minute, with a blackish-brown skin, loose. Stipe subterraneous, an inch long, of a dirty whitish colour, nearly as thick as a pigeon's quill, terminated by a thin umbel of leaves and flowers. Leaves few, sometimes no more than two, almost upright, or spreading a little.

44. *Oxalis minata*, or small wood-forrel: leaflets lanceolate, acute; styles very long; filaments toothlets. Stipe subterraneous, terminating in a poor umbel of leaves and flowers. Leaves few, minute, wholly smooth.

45. *Oxalis ciliaris*, or ciliate-leaved wood-forrel: leaflets oblong, blunt; styles very long; filaments toothlets. Bulb ovate, the size of a hazel-nut, with a black skin. Stipe out of the ground, having a few scales and one or two leaves, round, villose, often smooth at bottom, slender, weak, almost upright, terminated by a dense umbel of leaves and flowers. Leaves several, upright, and spreading very much.

46. *Oxalis arcuata*, or bending wood-forrel: leaflets linear-oblong, emarginate; styles very short. Bulb ovate, slender, with a blackish-brown skin, almost an inch in length. Stipe out of ground, round, almost half the thickness of a pigeon's quill, having a few scales but no leaves, hirsute, brownish-green, three or four inches long, procumbent, terminated by an umbel of leaves and flowers. Leaves very many, spreading.

47. *Oxalis linearis*, or linear-leaved wood-forrel: filaments toothlets; styles very long; corollas caryophyllous; leaflets linear. Bulb ovate, with a blackish-brown skin, smaller than a hazel-nut. Stipe out of the ground, round, slender, having a few scales but seldom any leaves, sometimes a single leaflet at top, hirsute, brown, from four to seven inches long; at first upright, but by age becoming wholly procumbent, terminated by a cloist umbel of leaves and flowers, and sometimes, but rarely, lengthened out into another umbel. Leaves several, almost upright.

48. *Oxalis gracilis*, or slender wood-forrel: filaments toothlets; styles very long; corollas bell-shaped; leaflets linear. Bulb roundish, the size of a hazel-nut, covered with a brown skin, sometimes loose. Stipe standing out, filiform, brownish, smooth, about half a foot long, very weak, and wholly prostrate; at bottom leaflets with a few scales; above having solitary leaves, and frequently an umbel, terminating in a thin umbel of leaves and flowers.

49. *Oxalis reclinata*, or reclining wood-forrel: filaments toothless; styles middling; leaflets linear. Bulb roundish, often an inch in diameter, covered with a brown skin, loose. Stipe standing out, a foot or eighteen inches long, round, smaller than a pigeon's quill, minutely and densely villose, brown; below the middle having a few scales but no leaves; above the middle leafy, and sometimes having a branchlet; when young wholly upright, but afterwards more or less reclining, and even entirely procumbent, on account of its weakness and the weight of the umbel; terminated by a denser loose umbel of leaves and flowers.

50. *Oxalis miniata*, or vermilion wood-forrel: filaments toothless; styles very short; leaflets linear. Stipe above ground, from one to four inches long, very weak, and always wholly prostrate, from its extreme slenderness; mostly leafless, and having only a few minute scales, except at top, where there is a leaf or one or two umbels; it is terminated also by a denser loose umbel of leaves and flowers.

51. *Oxalis versicolor*, or striped-flowered wood-forrel: filaments toothletted; styles very long; stem upright, hairy, generally simple; leaflets linear, callous on the under side at the tip. Bulb ovate, half an inch long, covered with a black skin, within which are frequently several bulbs; hence, when cultivated, it has almost always many stipes; these are out of the ground, have a few scales on them, are round, slender, have a very few hairs scattered over them, are six inches long, sometimes leafless, sometimes having a single leaf at top, when young almost upright, but afterwards wholly procumbent, terminated by a dense umbel of leaves and flowers. Leaves several, upright, and spreading a little. Dr. Smith remarks, that the flowers are expanded in the sunshine only, have no scent, but are beautiful, and extremely elegant, even when closed; that the petals are separate at the base, but, a little above it, united into a tube, then again separated, folded over each other to the left, white with an exquisite red border; that the five longest filaments are but half the length of the corolla, with didymous antheræ; and five other very short filaments, without antheræ, are attached to the longer ones, and stand between the shorter; that the germen is smooth and pellucid, full of little protuberances, occasioned by the prominent rudiments of the seeds, the styles the length of the longer stamens. Introduced in 1774 by Mr. Francis Masson. It flowers abundantly in the hot-houses of the botanic garden at Chelsea in the winter.

52. *Oxalis elongata*: filaments toothletted; styles very short; petals emarginate; leaflets linear. Bulb ovate, covered with a sooty skin, smaller than a hazel-nut. Stipe appearing somewhat hirsute when examined by a glass, having a few scales, and often one or two leaves, extremely weak, so as to be wholly procumbent.

53. *Oxalis tenuifolia*, or fine-leaved wood-forrel: filaments toothletted; styles very short; petals quite entire; leaflets linear. Bulb ovate, with a black skin, half the size of a hazel-nut. Stipe almost upright, smooth or somewhat villose, purple at bottom, from two to four inches long, scaly at the base, sometimes leafless, sometimes leafy all over; and even having barren branchlets; the umbel of leaves and flowers that terminates it being elongated, but barren.

54. *Oxalis polyphylla*, or many-leaved wood-forrel: filaments gibbously-toothletted; styles middling; leaflets linear. Bulb roundish, the size of a hazel-nut, or even of a walnut, covered with a brown skin, having ovate-acuminate loose scales, flesh-coloured or pale and fleshy. Stipe from half an inch to six inches in height, upright but weak, appearing somewhat villose in the microscope, purplish or brownish, the thickness of a pigeon's quill; sometimes leafless, and having only distant scales; sometimes leafy; commonly quite simple, but sometimes having a single branchlet or two, terminated by a cleftly-

leafy and many-flowered umbel. Leaves very many. This is described by Jacquin in his Collections, and figured in his Icones Rariores, under the name of *O. versicolor*. The three last, indeed, are probably considered by Linnaeus and Thunberg as varieties of *O. versicolor*.

55. *Oxalis cuneata*: filaments toothless; styles very long; leaflets wedge-shaped. Bulb ovate, almost the size of a hazel-nut, with a blackish-brown skin, often loose at top. Stipe standing out, round, scaly, brown, villose, procumbent, leafless, slender, two or three inches long, terminated by a dense umbel of leaves and flowers. Leaves very many, spreading a little.

56. *Oxalis cuneifolia*: filaments toothless; styles very short; leaflets wedge-shaped. Stipe about three inches long, frequently with a leaf or two on it. It differs from the preceding in having the interior filaments unequal, and the exterior filaments not smooth, but hirsute, with capitate hairs, and the styles very short.

57. *Oxalis glabra*, or smooth wood-forrel: filaments toothletted; styles very short; stipe upright, smooth; leaflets oblong, or wedge-shaped, smooth. Stipe standing out, round, filiform, appearing somewhat villose in the microscope, angular-grooved, one or two inches in length, having frequently a leaflet on it, terminated by an umbel of leaves and flowers.

58. *Oxalis pusilla*, or dwarf wood-forrel: filaments toothletted; styles middling; leaflets wedge-shaped. Bulb ovate, with a brown skin, less than a pea. Stipe partly under and partly above ground, from half an inch to two inches in length, filiform, smooth, the shorter upright, the longer procumbent, sometimes leafless, sometimes having a few leaves at the base or at top, terminated by a denser umbel of leaves.

59. *Oxalis ambigua*, or doubtful wood-forrel: styles very long; leaflets unspotted, flat; the middle ones wedge-shaped; the side ones oblong; calycine leaflets equal. Bulb oval, an inch long, covered with a black hard skin. Stipe standing out, one or two inches in length, scaly, round, the thickness of a pigeon's quill, purplish, somewhat villose, erect, terminated by a dense umbel of leaves and flowers. Leaves very many, spreading out in a ring. Calycine leaflets lanceolate, bluntish, hirsute, ciliate, pale-green with whitish edges, having generally below the tip one or two roundish orange spots, upright; corolla several times longer than the calyx; claws upright, sulphur-coloured; borders wide, rounded, snow-white within, somewhat sulphur-coloured without, one side being variegated with red dots, spreading very much. Antheræ incumbent, yellow. Jacquin doubted a long time whether this was any thing more than a variety of the next species; but the constant difference in the equal calycine leaflets, and the leaves never being waved, induced him at length to consider it as a distinct species.

60. *Oxalis undulata*, or wave-leaved wood-forrel: styles very long; leaflets unspotted, waved; middle wedge-shaped; lateral oblong; one leaflet of the calyx spatulate. Bulb equal, an inch long, with a blackish-brown skin. Stipe from one to three inches long, almost upright, green or brownish, slightly pubescent, leafless, but having lanceolate acuminate ferruginous ciliate scales, terminated by an umbel of leaves and flowers. Leaves several, almost upright, or spreading a little. Calycine leaflets oblong, blunt, green above, below having blood-red spots, variegated on the back with roundish, yellow, scattered, spots; one of them is larger, and spatulate; corolla five times as long as the calyx; claws short, yellow; borders very wide, long, white, with one side of the back dotted with purple. In other circumstances it agrees with the preceding, except in those pointed out before.

61. *Oxalis fuscata*: styles very long; leaflets spotted on both sides; middle wedge-shaped, lateral, oblong. Bulb oval, covered with a black hard skin, an inch long. Stipe subterraneous, scaly above, an inch and more in length,

length, terminated by a dense umbel of leaves and flowers, under which is frequently another umbel or two that is less dense. Leaves very many, spreading.

62. *Oxalis glandulosa*, or glandular wood-forrel: styles middling; leaves and calyxes capitately-ciliate; middle leaflet wedge-shaped, lateral ones oblong. Bulb ovate, covered with a black hard skin, twice as large as a hazel-nut. Stipe one or two, standing out, round, the thickness of a pigeon's quill, from one to three inches long, erect or procumbent, villose, scaly, leaflets, purplish, weak, terminated by a dense umbel of leaves and flowers.

63. *Oxalis tricolor*, or three-coloured wood-forrel: styles middling; ciliae simple; middle leaflet wedge-shaped; lateral ones oblong. Bulb ovate-roundish, covered with a black skin, larger than a hazel-nut. Stipe commonly wholly subterranean, having one or two scales at top, short, leaflets, round, almost as thick as a pigeon's quill, terminated by a denser umbel of leaves and flowers.

β. Bulb oval, an inch long, covered with a black hard skin. Stipe either wholly subterranean or standing out a little, scaly, leaflets, roundish, whitish, about an inch long, upright, thinner than a pigeon's quill.

64. *Oxalis exaltata*: styles very short; leaflets dusky-spotted; middle wedge-shaped, lateral, oblong; scapes upright. Bulb oval, an inch and a half long, covered with a black hard skin. Stipe partly under partly above ground, scaly, round, about an inch high, upright, leaflets, terminated by a dense umbel of leaves and flowers.

65. *Oxalis rubro-flava*: styles very short; leaflets unspotted; middle wedge-shaped, lateral, oblong; scapes upright. Bulb subovate, with a blackish-brown skin, less than an inch in length. Stipes standing out, scaly, leaflets, round, the thickness of a pigeon's quill, villose, almost upright, about an inch in length, terminated by a denser umbel of leaves and flowers.

66. *Oxalis flaccida*: styles very short; leaflets unspotted; middle wedge-shaped, lateral, oblong; scapes flaccid. Bulb ovate-acuminate, with a blackish-brown skin, about an inch in length. Stipe partly under partly above ground, round, villose, the thickness of a pigeon's quill, green, procumbent, somewhat scaly, an inch and a half long, leaflets, terminated by a dense umbel of leaves and flowers.

O. exaltata has always long slender scapes, strictly upright, and spotted leaves; *rubro-flava* and *flaccida* have always green unspotted leaves; and the former of these has yellow flowers on shorter upright scapes; the latter has white flowers on very long flaccid scapes. If these differences be not thought sufficient to distinguish the species, the three last may be considered only as varieties.

67. *Oxalis variabilis*, or variable wood-forrel: styles very short; leaflets roundish, unspotted, very slightly emarginate. Bulb ovate, with a blackish skin, half the size of a hazel-nut. Stipe subterranean, an inch long, terminated by an umbel of leaves and flowers. Leaves several. Calycine leaflets lanceolate, sharpish, green, with one or two orange spots at top, which, however, are often wanting; corolla large; claws upright, yellow on both sides; borders longer than the claw, wide, rounded, spreading very much, white on both sides, with a suffusion of flesh-colour within above the claws, and with one side of the back reddish and somewhat villose; antherae incumbent, yellow.

β. *O. variabilis rubra*. The variety with red flowers has the bulb the size of a hazel-nut. Stipe partly under partly above ground, and scaly. Leaves very many. Calycine leaflets green, with the edges blood-red at bottom; corolla several times longer than the calyx; borders the same length with the claws, red on both sides, except that one side of the back is dirty-yellow and somewhat villose. In other respects it agrees with the preceding.

68. *Oxalis grandiflora*, or great-flowered wood-forrel: styles very short; leaflets roundish, frequently blood-red underneath; scarcely emarginate. Bulb ovate, acute, small, loose. Stipe subterranean, an inch and a half long. Leaves in a ring. This bears a great affinity to *O. varia-*

bilis, differing chiefly in having the leaflets commonly blood-red underneath, whereas, in that, they are always green.

69. *Oxalis convexula*, or convex-leaved wood-forrel: styles middling; filaments toothless; leaflets roundish, convex. Bulb ovate, with a blackish-brown skin, from the size of a hazel-nut to twice that bigness. Stipe shortly subterranean, then standing out, from three to five inches long, round, purple, smooth, without scales, the thickness of a pigeon's quill or thicker, wholly procumbent, branched, brittle, with a central tough fibril, thickened at the tip, and from this terminated by a very close and elegant umbel of leaves and flowers, and finally densely bulb-bearing from the same. Leaves very numerous, spreading every way.

70. *Oxalis purpurea*, or purple wood-forrel: styles middling; filaments toothletted; petioles round; leaflets roundish, unspotted, ciliate. Bulb ovate, loose, small, loosely inclosed in a skin, from three to six times the size of the bulb. Stipe subterranean, from one to three inches long; round, slender, often bulbiferous, terminated by a dense umbel of leaves and flowers. Leaves very many, spreading or lying on the ground. According to Linnaeus, the leaflets are obcordate, obsoletely-emarginate, smooth even underneath, very finely ciliate. Scapes the length of the leaves. This does not agree with Jacquin's figure or description. Mr. Miller says the leaflets are roundish, large, hairy, and but little indented at the top, standing upon long slender footstalks, arising from a thick short stalk, which adheres to the root. He adds, that some earth that came to England with plants from the Cape of Good Hope was full of it. In 1690, it was cultivated in the royal garden at Hampton-court.

71. *Oxalis laxula*: styles middling; filaments toothletted; petioles round; leaflets roundish, often purple underneath. Bulb less than a hazel-nut, with a blackish-brown skin. Stipe about an inch long, terminated by a loose umbel. It is so nearly allied to the preceding, that it may perhaps be nothing more than a variety.

72. *Oxalis breviscapa*: styles middling; filaments toothletted; petioles thick, compressed; leaflets roundish. Bulb oval, with a black hard skin, an inch long. Stipe subterranean, an inch in height, thick, terminated by a dense umbel of leaves and flowers. Leaves very many, prostrate in a ring.

73. *Oxalis rigidula*: styles very long; leaflets roundish, unspotted. Bulb ovate, an inch long, covered with a blackish skin. Stipe subterranean, an inch in height, terminated by a stiffish umbel of leaves and scapes.

74. *Oxalis speciosa*, or handsome wood-forrel: styles very long; leaflets roundish; unspotted above; underneath blood-red and dotted with gold. Bulb oval, with a blackish skin, less than an inch in length. Spike subterranean, an inch long, scaly at top, terminated by an umbel of leaves and flowers.

75. *Oxalis fuggillata*: styles very long; leaflets roundish; when adult, livid underneath all over, and above at the edges. Bulb oval, with a blackish skin, less than an inch in length. Stipe subterranean, about an inch and a half in height, terminated by an umbel of leaves and flowers.

76. *Oxalis truncatula*, or truncate-leaved wood-forrel: styles very long; leaflets rounded, truncated. Bulb ovate-roundish, with a black hard skin, almost the size of a walnut. Stipe standing out, extremely short, terminated by an umbel of leaves and flowers.

77. *Oxalis sulphurea*, or sulphur-coloured wood-forrel: styles very short; filaments toothless; calyx ciliate; leaflets obcordate. Bulb oval, covered with a blackish hard skin, an inch and more in length. Stipe subterranean, about an inch long, terminated by a dense umbel of leaves and yellow flowers.

78. *Oxalis natans*, or floating wood-forrel: styles very short; filaments toothless; calyx smooth at the edges; leaves floating; leaflets obcordate. Stipe filiform, submersed,

merged, of an indeterminate length, leafless; but having a few scales, terminated by an umbel of leaves and flowers floating on the surface of the water.

79. *Oxalis frumosa*: styles very short; filaments toothletted, equal; leaflets spotted on both sides; middle one obcordate, lateral ones roundish. Bulb oval or obovate, with a black hard skin, almost an inch in length. Stipe subterraneous, one or two inches long, terminated by a dense umbel of leaves and flowers. Leaves numerous, villose on both sides, and at the edges.

80. *Oxalis luteola*: styles very short; filaments toothletted, equal; leaflets obcordate; unspotted and somewhat villose on both sides. Bulb ovate or oval, with a blackish skin, half the size of a hazel-nut. Stipe subterraneous, about an inch long, terminated by a loose umbel of leaves and flowers. Leaves several, villose all over on both sides, and at the edges.

81. *Oxalis lanata*, or woolly wood-forrel: styles very short; filaments gibbously-toothletted, equal; leaflets obcordate, very hirsute on both sides. Bulb deep in the ground. Stipe standing out, closely-woolly, with one or two woolly scales, about half an inch in length, terminating in an umbel of flowers and leaves.

82. *Oxalis punctata*, or dotted wood-forrel: styles very short, filaments toothletted, unequal; leaflets underneath coloured and dotted with gold; middle one obcordate; lateral ones roundish. Bulb oval or ovate, half the size of a hazel-nut, with a hard blackish variously-angular somewhat striated and wrinkled skin. Stipe subterraneous, about half an inch long, terminated by a thinner umbel of leaves and flowers.

83. *Oxalis obtusa*: styles middling; filaments toothletted, unequal; calycine leaflets rounded-blunt; leaflets obcordate. Bulb deep in the ground. Stipe standing out, villose, half an inch long, terminating in an umbel of leaves and flowers.

84. *Oxalis fallax*: styles middling; filaments toothletted, equal; leaflets obcordate. Bulb ovate or oval, with a blackish-brown skin, half the size of a hazel-nut. Stipe subterraneous, about an inch in length, terminated by a loose umbel of leaves and flowers.

85. *Oxalis marginata*: styles middling; filaments toothless, equal; leaflets obcordate. Bulb oval, with a blackish-brown hard skin, an inch long. Stipe subterraneous, scarcely an inch in length, terminated by a dense umbel of leaves and flowers. Leaves very many, spreading in a ring.

86. *Oxalis pulchella*, or pretty wood-forrel: styles very long; filaments toothless; stipe subterraneous; leaflets obcordate. Bulb oval or ovate, with a blackish-brown hard skin, about an inch in length. Stipe subterraneous, very short, terminated by an umbel of leaves and yellow flowers.

87. *Oxalis macrogona*: styles very long; filaments toothletted; stipe subterraneous; leaflets obcordate. Bulb oval or ovate, with a blackish skin, half the size of a hazel-nut. Stipe about an inch in length, terminated by a loose umbel of leaves and flowers.

88. *Oxalis incarnata*, or flesh-coloured wood-forrel: styles very long; filaments toothletted; stipe standing out, very long, branched; leaflets obcordate. Bulb in the young plant ovate, covered with a brown skin, twice the size of a pea. The root in the mature plant consists of several legs slenderly fusiform, terminating in a long fibre, round, the thickness of a reed and more, some inches in length, fleshy, brittle, pale, somewhat pellucid and sweet. Stipes very many, herbaceous, round, the thickness of a pigeon's quill, or even of a reed, thick, green or purplish-brown, a foot and a half high, upright, but so weak as not to be able to support themselves without assistance, at the base and origin of the branches having an ovate-acuminate stipule; both they and the branches terminated by distant umbels of leaves and flowers. Leaves several, at remote distances, in whorls. This was cultivated in 1739 by Mr. Miller.

89. *Oxalis bifida*, or cloven-leaved wood-forrel: styles very long, filaments toothletted, stipe standing out, commonly branched, leaflets semibifid, corolla bell-shaped. Stipe filiform, smooth, striated, leafless, loose, a foot high and more, together with the branches terminated by a dense umbel of leaves and flowers. Branches alternate, directed one way, striated, upright. Leaves several, smooth. These are all natives of the Cape of Good Hope.

90. *Oxalis longiflora*, or long-flowered wood-forrel: stipe standing out; leaflets semibifid; corolla caryophylleous. Stipe scaly, leafless, simple, terminating in a leafy flowering umbel; flowers long. Native of Virginia.

91. *Oxalis acetosella*, or common wood-forrel: styles equal; leaflets obcordate, hairy. Root perennial, branched, round, knobbed, creeping with very fine fibrils on every side, partly white, partly red, having an ovate-acute, thick, rigid, scale like a tooth at the knobs. Stipe partly subterraneous, partly standing out, sometimes very little, sometimes several inches, then procumbent and striking root into the ground, toothletted at the knobs like the root, round, somewhat hirsute, red, closely-toothletted above with the permanent joints of decayed leaves, perennial, putting forth from its top several aggregate leaves and scapes. Petiole jointed, round, somewhat hirsute, red, especially at bottom, from two to three inches long, almost upright but weak. Leaflets subfleshy, near half an inch long, wider, green and hirsute on both sides, shortly ciliate. Scapes one or two, jointed at the base, round, somewhat villose, red, the length of the leaves; with embracing, villose, jointed bractes, above the middle. Calycine leaflets oblong, acute, sometimes bifid, somewhat hirsute, ciliate, purple at the tip, upright; corolla three times as long as the calyx, white, beautifully veined with purple, bell-shaped: claws upright: borders obovate, rounded, spreading very much; antheræ oblong, incumbent, pale-yellow, or whitish. Receptacle none, except two papillæ, surrounded by a yellow ring, in the central angle of the cells, to each of which one seed is fastened. Seeds regularly two, scarcely ever more, ovate, compressed like a lens, with rugged, raised streaks, russet-yellow: a fleshy white aril invests the whole seed, at first smooth and closed on every side, but at length, opening elastically at the tip and rolling back, it wrinkles up, and throws off the seed with considerable force.

Mr. Curtis remarks, that the leaflets are of a yellowish-green colour, frequently purple underneath; that the petiole proceeds from a little bulb, which forms a kind of sheath to it; and that, although round at bottom, the upper part is grooved on one side; that the calycine segments are bluntish and membranous at the edges; that the petals adhere together from the base just above the claws, which bend a little inward, and are tinged at bottom with yellow; that the antheræ are bilocular; that the germ is four-cornered, the styles very slender and a little longer than the stamens, and the stigmas blunt; that there are three heart-shaped seeds in each cell, grooved longitudinally, of a bright reddish-brown colour; that, like the violet, it continues producing seed-vessels and seeds during the greatest part of the summer, without any appearance of expanded blossoms, which are only observable in April and May; and that, when it has done flowering, the flower-stalk, as in many other plants, bends down, and, when the seed is ripe, again becomes upright.

Linnæus remarks, that the leaflets in wet weather are erected, but hang down in dry weather. They are also said by some authors to manifest a degree of sensibility on being struck. Villars observes, that this elegant little plant has the leaves of trefoil, (see the BOTANY Plate IV. fig. 19. vol. iii.) the taste of forrel, and the flower of geranium; from which last it is distinct, according to Jussieu, in the number of styles, the form of the capsule and manner of its opening, its straight corcle or heart, without any perisperm or albumen.

Wood-

Wood-forrel has a grateful acid taste, more agreeable than common forrel, and therefore proper to be used in salads: its acid approaches nearly to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic. An infusion of the leaves, or a whey made by boiling the plant in milk, is useful in ardent fevers, to allay inordinate heat, and to quench thirst. The London College directs a conserve of the leaves and petals to be made by beating them with thrice their weight of fine sugar, and orange-peel. It is called *Conserva Lujulae*. The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used wherever vegetable acids are wanted. It is employed to take iron-moulds and ink-stains out of linen; and is sold under the name of essential salt of lemons. This salt, when genuine, which it seldom is, consists of the vegetable alkali and a peculiar acid, which, according to Bergman, seems more allied to the acid of sugar than that of tartar. What is sold for it in this country appears sometimes to consist of C. tart. with the addition of a small quantity of vitriolic acid. For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water. Dr. Beddoes informs us, that the leaves and stalks wrapped up in a cabbage-leaf, and macerated in warm ashes until reduced to a pulp, have been successfully applied to scrophulous ulcers. This poultice should remain on the sore for twenty-four hours, and be repeated four times. Afterwards the ulcer is to be dressed with a poultice made of the roots of the meadow-sweet (*Spiræa ulmaria*) bruised and mixed up with the scum of four butter-milk. Doubtless some of the foreign species may be superior to this in the same way. Thunberg says that *Oxalis cernua* grows to the greatest size and greatest abundance of any species at the Cape of Good Hope, and that a good salt was prepared from it; but he does not inform us in what quantity. Twenty pounds of our wood-forrel leaves, fresh, yield six pounds of juice, from which two ounces two drams and one scruple of salt have been obtained.

Wood-forrel is common in Europe in woods, and occurs also among bushes, in hedges, and on heaths. It is called, says Gerard, wood-four, four-trefoil, stubwort, and forell du bois; by herbarists, alleluya and cuckow's meat, "by reason, when it springeth forth and flowereth, the cuckow singeth most, at which time also Alleluya was wont to be sung in churches." The names Alleluya and Lujula, however, are corrupted from the Calabrian name *Juhola*. It is called *stubwort*, probably from its covering the ground among the stubs in coppices when they are cut down. In French it is *petits oseille* or *farrelle*, and *pain à corneau*.

β. A variety is found with purple flowers. It is said to be a smaller plant, and to flower later. Discovered in a hollow lane between Owsram and Halifax.

δ. With digitated leaves.

92. *Oxalis lupinifolia*, or lupin-leaved wood-forrel: styles very short; calyx smooth; leaflets flat. 93. *Oxalis flava*, or narrow-leaved wood-forrel: styles very short; calyx capitate-ciliate; leaflets channelled-converging. 94. *Oxalis flabellifolia*, or fan-leaved wood-forrel: styles of middling length; leaflets linear. 95. *Oxalis pectinata*: styles very long; leaflets smooth. 96. *Oxalis tomentosa*: styles very long; leaflets very hirsute underneath. The five last species are natives of the Cape of Good Hope.

Propagation and Culture. The European and North-American sorts require no particular culture. If the roots of the common wood-forrel are planted in a moist shady border, they will thrive and multiply; and, if kept clean from weeds, will require no other care. If the seeds of the other sorts are sown in an open border, the plants

will rise freely; and, if they are permitted to scatter, there will be a plentiful supply of plants.

The numerous species from the Cape of Good Hope must be planted in pots, which may be sheltered in the dry stove, or under a hot-bed frame in winter, where they may have as much free air as possible in mild weather. Most of them may be easily increased by offsets from the roots or bulbs which come out from the side of the stalks, generally in great abundance. Of *O. repatrix* in particular, Jacquin says, that as it runs along it puts forth bulbs in such abundance as in a short time to fill the pots with plants; but that, in four years during which he had cultivated it, he had only a single flower; which is common in plants that are suffered to run at the roots.

The sorts from the East and West Indies, being more tender than these, require to be placed in a stove kept to a moderate degree of warmth in winter. They are propagated by seeds, sown in pots, plunged into a moderate hot-bed. When the plants come up, set them singly in pots filled with light sandy earth, and plunged into a fresh hot-bed, shading them from the sun till they have taken new root; after which they must be treated in the same manner as other tender plants from the same countries. Jacquin remarks of *O. barrelieri* (n. 4.) from South America, that when sowed early in the spring, it grew luxuriantly in the stoves, produced seed abundantly, which, from the elasticity of the capsule, could not be collected without great difficulty, and that it always perished in the winter; but that, when it was sown later in the season, it sometimes continued through the winter, and flowered the next spring, but always continued in a languid state. See *PORTULACA* and *RUMEX*.

OX'BOROUGH, a village in Norfolk, to the south-east of Downham, on the river Ouse, with a fair on March 25. Here has been a military foss, where, on planting an orchard at the foot of the hill, the bones of men, and old pieces of armour, were dug up in abundance.

OX'BOW, a fertile tract in the state of Vermont, formed by a bend in the river Connecticut, near Newbury.

OX'EHAL, or OXENHALL. See DARLINGTON, vol. v.

OX'EN CREEK, a river of Maryland, which runs into the Potomack in lat. 38. 55. N. lon. 77. 8. W.

OX'ENBACH, a town of Austria: nine miles south of Ips.

OX'ENBERG, a village of Denmark, in the island of Funen, near Assens, where the count of Oldenburg was defeated by Christian III. in the year 1535.

OX'ENDEN, a village in Northamptonshire, south of Harborough. An echo in the steeple of the church repeats thirteen syllables.

OX'ENFORD, a village in Surrey, on the river Wey, south-west of Godalming. In Bonfield nunnery, near it, there is a spring, whose water was good for sore eyes and ulcers; and about it hart's-tongue grows in great plenty. Near it was dug up, in the last century, a quantity of old English coins and gold rings.

OXENSTIER'NA (Axel), a celebrated Swedish minister, son of baron Gabriel Oxenstierna, was born at Fano in Upland, in 1583. His father having died during his infancy, he was educated with great care, under the inspection of a tender mother; and, on leaving school, was sent for farther improvement to Germany, where he studied at Rostock, Wittenberg, and Jena; and made great progress in the languages, and in various branches of science. The principal object of his application, however, was theology, which he prosecuted with great diligence; and in this was encouraged by his relations, who intended him for the ecclesiastical state: and, though he afterwards devoted himself to a secular employment, he retained, during his whole life, a strong attachment to the study of theology, and an ardent desire to promote the diffusion of the evangelic doctrine.

When he had finished his academic courses, he paid a visit

a visit to most of the German courts; and, being recalled in 1602, with all the other Swedish nobility then in foreign countries, to take the oath of fidelity to Charles IX. he was soon after received into the service of that monarch; who, in 1606, sent him as envoy to the court of Mecklenburg. In 1609, when he had completed the twenty-sixth year of his age, he was admitted a member of the senate; being the fourteenth of his family who, in uninterrupted succession from father to son, had sat in that assembly. The first public business undertaken by him after this period, was the adjustment of some differences which had arisen in Esthonia between the Livonian nobility and the city of Revel, and which he brought to a happy conclusion.

He had now given such a favourable display of his talents, that the king, finding the powers of his own mind weakened by the infirmity of years, made choice of Oxenstierna to be guardian to the royal family, and placed him at the head of the regency. On the accession of the new sovereign, Gustavus-Adolphus, he was promoted to be chancellor; and in 1613, when overtures were made for peace between Sweden and Denmark, he was appointed chief negotiator on the part of the former. Next year he accompanied the king on his expedition into Germany, and soon after had the satisfaction of seeing an end put to hostilities between Russia and Sweden by an honourable peace, concluded at Stolborn. In 1620, he conveyed the intended consort of his sovereign from Brandenburg; in 1622, he attended the king to Livonia; and, being afterwards sent to Prussia with several regiments, he was nominated governor-general of all the districts in that country subjected to the Swedish arms.

When the imperialists entered Pomerania, in order to make themselves masters of the shores of the Baltic, Oxenstierna was dispatched to the duke of Pomerania, to treat respecting the admittance of a Swedish garrison into Stralsund, in room of the Danish troops, which at that time were in possession of the place; he then proceeded to Denmark, to prevail on his Danish majesty to sanction this arrangement; and afterwards, through the mediation of the French and English courts, brought the negotiation for peace with Poland to such a state, that a suspension of hostilities for six years was agreed upon.

That Oxenstierna was now in high favour with his sovereign, appears by a letter which he wrote to him in 1630, from Pomerania, when he was about to take the field against the imperialists. When the seat of the war was transferred farther towards the centre of Germany, Gustavus found the presence of his chancellor necessary, in order that he might profit by his talents and advice. He was therefore invested with full authority in all civil and military affairs on the Rhine; and, the king having afterwards advanced into Bavaria and Franconia, Oxenstierna fixed his head-quarters at Mentz; whence he proceeded with the troops he had collected to join his majesty, and then took up his station with some regiments in the upper part of Germany, while Gustavus advanced to Lutzen, where he fell gloriously in the arms of victory, in the year 1632. Oxenstierna was much affected, but not dispirited, by this melancholy event. He collected more troops for the defence of Sweden and the allies; and undertook a journey to Dreßden and Berlin, to concert measures with the electors of Brandenburg and Saxony in regard to the prosecution of the war. An unlimited commission was now given him by the Swedish government to pursue such plans, both in regard to negotiations and to the Swedish army in Germany, as he might think most conducive to the benefit of his country. In consequence of the power thus delegated to him, he entered into a correspondence with different foreign states; proceeded to the congress at Heilbrunn, and was there acknowledged as director of the allied powers, distinguished by the name of the Evangelic League. This elevation gave rise to much discontent, and excited against him no

little jealousy, which was greatly fomented by the French; but the efforts of his enemies were ineffectual, and were not able to lessen his consideration, nor to prevent the flattering mark of respect offered to him by the evangelic states, of being created elector of Mentz. In the meantime, he undertook a journey to France and Holland, in order to gain over these two powers to the evangelic party; but, on his return to Saxony, he was much mortified to find every thing in the utmost disorder. The foreign generals were wavering in their attachment to Sweden; the soldiers, discontented on account of their pay being in arrears, manifested a mutinous spirit; a great part of the allies had become disheartened, in consequence of the blow given to their cause by the unfortunate battle of Norlingen; and, to complete this disastrous state of affairs, the elector of Saxony had declared in favour of the enemies of Sweden. Oxenstierna, however, by his prudent and judicious conduct, found means to revive the drooping spirits of his party, and to surmount all these difficulties.

Having thus retrieved the affairs of Germany, and placed them on a more secure footing, he was recalled to Sweden in 1636, after being absent from it about ten years; and, as he now wished to retire from the more busy scenes of life, he resigned the authority with which he had been invested, and took his seat in the senate as chancellor of the kingdom, and as one of the five guardians of the queen. His chief care, after this period, was to instruct the queen in every thing that related to the art of government. With this view, he communicated to her the best rules and most useful maxims for the regulation of her conduct; and, as he had nothing so much at heart as to bring the German war to a happy termination, he dispatched, as plenipotentiary, his son, John Oxenstierna, to co-operate for that purpose; and peace was at length concluded by the famous treaty of Westphalia. Oxenstierna assisted at Bromsebo at the negotiation with Denmark, in 1645; and, on his return, queen Christina conferred on him the title of count. At the same time he was chosen chancellor of the academy of Upsal; an office which he discharged with great zeal for the success and prosperity of that seminary.

When Christina made known her resolution of naming a successor to the Swedish throne, Oxenstierna was one of those members of the senate who strongly opposed this measure: he however showed a much greater opposition to the steps which the queen took to abdicate the crown; and, when the act of abdication was discussed, he feigned indisposition, that he might avoid the mortification of being present at the debates on a measure which he conceived to be fraught with so much evil. From that day he became more and more dissatisfied with public affairs, but without deserting his duty, which he continued to discharge with credit to himself and advantage to his country. To add to his uneasiness, he found that the finances of the kingdom were in a deranged state, and that the national debt amounted to several millions: a circumstance which gave him more pain, as the Swedish territories had been considerably enlarged during the course of the preceding years, and as trade and the public revenue, in consequence of his judicious measures, had been more improved in the reign of Gustavus-Adolphus than they had been in those of his predecessors. In the latter part of his life he was subject to frequent fits of weakness, which often threatened his dissolution. With one of these he was one day seized in the king's apartment; and, being unable to go home without assistance, he began seriously to prepare for that awful change which he expected, and which took place soon after, in the month of August 1654.

Oxenstierna was undoubtedly a man of great talents. His character may be put in competition with that of the most celebrated men who have acted a distinguished part on the grand theatre of the world; and his name will, at all times, be classed among those of the immortal geni-

uses who have done honour to mankind. The natural powers of his mind were strengthened by an excellent education, and by the study of the most useful sciences. No person was better acquainted with the art of prying into the recesses of the human heart. His political sagacity excited no less respect than admiration; and he lived at a period which gave him an opportunity of displaying, to its full extent, the strength and solidity of his judgment. The form of government which he drew up, at the command of his sovereign, and which was adopted by the Swedish states in 1634, was considered as a masterpiece of political wisdom. His eloquence was concise, but nervous. He possessed the happy talent of foreseeing the various results with which any measure might be attended, and of thence deducing the best rules for directing him in his public conduct. His integrity not only procured him friends, but enabled him to outstrip all his competitors, and to overawe those who were hostile to his designs. The storms and vexations to which he was often exposed, he withstood with firmness, prudence, and magnanimity. The independence of his country was the darling object of his heart; and he possessed talents sufficient to defend it against every attack. Though he was classed among those who at that time were called *aristocrats*, he was never deficient in deference, fidelity, and respect, to his superiors; and on that account they loved and esteemed him. He exerted himself with so much zeal, particularly after his return from Germany, to introduce economy in the public expenditure, to revive commerce, and encourage manufactures, that, in this respect, he is entitled to a place among the most eminent of the Swedish patriots. A list of his works, as well as of the manuscripts which he left behind him, may be seen in *Stiernman's Bibliotheca Suiæ-Gothica*. We shall, however, here remark, that the second part of the "*Historia Belli Sueco-Germanici*," ascribed in general to P. B. Chemnitz, was composed by Oxenstierna. He compiled also the work "*De Arcanis Austriacæ Domus*," published by the same Chemnitz, under the name of Hypolitus à Lapide. *Gezelii Biographiska Lexicon*.

OXENSTIERNA had two sons, John and Eric, who were both men of talent, and obtained promotion.

OXFORD, a city of England, and capital of the county to which it gives name, the see of a bishop, and an university, situated on a gentle eminence, at the union of the Cherwell and the Thames, and anciently surrounded with walls, of which considerable remains are yet to be seen. Oxford is distant from London fifty-four miles, twenty-three from Henley, and seven and three quarters from Woodstock.

The town is situated on a broad eminence, which rises so gradually as to be hardly perceptible, in the midst of a most beautiful extent of meadows to the south, east, and west, and of corn-fields to the north. The vales on the east are watered by the river Cherwell, and those on the west and south by the main stream, and several branches, of the Isis. Both rivers meet towards the south-east. The landscape is bounded on every side, the north excepted, by a range of hills covered with woods. The opening to the north admits a free current of fresh air, and entirely removes all the inconvenience which would otherwise arise from the noxious vapours of a watery situation. From some of the surrounding hills, the traveller is surprised with an unparalleled prospect of magnificence and plenty; of numerous spires, domes, and turrets, with the combined charms of verdure, water, and trees. The soil is a fine gravel; and, on the whole, the situation is not less healthy than agreeable.

That part of the town properly denominated the *city*, and originally enclosed with walls, is not more than two miles in circumference, and of an oblong figure. The suburbs are most considerable on the north, east, and west sides; containing the parishes of Holiwell, Magdalen, St. Clement, St. Giles, and St. Thomas; with the colleges of Baliol, Trinity, Wadham, Worcester, St. John,

and Magdalen. The walls, from that part of them which remains as a boundary to New College on the north and east, appear to have been embattled with bastions at one hundred and fifty feet distance from each other. The walls likewise, but without their battlements, serve as a fence to Merton College on the south and east. A few detached fragments of them are discernible at other places. The whole town is about three miles in circumference. The principal street is the High-street, running from Magdalen-bridge to Carfax-church. Its length and breadth are hardly to be paralleled; and it is remarkably clean and well paved. It derives its principal grandeur from the fronts of three magnificent colleges, together with the churches of St. Mary and All Saints. This street would be less beautiful were it in a straight line: from its tendency to a curve, it affords a gradual and unexpected display of its parts, and successively surprises us, at every turn, with a new object. This street, but under different names, is continued towards the castle. The next considerable street, by some called Fish-street, leads from Carfax to a bridge over the Isis, on which formerly stood a turret called Friar Bacon's Study. It is adorned with the stately front of the college of Christchurch, which is extended to the length of three hundred and eighty-two feet. In the same street is the town-hall, where the assizes for the county, and the town and county sessions, are held; a neat and commodious edifice; partly erected at the expense of Thomas Rowney, esq. the late representative, and high-steward, of the city. From Carfax (where formerly stood a conduit erected by Otho Nicholson) we pass on the north into the Corn-market; and from thence, by Magdalen parish-church on the right, and Friar's Entry on the left, being the passage to the Carmelite friary in Beaumont, into St. Giles's; which is a street of extraordinary breadth; and, from the trees left before St. John's college, and those in the front of the church, has the appearance of an elegant village. On the east side stands St. John's college; and the town, as well as the street, is terminated at this end by St. Giles's church.

These are the chief entrances. The principal bridges are, 1. Magdalen-bridge, over the Cherwell, being five hundred and twenty-six feet in length, by which we enter the town from London. 2. High-bridge, or Hithe-bridge, in the western suburbs, over the Isis, consisting of three arches. 3. Folly-bridge, as it is commonly called, in the southern suburb, on the same river, over which is the Abingdon road, which leads to various parts of Berkshire, &c. This consists of three arches, and is, like the rest, entirely built with stone.

The origin of this famous town has been a subject of anxious investigation among the learned in different ages; and much curious but fanciful speculation has been exhibited by those who were ambitious to bestow on it a claim to very remote antiquity. John Ross, or Rous, whom Dugdale terms a "famous antiquary," even asserts, that a town was built here by Memphric king of the Britons, upwards of a thousand years before the Christian era. This town, the same author observes, was first called *Cuer-Memphric*, in honour of its founder; then *Bellestium*, from a pretty mountain near it; afterwards, *Ridohen*, implying, in the Celtic language, a Ford of Oxen; and *Cuer-Voffei*, from Bosfo, the name of an earl who was contemporary with king Arthur. Such a view of the origin of Oxford, however, though accredited and repeated by some antiquaries of modern times, is justly considered by Camden and others to be fabulous; and the fact is, that no mention of Oxford occurs during the Roman era; for the idea of Wood and Leland, that it was the *Calleva* of that celebrated people, and a place of splendour and notoriety under their government, has been proved to be altogether erroneous. Indeed, no credit can be given, by the rational enquirer, to any statement respecting it till the reign of Alfred, when it appears to have been famous for a monastery dedicated to the Holy Trinity. This was founded in 727, and was most probably the nucleus

cleus whence the town actually derived its origin, by collecting around it the habitations of the laity. At all events, whether this was the source of its existence or not, it is certain that a town of some kind occupied the site of Oxford in the tenth century. In 979 it was mostly burnt, and in 1002 again suffered the same fate. It soon revived, however, but only to encounter fresh disasters. In 1009, Swein king of Denmark set fire to it; and when, in revenge, king Ethelred ordered a general massacre of the Danes throughout all his dominions, the command was executed with terrible fidelity at Oxford. No regard was paid either to sex or age; even the altars were polluted with the blood of the devoted victims. Among those who perished on this occasion, was the lady Gunilda, sister to the Danish monarch. This savage policy of the Saxon king inflamed the resentment of Swein to the highest pitch; he consequently made a descent upon England with an overwhelming force, and laid in ashes many of the principal towns; but it appears that he only frightened the inhabitants of Oxford into a surrender, and imposed upon them a heavy contribution. About three years after this event, Ethelred having returned from France, whither he had fled to avoid the vengeance of Swein, invited some of the Danish nobles hither to a conference, and treacherously caused two of their number to be put to death. The remainder, fearing the same fate, immediately took to arms, but were overpowered; and either fell by the sword, or were consumed in the conflagration of St. Frid's church, in which some of them had sought protection from the rage of their assailants. During the subsequent contests of the Danes and Saxons, Oxford frequently suffered severely. It attained, however, at this period, a very high degree of political importance. King Edmund, surnamed Ironside, occasionally resided here; and was unhappily murdered in the town, November 30th, 1016. Canute the Great held his court frequently at Oxford; and in 1022 he assembled here a general council, in which the laws of Edward were discussed, and made binding upon all his subjects, Danes as well as English. The same monarch, in a subsequent parliament, confirmed the edicts of king Edgar. Harold, surnamed Harefoot, likewise fixed his chief residence at this place, which was the scene both of his coronation and of his death.

When William the Conqueror made a progress to the north, after he had been crowned at Westminster, the inhabitants of Oxford, being much attached to their deceased sovereign, refused to open their gates to the usurper of his throne. The king was therefore compelled to obtain entrance by force of arms; and, as a punishment for their resistance, he levied upon the townsmen a tax much higher than was paid by other towns. The better, however, to restrain their rebellious spirit, he conferred the government of Oxford on Robert de Oigli, a Norman of tried valour, and empowered him to build and fortify a castle. This structure was of great size and strength, and was raised on the west side of the town, near the river. After the completion of the castle, Oxford became more submissive; and, long before the termination of the Conqueror's reign, appears to have been perfectly reconciled to the Norman government. The immediate successors of William frequently made it the place of their residence, and on several occasions summoned parliaments and councils to it. When William Rufus found his throne threatened by formidable insurrections in the north, he convened a general council here, and, declaring his resolution to govern his subjects with strict impartiality, succeeded in confirming the allegiance of many of his great barons, who might otherwise have deserted his interest; and, through their means, was enabled to quell the revolt. Stephen several times held his court here; and, during the contest for the crown between him and the empress Maud, the latter having taken up her abode in the castle, was besieged in it by the king

in person, and only effected her escape, by stratagem, the day previous to its surrender.

Henry II. convened several councils at Oxford; and in the year 1177, the princes and chief lords of Wales did homage to him here for their territories and estates. This monarch resided, during a greater part of his reign, in the palace of Beaumont, which had been erected in the north suburbs by Henry I. Within the walls of that structure, his heroic son, Richard Cour-de-Lion, was born, and subsequently held a council here anterior to his departure for the Holy Land. King John passed many of his troubled hours in the same palace; and had a meeting with his indignant barons in the vicinity about two months before he was compelled to sign that grand bulwark of English liberty, Magna Charta. Henry III. following the example of his predecessors, occasionally fixed his abode at Oxford, and held many parliaments and councils here on subjects of great political importance.

In the reign of Henry VIII. Oxford was constituted the seat of a bishop's see, and consequently elevated to the rank of a city. By order of queen Mary, archbishop Cranmer, with bishops Ridley and Latimer, were executed here, October 1555, for heresy to the Romish church. Her successor, queen Elizabeth, frequently visited Oxford, as will be more particularly mentioned in the sequel of this article. In the year 1577 the plague raged with dreadful mortality in this town. While the court sat on the trial of a popish bookfeller, accused of circulating offensive pamphlets, a sudden sickness seized nearly the whole of the persons present; and, within 48 hours, upwards of 300 persons died, among whom were the lord chief-baron, the high-sheriff, several justices of the peace, and most of the jurors. King James I. withdrew to this city when the plague broke out in London. The malady, however, likewise found its way hither, and began its devastations with such awful effect, that the scholars fled from the university, and the citizens shut their shops. "Not a living creature," says Aycliffe, "besides nurses and corpse-bearers, was to be seen in the streets, which were covered with grass, even in the market-place."

Charles I. held a parliament at Oxford in the early part of his reign; and at a subsequent period, when he found it expedient to quit London, he chose this city for his place of abode, being well assured of the loyalty of the citizens, and of the collegians. The whole melancholy winter of 1646 was spent by that monarch within the walls of Christchurch, where he assembled the shattered remains of his parliament, and whence he wrote the memorable letter to lord Digby, declaring that, "if he could not live as a king, he would die as a gentleman." The negotiations for peace between Charles and the republican parliament were chiefly carried on at Oxford; but no military event of any consequence occurred here throughout the war, though the city was strongly fortified, and its possession considered an object of great importance to both parties. It was surrendered by the express command of the king himself, after he had been made prisoner by the Scots. The last parliament which met at Oxford was convened in the year 1681 by king Charles II. As party-spirit then prevailed in a very high degree, its meeting was attended with many boisterous circumstances. The popular faction affecting to dread some secret machinations among the papists, their representatives entered Oxford with a large train of servants and partisans as body-guards. Numerous bands of soldiery were drawn up round the royal quarters; and, on the whole, according to Hume, "the assembly rather bore the appearance of a tumultuous Polish diet than of a regular English parliament." This parliament lasted only seven days, having been dissolved by the king, to prevent a bill of banishment and exclusion from the throne being passed against his brother James duke of York, afterwards

terwards James II. in whose reign many scenes of turbulence happened here, in consequence of his illegal interference with the civil rights both of the city and university. Since that time, the annals of Oxford afford no very remarkable historical particulars.

THE UNIVERSITY.

The origin of the university is no less involved in doubt and obscurity than the early annals of the town. Some of the more eager disputants for the remote antiquity of Oxford contend that it was a seminary of learning immediately after the destruction of Troy. "The studies of literature," observes Middendorp, "flourished here ever since those excellent philosophers, with the Trojans, coming out of Greece, under the command of Brute, entered and settled in Britain." Other writers, less fantastical, wish to show that the university was founded by Arviragus, a British king who lived in the time of Domitian, about seventy years subsequent to the Christian era. A third class, with greater appearance of candour, decline to affix any precise date to its foundation, but uphold the opinion that it took place during the government of the Romans. All these notions, however, we are to treat as chimerical, and unworthy attention. We shall therefore pass them over without further remark, and descend at once to a period later by about a thousand years.

Among the many national improvements attributed to the great Alfred, the foundation, or, as some will have it, the restoration, of the university of Oxford, is one of the most eminent. John Rous, the historian already mentioned, affirms, that he established within this city, at his own expense, three teachers of grammar, arts, and divinity, in three different places. One of the fragments of Leland says, "Alfred founded the university of Oxford, at the instigation of his brother St. Neot;" and in the edition of Asser, the contemporary of the monarch, which was published by Camden in 1603, there are several passages corroborative of this assertion. The critical inquiries of succeeding writers, however, have clearly proved these passages to be interpolations, and to have formed no part of the genuine work of Asser. Many conclusive arguments have likewise been adduced, to show that Alfred never founded any school-establishment except that of Winchester. Add to this the fact that no mention is made of Alfred in the early statutes, or other records, of the university; and it is not possible to resist the conviction that Alfred had no concern either in its original foundation, or its revival at any subsequent period.

At what time then, it will perhaps be asked, was the university really founded? To this question our answer is, that its progress to that rank was gradual, and that, in all probability, no regular system of education, or corporate body for the purposes of learning, existed at Oxford till about the twelfth or thirteenth century. It is admitted, however, that there were numerous schools for the acquisition of knowledge established here at a much earlier date; but these were either of a private nature, or attached to some of the religious houses with which the town abounded. The clergy, before the conquest, monopolized the small portion of learning which, in those early days, was permitted to enliven the otherwise dark and cloudy atmosphere of European ignorance. They were almost the only teachers to whom the people could apply for instruction. Every monastery, therefore, was in fact a school; and, whenever there chanced to be a number of them at one place, it might not improperly be called a seat of learning. It could not, however, be regarded in the light of an *university*; as that term, in its modern signification at least, implies a corporate establishment, with the privileges of holding property and conferring degrees. In Domesday-book no mention of such a corporation occurs at Oxford.

Under this view of the subject, it seems reasonable to

conclude, that, when the Conqueror mounted the throne, Oxford enjoyed no greater pre-eminence in learning than what naturally resulted from the number of its monastic establishments, and from the circumstance of its having been, during the preceding century, a favourite residence of the English monarchs. This, indeed, was a certain degree of distinction; and would assist in paving the way to the future celebrity of the town. Its schools might for these reasons be more numerous, and better attended, than in other towns, and might possibly possess some few trifling privileges, which would be gradually augmented, till the plan of a modern university was completed.

Henry I. having been educated here, seems to have paid great attention to Oxford as a seminary for learning, and is said to have granted to the teachers and the scholars some important privileges in their individual capacity. In the reign of Stephen, learning sunk to a very low ebb, and continued in the same degraded state during that of his successor Henry II. Richard I. however, stimulated its revival in every part of his dominions; but especially gave encouragement to Oxford, because of its having been the place of his birth. Many new halls or schools were established under his royal patronage, and with money issued by his command from his own exchequer. To so flourishing a condition, indeed, did he raise Oxford, that the number of scholars at its several halls, in the early part of the succeeding reign, is stated to have been not less than three thousand. In the reign of Henry III. anno 1229, a serious dispute having arisen between the students and citizens of Paris, the king seized the opportunity to advance the interests of Oxford, by inviting the Parisian masters and scholars to settle there. Accordingly, no fewer than a thousand of them resorted thither; but these foreigners introduced such a dangerous levity of manners, that tumults were continually breaking out, and caused great alarm and disquiet in the town. They had sometimes even the audacity to interfere in political matters; and thus it may reasonably be supposed, that, though the number of scholars was great, yet the real votaries of learning were few. But still amongst these few some names have attained considerable distinction from their eminence in the fashionable literature of the age, which was deeply corrupted with the subtleties of the Aristotelian philosophy, and the mysteries of theological belief. The reign of Henry III. however, will be always memorable in the annals of the university, on account of an important acquisition of private patronage which prevailed towards its conclusion. Previous to that period the teachers and scholars lodged and studied in mansions, or *halls*, rented from the townsmen; and this was one great source of the numerous quarrels which were constantly taking place between them. To remedy this evil, as well as to encourage learning, by conferring upon its professors more complete independence than had hitherto been enjoyed, several public-spirited individuals purchased, or built, large houses for their reception, and set the example of appropriating funds for the support of those who might not possess the competent means of pursuing their studies to advantage. By such progressive steps, a taste for erecting and endowing *colleges* was introduced.

The reign of Edward I. is marked with no very interesting features in the annals of literature. That prince, continually occupied in war, and in schemes of political aggrandizement, had little leisure to attend to the advancement of learning. Some privileges, however, were conferred on the university in his time; and, towards the conclusion of his reign, a violent dispute arose between the *university*, for such the school-establishments here had now really become, and the bishop of Lincoln, in whose diocese Oxford was then included. This dispute related to the limits of the bishop's jurisdiction in university-matters; and ultimately led to the total emancipation of the learned body from ecclesiastical authority, under the sanction

sanction of a papal bull, granted by pope Boniface in the year 1301.

Edward II. granted many additional privileges to the university, and confirmed all the grants of his predecessors. In this monarch's reign *lectures* were first instituted in the Hebrew language. The original lecturer, John de Bristol, a converted Jew, is said to have been a man of greater science and erudition than was common in his age; and his lectures were received with the greatest approbation.

Edward III. having been educated at Oxford, retained, during his whole life, a high veneration for the university, and was more liberal in his grants to it than any of his predecessors. Though almost constantly engaged in war, his vast and capacious mind did not forget the interests of literature. He effected many regulations in the police of the town, highly useful, and calculated to promote the health and comfort of the numerous students by which it was frequented. While he added progressively to the power of the superior officers of the university, he was equally careful to increase the consequence and security of the scholars. He took the most decided measures to root out the ancient animosity arising from difference of country as to north and south, which had given birth to many dangerous tumults; and endeavoured to turn the current of jealousy into the channel of emulation. The state of society, however, had not yet advanced far enough to teach men to restrain their ardour in debate within the bounds of decorum. The increase of learning augmented the violence of discussion on doctrinal points; and the university became split into sects or parties, not one of which recollected that urbanity should form the basis of disputation. Among the more celebrated of the disputants at this period, were Duns Scotus, and Oakham. The former was the founder of the sect called the Nominals, and the latter the patron of the Reals. The distinction between these sects does not appear clearly upon record; but one subject of difference was the relative authority of the civil and ecclesiastical power. Oakham, who maintained the pre-eminence of the civil power, is said even to have convinced the pope himself by the influence of his oratory. He was styled by his holiness the Invincible Doctor, and his antagonist the Subtle Doctor.

The reign of Richard II. is distinguished by the appearance, at this university, of one of the brightest luminaries that had hitherto enlightened the religious hemisphere. We allude to Dr. John Wicliffe, a man whose name is yet deservedly venerated by all who regard the reformation as an occurrence favourable to the interests of Christianity, and to the progress of the human mind. This eminent character was the first warden of Canterbury-college; and it was at Oxford that he read those lectures on divinity which laid the basis of the religious liberty we now enjoy. He loosened the shackles of papal thralldom which Henry VIII. afterwards burst asunder, though from motives of a very opposite nature to those which animated the father of the reformers. No sooner were the doctrines of this great man divulged at Oxford, than they were approved of by the judicious, and received with enthusiasm by a large proportion of the university. But, though the spirit of the university was thus favourable to liberty of opinion, learning was by no means in a flourishing condition at this era. The number of students had greatly diminished; and many of the halls and schools were let for purposes entirely different from their original destination. Some new foundations, however, took place during this reign; but the ages which succeeded were dull and fordid in a lamentable degree. The reigns of Henries IV. V. and VI. are only memorable for the violence of the religious dissensions which prevailed, and had nearly produced a dissolution of the university. Thus circumstanced, the accession of the house of York was viewed by many of the collegiates as a matter of indifference, and by some was even hailed with joy, from a

hope that their situation might be bettered under the new dynasty. Nor were they deceived in their expectations; for no sooner was Edward IV. seated on the throne, than he assumed the title of "Protector of the University," and in many respects proved a zealous friend to the cause of learning. Richard III. who is commonly stigmatised as the worst of tyrants, was likewise a great benefactor to the university, and an encourager of literature. Among many other judicious measures adopted by this monarch for its advancement, he passed a law, empowering the university "to import or export books at pleasure;" a permission which may be rationally construed to signify an entire freedom of the press, and liberty of discussion.

The reign of Henry VII. from a variety of fortuitous causes, is entitled to the proud distinction of having fostered with more than common success the revival of learning. From the many discouraging particulars of the preceding century, genuine scholarship had become almost an obsolete character, in a professional light. The Greek language had not only fallen into general disuse, but was affectingly held in contempt by a great body of the scholars, who formed themselves into an association under the name of *Trojans*. So strong, indeed, were the existing prejudices against this noble and harmonious language, that, when Erasmus repaired hither for the purpose of teaching Greek, several leading men in the university read lectures against him in the schools, and endeavoured to attach ridicule both to the man, and to the knowledge which it was his object to disseminate.

The period during which Henry VIII. held the sceptre, is, in some respects, one of the brightest in the annals of the university. Soon after his accession, this prince confirmed all the grants of his predecessors, and honoured Oxford with a regal visit. Wolsey, so celebrated for his unexpected elevation to the highest pinnacle of power, for his talents, and for his fall, proved himself one of the most munificent patrons of learning that graced his own or any other age. In 1518, this illustrious prelate and statesman founded seven lectures for theology, civil law, physic, philosophy, mathematics, Greek, and rhetoric; and appointed all such men as were most distinguished for their abilities and for their knowledge in these respective branches of learning. His efforts to promote the good of the university were indeed vigorous and uniform. Through his means the Greek language was again received into estimation, and a taste for elegant literature was introduced; and this happily supplanted the quibbling sophistry which had hitherto occupied the chief attention of the learned. Wolsey also founded the college now called Christ-church. About the same time the colleges of Brazen-nose and Corpus Christi were also founded; the former by Wm. Smyth bishop of Lincoln, and sir Robert Sutton, and the latter by Richard Fox bishop of Winchester. Yet, soon after, when Henry began his system of spoliation and suppression, the university presented a most dismal spectacle. The plague, together with the calamities of the church, concurred in driving the students from their habitations; and, so few in number were those who resorted hither at this era, that, in the year 1546, only ten inceptors in arts, and three in divinity and law, are recorded.

The accession of Edward VI. brought with it evils of no less magnitude than those which marked the footsteps of his father. The first act of this young prince's counsellors, (for to them must belong the merit or demerit of almost every act of his reign,) was a gross infringement on the rights and privileges of the university, as it directed "that no gownsmen should concern themselves at the election of any president, fellow, or scholar, or do any thing to oppose the visitation now ordered by the king." Accordingly, when the threatened visitation took place, the royal commissioners executed whatever measures they deemed proper. They entirely changed the form of the university-government, and framed a new code of statutes, called Edward's Statutes, which remained

remained in force until archbishop Laud introduced a better model. They moreover despoiled the libraries, and destroyed many rare manuscripts on subjects of science, merely because they had been written by votaries of the old school. This treatment so inflamed the few remaining scholars, that the greater part of them quitted Oxford, and retired to foreign seminaries to prosecute their studies.

When queen Mary ascended the throne, the ancient forms and government were again established, and the late regulations completely abrogated. The popish party, now in their turn predominant, was not behind its antagonists in the work of cruelty and destruction. The ingenious arts were consigned to contempt; the divinity-school was seldom opened; there was scarcely one sermon preached in the city in a month; public lectures were neglected, either through insufficiency or idleness. The Greek tongue again fell into almost total disuse; and, in general, learning, in every branch, was sunk to the lowest ebb. For six years there were only three inceptors in divinity, eleven in civil law, and six in physic.

The death of Mary without issue, gave Elizabeth possession of the regal sceptre at a most critical juncture for the united interests of religion, as well as of learning. This wise and politic princess reversed all that her sister had effected in the constitution of the university. But, unlike her predecessors, she conducted the change with gentleness and moderation. Objectionable individuals were simply deprived of their places, or induced to resign; and no greater punishment than a few days' imprisonment was inflicted, even upon the obstinate opposers of the queen's measures. These, however, were some time before they produced the desired effect of restoring the university to any tolerable degree of prosperity. The shock occasioned by the versatile state of the court-religion during the three previous reigns, and the consequent uncertainty of ecclesiastical provision, was not to be quickly overcome. In the year 1560, not one person performed theological exercises in the schools, and only one in civil law, and three in physic. No divine, legislator, or physician, stood that year for a degree. In 1563 there were only three university-preachers in Oxford, and two of these shortly afterwards retired. Hence the pulpit was frequently supplied by laymen. Mr. Taverner, sheriff of Oxfordshire, mounted the pulpit, with his sword by his side, and his golden chain of office round his neck, and preached a sermon to the academics. This sufficiently evinces that the condition of ecclesiastical literature must have been low indeed, or the Oxonians never could have listened to such flagrant absurdity as the following: "Arriving at the Mount of St. Mary's," says this preacher at the commencement of his sermon, "in the stony stage [the pulpit was of stone] where I now stand, I have brought you some fine biscuits baked in the oven of charity, carefully conserved for the chickens of the church, the sparrows of the spirit, and the sweet swallows of salvation." And afterwards he goes on in this strain: "Here I find that all houses are ale-houses, matrimony is made a matter-of-money, and men place their paradise in a pair-of-dice. Was it so in the days of Noah? Ah! No!"

In the 13th year of queen Elizabeth the two universities were incorporated by act of parliament; and two years subsequent, the obligation of subscribing the Articles of the Church of England began to be rigidly enforced on all who entered into the ministry. This occasioned some disturbance, as there were many persons in the university who favoured the puritanical doctrines, and peremptorily refused their assent to the proposed articles. However, the university rapidly rose in consequence, and could boast among its members numerous individuals eminent for their proficiency in almost every branch of the liberal arts or sciences. Queen Elizabeth twice visited the university; and on one of these occasions delivered a Latin speech extempore, with so much ease and correctness as excited the surprise of all who heard her.

In this reign sir Thomas Bodley founded the Bodleian library, which has proved an highly useful and valuable addition to the university.

The reign of James I. is remarkable in the annals of the university, for the privilege it then acquired of sending two representatives to the national council. In this era, the disputes between the Papists, Episcopalians, and Puritans, were carried to a great height; and proved highly injurious to the interests of solid learning, by inducing too eager a thirst for controversial inquiry. On this account, sir Henry Savile informs us, "that geometry was almost totally unknown and abandoned;" and hence we may fairly presume that many of the other sciences were in a similar state of decay and neglect.

Charles I. in the early part of his reign, conferred some important benefits on the university. At the intercession of the chancellor, the celebrated archbishop Laud, he granted to it a new charter, in which its ancient liberties and privileges were explained and confirmed; and new ones were added. This charter was sealed with the great seal of England; and, to distinguish it from other grants, it was denominated the *Caroline Charter*. In 1636, the statutes of the university, after being corrected and enlarged, and approved of by the heads of the colleges, received the royal sanction; and in 1638 the statute ordering the examination of all candidates for degrees, was first put in execution. During the rebellion which broke out shortly after, the university maintained an inviolable allegiance to the unfortunate monarch; but its firmness was of little avail in checking the religious fanaticism which at this period possessed the minds of the predominant party. The dean and chapter's lands were sold; the episcopalian divines were ejected; the libraries were pillaged; and some of the more zealous votaries even proceeded so far as to destroy the ornaments and decorations of the several colleges, without regard to the circumstance whether they bore relation to matters of religion, or not. Classical learning now experienced a total stagnation. The candidates for holy orders were no longer required to be men of science and polite erudition: it was enough if they "abounded in grace," and were "endowed with the spirit of preaching." Still, amidst this melancholy scene of religious bigotry, a few men of real talent inhabited the more shady recesses of the university, and kept alive the dying embers of genuine knowledge. These individuals met together at stated periods, to communicate to each other their respective discoveries in physics and geometry; and thus laid the foundation of the Royal Society, the most honourable and scientific institution of which our country can boast.

Cromwell, who was elected chancellor of Oxford in 1650, gave several proofs of his predilection for learning; but the temper of the times is supposed to have checked his efforts for its revival and encouragement. On the restoration, however, this sentiment being in a great measure removed, the university was again replaced on its former basis. The lands of the dean and chapter were restored, and most of the persons who had suffered expulsion on account of their principles, were reinstated in their respective collegiate stations. Learning once more began to flourish; and some of those who were the proudest boasts of science and of literature matured their studies, or laid the foundation of their future eminence, here, in the reign of the second Charles.

But this pleasing aspect of affairs did not continue long: violent party-contentions disturbed the peace of the university during the whole reign of James II. who exhibited a signal proof of his determination to subvert the civil and religious liberties of the country, in his conduct towards Magdalen-college. It happened that, shortly after he had ascended the throne, the president of that establishment died; and the king transmitted an order for the election of a person named Farmer, as successor in that office. The fellows, however, knowing that Farmer was a man of contemptible character, petitioned his majesty either

either to leave them the freedom of choice which their statutes entitled them to assume, or to propose a more respectable individual for their head. James took no notice of this application; so that, when the day of election arrived, the fellows elected Dr. Hough for president. This measure roused the vengeance of the monarch, who viewed their refusal to obey his mandate as an act bordering on rebellion. He therefore repaired to Oxford in person, and commanded the fellows to appear before him at Christ-church; but, finding that even his own presence could not influence their decision, he expelled the whole of them, except two, from the college. This conduct of the monarch excited the detestation of all friends to cool reason and upright government; and in 1688, when James became alarmed by the preparations of the prince of Orange to invade his dominions, one of the first measures he adopted to conciliate his subjects, was the reinstatement of the expelled members of Magdalen-college.

From the period of the revolution to the present day, the university of Oxford has continued to flourish in an unexampled degree. Its revenues have been increased, and the system of education has generally kept pace with the improvements which have happily been accomplished in almost every branch of human science. The doctrines of the schools, indeed, were received and taught here for some time after they had been exploded in the northern universities; but they have now yielded, as in other seminaries, to the more rational views of the experimental philosophy. For some remarks on the state of national learning during the last century, and the peculiar features of university-tuition, discipline, and influence, see UNIVERSITY.

The university, as a corporate body, has been governed by statutes enacted at different periods, and sanctioned by charters granted in different reigns. Those at present in force were chiefly drawn up in 1620, and were confirmed, as already mentioned, by king Charles I. in the year 1635. In that charter the corporation is styled "The Chancellor, Masters, and Scholars, of the University of Oxford;" and this body is vested with the power of framing laws for its own government.

The principal officers of the university are, the chancellor; the high-steward; the vice-chancellor; two proctors; a public orator; a keeper of the archives; a registrar; numerous public lecturers and professors; two curators of the theatre; two clerks of the market; the Bodleian librarian, and the keeper of the Ashmolean Museum. The first five mentioned officers are invested with magisterial authority, and have the power of appointing deputies.—Of these,

The *Chancellor* is chosen by the members of convocation, and now holds his office for life, though formerly it was annual, or at most triennial. It is a station of great dignity, and is usually filled by a person of the first eminence in the kingdom. The duties of the chancellor are, to superintend the interests of the university, to defend its privileges, and to decide, either in person or by deputy, in all civil questions in which a member happens to be involved. For this purpose he is empowered to hold regular courts; he likewise presides, if present, at all university-meetings, and possesses an absolute negative on their proceedings. The present chancellor is lord Grenville, who was elected in the year 1809.

The *High Steward* is nominated by the chancellor, but must be approved of by convocation. He holds his office for life, and is bound to assist the chancellor, vice-chancellor, and proctors, in the execution of their several duties, and to sit in judgment in capital causes, where a member of the university, or a privileged person, is the party offending. He likewise holds the university court-leet, either in person or by deputy. Lord-chancellor Eldon, the present high-steward, was elected in 1801.

The *Vice-Chancellor*, who is always the head of some college, is appointed by the chancellor, and admitted, and sworn, in convocation. This office is annual, but

the same individual is usually named for four successive years. The vice-chancellor nominates four deputies, or pro-vice-chancellors, who must likewise be heads of colleges. His duties are, to enforce the university regulations, to call congregations, convocations, and courts, license taverns, expel delinquents, &c. The present vice-chancellor is John Cole, D.D. rector of Exeter-college, appointed in 1810.

The professors and lecturers are public officers, who have certain salaries allowed to them, on some foundation, and who are, in consequence, required to deliver lectures annually, on such subjects as the founders may have appointed in their charters, or wills. The lectureships at present in Oxford are twenty-five in number.

The whole business of the university, in its corporate capacity, is conducted in two separate assemblies, called the House of Congregation, and the House of Convocation.

The *House of Congregation* is constituted entirely of regents; either of necessary regents, or regents *ad placitum*. Of these, nine at least, besides the vice-chancellor and proctors, are required to make a congregation. The business of this assembly refers chiefly to the passing of graces and dispensations, and to the granting of degrees. All votes are given secretly, by whisper in the ear of the proctor.

The *House of Convocation*, which is composed of regents and non-regents alike, but with certain limitations, is privileged to investigate and determine every subject in which the interest of the university is concerned. In this assembly, laws are enacted, altered, or explained, without restriction, unless the statute proposed to be altered be a Caroline statute, and then the royal consent must be previously obtained. In both these meetings, the chancellor or vice-chancellor singly, and the two proctors jointly, are officially empowered to negative every proceeding. All questions are decided by a majority of votes; and all elections, except for members of parliament, are conducted by a private scrutiny in writing.

We have already noticed, that the privilege of sending burgesses to parliament was granted to this university by king James I. this was in the year 1603. The right of election is in the doctors and actual masters of arts, who are in number about 1200; the returning officers are the vice-chancellor and heads of colleges. "The political principles of the members of this university (says Mr. Oldfield) are, with a few exceptions, those of toryism. They have always assisted and given shelter to royalty, whenever it was distressed by the parliament or people. So little are they, however, to be influenced in the choice of their representatives, that they do not suffer any canvass to be made, nor either of the candidates to be, at the time of election, within ten miles of the jurisdiction of the university." The present members (elected Mar. 1820) are—sir Wm. Scott (brother of lord Eldon) and the right hon. Robert Peel, eldest son of sir R. Peel, bart.

The several *degrees* conferred by the university of Oxford, are those of Doctors of Divinity, Civil Law, Medicine, and Music; of Bachelors in these sciences, and of Masters and Bachelors of Arts. For the attainment of each of these degrees, a residence for a certain number of terms is required; but it is to be observed, that the terms kept by students at universities, vary from those observed by our courts of judicature, and from each other, as to their times of commencement and termination, though not in their titles.

It is only within these few years that the public examinations for degrees at Oxford have been at all placed on that footing of scholarship which they demand. The strictness of the new statute has, however, been considered, by some well-judging persons, to be carried to too great an extent; and instances have occurred, in which more exactness seems to have been required than is generally attainable by the youthful candidate. It is, no doubt, a most difficult and delicate point, to hit the precise medium of proper inquiry into the attainments of the

early scholar; but, to err on the liberal side, will probably always be found the safest.

Find'st thou the golden mean, where Right from Wrong
(Though e'er so close) runs clearly mark'd along?
Where Rigour ends ere Laxity begins,
And pardon'd faults stop short of licensed sins?
'Tis well. But, candid Rhedycina, say,
In this the reflux of thy brighter day,
Screws not thy hand too tight the strong machine,
Where thy young votaries ne'er before were seen?
How canst thou hope degenerate times like these
Will yield a host to storm Thucydides?
How canst thou bid them at so green an age,
Reap the full vigour of that attic page? *Sacculomastix*, 1819.

COLLEGES and HALLS.

The university contains twenty distinct endowed corporations, termed *colleges*; and five *halls*, or buildings appropriated for the residence of students, under the superintendence of a principal, who receives rent for their chambers. The following is an account of these institutions, according to the date of their respective charters of foundation.

1. MERTON COLLEGE, which is the oldest in point of legal establishment in the university, was founded by Walter de Merton, bishop of Rochester, and lord-chancellor of England, who began to erect the buildings about the year 1260, and established the college by charter, dated January 7, 1264, under the appellation of "*Domus Scholarum de Merton*." A second charter was granted in 1270, and a third in 1274; both confirming the original deed, and adding new privileges and possessions to those previously conferred. The first officers of this college were nominated in 1276, about two years after the completion of the buildings. Its chief benefactors, besides the founder, were Ella countess of Warwick, about the year 1295; John Willyott, chancellor of Exeter, in 1380; Dr. Thomas Jessop, physician, in 1595; William Rede bishop of Chichester; and sir Thomas Bodley. This college is situated in St. John's-street, to the east of Corpus Christi, and its buildings are arranged round three courts or quadrangles. The outer court to the street was rebuilt in 1589, with the exception of the tower and gatehouse, which were constructed in the early part of the fifteenth century, in the wardenship of Thomas Rodburne bishop of St. David's, and one of the most distinguished mathematicians of his age. Within this court are the warden's lodgings, some portions of which are supposed to be coeval with the original edifice. The second or grand court is of modern date, and exhibits a mixed style of architecture: the centre elevation is adorned with four tiers of columns, or four orders of architecture; but the third, or small court, is of ancient erection, and is supposed to have been entirely built about the same time with the library, which forms its south and west sides. This library was founded in 1376, by the bishop of Chichester above mentioned, and is the oldest structure, distinctly appropriated as such, in the kingdom. In 1550, when the work of reformation was conducted, in some instances, with more zeal than judgment, many of the printed books and manuscripts belonging to this institution were either sold or destroyed. Upon the restoration of the library, however, by sir Thomas Bodley, a considerable part of them was recovered by the liberality of those private individuals by whom they had been purchased. The hall of this college is remarkable, as having been the room in which queen Elizabeth was entertained at dinner, on the occasion of her visit to the university, with her privy-council, in 1592.

2. UNIVERSITY COLLEGE, as already noticed, is said to have owed its origin to king Alfred. Smith, in his history of this college, has proved to the satisfaction of every unprejudiced mind, that it was founded by the university, with the money of William of Durham, who died at Rouen in Normandy in the year 1249, and bequeathed

310 marks to purchase certain annual rents for the maintenance of ten, eleven, twelve, or more, masters. At first, the funds left by this benefactor were appropriated to the support of a limited number of individuals, (chosen from the various halls of the university,) who did not form an independent society, but were severally subordinate to the schools in which they had been educated. In 1280, however, they were constituted a society by themselves, under certain conditions; and in 1292, their privileges were confirmed and enlarged by a body of statutes. The situation of their house, or hall, at this period, is uncertain; but historians have generally placed it on part of the site of Brazen-nose College, and assert that they removed to the present college, in the High-street, about the year 1343. On this removal, they styled themselves the Masters and Scholars of the Hall of the University of Oxford, and their house University Hall; but in 1381, the latter began to be called Great University Hall. When the term College was first applied is not ascertained, nor is it known at what time the corporation was completed. This, however, most probably did not take place till about the year 1475, when the body of statutes still in force were enacted; but a common seal was used as early as the year 1320.

Numerous benefactors to this college appeared within the first century after its foundation; and in 1403 Walter Shirlaw bishop of Durham, gave the manor of Mark's Hall, in Essex, for the maintenance of three fellows, natives of York and Durham. Henry earl of Northumberland, in 1442, gave lands and the advowson of a rectory to support three bachelors or masters of arts from the dioceses of Durham, Carlisle, and York. In 1566, Joan Davys, wife of a citizen of Oxford, gave certain estates for the establishment of two logic lecturers, or one in logic and another in philosophy; and for an augmentation of the allowance to the masters and fellows. Francis Russell second earl of Bedford, Robert Dudley earl of Leicester, John Freyften of Altofts in Yorkshire, the Rev. Robert Gunsey, and sir Simon Bennet, were likewise very considerable donors. But the greatest benefactor of modern times was Dr. Radcliffe, who, besides rendering munificent assistance toward improving the buildings of the college, instituted and endowed two travelling fellowships for students in medicine. Each fellow receives 300l. per annum for ten years, the first five of which he is required to spend abroad.

University College stands on the south side of High-street, and consists principally of two quadrangular courts, one of which was built at various times between the years 1634 and 1675. It is a hundred feet square, with a chapel and hall on the south side. The other court, which was chiefly erected by Dr. Radcliffe, has only three sides, the fourth opening to the master's garden. These two quadrangles form a grand front towards the street, of about 260 feet in length, with two tower-gateways. The chapel of this college was built in 1665, and displays much painted glass in the windows. It also contains a cenotaph to the memory of sir William Jones, the celebrated orientalist, designed and executed by Flaxman, and is highly creditable to the talents of the artist. The library here was completed in 1669, and is furnished with a very valuable collection of books and manuscripts.

3. BALLIOL COLLEGE owes its foundation to John de Balliol, of Bernard Castle, in the county of Durham, father to the unfortunate king of Scotland of the same name. This gentleman, who possessed a taste for literature and a benevolence of disposition little prevalent in the thirteenth century, commenced it in the year 1263, and intended that it should maintain sixteen poor scholars of Oxford. He died, however, without having effected the design, and so suddenly, that he left no will, but verbally enjoined his lady and executors to take charge of, and give permanency to, his infant institution. Lady Dervorgille, accordingly, at the instigation of her confessor Richard Slickbury, hired a house on the site of the present

present college; and was so fortunate as to meet with the concurrence of the founder's executors in all her subsequent steps to perpetuate the establishment. In 1282 she appointed statutes under her seal, which are interesting; because they serve to throw some light on the modes of collegiate discipline at that early period. In 1284 this lady purchased a tenement called Mary's Hall; and, having repaired and enlarged it, transferred the scholars to this new residence, which was henceforth called New Balliol College. The same year she presented them with some lands in the county of Northumberland, and had their statutes confirmed by Oliver bishop of Lincoln, and by her son John de Balliol, who at that time held the Scottish sceptre under the protection of Edward I. But, notwithstanding these generous efforts, the revenues of the college still continued extremely small, not yielding above eight-pence a-week to each scholar. A number of benefactors, however, soon arose, and by their united contributions conferred a considerable degree of opulence on the institution. In 1294, Hugh de Wychenbroke gave the advowson of St. Lawrence, Old-Jewry, London; and in 1310, Hugh de Warkenby and William de Gotham gave four messuages in School-street, for the support of a chaplain to officiate in the oratory. In 1320, Richard de Hunstonsore also gave a tenement in Oxford. But these donations were trivial compared with the liberal gifts of sir William Fenton and sir Philip Somervyle. The benefaction of the latter, indeed, was deemed so considerable, as to entitle him to the honours of a second founder. A new body of statutes was drawn out under his sanction, one article of which enacted that the society should henceforward be governed by a master. These statutes were confirmed by Edward Balliol king of Scotland, and remained in force till 1364, when a third code was enacted by Simon de Sudbury, afterwards archbishop of Canterbury. In 1507 this code was likewise superseded, and the one at present in force substituted in its stead. Among the various benefactors since that period, the most distinguished were Thomas Harrope, rector of Hasely; Peter Blundell, of Tiverton in Devonshire; lady Elizabeth Periam, of Greenland in Berkshire, sister to the great lord Bacon; Dr. John Warner, bishop of Rochester; and John Snell of Warwickshire. The two last gave donations exclusively for the benefit of Scotch scholars.

The buildings of Balliol-college were erected at various times on the site of the tenements or halls hired and purchased by the lady Dervorgille, and are chiefly arranged round a quadrangle, which is 120 feet long and 80 broad, in the interior. The front towards the street presents much irregularity of structure. Over the entrance, in the centre, is a fine square tower, embattled at the top, with an oriel window in front, also a highly enriched and canopied niche on each side. This gateway is likewise adorned with the arms of Balliol. The buildings to the east and west of the tower were constructed at the beginning of the last century, and possess little consonance of character with the older portions of the college. Within the court the same dissimilarity of architecture is visible as on the outside. The hall, and the residence of the master, occupy its western side; the northern side is composed of the chapel and library; and the other sides are appropriated as lodgings for the fellows and scholars. The library was built in two parts; that towards the west by Dr. Chace, A. D. 1427, and that on the east by Robert Abdy in 1477. The interior of the whole has been lately renewed under the superintendence of Mr. James Wyatt, the architect. Formerly this library was esteemed among the first in the university. Before the time of Edward VI. it was particularly rich in MSS. above two hundred of which, highly illuminated, were presented by Grey bishop of Ely in 1454. Most of these, however, have been since lost or destroyed; but the collection of printed books is still both valuable and extensive. Besides the quadrangle, there is an area on the

VOL. XVIII. No. 1231.

north-west, consisting of several detached lodgings for the students: these were purchased and made over to the society by archbishop Abbot. There is likewise a building belonging to the college, at the south-west angle of the quadrangle fronting the street, which was erected at the expense of Mr. Fisher, late fellow of Balliol.

4. EXETER COLLEGE was founded in the year 1315, by Walter de Stapleton bishop of Exeter, who was likewise the founder of Hert or Hart hall, now Hertford-college, the origin of which is so intimately blended with that of Exeter-college, that it is difficult, at least for some time, to consider them as separate establishments. The rector and scholars of Hart hall, indeed, were actually the first possessors of this college, having been removed to the buildings which formerly occupied the present site, and others dependent on them substituted in their stead. According to the statutes then formed, the society was to consist of thirteen members, eight of whom were to be chosen from Devonshire, four from Cornwall, and one, a priest, nominated by the dean and chapter of Exeter, from any part of the kingdom. The chief benefactors of this institution were Edmund Stafford bishop of Exeter, who added two fellowships, and reformed the statutes, in 1404; and sir William Petre, who procured a new body of statutes, and a regular deed of incorporation for the college, in 1565. The same gentleman likewise endowed eight new fellowships. The other considerable contributors to the prosperity of this establishment, were sir John Ackland; king Charles I. sir John Maynard; Samuel Hill, rector of Warlegan; and the lady Shiers.

The buildings of this college encompass a single quadrangle. The grand entrance facing the street is surmounted by a tower with Ionic pilasters, which supports a semicircular pediment, ornamented with the arms of the founder on a shield surrounded with festoons. The inner front is of similar construction; but the arms here are those of lord Petre. More uniformity prevails in the architecture of this college than in any of those hitherto noticed; and, on the whole, its appearance is simple and pleasing. The chapel, which occupies a large portion of one side, is a neat and solid edifice in the later pointed style, and possesses the peculiarity of having two aisles. The hall is a handsome building, also in the pointed style, erected by sir John Ackland about the year 1620; but the library is of modern erection, and contains, among other valuable works, a fine collection of Aldine classics.

5. ORIEL COLLEGE was founded about the year 1324, by Adam de Brom, rector of St. Mary's in Oxford, under the sanction of Edward II. to whom he afterwards surrendered the whole, in the hope of obtaining the royal protection for his infant establishment. Nor were his expectations groundless; for the king readily took the college under his especial care, and the next year granted a new charter, appointing it a college for divinity and the canon law, to be governed by a provost. He likewise bestowed upon the society some tenements in Oxford, and the advowson of St. Mary's church, on condition of their providing chaplains for the daily service. Adam de Brom was named the first provost, and drew up a code of statutes in 1326, by which the college was to consist of a provost, ten fellows or scholars, seven to study divinity; and three the canon law. He likewise gave them the livings of Aberforth in Yorkshire, and Coleby in Lincolnshire; and in 1327 Edward III. bestowed upon them a large messuage called La Oriole, or Oriel, to which the members soon after removed; and hence the college derived its present name. The chief subsequent benefactors of this institution were John Franke, lord-chancellor of England in 1441; Carpenter, bishop of Worcester; Smyth, bishop of Lincoln; Dr. Richard Dudley, chancellor of Sarum; Dr. Robinson, bishop of London; Dr. Carter, provost of the college in 1708; Charles fourth duke of Beaufort, and her majesty queen Anne. By some of these benefactors fellowships were founded; so that the

Q q

society

society now consists of a provost, eighteen fellows, fifteen exhibitioners, and other students. The lord-chancellor is the visitor.

The buildings consist of a large quadrangle, and two lateral ranges of chambers for the reception of students, with a library between. The whole of the quadrangle was rebuilt in the early part of the seventeenth century, and both exteriorly and interiorly possesses uniformity of style and construction. The front, towards the street, is divided by a square tower, which rises over the entrance, and is ornamented with a bay-window, or *oriel*. The hall faces the gateway, and is approached by a flight of steps under a portico, surmounted by statues of Edward II. and III. in niches, with the virgin and child in another niche immediately above. The provost's lodgings are on the north side; and the buildings on the south and west are entirely appropriated for the accommodation of students. The library was designed by James Wyatt, esq. architect, and executed under his direction. It contains, among many other books, a very curious and valuable collection, which was bequeathed to the society by Edward lord Leigh of Stourleigh.

6. QUEEN'S COLLEGE was founded by Robert Eglesfeld, confessor to queen Philippa, the illustrious consort of Edward III. The founder was descended from an honourable family in the county of Cumberland; and appears to have been deservedly held in high estimation by his royal master and mistress, as he employed his interest at court chiefly in promoting religion and learning. Anxious to supply the means of education to the border-counties, in which, to use his own expression, "an unusual scarcity of literature prevailed," he purchased some tenements on or near the site of the present buildings; and obtained a charter, dated January 18, 1340, from Edward III. to constitute a collegiate hall, under the name of "Aula Scholarium Reginæ de Oxon;" a title which seems to imply that the queen had some share in its institution. At all events, she took it immediately after under her protection; and, in consequence, the honorary patronage of the college has ever since appertained to the queens of England. By the original charter and statutes of this establishment, the society was to consist of a provost and twelve fellows or scholars; the provost to be in holy orders, and chosen from among the fellows, who were to be natives of Cumberland and Westmoreland, in the first instance; and afterwards of those counties in which the college possessed property. This number, however, has since been increased by various benefactions, but by none so much as by that of John Michel, esq. of Richmond, who bequeathed estates valued at 700*l.*a-year, for the maintenance of eight master-fellows, four bachelor-scholars, and four under-graduate scholars, or exhibitioners; and for the erection of suitable buildings for the accommodation of the masters and scholars; so that this has been considered in the light of a new foundation. The queens who have contributed to the college, besides queen Philippa, are Henrietta Maria, consort to Charles I. queen Caroline, and her late majesty. The first gave three rectories and as many vicarages, and the two last presented 1000*l.* each towards enlarging and repairing the buildings, which now consist of two courts, divided by the hall and chapel, and forming an oblong 300 feet long and 220 broad. With the exception of the chapel, the whole of this college was erected during the last century. The style of its architecture is therefore modern. The principal front is in the High-street, and has in the centre a large gateway, over which is a statue of queen Caroline, under a cupola supported by pillars. This gateway leads into the first court, which bears, in general, a remarkable resemblance to the Luxembourg-palace at Paris. The principal library-room is one of the largest in the university, and is arranged in a very tasteful manner. Here are two very ancient paintings on glass of Henry V. who received his education at this college.

7. NEW COLLEGE is indebted for its origin to William de Wykeham bishop of Winchester, one of the most illustrious characters of his age. He founded the society about the year 1373, and established the members in halls, which he hired for their reception, till a college could be erected. Of this college he laid the foundation-stone in 1380, under the authority of the king's license, and likewise of the pope's bull; but the buildings were not completed for a period of six years. As soon as they were, however, the society removed into them, and took possession with great solemnity. The same year, Wykeham began his collegiate establishment at Winchester, which was to serve as a nursery to that of Oxford; so grand and comprehensive was the original design of this distinguished benefactor. Both societies, by their respective charters and statutes, were made to consist of a warden and seventy scholars, besides priests, clerks, and choristers, for the service of the chapels. That of Winchester had likewise a schoolmaster and usher, and was to supply students to the Oxford college, by election, and to submit to an annual visitation from the warden and two fellows of the latter. Many special privileges were at this time secured to New College; of which one was, that the fellows should be admitted to all degrees in the university, upon being found qualified by examinations conducted, according to form, in their own college. This right was questioned in 1608, but decided by the then chancellor, archbishop Bancroft, in favour of Wykeham's foundation. See WYKEHAM.

Many benefactors have contributed to augment the prosperity of this college besides the founder, but only one appeared during his life-time: this was John de Buckingham, bishop of Lincoln, who presented to the society the advowson of Swalcliffe church, together with some adjacent lands. Of the subsequent donors, the principal were, Thomas Beckington, bishop of Bath; Robert Shireburn, bishop of Chichester; John Smyth, a burgher of Ipswich; Dr. Flethmonger, dean of Chichester; and Christopher Rawlins, vicar of Alderbury in 1589. By the assistance of these, and numerous smaller benefactions, this society became one of the richest in Oxford; its yearly revenues being reckoned at 1000*l.* in 1592, when it consisted of 130 persons. The present members are a warden, seventy fellows, ten chaplains, three clerks, a sexton, and sixteen choristers. The whole of the fellows must be elected from Winchester, at a regular meeting for that purpose, which is attended by the wardens of both colleges, two fellows of New College, and the sub-warden and head-master of Winchester. The visitor of New College is the bishop of Winchester. In the original charter of foundation, this college is entitled "Seinte Marie College of Wynchestre;" but, having popularly received the name of New College at the time of its erection, it has, by a remarkable inattention to propriety, retained that appellation through every succeeding age.

The buildings of this college are extensive, diversified, and interesting. As originally projected by the founder, they consisted of a spacious quadrangle, including the chapel, hall, and library, with a small quadrangle adjoining, called the cloisters. The other buildings, which form the garden-court, constitute an addition to the original design, and were built in 1684, in imitation either of the palace of Versailles, or of the king's house at Winchester. The approach to the great quadrangle is by a portal, with a tower above, which still retains the sculptured effigy of Wykeham in one of its ornamented niches. The chapel and hall on the north side of the great court present as fine an elevation as any in the university. The former is peculiarly beautiful and chaste in its interior decorations. The choir of this structure is 100 feet long, 35 broad, and 65 high; and the anti-chapel, running at right angles into the choir, measures about 80 feet in length by 36 in breadth. The windows of the latter division afford a magnificent display of painted glass, in
four

four different styles of execution. None of them however come near, either with respect to design or beauty of colouring, to the great west window, which probably equals any similar effort in the pictorial art in Great Britain. It was executed by Jervais from finished cartoons by sir Joshua Reynolds, and is divided into two parts, the higher representing the Nativity, and the lower seven figures emblematic of the Christian and Cardinal Virtues. The famous crozier of the founder is preserved in this chapel; and over the altar-table are some beautiful specimens of sculpture from the chisel of Westmacott. The service of the chapel is assisted by sixteen choristers, appointed by the warden solely. No particular rule is laid down with regard to the age of the boys, when admitted; but, generally speaking, we may say from seven till ten years of age. They wear the usual academical habit, and have a liberal education at a school within the college: they are instructed in grammar, in the Latin and Greek classics, in writing, arithmetic, and music. Their musical school-room is furnished with a small organ, where the organist attends them personally three times a-week, from twelve till one o'clock. Choral service is performed twice a-day, at eight o'clock in the morning, and at six in the evening, except in the long vacation, when the chapel is shut from the beginning of July till the 10th of October. Before the year 1807, those boys whose friends lived in Oxford, boarded and lodged at home; and those who came from the country, where their friends thought proper to place them. At that time they received from the college 7l. per annum each, besides their education, and a dinner in the college-buttery every day; but in the year 1807, the warden and fellows thought it would be better for the boys all to board and lodge together, for which purpose a large and healthy house was taken, and an extra master appointed to have the charge of them; and, instead of their receiving 7l. from the college, they pay 7l. per annum to the person with whom they board, and the college pays him 16l. for each boy. Such of the choristers as can obtain the appointment, are permitted to sing at St. Mary's church, on Sundays and holidays, but never perform on any occasion for the profit of a master.

8. LINCOLN COLLEGE. The original institution of this college took place in 1427, when Richard Flemming bishop of Lincoln obtained the royal licence to establish a society of one rector or warden, seven fellows, and two chaplains, in the church of All-Saints, Oxford, and to unite to that church those of St. Mildred and St. Michael, under the general name of the first. This society he appointed perpetual patrons of the collegiate church; and intended to have erected buildings for the reception of its members, but was prevented by death from executing his benevolent views. They continued to reside, therefore, in a tenement called Deep-hall, till the original design of the present college was completed by the munificent exertions of bishop Rotherham, who was afterwards archbishop of York. This prelate likewise increased the number of fellows from seven to twelve, and framed a body of statutes for the government of the society. Various other benefactors have arisen since that period; among whom bishop Smyth, the founder of Brzen-nose, Edward Darby, M. A. archdeacon of Stowe, and Nathaniel lord Crew, bishop of Durham, were the principal. The society now consists of a rector, twelve fellows, eight scholars, twelve exhibitioners, and a bible-clerk. The bishop of Lincoln is visitor.

The chief buildings of this college compose two quadrangular courts. The first court, begun soon after the founder's death, and finished by bishop Rotherham, still retains much of the character of ancient collegiate structures. It contains the hall, the library, the rector's lodgings, the common room, and some apartments for scholars, all of which are of low elevation, and arranged with great simplicity. The other quadrangle was erected about the year 1612, with the exception of six sets of rooms,

which were added in 1759. The chief ornament of this court is the chapel, built at the expense of Dr. John Williams, bishop of Lincoln.

9. ALL-SOULS COLLEGE was founded in the year 1437 by Henry Chichele archbishop of Canterbury, who prevailed on king Henry VI. to assume the title of co-founder. Chichele, however, retained all legislative power respecting the new establishment; and drew up a code of statutes, after the model of those promulgated by bishop Wykeham. By these statutes, in conformity with the charter, the society was made to consist of a warden and twenty fellows, of whom sixteen were to study the civil and canon laws, and the remainder philosophy, and the arts, and divinity. Chaplains, clerks, and choristers, were likewise added for the service of the chapel. Numerous benefactors have enriched this college at different periods, by whose conjunct donations this society has been enabled to augment the number of its members to a warden, forty fellows, two chaplains, and six clerks and choristers. The warden is elected in the same manner as the warden of Merton-college. The archbishop of Canterbury is visitor.

The buildings of this college constitute two large quadrangles, one of which is entered from High-street, and the other from Radcliffe-square. The former was erected by the founder, and, though in some parts modernized, still preserves many features of the original style of its architecture. Two niches over the principal entrance contain large and well-sculptured statues of king Edward VI. and of Chichele. The latter quadrangle is comparatively of modern erection, and measures, within the court, 172 feet in length, and 155 in breadth. On the west are the grand entrance and the cloister; on the east, the common room and other apartments, with two handsome towers; on the south, the chapel and hall; and on the north, the library. "This quadrangle," says Chalmers, "especially when viewed from the west entrance, presents one of the most attractive scenes of which Oxford can boast. The general style is the mixed Gothic." The library, which was begun in 1716, and only completed in 1756, owes its erection to the munificence of colonel Codrington, who left 10,000l. for that purpose, besides bequeathing to the society a collection of books, then valued at upwards of 6000l. The principal room is probably the largest so appropriated in the kingdom, being 198 feet in length, and 32½ in breadth, exclusive of a grand central recess, in the area of which is fixed a statue of the colonel. Dr. Young, author of the Night Thoughts, laid the foundation-stone of this structure, which was designed by Hawksmoor, and chiefly executed under his direction.

10. MAGDALEN COLLEGE was founded by William of Waynflete bishop of Winchester, under the authority of a license, dated July 18, 1457, for a president, forty fellows, thirty scholars called *demies*, a divinity-lecturer, a school-master, an usher, four chaplains, an organist, eight clerks, and sixteen choristers. The fellows were directed to study divinity, medicine, and the canon law; and the demies to be "conversant in grammar, logic, sophistry, and that species of music called plain song, or chaunting." Among the chief benefactors of this institution were sir John Fastolf, who appointed the founder one of his executors, William earl of Arundel, Ralph Freman, and John Norris, LL. D. by whose and other donations, added to the endowments of Waynflete, the college became so opulent, that its annual revenues were estimated, in 1535, at 10761. 5s. 2d. The members of this society still remain the same in number as at the time of foundation, with the addition only of gentlemen-commoners, for no commoners are admitted. The choristers are at the sole appointment of the president, who is not limited to particular age. They receive about 22l. per annum for their commons; and eight of them have each an exhibition besides, of between 5l. and 6l. a-year. They wear the proper collegiate dress, attend chapel daily at 10 and 4; and

4; and three or four of them are permitted to sing at St. John's, where the service is performed at other hours. They are educated free of expense in the grammar-school belonging to the foundation. The president requires them to be removed at fourteen years of age, unless the head-master of the school approves of the progress they have made in classical learning. They have music-lessons three times a-week in the college-chapel. Dr. Sheppard has lately left by his will 60*l.* a-year to be given to those choristers who are sons of clergymen, and either become members of the university, or are bound apprentices to trades or professions.

The buildings of this college, as designed by the founder, compose two quadrangular courts, one of small and another of large dimensions. The entrance to the first is through a modern portal of the Doric order, which appears very inappropriate, and very badly accords with the rest of the structure. This court contains the president's lodgings on the left, and in front is the entrance door-way to the chapel. This door-way is a very curious and beautiful specimen of architecture. In niches over it are small statues of Waynflete, Henry VI. St. John the Baptist, and St. Mary Magdalen, standing in canopies of exquisite workmanship. The large quadrangle remains nearly in the same state in which the founder left it, the south cloister being the only portion of the buildings that has been added since his death. Here are the chapel, hall, and library, a part of the president's lodgings, and chambers for the fellows and demies. Great pains have been taken to unriddle the meaning of the hieroglyphics which surround the cloister. Some affirm that they are nothing more than the licentious invention of the mason; while others as warmly contend that they contain a complete system of academical discipline.

The chapel, a most elegant structure, has been described by Mr. Chalmers in a manner that will interest every reader. "In this elegant chapel (says Mr. C.) the original style of building still predominates; but in the screen and panneling, put up about the year 1740, which last covers the east wall, formerly of great beauty, we have those Grecian ornaments which were generally adopted in the seventeenth and eighteenth centuries. The body is lighted by ten windows, painted with figures of the apostles, fathers, saints, &c. in *claro obscuro*. The west window, containing the Last Judgment, was executed after a design of Christopher Schwartz, originally prepared for the wife of William duke of Bavaria, as appears by a print engraved by one of the Sadeliers. After being damaged by the high wind in 1703, it was restored in 1794 by Egginton to its pristine beauty. Eight of the lateral windows were removed from the anti-chapel in 1741, and two new ones next the altar added by the younger Price, who died in 1765. The eight fine windows now in the anti-chapel, put up in 1797, were executed from designs of Egginton, and are filled with the college-arms, scripture-history, and portraits of St. John the Baptist, St. Mary Magdalen, kings Henry III. and VI. the founders of Magdalen, New College, Corpus Christi, and Cardinal College, now Christ-church; the two last of whom had been fellows of this college, admirably drawn and coloured. The present altar was constructed in 1740, and corresponds with the modern alterations in the interior of the chapel. The altar-piece by Fuller, representing the Last Judgment, has not been fortunate in attracting universal admiration. As an imitation of Michael Angelo, it falls far short of the sublime, although sometimes wild, imagination of that great artist; nor is the colouring harmonious or natural. Some of the figures, however, are correctly drawn; and he has at least imitated the temper of Michael Angelo with success, in introducing among the damned the portrait of an hostler at the Greyhound-inn, near the college, who had offended him. Mr. Addison has honoured Fuller's painting with an elegant Latin poem, in which he seems

to praise the genius that ought to have predominated in such a subject. This painting was placed here about the year 1680. Underneath is a nobler picture of Our Saviour bearing his cross, which was long supposed to have been painted by Guido, or, in the opinion of Mr. Byres of Rome, a very competent judge, by Ludovico Caracci; but it is now given to Morales, styled El Divino, a Spanish artist who flourished in the sixteenth century, and whose works are rare in this country. Sherwin's beautiful print from it is well known; and Egginton made a copy for the east window of the church of Wanstead in Essex. It remains to be added, that this picture was brought from Vigo in 1702 by the last duke of Ormond, and afterwards fell into the hands of William Freeman, esq. of Hamels in Hertfordshire, who gave it to the college. He gave also a new organ, and was in other respects a considerable benefactor."

Besides the two courts above-mentioned, there are a tower, and several other ranges of buildings belonging to Magdalen-college, which have been erected at different periods, and were not included in Waynflete's design. The tower is a structure of very fine proportion; and is supposed to have been designed by Wolsey, while he was burf of this college. It was commenced in 1492, and finished in 1498. A few years afterwards the chaplain's court was built; and some further rooms, towards the east, were added in 1635. At the beginning of the last century, a plan was proposed, and agreed to, for the building of a new quadrangle, but only one side of it has yet been finished. By this plan, three sides of the old quadrangle were to have been demolished, leaving only the hall, chapel, and south cloister.

Magdalen-college being bound by its statutes to entertain the kings of England and their sons when at Oxford, the hall has frequently been the scene of royal and princely festivity. Edward IV. and Richard III. were both entertained here by the founder. In 1496, prince Arthur paid a visit to this college; and in 1604 James I. held his court within its walls, upon which occasion Henry prince of Wales was admitted a member of the society. Oliver Cromwell, Fairfax, and other principal officers of the parliamentary army, also had a sumptuous dinner provided for them here in 1649, and afterwards played at bowls in the college-green, which, with the grove and water-walk, form pleasure-grounds of great extent and beauty.

II. BRAZEN-NOSE COLLEGE. This noble institution was founded by William Smyth, bishop of Lincoln, in concert with his friend sir Richard Sutton. The buildings were begun about the year 1509, and shortly after the society was formed, and accommodated in some of the ancient premises which occupied the site of the present college, and most probably in the tenement called Brazen-nose Hall, whence the new foundation derived its name. By the charter of incorporation, which is dated the 15th of January, 1511-12, this society was to consist of a principal and sixty scholars; but, in 1621, a revision of the statutes having been made by the surviving founder, sir Robert Sutton, the members were limited to a principal and twelve fellows. They were soon, however, augmented by the munificence of succeeding benefactors, some of whom added fellowships, others scholarships and exhibitions, others lectureships in philosophy, in humanity, Hebrew, Greek, and mathematics. These last were founded by sir John Port, John Barneston, D. D. Richard Harper, a judge of the common pleas, and Thomas Weston, rector of Crisfelton, near Chester. The other contributors are too numerous to be mentioned; so that we shall only observe, that, by their conjunct donations, the society now consists of a principal, twenty fellows, thirty-two scholars, and fifteen exhibitioners, besides a great number of independent members. The bishop of Lincoln is visitor.

The buildings of this college are arranged round a large quadrangle and a smaller court to the south, with the

the exception of the residence of the principal, and lodgings for seven students, which are detached. The large quadrangle contains the hall and chambers for the society; and has suffered little alteration since it was originally built, except the addition of a continued attic. The small court is occupied by the library and chapel, and was erected in the seventeenth century, from plans, as some assert, by sir Christopher Wren, while a very young man at college. The architecture is of the mixed kind; arched windows and battlements are here opposed by Grecian pilasters and capitals.

12. **CORPUS-CHRISTI COLLEGE** was founded and endowed by Richard Fox, bishop of Winchester. This prelate had designed and partly executed a collegiate establishment for monks and secular scholars, to be subordinate to the priory of St. Swithin in Winchester; but was induced to alter his plan, by the advice of Hugh Oldham, bishop of Exeter, and to found a college for the study of divinity, philosophy, and literature. He accordingly obtained a charter to that effect, dated March 1516; and shortly after drew up a body of statutes, declaring the society to consist of a president, twenty fellows, twenty scholars, two clerks, and two choristers. He likewise appointed two lectures for Greek and Latin, a measure which soon raised the reputation of the college to the highest pitch, as the founder conferred those offices on men of established fame and acknowledged erudition. The benefactors of this college are not so numerous as those of some other colleges; but the donations were in general liberal, and the ample provision of the founder rendered additional contributions the less requisite. Bishop Oldham above mentioned gave 6000 marks, besides some estates in land, and Dr. Turner 6000*l*. The members of the college are the same as those prescribed by the charter, with the addition only of four exhibitioners and six gentlemen-commoners. The bishop of Winchester is visitor.

Of the buildings of this college, the spacious quadrangle alone, with the chapel, hall, and library, was built by bishop Fox. This court is entered by a gateway under a lofty square tower in the centre of the principal front. On the east side is the hall, and on the south the library, which last is decorated with a statue of the founder in his pontifical robes. The rooms to the east of the quadrangle were first erected in 1667, and re-built in 1737, for the residence of the six gentlemen-commoners. The fine building which looks into Christ-church walks owed its construction to Dr. Turner, and is appropriated for the reception of students. The library is enriched with an invaluable set of Aldine classics, and with numerous curious MSS. and rare works, in a state of excellent preservation.

13. **CHRIST-CHURCH COLLEGE** is indebted for its origin to the munificence of cardinal Wolsey, who has been justly styled the Mæcenæ of his age. This prelate began the great work in question in the year 1524, upon a scale far surpassing the design of any former or succeeding founder. By the original charter, which he procured from king Henry VIII. his projected establishment was made to consist of one hundred and sixty persons, who were to apply themselves to the study of the sciences at large, as well as to polite literature. For the support of this society he settled upon it a clear annual revenue of 2000*l*. and commenced the present structure for the accommodation of its members, under the designation of "Cardinal College." Before he had completed his plans, however, he was hurled from the pinnacle of power, and plunged into irretrievable disgrace; but, before his death, he warmly recommended his college to the fostering regard of his monarch. Accordingly Henry, after the first effusions of his resentment had subsided, yielded to the entreaties of the society in 1532, and became its patron. But, in order to preclude Wolsey from all nominal participation in the merit of the undertaking, he granted the college a new charter of foundation, directed that its

members should consist of a dean and twelve canons, and that it should be called "King Henry the Eighth's College in Oxford." This arrangement, however, only continued for twelve or thirteen years, at the end of which period the society yielded up their charter and possessions to the king, who converted the college into a cathedral-church, by translating the episcopal see hither from Oseney. The institution now became an appendage to the cathedral, and received the name of "The Cathedral Church of Christ in Oxford, of King Henry the Eighth's Foundation." At the same time the society was declared to consist of a bishop, with his archdeacon, a dean, and eight canons, who had all the college-estates made over to them on condition of their maintaining three professors of divinity, Hebrew, and Greek, one hundred students in theology, arts, or philosophy, eight chaplains, and a numerous choir. The king himself is visitor of this college.

The benefactors to Christ-church are few, and all of them appeared at a period long subsequent to its foundation. Among the principal of them were the celebrated Dr. Busby of Westminster, who bequeathed a sum of money for a catechetical lecture; bishop Fell, who contributed ten exhibitions of 10*l*. per annum each; and Dr. Lee, physician to George II. who left 20,000*l*. for the purpose of erecting an anatomical theatre.

The buildings of this magnificent college occupy the area of the ancient priory of St. Frideswide, and have undergone as many revolutions as the society itself. They are chiefly arranged round four courts, two of which are very spacious. The great west quadrangle is particularly interesting, as being the work of Wolsey; and indicates that, if he had survived to complete the design he appears to have formed, his college would have exceeded in magnificence every other in Europe. This quadrangle is entered by the gateway of the principal front, which extends 382 feet, and is adorned in the centre by a stately tower begun by Wolsey, but only completed in 1681, by sir Christopher Wren. All the buildings here are beautifully proportioned, and are faced with a fine terrace, as well as surmounted by a handsome stone balustrade. The hall and kitchen are on the south, and on the east and west sides are splendid ranges of lodgings for the dean and canons. The hall occupies more than one-half of an entire range, and was begun and finished under the direction of the founder. This room is 115 feet in length, forty in breadth, and fifty in height. The roof is of oak, carved in an elaborate style. The windows are intersected Gothic, and one in a recess on the southern side is among the finest specimens of that mode of architectural disposal. The side-walls are of pannelled wainscot, and display an extensive collection of portraits, among which is an original half-length of Wolsey, a whole length of Henry VIII. another of queen Elizabeth, and a third of Dr. Busby, with a pupil in attendance.

The second great quadrangle of this college, termed Peckwater-court, was erected at the commencement of the last century, and contains the library on its southern side. This edifice is 141 feet long in front, and is adorned with massive pillars in the Corinthian style. Each of the other sides is appropriated as lodgings for students. Their elevation is three stories, the lower of which is rustic, and supports a range of architecture of the Ionic order, finished by an entablature and balustrade of stone. In the library, which is rich in MSS. prints, and coins, is likewise a very noble collection of paintings, bequeathed to the college by brigadier-general Guise in 1765. Most of these paintings are by the old masters, and must have been collected at a very great expense. The two smaller courts are denominated Canterbury-square and Chaplain's-court. Of these the first only deserves to be noticed, being now the principal entrance into the college. It stands on the site of Canterbury-hall, which was founded in the fourteenth century by archbishop Islip, as a place for the study of the canon and civil law.

The design of this court was furnished by James Wyatt, architect, and the whole carried into execution under his direction. It was completed in 1783, chiefly through the munificence of Richard Robinson baron Rokeby, late lord-primate of Ireland.

The Cathedral of Christ-church, to which the college is appended, is situated to the east of the grand quadrangle of the college. It was originally the church of St. Frideswide's monastery. This edifice is referred by King, in his *Munimenta Antiqua*, to the era of the Saxons; but Dugdale, Tanner, and Willis, date its foundation in the time of Henry I. In its architecture this church presents the styles and examples of different ages, from the time of the original building up to the commencement of the sixteenth century. The church is built in the shape of a cross, and measures 154 feet in length. In the centre rises a tower with a spire to the height of 144 feet. Some of the windows contain fine specimens of painted glass, and in the north aisle is a monument attributed to St. Frideswide. There are eight choristers, partly maintained by the dean and chapter; that is, they have dinner in the hall of the college daily. They receive also a salary arising from corn-rents, and consequently varying in amount; it however is always sufficient to pay for the rest of their board and lodging, for clothes, and to cover the expenses of a journey to a moderate distance. The choristers are in the sole nomination of the dean, exclusive of the chapter, and he appoints at any age he thinks proper; the time of their dismissal is also at his discretion. They wear caps and gowns in their ordinary dress, and surplices in the choir. A preference is usually given to the sons of clergymen and professional gentlemen. Since the foundation of the college there has always been a master provided for the boys, who instructs them in Latin and Greek. They are also taught writing and arithmetic. The choristers attend morning-service in the cathedral at ten o'clock, and afternoon-service at half-past three. They are in the grammar-school from seven in the morning till nine, from eleven till one, and from two till half-past three. They are taught singing by the organist. They are permitted to be members of any other choir in Oxford, provided their attendance does not interfere with their duty at Christ-church. They have not any engagements for the profit of the singing-master. There is no provision for superannuated choristers: frequently, however, as they have had a good education, they enter as servitors at Christ-church. We may observe, in general, that the singing-boys brought up in these choirs have usually entered into holy orders, and have deservedly obtained the patronage of their several colleges. *Gent. Mag.* Feb. 1819.

14. TRINITY COLLEGE was founded by sir Thomas Pope, in the reign of Philip and Mary, from whom he obtained a royal license and charter, dated the 8th and 28th of March, 1554. The society was then made to consist of a president, a priest, twelve fellows, and eight scholars; but the latter were soon increased to twelve. These he placed in the tenements called Durham-college, which he bought and repaired for their accommodation. In 1556 he drew up a body of statutes for their regulation, under the auspices of the celebrated cardinal Pole, to whom it is supposed he was indebted for many useful hints. The same statutes are still in force, with some slight alterations made by the first president, with the consent of the founder, after the re-establishment of the Protestant worship, on the accession of queen Elizabeth. The endowment of this institution by sir Thomas was only limited by the extent of his means, which were happily ample. In May 1556 he gave the society one hundred pounds; and, before the close of that year, made over to them no fewer than thirty-five manors and thirteen advowsons, besides impropriations and pensions. So liberal, indeed, was his donation, that, with the exception of the contributors towards the new buildings, few persons have deemed it requisite to become benefactors to this college,

so that the society remains nearly in the same state as when originally founded, with the addition only of gentlemen-commoners and commoners. The bishop of Winchester is visitor.

Architecturally considered, this college consists of two courts. The first contains the chapel, the hall, the president's lodgings, the library, and some apartments for the fellows and scholars; and the latter is wholly occupied by lodgings for the reception of students. The chapel was built chiefly at the expense of Dr. Bathurst, as is generally supposed, after a design by dean Aldrich, corrected and improved by sir Christopher Wren. The interior is highly decorated. In a recess at the upper end of this chapel is a monument in honour of sir Thomas Pope, and of his third lady, with their whole-length figures sculptured in alabaster.

15. ST. JOHN'S COLLEGE. All the colleges hitherto noticed have owed their origin to the munificence of distinguished statesmen, or prelates; but we now come to one which was founded and endowed by an individual whose fortune was gained by industrious exertions in the mercantile world. This was sir Thomas White, a citizen and merchant of London, and one of the most liberal and benevolent characters of his age. The spot selected for the new foundation was the site of St. Bernard's college, the buildings of which, indeed, still form a small portion of the present college. Here sir Thomas fixed his society in 1557, shortly after he had obtained a license and charter for its institution; and in the same year drew up a body of statutes, declaring that it should consist of a president, fifty fellows and scholars, three chaplains, three clerks, and six choristers; but the twelve last-mentioned members were soon discontinued, the funds being found inadequate to their proper support. A suitable choir, however, has since been founded by sir William Paddy, one of the numerous benefactors who have continued to enrich the society at different periods. Among these the chief were archbishops Laud and Juxon, and Dr. William Holmes and his lady. All the fellows of this college, except six of the founder's kindred, and two from Coventry, two from Bristol, two from Reading, and one from Tunbridge, schools, are elected from Merchant Tailors' school in London, sir Thomas having been a member of that respectable corporation. The bishop of Winchester is visitor.

The buildings of St. John's College, as they at present stand, have been erected at various periods. They are arranged chiefly in two quadrangles, one of which still retains a part of the tenements which composed Durham-college. In this division are the hall and chapel, the president's lodgings, and chambers for the fellows and scholars. The principal entrance is under a square tower adorned with a statue of St. Bernard, placed in a richly-canopied niche. On the east side is a passage leading into the second quadrangle, which contains the library, and was erected at the sole expense of archbishop Laud, from a design by Inigo Jones. In the centre, both on the east and west sides, is a gateway of the Doric order, surmounted by a semicircular pediment of the Ionic and Corinthian, and having a statue on either side between the columns. These represent king Charles I. and his queen, and were designed and cast in brass by Fanelli of Florence. The apartments in the same range with the gateways are built over cloisters, supported by eight round arches, and adorned with busts of the cardinal and Christian virtues over each pillar. The library here is enriched with a valuable collection of books and manuscripts, and a variety of antiquarian curiosities.

16. JESUS COLLEGE owes its foundation to Hugh ap Rice or Price, D.D. first prebendary of Rochester and treasurer of St. David's. This benevolent character, observing that his countrymen, the Welsh, were scarcely ever noticed in collegiate endowments, resolved to found a college peculiarly for their benefit; and with this view prevailed on queen Elizabeth to institute the present establishment.

blishment by charter, dated June 27, 1571. This deed prescribed that the college should be erected by the name of "Jesús College, within the City and University of Oxford, of Queen Elizabeth's Foundation;" and declared the society to consist of a principal, eight fellows, and eight scholars. It further permitted Dr. Price to settle upon them an annual revenue of 160*l.* to which he added a donation of 1500*l.* to assist in erecting the buildings, besides a small sum which he bequeathed for the same purpose at his death. The queen, though nominally foundress, bestowed little patronage, and still less property, on her college; a circumstance not a little remarkable, as we believe this to have been the first college in Oxford which could boast of deriving its origin from a Protestant benefactor. Hence, when Dr. Price died, the funds of the society were so much exhausted as to stop for a time the progress of the buildings. But private munificence soon after supplied the want of regal bounty. The buildings were gradually completed; and many extensive benefactions quickly added stability to the hitherto limited finances of the institution. Sir Eubule Thelwall, besides liberal donations, procured for the society a new charter, dated June 1, 1622. Dr. Williams founded a logic lecture, and sir Thomas Canon a catechetical lecture. Among the other more extensive contributors were Henry Westphaling, bishop of Hereford; Henry Rowlands, bishop of Bangor; king Charles I. Francis Mansell, D.D. sir Leoline Jenkins; and Edward Merrick, M.A. treasurer of St. David's; some of whom added new fellowships and scholarships. These additional revenues rendered new charters necessary at different periods. The last was granted by George II. January 10, 1729; and under it the society now consists of a principal, nineteen fellows, and eighteen scholars, besides a number of exhibitioners, &c. The earl of Pembroke is visitor.

The buildings of Jesús College form two quadrangles, the first of which measures 90 feet by 70, and the second 100 feet by 90. The former, entered from the street, contains the chapel on the north, and the hall on the east sides. The other sides are occupied by apartments of three stories high. The front, in the street, was rebuilt in 1756, and is a heavy erection, destitute alike of interest and beauty. The second, or inner quadrangle, was begun in 1640, under the management of Dr. Mansell, then principal; but the disturbances arising from the rebellion prevented its completion till the year 1767, when it was finished by sir Leoline Jenkins, at his own expense. The library, on the west side of this quadrangle, contains a good collection of books and some curiosities; among which are an immense silver bowl, weighing 278 ounces, and capable of holding above ten gallons; a metal watch given by Charles I. and a huge stirrup, said to have been pressed by the foot of queen Elizabeth. The chapel, built in 1621, is divided into three parts by two screens. The roof is finished in compartments, and is very richly decorated.

17. WADHAM COLLEGE was founded by Nicholas Wadham, esq. and his wife Dorothy, daughter of sir William Petre, an eminent benefactor to several colleges in this university. The execution of the undertaking, however, wholly devolved on the latter, as Mr. Wadham himself died before the plan he had proposed could be carried into effect. Her first step was to purchase the site of the ancient priory of Austin-friars, once a place of great distinction in the university, which she accomplished in 1610; and on the 31st of July, in the same year, laid the first stone of the present college. A royal license was obtained in 1611, and in 1612 the statutes promulgated by the foundress received the sanction of an act of parliament. By these statutes, which still continue in force, (except as to the subject of marriage,) the college was made to consist of a warden, fifteen fellows, fifteen scholars, two chaplains, and two clerks. To these, however, several exhibitions have been added by successive benefactors, among whom the late Dr. John Wills, who died in 1806,

deservedly holds the first rank. This gentleman bequeathed 400*l.* a-year to the wardenship; 1000*l.* to improve the warden's lodgings; two exhibitions of 100*l.* per annum each to two fellows, students in law or medicine; two exhibitions of 20*l.* to scholars in the same faculties; 20*l.* a-year for a divinity-lecturer; an annual exhibition of 75*l.* and another of 100*l.* to two superannuated fellows; 11*l.* 10*s.* to a preacher; and 6*l.* a-year for the purchase of books to be given as a premium to the best reader in the chapel. He further nominated the society his residuary legatee.

The buildings are entirely comprised in one very spacious quadrangle, about one hundred and thirty feet square; the whole of which, with the exception of a building of three stories on the south of the front, were erected by the foundress, at the expense of 10,816*l.* 7*s.* 8*d.* This college is entered by a gateway, under a central tower; and has on its eastern side the hall and chapel, and on the other three, the warden's lodgings, and apartments for the fellows, scholars, and students. In the middle of the eastern side is a portico in four compartments, adorned with statues in canopied niches of the founder and foundress, and of king James I. whose arms, sculptured in stone, are placed in the highest compartment. The bishop of Bath and Wells is visitor.

18. PEMBROKE COLLEGE owes its foundation to the joint munificence of Thomas Tefdale and Richard Wightwick; for though, in the charter, which is dated 1624, king James is denominated founder, and the earl of Pembroke, chancellor of the university, godfather, yet they in fact contributed little or nothing towards its establishment, further than what their patronage may be supposed to have accomplished. According to the statutes drawn up agreeably to the charter, the society was made to consist of a master, ten fellows, and the same number of scholars; but the fellows have since been increased to fourteen, and the scholars and exhibitioners to twenty-one, by the liberality of different benefactors, among whom the most eminent were lord Ossulston, grandson to the founder, Tefdale, and George Morley, bishop of Winchester. The chancellor of the university is visitor.

Pembroke College now forms two small courts, which are built on the ancient site of Broadgate's Hall, some portion of which is still standing, and constitutes the hall of the present college. The principal court is uniform in its architecture, and possesses the merit of simplicity. It was chiefly erected at different periods during the seventeenth century, partly with the money of the founders, and partly by the aid of subsequent contributions. The front, which was only completed in 1694, is an unadorned elevation, with a low tower over the entrance in the centre. The chapel is a small but elegant edifice of the Ionic order, and is richly ornamented within.

19. WORCESTER COLLEGE was founded in 1714, under the will of sir Thomas Cookes, of Bentley Pauncefort in Worcestershire, who died in 1702, and bequeathed 10,000*l.* to be applied either in establishing a new college, or in the endowment of additional fellowships and scholarships in some previous establishment. The trustees at first hesitating which of the above plans to adopt, the money accumulated to 15,000*l.* before they came to the resolution of founding the present institution. This however they at length determined on; and a charter of incorporation was obtained in 1714, for a college, to be called "The Provost, Fellows, and Scholars, of Worcester College, in the University of Oxford." A body of statutes was framed about the same time; and the society settled in the ancient tenements of Gloucester-hall, some part of which still remains. Several liberal benefactors soon after added considerable donations. Of these, the principal were Dr. James Fynney, George Clarke, D.C.L. and Mrs. Sarah Eaton, the last of whom endowed seven fellowships and five scholarships for the sons of clergymen only. Hence the society now consists of a provost, twenty-one fellows, and fifteen scholars. The visitors are the bishop of

of Oxford and the vice-chancellor of the university. A preference is given in the choice of students, on the original foundation, to persons educated in the founder's schools of Bromsgrove and Feckenham, and to his own kindred.

The situation of Worcester-college is on the western side of the city, on an eminence near the bank of the river Isis. The buildings form a court, the south side of which is still occupied by a range of old apartments; but its other divisions are all of modern erection, and comprise a chapel, a hall, a library, and lodgings for the accommodation of members and students. The architecture of these portions is grand and imposing, though simple and devoid of ornament. The library, however, is supported by a spacious cloister in the front towards the court; and is particularly remarkable for a valuable collection of architectural books and manuscripts.

20. HERTFORD COLLEGE, the last we have to notice, was the ancient Hart hall, which was founded by William Stapledon, bishop of Exeter, and continued attached to Exeter-college till the year 1740, when it was elevated to the rank of an independent college by Dr. Newton, (see vol. xvii. p. 36.) who bestowed upon it his whole property. This however proved insufficient for its intended purposes; and, as few benefactors appeared in aid, the institution declined. Since 1805 it has had no principal, and in 1812 there was only one fellow, though by the statutes the society was made to consist of a principal, four senior fellows, and eight junior fellows or assistants. According to the design of Dr. Newton, the buildings of this college were to have formed one spacious quadrangle, containing a chapel, hall, and library, lodgings for the principal, and apartments for the society. Of this plan only a part had been carried into execution, and that by the founder himself, no additions having been made since his death. The portions of Hart hall left standing were, the refectory, built in the reign of queen Elizabeth, the old principal's lodgings, with the kitchen and chambers over them, and the gatehouse and library.

At length, the college, being entirely deserted, was considered to have escheated to the crown; and his present majesty, when regent, was graciously pleased, in the name and on the behalf of the late king, to direct a grant of the site, with all the property attached to it, including an excellent library of books, to be made to the chancellor, masters, and scholars, of the university, in trust for the principal and other members of Magdalen-hall for ever. In consequence of Magdalen-hall being burnt down, as mentioned below, the royal gift became extremely valuable and appropriate; and on the 3d of May, 1820, the vice-president and fellows of Magdalen-college went in procession from St. Mary's church to the dissolved college of Hertford, for the purpose of laying the foundation-stone of the new buildings intended for the future residence of the members of Magdalen-hall; the principal and vice-principal of that society were also in the procession. The stone was laid by the Rev. T. N. Blagden, B. D. vice-president of Magdalen-college, assisted by the architect, Mr. Garbett of Winchester, and by the builder, Mr. Evans of London. A brass-plate was placed in the centre of the foundation-stone, on which was engraved the following inscription: "In Honorem Dei bonarumque Literarum Profectum Imum hunc Lapidem Aulae Magdalenensis Regis Georgii Quarti Auspiciis in Alia Sede Renovatæ Collegium Magdalenense, P.C."

Of the numerous halls, hostels, or inns, which were the only houses originally possessed by the students of Oxford, only five subsist at present, one of which is destitute of students. Each hall is governed by a principal, under the guidance of statutes originally drawn up by the principal of the university, and alterable at his pleasure. This officer is officially visitor of all the halls; and has the power of nominating the whole of the principals, except the principal of St. Edmund's Hall, who is elected

by the provost and fellows of Queen's College. The students in these halls have equal university-privileges with those belonging to the colleges; and are subject to the same regulations with respect to discipline, course of studies, tuition, length of residence, examinations, dress, &c.

1. ST. ALBAN'S HALL, the most ancient of those now remaining, is situated on the east side of Merton-college. This hall derived its name from Robert de Sancto Albano, a burgess of Oxford, in the reign of king John. In the time of Henry VI. it was united to Nunne-hall, which stood west from it; but its principals were appointed by Merton-college. Henry VIII. granted both halls, conjoined, in the name of Alban-hall, to his physician, from whom it passed to different proprietors, and is now the property of the warden and fellows of Merton-college. The buildings of this hall form a quadrangle, plain in its architecture, but commodious in respect to internal arrangements. It has no chapel.

2. EDMUND HALL is traditionally so called from St. Edmund, archbishop of Canterbury in the reign of Henry III. At the dissolution, it belonged to Oseney-priory; and soon after that event came into the possession of Queen's College, and was renewed as a place of study under the auspices of that institution, to which it still continues attached. Several extensive additions to the old buildings of this hall have been made during the two last centuries, chiefly by the liberality of its own members, and those of Queen's College. The library, begun in 1680, has been enriched by several valuable collections of books and manuscripts. This portion of the buildings, as well as the chapel, was erected by Stephen Penton, B.D. principal, and chiefly at his own expense.

3. ST. MARY'S HALL was anciently conveyed to the rectors of St. Mary's church for a parsonage-house; and remained in their possession till the year 1325, when Edward II. gave it, with the advowson of the church, to the society of Oriel-college, who converted it into an academical hall in 1333, under its present appellation. The buildings are arranged in the form of a quadrangle, containing lodgings for the principal on the north, a hall and chapel on the south, and apartments for the students on the west and east, all of which have either been rebuilt or much improved within the last century.

4. NEW-INN HALL is entirely gone to decay, the only part of its buildings now remaining being a house for the principal, who is only nominally such, there having been no students at this hall for many years. It was at one time, however, very famous for students of the civil and canon law, and produced many eminent characters in that faculty. In 1642 it was occupied as a mint by king Charles I. who here melted down the plate presented to him by the university. It has no chapel.

5. ST. MARY-MAGDALEN HALL was founded as a grammar-school in 1480 by William Waynflete, founder of Magdalen-college, to which it immediately adjoins. It was first called Grammar-hall, but received the name of Magdalen-hall upon being enlarged, and placed upon the same footing with respect to academical privileges as the other halls. This foundation appears to have been generally in a very flourishing condition, and at one time is said to have had nearly three hundred members; but it is difficult to conceive how so many persons could be accommodated within its walls. Dr. William Lucy, and some other benefactors, established a number of exhibitions in this hall for the benefit and encouragement of the students. Part of the buildings were erected by the munificence of private individuals, among whom Dr. John Wilkinfon, principal from 1605 to 1643, and his successor Henry Wilkinfon, are deservedly the most noted. The latter built the library, and procured for it a good collection of books. This seminary boasts the education of the celebrated lord Clarendon.

Nearly the whole of Magdalen-hall, consisting of eighteen sets of rooms, with an immense quantity of books and

and furniture, was destroyed by fire, on the morning of the 9th of January, 1820. Of the new lodgings providing for the members we have already spoken.

The following summary of the members of the Universities of Oxford and Cambridge, in the year 1815, will serve to show the comparative state of both these distinguished seminaries, and of their respective colleges and halls.

Oxford.	Members of Convocation.	Members on the Books.	Cambridge.	Members of the Senate.	Members on the Boards.
University Coll.	74	157	Trinity Coll.	407	922
Balliol	39	130	St. John's Coll.	306	683
Merton	52	104	Emmanuel Coll.	80	170
Exeter	56	155	Jesús College	51	162
Oriel	100	207	Queen's College	56	143
Queen's	97	195	Trinity Hall	24	131
New	56	119	Caius College	59	126
Lincoln	33	72	Christ College	45	113
All Souls	69	90	Pembroke Hall	30	102
Magdalen	109	152	Clare Hall	37	98
Brazen-nose	141	320	St. Peter's Coll.	40	87
Corpus-christi	61	94	King's College	60	86
Christ-church	300	647	Magdalen Coll.	35	73
Trinity	63	161	Sidney College	24	73
St. John's	92	169	Bene't College	20	71
Jesús	63	127	Catharine Hall	16	56
Wadham	50	134	Downing Coll.	7	8
Pembroke	30	82	Oppidants	4	0
Worcester	65	137			
Hertford	1	2			
St. Mary Hall	16	37			
Magdalen Hall	30	84			
New Inn Hall	1	1			
St. Alban Hall	8	40			
St. Edmund Hall	25	73			
Total	1631	3489	Total	1301	3104

The Totals, in the year 1819 and 1820, stood thus :

1819.	Oxford.	1819.	Cambridge.
Members of Convocation	1874	Members of the Senate	1495
on the Books	3984	on the Boards	3698
1820. of Convocation	1873	of the Senate	1558
on the Books	4102	on the Boards	3395

Besides the colleges and halls, there are several public buildings and establishments, which either owe their origin to the university, or are placed under the management of its officers. The principal of these are the Schools; the Bodleian Library; the Theatre; the Clarendon Printing-house; the Radcliffe Library; the Ashmolean Museum; the Observatory; and the Physic-garden.

The first Public Schools were erected about the commencement of the fifteenth century, by Thomas Hokenorton, abbot of Osney; and consisted of ten apartments, allotted to different branches of education. To these were added the divinity-school in the year 1427, the erection of which was chiefly effected by the liberality of Humphry duke of Gloucester, usually styled the Good. This last is still standing, and is a curious specimen of architecture. All the others, however, were demolished in the beginning of the seventeenth century, when the present schools were erected, which, with part of the Bodleian library, form a quadrangle of about 170 feet in length. Over the gateway is a lofty tower, fantastically arranged in compartments, exhibiting an imitation of the five orders of classic architecture. (See Britton's Architectural Antiquities, vol. iii.) The whole quadrangle is now three stories high, two of which are appropriated as schools, while the third and highest is occupied as a picture-gallery, and contains a numerous and splendid collection of the portraits of founders, benefactors, and other eminent persons connected with the university. The schools are governed by three masters, who cannot hold their office more than two years in succession. The public professors read lectures here in the different sci-

ences; and here also the scholars of the university are obliged, by statute, to perform the exercises required of them, before they can obtain their degrees. In the moral-philosophy lecture-room is preserved a collection of statues, marbles, and busts, the gift of the countess dowager of Pomfret; and, in an apartment on the north side of the schools, are ranged the Arundelian Marbles, together with numerous other monuments of Grecian antiquity, collected by Selden, Wheeler, and others, and presented or bequeathed to the university.

The Bodleian or Public Library, was founded by sir Thomas Bodley, at the close of the sixteenth century, on the remains of that which was established by the duke of Gloucester before-mentioned, but had been divested of all its valuable books and illuminated manuscripts by the commissioners of Edward VI. This library occupies three extensive rooms, disposed in the form of the letter H, and probably contains the most valuable collection of books and manuscripts in Europe, as the donations in aid of sir Thomas's contribution have been splendid and liberal beyond precedent. Among those who had added whole libraries to the original collection, are the earl of Pembroke, Mr. Selden, archbishop Laud, sir Thomas Roe, sir Kenelm Digby, general Fairfax, Dr. Marshall, Dr. Barlow, Dr. Rawlinson, Mr. St. Amand, Dr. Tanner, Mr. Willis, T. Hearne, Mr. Godwin, and Mr. Gough. The last contributed all his topographical collections, books, prints, copper-plates, and drawings. The statutes by which this library is governed, were drawn up by sir Thomas Bodley, who, besides his books, left an estate to the university for the provision of suitable salaries to its officers, and for the repair of the buildings. These statutes are preserved in the founder's own hand-writing, in the archives of the library; and contain, among other clauses, one appointing the vice-chancellor, proctors, and the regius-professors of divinity, law, medicine, Hebrew, and Greek, visitors or curators.

The Theatre, or Selden Theatre, in which are held all the acts called the Encenia and Comitia, also lord Crewe's annual commemoration of benefactors, was built at the sole charge of archbishop Selden, who, besides, gave the sum of 2000*l.* as a fund for repairs. The architect was sir Christopher Wren, who, in the plan and construction of this edifice, gave a happy preface of those talents which he afterwards displayed in the metropolis. By an ingenious disposition of its parts, he has contrived to render it capable of holding nearly four thousand persons, though its dimensions seem altogether inadequate for that purpose. The roof is eighty feet by seventy, and rests entirely on the side-walls, without any central support. The exterior elevation on the side opposite to the divinity-school is adorned with columns of the Corinthian order, and statues, in niches, of the founder, and the duke of Ormond.

The Clarendon Printing-house was erected in 1711, with the profits arising from the sale of lord Clarendon's History of the Rebellion, the copyright of which was presented to the university by his lordship's son. It is a massive structure, two stories high, adorned in front with a portico of the Doric order, and has a statue of the noble author over the southern entrance. The business of this house is superintended by persons termed delegates of the press, who are appointed by the vice-chancellor and proctors.

The Radcliffe Library, which is certainly one of the most imposing architectural ornaments of the university, was founded by Dr. Radcliffe, an eminent physician in the reigns of king William and queen Anne, he having bequeathed 40,000*l.* for its erection, 150*l.* per annum for a librarian, and 100*l.* per annum for the purchase of books. The building itself was designed and executed by Gibbs, between the years 1737 and 1749; and some of the first artists of the age were employed on its interior embellishments. Exteriorly, a rustic basement, in the form of a double octagon, supports a cylindrical superstructure, adorned

adorned with three-quarter Corinthian columns, ranged in couplets, between which are windows and niches alternately. A ballustrade, finished with vases on the piers perpendicular to the columns, surmounts the entablature, and the whole elevation is terminated by a fine cupola sixty feet high, which renders this building a striking feature in every distant view of the city. The contributions to this library are few, compared to those of the Bodleian, which seems almost to have wholly engrossed the munificence of the learned.

The Ashmolean Museum owes its foundation to Elias Ashmole, author of the History of the Garter, who offered to bestow on the university all the extensive collections in natural history which had been bequeathed to him by the two Tradescants, the celebrated naturalists and physic-gardeners at South Lambeth, and to add to these his own coins, medals, MSS. and books, provided the university would defray the expense of erecting a proper building for their reception. This offer was accepted, and the present edifice raised under the direction of sir Christopher Wren. The contributors to this museum have been numerous. The chief of them were Dr. Plot, Mr. Llwyd, Mr. Borlase, and Mr. Reinhold Foster. The contribution of this last consists chiefly of curious articles from the South-Sea islands. This building likewise contains the books of Dr. Lister, and the MSS. of Dugdale, Aubrey, and Wood. See farther under MUSEUM, vol. xvi. p. 276.

The Astronomical Observatory was built at the expense of 30,000*l.* defrayed by the trustees of Dr. Radcliffe. It is situated at the extreme end of the north suburb, on a very appropriate site with attached grounds, which were presented to the university by the duke of Marlborough. The central elevation of this edifice is upwards of 100 feet, and its third story consists of an octangular tower, with sculptural representations of the eight winds on the entablature, and a ponderous earth-coloured globe at the top. The whole structure comprises a dwelling-house for the observer, apartments for observation, for an assistant observer; and for lectures; and is supplied with a valuable set of astronomical instruments, besides a library. See OBSERVATORY, vol. xvii. p. 375.

The Physic Garden, comprising about five acres of ground, is situated opposite to Magdalen-college on the south, and is encompassed by a lofty wall, with a handsome gateway designed by Inigo Jones. Over the arch of this gateway is a bust of the founder, Henry Danvers earl of Danby, and on the right and left are statues of Charles I. and II. The garden is arranged in four quarters, and is provided with suitable green-houses, and a hot-house for the reception of the more tender plants. The chief contributor to this garden was Dr. Sherard, who in 1728 left 3000*l.* for the endowment of a professorship of botany; and in 1793 a regius-professor in that science was likewise appointed by his late majesty.

GOVERNMENT and CIVIL HISTORY.

The corporation of this city, established both by charter and by prescription, is governed by a mayor, a high-steward, recorder, four aldermen, eight assistants, two bailiffs, a town-clerk, two chamberlains, and twenty-four common-councillors. By grant from Henry I. the mayor, for the time being, acts in the buttery at the coronation-feasts of the kings and queens of England; and hence, as well as from other causes, many of them have received the honour of knighthood. Oxford sends two members to the national senate, and has done so, according to Willis, in his *Notitia Parliamentaria*, since the first institution of a parliament in this island. The electors are the corporation and freemen; and the returning-officers, the mayor and bailiffs.

This city is remarkable for an act of bribery, committed by almost all the members of the corporation. In 1767, Philip Ward, esq. then mayor, in conjunction with Thomas Robinson and John Brown, the bailiffs of the

said city, and several of the aldermen, wrote a letter to sir Thomas Stapleton, bart. and the hon. Robert Lee, their members, stating that they would elect them again at the next general election, for a certain sum of money, stipulated in that letter; and acquainting them, that, unless they complied with that condition, they certainly should not meet with their support. This letter was produced in the house of commons by the honourable members who received it; when, upon being read, it was agreed, that the persons concerned in writing that letter should be taken forthwith into the custody of the serjeant-at-arms. They were accordingly taken, and brought to the house of commons, and were by them committed to Newgate; but, after a confinement of some considerable time, upon their petitioning, and setting forth to the house their hearty sorrow and sincere contrition for their offence, they were discharged, after being reprimanded on their knees, by the speaker, in the following words.

“Philip Ward, John Treacher, sir Thomas Munday, Thomas Wise, John Nicholes, John Philips, Isaac Lawrence, Richard Tawney, Thomas Robinson, and John Brown: The offence of which you have been guilty has justly brought you under the severe displeasure of this house. A more enormous crime you could not well commit, since a deeper wound could not have been given to the constitution itself, than by the open and dangerous attempt which you have made to subvert the freedom and independence of this house. The freedom of this house is the freedom of the country, which can continue no longer, than while the voices of the electors are uninfluenced by any base or venal motive. For, if abilities and integrity are no recommendation to the electors, if those who bid highest for their voices are to obtain them from such detestable considerations, this house will not be the representatives of the people of Great Britain. Instead of being the guardians and protectors of their liberties, instead of redressing the grievances of the subject, this house itself will be the author of the worst of grievances; it will become the venal instrument of power to reduce this happy nation, the envy and admiration of the world, to the lowest state of misery and servitude. This is the abject condition to which you have attempted to bring your fellow-citizens. Many circumstances concur to aggravate your offence. The place of your residence was a singular advantage. You had at all times the example of one of the most learned and respectable bodies in Europe before your eyes. Their conduct in every instance, but especially in the choice of their representatives in parliament, was well worthy your imitation. You are magistrates of a great city. In such a station, it was a duty peculiarly incumbent on you to watch over the morals of your fellow-citizens; to keep yourselves pure from venality; and to prevent, by your influence, those under your government from being tainted by this growing and pestilential vice. How have you abused this trust? You yourselves have set the infamous example of prostitution in the most public and daring manner. Surely you must have felt some remorse from the generous disdain with which your corrupt offer was rejected by your representatives. They thought, and justly thought, that a seat in this house, obtained by a free and independent choice of their constituents, was the highest honour to which a subject can aspire; and that, discharging their duty as such representatives, was the noblest of services. Sorry I am to say, that these considerations do not appear to have had the least weight with you. However, you have at last acknowledged your guilt; and, by your petition yesterday, you seem conscious of the enormity of your offence. This house, in the terror of its judgments, always thinks upon mercy; nor do they ever inflict punishment but for the sake of example, and to prevent others from becoming the objects of their resentment. The censure passed upon you, will, they hope, have that effect. You are now the object of their mercy, and are brought to the bar to be discharged. May you be penetrated with
a due

Engraved for the Encyclopædia Londinensis, 1820.

a due sense of their justice and lenity! May you atone for your past offence, by a constant endeavour to make a right use of the invaluable privileges which you enjoy as electors! Consider these privileges as a sacred trust reposed in you. Discharge it with integrity. But, before you rise from your present posture, I do, in obedience of the commands of this house, *reprimand you*. I am now to acquaint you, that you are discharged, paying your fees."

From the above period to the year 1796, the members for this city were nominated by the duke of Marlborough and the earl of Abingdon; but, at the general election in that year, Henry Peters, esq. offered himself as an independent candidate, and was elected, after an expensive contest. At the general election in 1802, the duke of Marlborough brought in one member, and the corporation the other; and procured the return of the same gentlemen again in 1806. In 1807, Mr. Lockhart, who had been an agent to Mr. Peters, succeeded upon the independent interest, in opposition to Mr. Atkyns Wright, the corporation-candidate. At the general election in 1812, the hon. George Eden was supported by the duke of Marlborough, Atkyns Wright, esq. by the corporation, and John Ingram Lockhart, esq. by the independent interest: the duke's member was not returned. The present members, elected Mar. 1820, are J. J. Lockhart and C. Wetherell, esqrs.

Oxford, with its suburbs, contains, according to the parliamentary returns of 1811, 2064 houses and 12,931 inhabitants, of whom 1015 persons belong to the colleges. The city is divided by four wards, under the immediate jurisdiction of the four aldermen; and these again, with their suburbs and liberties, are subdivided into fourteen parishes, viz.

St. Mary's Church, or, as it is sometimes called, the University Church, is a beautiful structure, in the pointed style of the reign of Henry VII. It is situated on the north side of High Street; and consists of a spacious chancel, and three aisles, with a square tower and spire 180 feet high. The spire is supported by two graduated buttresses at each angle, and is finely ornamented with statues in niches, pinnacles, &c. The annexed Plate is from Loggan's *Oxonia Illustrata*. In this church the public sermons of the university are preached on Sundays and holidays; and it is consequently fitted-up in a manner proper for the reception of the several members of that distinguished corporation. The pulpit stands in the middle aisle, and at its western end is the chancellor's throne, which is raised several steps above the other seats. Close to the throne are the seats of the proctors; and, next to them, on either side, sit the doctors and heads of houses.

All Saints is situated in the same street with St. Mary's, but is a structure of a very different kind, being of comparatively modern erection, and in the style of sacred architecture which Sir Christopher Wren contributed to render popular. This edifice comprises a nave, a chancel, and two aisles; and its roof is supported entirely upon the side-walls, there being no pillars within the church, though pilasters of the Corinthian order are frequent. The tower is surmounted by a turret, encircled by Corinthian pillars, whence rises a spire. Between the lower range of windows are pilasters of the same character, disposed in couplets.

St. Peter's in the East is an interesting edifice, of a very ancient date. It is commonly said to be the earliest stone church erected in this part of England. The precise date of its foundation, however, is uncertain, as the

claims of St. Grymbald to be the founder are at least as doubtful as the story of his professorship under the patronage of King Alfred. This church was formerly the university-church, and the vice-chancellor and heads of houses still attend divine service here in the afternoon of the Sundays during Lent. It has a nave, chancel, and two side-aisles, with a tower at the west end. The chancel is a singular and curious specimen of architectural design; particularly in the ribs beneath the ceiling, and in two windows. Beneath the chancel is a crypt, supported by six circular pillars with square bases and capitals. Some of the latter are charged with very rude but singular sculpture.

St. John's Church, which is likewise a chapel to Mer-ton-college, is a rich specimen of the architecture of the fifteenth century, and in higher preservation than usually happens with the buildings of that age. Its members are a choir, a cross-aisle, an anti-chapel, and a square tower, which rises from the centre of the cross-aisle, and is elegantly adorned with panneling and pinnacles. The windows, both of the choir and cross-aisle, are filled with painted glass: so is likewise the great east window, the masonry of which is exquisitely delicate. Near the altar of this church are the monuments of those distinguished benefactors to the university, Sir Thomas Bodley and Sir Henry Savile; and, close to the door, is a small mural tablet, commemorative of the celebrated Oxford historian, Anthony Wood.

St. Martin's Church, commonly called *Carfax*, from its situation, as some suppose, at the meeting of the four main streets of Oxford, is a building of small extent, yet of just and even excellent proportions, and displays some specimens of very ancient and curious architecture. But alterations were rapidly effected in the pointed style shortly after its establishment, at the beginning of the 12th century, which were practised on the then existing structures whose importance did not require that their proportions also should be adapted to the new order. This is exhibited in the building now before us, which contains that variety and mixture of styles found, with very few exceptions, in ancient buildings. In the original unadorned walls of this church, several elegant alterations were made by the substitution of spacious windows, with beautiful and varied tracery, for the chaste and plain lancet-arches of the 12th century; a circumstance which proves that the situation was occupied by an elegant edifice, till the corrupt taste of the seventeenth century altered and injured its form, character, and relative proportions. Succeeding times have still more defaced this ancient structure; and, amidst many injudicious alterations and unnecessary dilapidations, only a portion of its originally good architecture, variety of form, and embellishments, appears undisguised or perfect. For these reasons we understand that this church is about to be totally demolished, and rebuilt (some say) upon the plan of Gloucester cathedral. (See Lamentations upon this subject, in the *Gent. Mag.* Aug. Sept. and Suppl. 1819.) We shall therefore give a further description of it, with a view, (see the Second Plate,) as it appeared in the last year, 1819. This church occupies the north-west angle of the intersection, or crossing, of the two streets; and is so situated as to expose to the full view of the High Street nearly the whole of its eastern front; which consists of three divisions, corresponding to the three aisles of the church: these are separated into nave and chancel, (an arrangement sufficiently apparent in the outside of the roof,) with a tower of good proportions at the west end. The introduction of the highly-beautiful architecture of the fourteenth century, observable in the principal windows of the east front, and in the whole of the fourth aisle, and the alterations of the north, has removed only a small portion of the original ancient edifice; for the entire east and north walls, with the lower half of the tower, were doubtless built at the commencement of the twelfth century: and those conversant with English architecture

chitecture will discover, in the very curious buttresses and northern window of the east front, the remarkable square door on the north side, and in the design of the tower, a peculiar character in the proportions, mouldings, and ornaments, belonging to that period, and not to a later. Nor is the masonry of this most ancient work unworthy of remark: the east and north walls are nearly twice as old as that of the south aisle, but are yet far more substantial and strong; and, to the decay of the south wall, and its being the most seen, must be chiefly attributed the fear of some accident, and the demand for a new church. The bold undertaking of opening spacious windows where only lancet-arches were originally designed, has, in this church, been executed with peculiar success; and their magnitude and beautiful tracery, particularly that of the great east window, excites no regret at these alterations, which, in many cases, have proved dangerous and mischievous. On the south side are three handsome windows; and between them and a double tier of small windows is the door, once a pointed arch, but altered in the year 1624 to a heavy Doric frontispiece. At the same time, the pediment of the east end was deformed as it now appears, and the heavy clock and chimes placed by its side. The upper, or *clere*, story, has four windows on the south, and the same number on the north side, where, in the aisle beneath, are large windows, the most western of them containing tracery like the elegant east window of the south aisle. The tower is without a door; but each side has a long narrow window, spreading to a considerable width inside, where it is quite plain, and sufficiently massive to withstand a siege, if required. The upper story of the tower is less ancient; each side has a window, and the whole a parapet of carved blocks and battlements.

The architecture of the interior of this church is very noble. The aisles are separated by three arches on each side, supported by octagonal columns, capitals, and bases, and are beautifully proportioned, very lofty, spacious, and uniform. The division of the body and chancel was formerly made at the most eastern column of each side by a very elegantly-carved wooden screen, portions of which still remain unobscured and uninjured; over this stood the ancient rood-loft; but, together with this screen, this also was removed, except the canopy, which is a richly-carved oak cove, quite entire. The roof of the nave is ancient, subdivided by arches and ribs, the whole of it painted, and the cornice ornamented with shields and arms. At the west end of the body, before the arch of the tower, and between the two entrances to the church, stands the font, raised on a step. Its form is octagonal, with a niche and figure in each face; at the angles are pannelled buttresses, and on the parapet quatrefoils and shields. In Oxford there are a few more ancient fonts, but certainly none more curious, notwithstanding that, between wanton injury and the whitewash of centuries, it is much defaced.

The absence of neatness, and consequent gloominess of the interior of this church, and, above all, the useless bulk of the galleries, and ill-disposed cumbrous pews, which occupy much more room than is necessary, are among the objections to the present building. And we suppose it to be a preliminary to removing the whole edifice, that a group of ancient and very picturesque houses, contiguous to the church-yard on the north side of the church, have been demolished; and the large plot of ground which for a considerable period has been thus occupied, is laid open to the spacious street leading towards St. Giles's church. But, whether any building of magnitude and use, or merely an obelisk, is to be erected within that space, is not known at present.

St. Ebba's, so called from Ebba, daughter of Ethelfrid king of Northumbria, has, we understand, been re-built, and was opened Feb. 9, 1817.

St. Giles's. It is conjectured that those churches which were dedicated in former times to St. Giles, the patron

saint of lepers, usually occupied a position at one extremity of the town to which they belonged, and were intended principally for the resort of those persons afflicted with the leprosy, and who resided in an hospital near the spot. The church thus dedicated at Oxford, stands at its northern extremity, a considerable distance beyond the gate called Bocardo, which joined, or very nearly so, the ancient tower of St. Michael's church. St. Giles's church is the most extensive of the parish-churches contained in this city. It is composed of architecture of various periods; the most ancient of which, appearing in the tower, and in the massive and plain pointed arches by which it is supported, belong to the twelfth century, the age when some of the characteristic features of the Norman style were united to those belonging to the pointed arch. The body of this church is composed of three very handsomely-proportioned aisles, which are each spacious and well lighted; the centre by a *clere* story of windows, and the side-aisles by lancet-windows, which on the south side are single openings, of lofty and narrow proportions, uniformly placed on each side an elegant stone porch, which is the principal, and indeed now the only, entrance to the church. The north aisle is lighted by double and triple lancet-windows, in five divisions. Four of these divisions are covered with pediments, which increase the variety of the design, and augment the elegance of this side of the church, now the most concealed from public view. The other component parts of this church are, a chancel, and a south aisle, the walls of which are not less ancient than those of the body, having a lancet-window on the south side, and another on the north side; the other windows possess various forms, and are of various dates; and so extensively and injudiciously has the eastern portion of the edifice been altered, that internally it appears gloomy and inelegant. Under the windows, towards the east end of the south aisle, are two recessed arches and a piscina. Every division of windows in the north aisle has an arch extending across from the great columns to the opposite piers, where are brackets for their support. One of these arches has been destroyed; and we may conjecture that each division or space of this aisle was formerly used as a chapel, having been separated by wooden screens which are now removed. Whether this conjecture be probable or not, a more reasonable one cannot perhaps be suggested that will lead us to account for the singular variety appearing in all the windows, such as double and triple openings; some with attached, others with insulated, columns; several of the arches are plain, and several are carved, with mouldings; some of the capitals plain, while others are enriched with exquisitely-sculptured foliage. The font is placed on a sub-base at the west end of this aisle. It possesses considerable elegance in design, with great novelty, and was certainly constructed early in the 13th century. Its general form is a square, the body being composed of broad semi-circular mouldings divided by rows of ornaments, and resting on a column with two slender and detached columns at every angle. A well-proportioned pointed arch opens from the south aisle of the body to the aisle of the chancel, which is now used as a vestry-room. A more spacious arch divides the body and chancel. A large semi-circular arch opens the chancel to the south aisle, which was made a chapel or chantry by one of the Fitzwarrens, and dedicated to the blessed Virgin Mary. It contains a stone seat for the officiating priest, and a piscina. The east window of this aisle is peculiarly elegant, while the larger window of the chancel is quite plain. At the east end of the north aisle is a large marble monument, consisting of two arches, supported on columns, and forming canopies to the kneeling figures of a male and female, and three children. A long inscription records the worth of Henry Bosworth, who was buried Jan. 3, 1633. A view of this church is added to the annexed Plate.

The above are the churches principally worthy of notice; and, as dissenters from the established church are comparatively

comparatively few in Oxford, meeting-houses are neither frequent nor spacious in extent. Here are, however, chapels belonging to the Roman Catholics, the Quakers, the Baptists, and the Methodists: a new Wesleyan chapel was opened on the 19th of February, 1818.

Among what have been termed the municipal public buildings, the Town and County Hall may properly claim the precedence as the seat of the courts of justice, and the focus of the municipal authority. It is a spacious edifice of stone, having a pediment over the centre of the front, which exhibits a range of rustic work in its lower division. The expense of erecting it was chiefly defrayed by Thomas Rowney, esq. late high-steward of the city.

The Radcliffe Infirmary is one of the public edifices conferred on Oxford by the munificence of Dr. Radcliffe; it having been built by his trustees with part of the funds remaining in their hands after the completion of the Radcliffe Library. It is a stone building, well adapted for the reception of patients, and has extensive grounds attached, the donation of T. Rowney, esq. above mentioned. The charity is supported by voluntary subscriptions.

The Town and County Gaol is a large edifice of stone, with separate lodgings, and yards of exercise for the debtors and felons. It occupies a part of the site of the old castle, built by Robert d'Oigly, and displays much more lightness and architectural taste than is usual in structures of a similar description. It was designed and erected by D. Harris, esq. architect.

The City Bridewell is a modern building, substantial in its construction, and well arranged for the purposes to which it is appropriated. Before the erection of this edifice, in 1789, offenders, within the jurisdiction of the mayor, were placed in a prison over the north gate, called Bocardo, where Cranmer, Ridley, and Latimer, were confined, and whence they were led to the stake. In a small room, which forms the entrance to the Bridewell, is still preserved the door which is said to have led to the cell of these illustrious martyrs.

The General Market-house is a commodious range of building, erected under the authority of an act of parliament, and certainly constituting one of the greatest improvements effected during the last century. It is separated into three divisions, one appropriated to butchers, a second to the venders of poultry, bacon, &c. and a third to the sale of vegetables and fruits. Round the whole are ranges of shops under an arcade. Market-days, Wednesday and Saturday.

The House of Industry stands near the Infirmary. It was built for the reception of the poor of eleven parishes, and is consequently a structure of considerable extent, but possesses no architectural features worthy of remark. The other principal charitable institutions in Oxford are, Boulter's and Stone's alms-houses, and four charity-schools, one of which, for fifty-four boys, is supported by the university.

A *Provident or Saving Bank* was established here on the 22d of April, 1816. On the 3d of January, 1818, it appeared, that the number of persons who had deposited money therein was 530, and the amount 7289l. 19s. 4d. of which upwards of 1400l. had been paid in within the last three months.

This city, as has been already hinted, contained no fewer than nineteen religious houses prior to the reformation, some of which were converted into collegiate establishments. The names of these monastic institutions were as follows: 1. St. Frideswide's Priory; 2. St. George's College; 3. Osney Abbey; 4. Rowley Abbey; 5. St. Bernard's College; 6. Canterbury College; 7. Durham College; 8. Gloucester Hall; 9. London College; 10. St. Mary's College; 11. St. Bartholomew's Hospital; 12. St. John's Hospital; 13. Austin Friars; 14. Black Friars; 15. Grey Friars; 16. White Friars; 17. Crouched Friars; 18. Friars de Sacco; 19. Trinity-House. But of these we can now notice only two or three.

VOL. XVIII. No. 1232.

St. Frideswide's Priory is said to have been originally founded for nuns of noble birth, by Didanus, an earl of Oxford, about the year 727, and to have derived its name from Frideswide, his daughter, whom he appointed the first prioress. In 1111 it was made the seat of a society of regular Augustine canons, and continued such till its suppression, when the site and buildings were granted to cardinal Wolsey for his college of Christ-church.

Osney Abbey was originally a priory for Augustine or black canons, founded by Robert d'Oigly, nephew to that Robert who was the founder of the castle; but was shortly after constituted an abbey. Within the walls of this religious seminary stood a most magnificent church, the grandeur and extent of which were much increased by the additional building erected by John Leech, abbot of this house, and other benefactors. The church, with the adjacent edifices, continued to be the admiration of beholders, till, with other societies of like nature, it felt the effects of the reformation, though it escaped, for a time, total demolition; for Henry VIII. converted it into a cathedral, and established therein a bishop, dean, and other officers; in which state it continued till the bishopric and chapter were transferred to St. Frideswide's college, now Christ-church; and Robert King, the abbot, was made first bishop of Oxford. From this time a gradual demolition has been made, till there are scarcely any vestiges of it remaining. It is probable that what the reformation began the rebellion completed. But it fortunately happened, that Mr. John Aubrey, the author of the *Antiquities of Surry*, then a gentleman-commoner of Trinity-college, whose natural turn for the studies of antiquity led him to fear the entire destruction of this magnificent structure, was induced to procure the view of it, as it appeared just before the rebellion commenced. What became of the original plate is not known: the impression is found but in very few copies of the *Monasticon*, vol. ii. page 136. and, wherever it is, it renders that copy of the work more valuable. A correct re-engraving of the print was given in the *Gentleman's Magazine* for April 1771; which, says the proprietor, "will doubtless be an acceptable present to the public, whether as a curious specimen of ancient architecture, or *for the purpose of inserting it in the work above mentioned.*" This hint, of tearing a plate out of one book to stick it into another, has been so well attended to, that the print has again become scarce, the copper having been probably destroyed in the fire of 1785. It has therefore been again re-engraved for the present work.

The Carmelite or White Friars first settled in Oxford A. D. 1254, in a house given them by Nicholas de Meules near the river, opposite to Rowley. About sixty years afterwards, however, they were transferred by king Edward II. to the ancient palace of Beaumont, which they possessed till the suppression.

The Palace of Beaumont, just mentioned, stood on the west side of the city. It was built by Henry I. before the year 1128, and continued to be a favourite regal residence during several succeeding reigns. Henry II. spent much of his time in this palace, which had the honour of giving birth to his gallant son, Richard I. All the buildings were pulled down at the dissolution, except the hall, the materials of which were afterwards used by archbishop Laud, in his additions to St. John's college. Only a small low fragment of them, therefore, now remains; and this appears to have constituted a part of one of its inferior divisions.

The Castle, built, or, as King supposes, restored, by Robert d'Oigly, was a fortress of prodigious strength, and occupied a great extent of ground close to the river Isis, towards the western side of the city. Being in a neglected state, and much decayed, in the reign of Charles I. it was repaired and rendered a post of defence by that monarch; but, after it became possessed by the parliament, a great part of its buildings were demolished. Hence the only remains of it now in existence are the

T t mount,

mount, a crypt, and the shell of one of the original towers, which is a square massive structure, lighted by a few loop holes only, and having a projecting bastion-turret at one angle, through which a narrow staircase leads to the top of the castle. It now constitutes part of the gaol.

FOREST HILL is the name of a small village situated on a pleasant hill, about three miles from Oxford, and was so called because it formerly lay contiguous to a forest, which has since been cut down. MILTON chose this place of retirement after his first marriage; (see vol. xv. p. 404.) and he describes the beauties of his retreat in that fine passage of his *L'Allegro*:

Sometime walking, not unseen,
By hedge-row elms, on hillocks green,
While the ploughman, near at hand,
Whistles o'er the furrowed land;
And the milkmaid singeth blithe,
And the mower whets his scythe;
And every shepherd tells his tale
Under the hawthorn in the dale.
Straight mine eye hath caught new pleasures,
Whilst the landscape round it measures;
Russet lawns, and fallows grey,
Where the nibbling flocks do stray;
Mountains, on whose barren breast
The lab'ring clouds do often rest;
Meadows trim, with daisies pied,
Shallow brooks, and rivers wide;
Towers and battlements it sees,
Bosom'd high in tufted trees.
Hard by a cottage-chimney smokes
From betwixt two aged oaks, &c.

"It was neither the proper season of the year, nor time of the day, (says Sir Wm. Jones, in his account of a visit to it,) to hear all the rural sounds, and see all the objects, mentioned in this description; but, by a pleasing concurrence of circumstances, we were saluted, on our approach to the village, with the music of the mower and his scythe; we saw the ploughman intent upon his labour, and the milkmaid returning from her country employment. As we ascended the hill, the variety of beautiful objects, the agreeable stillness and natural simplicity of the whole scene, gave us the highest pleasure. We at length reached the spot whence Milton undoubtedly took most of his images; it is on the top of the hill, from which there is a most extensive prospect on all sides: the distant mountains, that seemed to support the clouds, the villages and turrets, partly shaded with trees of the finest verdure, and partly raised above the groves that surrounded them; the dark plains and meadows of a greyish colour, where the sheep were feeding at large; in short, the view of the streams and rivers, convinced us that there was not a single useless or idle word in the above-mentioned description, but that it was a most exact and lively representation of nature. Thus will this fine passage, which has always been admired for its elegance, receive an additional beauty from its exactness. After we had walked, with a kind of poetical enthusiasm, over this enchanted ground, we returned to the village.

"The poet's house was close to the church; the greatest part of it has been pulled down, and what remains belongs to an adjacent farm. I am informed that several papers, in Milton's own hand, were found by the gentleman who was last in possession of the estate. The tradition of his having lived there is current among the villagers; one of them showed us a ruinous wall that made part of his chamber; and I was much pleased with another, who had forgotten the name of Milton, but recollected him by the title of The Poet. It must not be omitted, that the groves near this village are famous for nightingales, which are so elegantly described in the *Penferoso*. Most of the cottage-windows are overgrown with sweet-briars, vines, and honey-suckles; and that

Milton's habitation had the same rustic ornament, we may conclude from his description of the lark bidding him good-morrow,

Through the sweet-briar, or the vine,
Or the twisted eglantine;

for it is evident, that he meant a sort of honey-suckle by the eglantine; though that word is commonly used for the sweet-briar, which he could not mention twice in the same couplet."

NUNEHAM-COURTENAY, the seat of the earl of Harcourt, is near Oxford. At the general survey, this manor belonged to Richard de Courcy; afterwards to the family of Riparys, or Redvers. Mary, youngest daughter of William de Redvers earl of Devon (who, as well as his uncle William, was surnamed de Vernon), married Robert de Courtenay baron of Oakhampton, in 1214. It is probable that by this marriage the manor of Nuneham passed into the family of Courtenay, and thence assumed the name of *Nuneham-Courtenay*. After them succeeded (the Pollards) sir John Pollard, of Devon. From thence it came to Mr. Audley, of the Court of Wards, called the Rich Audley. From him to Robert Wright bishop of Lichfield, whose son, Calvert Wright, sold it to John Robinson, of London, merchant (temp. Oliver Cromwell); knighted in 1660 by king Charles II. and made lieutenant of the Tower. From the Robinsons it descended to David earl of Wemys, (who married Mary, daughter and co-heiress of sir John Robinson, bart.) from whom it was purchased in the year 1710, by Simon, first lord Harcourt, lord-high-chancellor of England.

The house was built by the first earl, but has since been much altered and enlarged (by the addition of a court of offices, &c.) according to the plans of Mr. Brown: it stands in a park of six miles and a half in circumference, well wooded, and containing near twelve hundred acres, in which are scenes worthy of the bold pencil of Rubens, or to be subjects for the tranquil sunshines of Claude. The gardens contain thirty-eight acres, and (except the terrace and flower-garden) were laid out by Mr. Brown. From the centre window of the breakfast-room round the south side of the garden, and back again, is half a mile and sixteen poles. From the same place along the terrace round the hill, at the termination of it, and back again, is a mile and a furlong.

The church is a beautiful building of the Ionic order, in the style of an antique temple; it was erected in the year 1764, at the sole expense of Simon earl of Harcourt, who gave the original design, which afterwards received a small alteration from Mr. Stuart. The principal portico, which consists of six columns, has no communication with the church, but serves for a seat in the garden; the public entrance is on the opposite side, and that to the family-pew through the semicircular portico at the west end. The inside was furnished and decorated by the late earl. The altar-piece, which represents the parable of the Good Samaritan, was designed and painted by Mr. Mason. The piece of tapestry at the west end (which is framed like a picture) represents the chiefs of the twelve tribes of Israel at the passover.

STANTON-HARCOURT is a village about seven miles from Oxford, situate between the two roads leading to Farringdon and Whitney, and was once the residence of the family of the Harcourts; but the mansion no longer appears in its former splendour. The chapel is still preserved by the present lord, with a great deal of attention and care. The interior part of this edifice, which was appropriated to the service of divine worship, is still entire; and the antique decorations of the ceiling preserve in a great degree their original form and appearance; it was adjoining the great hall, from whence there was a communication to a door opposite the altar, over which was a window enriched with stained glass, representing the various quarterings borne by the Harcourts, and also portraits of distinguished persons of that family. But the painted

painted glass is now removed, to preserve it from the probable destruction of such a deserted situation. In the tower are three rooms, about thirteen feet square; and over part of the chapel is a fourth. The uppermost of these rooms was occupied as a study by Mr. Pope, who passed two summers here for the sake of retirement. In one of the windows is the following inscription, written by him on a pane of glass: "In the year 1718 Alexander Pope finished here the fifth Volume of Homer."

The old kitchen is one of those ancient buildings erected without chimneys. Dr. Plot, in his History of this County, gives the description of it: "Among these eminent private structures (in the county of Oxford) could I find nothing extraordinary in the whole; but in the parts, the kitchen of the right worshipful sir Simon Harcourt, knight, of Stanton-Harcourt, is so strangely unusual, that, by way of riddle, one may truly call it either a kitchen within a chimney, or a kitchen without one; for below it is nothing but a large square, and octangular above, ascending like a tower, the fires being made against the walls, and the smoke climbing up them, without any tunnels or disturbance to the cooks; which being stopped by a large conical roof at the top, goes out at loop-holes on every side, according as the wind sits, the loop-holes at the side next the wind being shut with falling doors, the adverse side open."

Detached fragments of buildings and walls, and one or two respectable dwelling-houses, formed out of the ruins, though possessing little of antiquity, and nothing of interest, with their large gardens and orchards, now cover the site of this venerable mansion. The gate, or lodge, consists of a large arch with rooms over and at the sides, and had formerly a battlemented parapet, but is otherwise quite plain. In addition to Dr. P.'s description of the kitchen, we should observe that it is nearly of a square form, terminated with battlements, upon which is a low octagonal story, supporting a spiral or conical roof, and the figure of a lion on the top holding a vane, once charged with the arms of the family. This part is constructed of wood, every side having open compartments and trefoil arches to emit smoke from the fires within, and all being filled with weather-boards, which were open or closed, according to the direction of the wind.

The magnificent church, belonging to the village, stands a short distance eastward of this ruined mansion, and combines some early, as well as some very superbly-enriched, architecture of a later period.

Stanlake is a village near Stanton-Harcourt. The parson of this parish used formerly, in the procession on Holy-Thursd'ay, to read the Gospel at the barrel-head, in the Chequer-inn here, where some say was anciently an hermitage, others a cross, at which a Gospel used to be read in time of popery; and the inn, or cellar of it, being built over it, they were afterwards forced to perform it as aforesaid.

The remains of a Roman villa, were lately discovered on the duke of Marlborough's estate at *Stonesfield*, eleven miles from Oxford. They were first pointed out in 1816, by the Rev. Mr. Brown, vicar of that parish. By the assistance of that gentleman, and of the duke of Marlborough, extensive discoveries have been made. The building encloses about three acres of land; the peristyle, on every side of the quadrangle, is very evident, as are the divisions of forty-seven rooms. The pavements are tessellated, and in good condition. One of them, in a large room, is perfect. The tesserae are so exactly laid together, so beautifully varied, and the pattern so correct and elegant, that the best floor-cloth is not painted with more accuracy or beauty. The pattern is one which frequently appears on our modern floor-cloths. The baths are completely excavated; and the hypocausts and flues, by which they warmed the rooms, in the manner we have adopted for hot-houses, are apparent. The largest rooms seem to be about 30 by 25; one is exactly 28 by 24; a pro-

portion, in which the length exceeds the width much less than in modern rooms. Nothing has yet been found to fix the precise date of the villa; the coins collected are those of Constantine the Great, who flourished from 306 to 337.

The works chiefly consulted in the compilation of this article are—Nichols's Account of Queen Elizabeth's Progresses. Wilkes's British Directory, vol. iv. Wood's Athen. Oxon. Gent. Mag. 1771, 1818, 1819, 1820. Monthly Mag. 1810, 1814, 1815. Chalmers's Hist. of the University of Oxford, 1811. Chandler's Life of Bp. Weynflete, 1811. Britton's Architectural Antiq. vol. iii. iv. Oldfield's Representative History, 6 vols. 8vo. 1816. Brady's Clavis Calendaria. Plot's Oxfordshire. Beauties of England, vol. xiii.

OXFORD, a township of North America, in Worcester-county, Massachusetts: eleven miles south of Worcester, and containing 1277 inhabitants.—A town taken from the north part of Derby in Connecticut: seventeen miles north-west of Newhaven; containing 1400 inhabitants.—A post-town of New York, in Chenango-county, between Jericho and Norwich; incorporated in 1793, and containing an incorporated academy, and 1405 inhabitants.—A township of New Jersey, in Sussex-county, on the east bank of Delaware-river, fifteen or twenty miles north-east of Easton, in Pennsylvania, containing, in 1810, 2470 inhabitants.—A township of Pennsylvania, in Philadelphia-county; containing 973 inhabitants.—A township in Grenville-county, Upper Canada, situated in the rear and to the northward of the townships of Edwardburg and Augusta, and watered by the Rideau.—A township upon the Thames, in the Western District, Upper Canada, south of Dundas-street, where the western end of that road meets the upper forks of the river Thames.—A town in New Hampshire, Grafton-county, containing 988 inhabitants.—A port of entry, on the east shore of Chesapeake-bay, in Talbot-county: thirteen miles south-by-west of Easton, and about forty-eight south-east of Baltimore.—A small post-town of North Carolina; thirty-six miles from Hillsborough, and about 416 from Philadelphia.—A township of Ohio, in Guernsey-county, with 440 inhabitants; another on the Ohio, in Tuscarawa-county, with 271 inhabitants.

OXFORD (Lower), a town of Chester-county, Pennsylvania; with 769 inhabitants: twenty-one miles west-south-west from Philadelphia.

OXFORD (Upper), in the same county; with 700 inhabitants: twenty miles south-west of Philadelphia.

OXFORDSHIRE, one of the central counties of England, is bounded by Gloucestershire on the west; by Buckinghamshire on the east; by Berkshire on the south, south-west, and south-east; by Northamptonshire on the north; and by Warwickshire on the north-west. In figure this county is extremely irregular, being only seven miles in breadth in the centre, while its southern division is about twelve miles in diameter, and its northern half varies from little more than a mile, to thirty-eight miles in width. This latter portion, in proceeding northward from the centre, assumes the form of a cone, which terminates at what is denominated the Three-Shire Stone, in a complete point or apex. The total area of the county is computed, by Mr. Davis, at 742 square miles, or 450,000 acres, of which 309,000 lie to the north, and 141,000 to the south-east, of the city of Oxford; but in the table of poor-rates drawn up under the inspection of the late George Rose, the number of acres is estimated at 474,880.

When the Romans obtained possession of Albion, Oxfordshire, with some portion of the county of Gloucester, constituted the dominions of a British tribe called the *Dobuni*, who seem to have been of a less warlike disposition than most of their neighbours. Before the arrival of the Romans, they were held in subjection by the Cat-tieuchani, whose domination was so galling, that the Dobuni immediately embraced the protection of the new invaders,

invaders, and were admitted as tributary allies of the Roman people. Hence Cogidumnus, their legitimate prince, was not only continued in the government of his own territories, but had other states placed under his authority. The same power and privileges descended to his successors, each of whom, in union with his subjects, evinced on all occasions a firm adherence to their illustrious superiors, during the whole period of the residence of the Romans in Britain.

When the heptarchy was established, Oxfordshire became part of the powerful kingdom of Mercia, and remained annexed to that monarchy to the latest period of its independence.

In the subsequent contests which ensued between the Danes and the Saxons, several very obstinate and furious engagements were fought within the limits of Oxfordshire. Hoke-Norton is remarkable for a dreadful slaughter of the Kentish division of the army of Edward the Elder, by the Danes, and the Five Burgher insurgents under the command of Ethelwald.

In the wars between the houses of York and Lancaster, several persons of eminence belonging to this county lost their lives and properties; but it had the good fortune to escape the destructive ravages which at this period desolated many other districts of the kingdom. In one instance only did the partisans on either side enter Oxfordshire in arms. This was in the year 1469, when the earl of Warwick took post near Banbury, and soon after completely overthrew the Yorkists under the command of the earl of Pembroke, whom he took prisoner, and thus paved the way for the temporary restoration of Henry VI. The scene of this decisive action was the plain called *Daneşmore*, on the border of the county.

Oxfordshire, however, was not so much favoured during the next great civil contests which divided the people of England, and deluged her fertile fields with the blood of her own citizens; for, though the inhabitants do not seem to have embraced with senseless zeal either the republican or royal cause, it was their calamity to feel the iron rod of war with peculiar severity. The contending armies frequently traversed the county from one extremity to the other, levying contributions, and committing excesses equally destructive to the great body of the people, whether the troops in possession marched under the banners of the king, or of the parliament.

This county exhibits considerable variety of aspect. In its southern division, an alternation of hill and dale is productive of many pleasing displays of pictorial scenery. The Chiltern Hills, partly clothed with wood, and sometimes arable almost to their summits, possess a rich diversity of appearance. The middle district of the county is destitute of this inequality of surface, so favourable to beauty, but it is well wooded and highly fertile. In proceeding more to the north, the same flatness prevails; and, as the fields are generally inclosed by stone fences, the eye "is often fatigued by a rude and frigid monotony of scene." Here also the air is generally cold and piercing during the greater part of the year, and excessively hot in the summer-months. It is cold also throughout the whole Chiltern districts, especially on the poor chalk-lands, at the foot of the hills, where it is remarked that the frost will take effect sooner, and continue longer, than on the deeper lands in the vicinity. In warm seasons, the same district is usually moist, owing to the fogs, which are more frequent on the hills and woods than in the vales.

No county is more plentifully supplied with rivers. Dr. Plot says there are no less than seventy distinct streams, which either take their rise in this county or flow through it; nor do we believe the number is at all exaggerated, though at the same time it must be admitted that only a few of them are entitled to the denomination of considerable rivers. The principal of these are, the Thame, the Isis, the Charwell, the Evenlode, the Glym, the Ray, and the Windrush. The whole of these rivers unite with

each other at different points of the county, and eventually constitute the Thames, or *Thamisis*. The chief branch of this river enters Oxfordshire, under the denomination of the *Isis*, at Kilmescot, and proceeds in an irregular channel by Tynesham, Godflow, Oxford, and Abingdon in Berkshire; to Dorchester, where it is joined by the Thame, and is then called the *Thames*. Thence it continues its course by Wallingford, Goring, Whitchurch, and Caversham, to Henley, near which town it passes into Buckinghamshire. Throughout the whole of its current by Oxfordshire, this river forms the boundary between it and the county of Berks, and exhibits in the scenery of its banks much variety and beauty of aspect.

From the number of its rivers, Oxfordshire abounds in meadows and pastures; but these are no longer, as in the time of Gibson, the "greatest glory" of the county, being much circumscribed by the encroachments of arable cultivation. A large tract of meadow-land, on the banks of the Charwell, has been greatly injured by the construction of the canal from Oxford to Banbury. At Water Eaton is the best grass-land in the county. It is under-dairies which indeed constitute the appropriation of most of the meadow and pasture-grounds in Oxfordshire. Butter is the chief article here, only a small proportion of cheese being made for sale. The long-horned breed of cows is that generally preferred here. In the middle parts of the county a few oxen, cows, and sheep, are fattened; and a number of calves are suckled for the London market. No watered meadows are found in Oxfordshire, though many places are extremely well adapted for their formation.

Oxfordshire is said by Camden to have been anciently famous for its woods; and, even at present, except in the more northerly parts, it is better supplied with trees than most other counties of England. The only forest, however, within its boundaries, is that of Whichwood, which comprehends 6720 acres, 1 rood, and 39 poles. In this forest, the oak, the ash, the beech, and the elm, are intermixed; but the oak is most abundant and thriving; and, in the course of half a century's growth, will be perfectly fitted for naval purposes. The Chiltern district is profusely covered with beech, produced almost entirely by the falling of the beech-mast, very little being permitted to grow on the old stools. The other principal woodlands in this county are those at Stanton-St.-John, called the *Quarters*, and at Blenheim, the seat of the duke of Marlborough. Smaller plantations are numerous; almost every gentleman's seat in Oxfordshire being more or less surrounded with trees of different ages and sorts.

The only tracts of waste land, of any very considerable extent, are those situated in the parishes of Whichwood-forest, and the deanery-district, termed *Ottmoor*, which lies in the vicinity of Islip. The last, which contains about 4000 acres, is commonable to eight adjoining townships. The whole of it is extremely flat and wet, and consequently unwholesome to cattle, as well as prejudicial to the neighbourhood. The soil, however, is good; and, if drained, (which might be easily effected,) and inclosed, would undoubtedly prove highly amenable to the purposes of agriculture. The value of the grounds would thereby increase to probably ten times their present amount. The same may be said of the waste lands of Whichwood, and of the small commons in the northern district; but those in the Chiltern division are not susceptible of much culture.

The only canal yet cut through any portion of Oxfordshire is that which enters the county at its northern extremity, between Claydon and the Three-Shire-Stone. Approaching the vicinage of the river Charwell at Cropredy, it proceeds at a small distance from the banks of that river to the city of Oxford, (whence it is called the Oxford Canal,) where its channel terminates, and is succeeded by the navigation of the Isis. The probable advantages which will accrue from this cut are very great, as a direct water-communication has been thereby opened between

OXFORDSHIRE.

Engraved for the Encyclopædia Londinensis 1820.

between the interior of the county, and Birmingham, Liverpool, Manchester, and the Wednesbury-colleries, as well as with the cities of London and Bristol.

Oxfordshire is divided into fourteen hundreds, which, together, contain 1 city, 12 market-towns, and 207 townships and parishes, all of them in the diocese of Oxford, and province of Canterbury. According to the parliamentary returns of 1811, the number of houses in the whole county was 23,217, and the number of inhabitants 119,191. In 1801, the houses were estimated at 20,599, and the population at 109,620 persons. Oxfordshire is represented in parliament by nine members; two knights of the shire, two citizens for Oxford, two representatives for the University, two burgesses for Woodstock, and one for Banbury. This county was formerly under one sheriff with Berkshire. It was summoned on the 22d of Edward I. and from that time has returned members to parliament. In the 22d of Edward I. the sheriff returned two knights of the shire, and two burgesses for Oxon; and, in the 28th year of that reign, to this county the sheriff added the knights for Berks, though not directed by his writ; and in the 18th of Edward III. he returned for both counties in one indenture.

This county is remarkable for having had the last great contest between the whig and tory parties, which happened at the general election in 1754, and first brought the famous Mr. Charles Jenkinson, who afterwards became earl of Liverpool, into court-favour and public notice; and procured him, at first, the humble situation of a clerk in the treasury; from whence he rose, by a regular gradation, in 1762 to be private secretary to lord Bute, in 1763 to be secretary to the treasury in the administration of Mr. George Grenville, grandfather to the present marquis of Buckingham; in 1766, a lord of the admiralty, under the administration of the duke of Grafton; in 1767, a lord of the treasury; in 1778, secretary at war, under lord North; in 1786 created lord Hawkesbury, and made chancellor of the duchy of Lancaster by Mr. Pitt; in 1790, first lord of trade and plantations; in 1796, earl of Liverpool, besides holding, for many years, the sinecure place of collector of the customs in the port of London, worth 6000*l.* per annum; and at last retired from office with the addition of an enormous pension for life. "All this accumulation of wealth, fortune, and favoritism, originated (says Mr. Oldfield) in his being what is commonly called squib-writer to the court-candidates at this memorable election. Lord-viscount Parker, and sir Edward Turner, were the whig-candidates, supported by the duke of Marlborough, earl of Guildford, earl Harcourt, and earl of Macclesfield, and by the administration of that day, the whigs being then in place; and it was lord Parker who first introduced Mr. Jenkinson to the duke of Newcastle, at that time minister, and procured for him the first appointment he obtained. Lord-viscount Wenman and sir James Dashwood were supported by the tory and opposition interest, and by the earl of Abingdon, and earl of Lichfield; and, after a most violent and expensive contest, this election ended in a double return of all four candidates; and, on the 23d of April, 1755, the house of commons declared that lord Parker and sir Edward Turner were duly elected, and ought to have been returned. At the ensuing general election in 1761, the duke of Marlborough nominated one member, and the tory-party the other, and they have continued to do the same ever since." Oldfield's Representative Hist. 1816.—The present members are, John Fane and W. H. Ashurst, esqrs.

Oxfordshire has little claim to be ranked among the number of the manufacturing counties. Witney blankets, indeed, were formerly much noted; but this branch of trade is now declined, and the town is reduced to a comparatively poor and destitute condition. At Woodstock is a small manufacture of polished steel articles, which was introduced by a Mr. Medcalf, and was at one time in a very flourishing state. Here is likewise a manufacture of

VOL. XVIII. No. 1232.

leather breeches and of gloves, which employs about 70 men, and 1400 or 1500 women and girls. The wages of the men are from one guinea to 30*s.* weekly, and those of the women from 8*s.* to 12*s.* per week. A small quantity of lace is made in the town and neighbourhood of Thame; and at Bloxham and Banbury a coarse sort of velvet is produced. Henley has, for several centuries, been one of the London depots for malt.

Oxfordshire does not offer such a field for antiquarian research as many other counties; but, nevertheless, it affords some materials in this branch of inquiry, by no means unworthy of attention. Several very curious British coins have been found within its limits; and there are numerous barrows and other monuments here, which, we presume, may properly be referred to an era antecedent to the records of history. Of this description is the Druidical monument called *Rollrich* or *Rowbright Stones*, which were originally 60 in number, (though only 22 of them are now standing,) and formed a circle nearly equal in diameter to the outer one at Stonehenge. The sizes of these stones, however, are trifling, compared to the immense masses of the Wiltshire temple, few of them exceeding four feet in height, and sixteen inches in breadth. One only, in the northern part of the circle, is seven feet high, and five and a half broad; but, detached, is another, measuring eight feet in height, and seven in breadth. This last is denominated the King-stone, from a tradition that some ancient monarch and his court were converted into stones on this spot. Contiguous to it is a large long barrow, supposed to contain the ashes of an arch-druid; and near it is a square entrenchment, with a double ditch and vallum, having some remains of stone-work in its interior. These Dr. Stukeley calls Druid-courts, or houses. Several other barrows, with the apparent foundations of buildings close to them, are discovered in the vicinity of this temple; and about 300 paces from it was formerly a kistvaen of six stones, which have been lately removed.

Of the four principal Roman roads intersecting the island, one only passes through Oxfordshire. This is the Ikenild-street, which enters the county at the parish of Goring, and crosses it in a direction from south-west to north-east by Ippden, Ewelme, Watlington, and Crowell, to Chinnor, where it enters Buckinghamshire. Vicinal ways, however, are abundant. The Akeman-street stretches itself throughout the broadest part of the county, entering it near Holywell, and leaving near Ambroden, in the vicinity of the station Alcester. From this street many minor roads branch off in different directions. Two of these are traced near Kirklington, a third within Blenheim-park, and a fourth to the south of Bicester. Between Mongewell and Nuffield is a vallum, or high ridge-way, called Grimes's Dyke, or Devil's Ditch, also numbered by Dr. Plot among the Roman vicinal ways; but we are inclined to refer it to a more remote era.

OX'HANGER, a small island on the east side of the Gulf Bothnia. Lat. 63. 19. N. lon. 21. 58. E.

OXIA'NA, in ancient geography, a town of Asia, in Sogdiana, near the Oxus, or JIHON; which see.

OXIA'NA PA'LUS, a marsh of Sogdiana, called by Pliny *Oxus*, from the name of the river of which it is the source.

OXIB'II, a people of the Maritime Alps, between the river Argens and Antibes. These people were powerful, and signalized themselves against the Romans when they undertook the conquest of the Gauls. They leagued with the Deciales, for attacking the towns of Nice and Antibes. Steph. Byz. assigns to them a town called *Oribium*. Strabo mentions a port named *Oribus* as belonging to them, supposed to be the same with the maritime town called by Polybius *Egytna*.

OX'NA, a small island on the east coast of Shetland. Lat. 60. 8. N. lon. 1. 42. W.

OX'NEY, a river-island of England, in the county of Kent, formed by the divided streams of the Rother, about seven miles long, and three broad. It contains three parishes, and gives name to a hundred.

U u

OX'TER,

OXTER, *f.* [oxtan, Sax. probably from the Lat. *axilla*.] The arm-pit. *Common in the North of England.*

OX'US. See JIHON, vol. x.

OX'WICH, a seaport and parish in the hundred of Swansea, and county of Glamorgan, South Wales, is situated on a small promontory, to which it gives name, on the north coast of the Bristol Channel, at the distance of thirteen miles from Swansea. A considerable trade in limestone is carried on here, and gives employment to a number of people in the vicinity. The sea has made great encroachments on this parish; and is even supposed to have inundated the whole of the original village, as the old church and parsonage-house stand close to the shore, and the present village is built at some distance inland. Here are the remains of a large mansion, called Oxwich-castle, which was erected by Sir Rice Mansel, about the reign of Henry VIII. This edifice never appears to have been intended for the purposes of defence, but it may not unlikely have been built on the site of an ancient fortress, as, only a few yards from it, there are still to be seen the remains of a watch-tower of much older and stronger construction. Part of this castle was converted, many years ago, into a farm-house. Lobsters and crabs are caught in great plenty along the whole coast of this parish, which, according to the parliamentary returns of 1811, contains 50 houses, and 236 inhabitants.

Penrice-castle stands about three miles from Oxwich. It derived its name from the family of the Penrices, who settled here in the reign of Edward I. but is now the property of the Talbots. This demesne has lately been amazingly improved, and exhibits a diversity and richness of scenery altogether unexpected from the dreary appearance of the surrounding country. In the avenue to the gardens is a fine tomb of one of the emperors, which was brought from Italy. The village of Penrice has a good harbour for shipping. North from this place, upon a mountain called Com-Bryn, is a table-like monument, or cromlech, called *Arthur's Stone*. It consists of six or seven stones, about five feet in height, supporting a large flat stone, supposed to weigh nearly twenty tons. A spring issues from beneath, which ebbs and flows with the tide, and is celebrated as *Ffynnon Vair*, or my Lady's Well.

OX'WICH POINT, a cape on the south coast of Wales, in the Bristol Channel. It forms the eastern boundary of a bay called *Oxwich Bay*. Lat. 51. 27. N. lon. 4. 6. W.

OXYACANTHA, *f.* in botany. See BERBERIS, CRATÆGUS, and MESPILUS.

OXYBAPHUS, *f.* [from the Gr. *ὄξύς*, acid, and *βαφύς*, a dyer, or *βαφύς*, a colour used in dyeing.] UMBRELLA-WORT; in botany, a genus of the class triandria, order monogynia, natural order nyctagines, *Juss.* Generic characters—Calyx: perianthium inferior, of one leaf, bell-shaped, with five folds, and five broad, equal, shallow segments, permanent, sometimes three-flowered. Corolla: of one petal, funnel-shaped; tube about the length of the calyx; limb spreading, in five equal notched lobes; nectary fleshy, surrounding the base of the germen. Stamina: filaments three, inserted into the nectary, thread-shaped, declining, rather unequal, various in length; antheræ roundish, ascending. Pistillum: germen somewhat stalked, superior, roundish, furrowed; style thread-shaped, the length and position of the stamens; stigma globose, ascending. Pericarpium: none, except the permanent hardened base of the corolla. Seed: solitary, ovate, with five angles, standing upon the dilated, spreading; permanent, calyx.—*Essential Character*. Calyx five-cleft, bell-shaped; corolla funnel-shaped; seed solitary, coated, standing on the spreading permanent calyx. There are six species in this genus, which has been separated from MIRABILIS, on account of its short tube, lobed limb, three instead of five stamens, and calyx much dilated after flowering.

1. *Oxybaphus viscosus*, or viscid umbrella-wort: downy and viscid; leaves heart-shaped; panicle racemose; stamens longer than the corolla. Native of Peru, from

whence it was sent, about twenty-five years ago, to the royal garden at Madrid, and thence communicated to various other collections. Root perennial, but usually treated as annual: the whole plant covered with jointed glandular viscid hairs. Stem two feet, or much more, in height, erect, with opposite spreading branches. Leaves wavy, bluntly-pointed, thickish, but soft and pliant, like those of *Mirabilis longiflora*. Panicle branched, viscid, many-flowered, its branches beset with whorls and short clusters of small purplish flowers, the lobes of whose corolla are inversely heart-shaped, and much shorter than the stamens and style. Calyx of the fruit pendulous, membranous, pallid, reticulated with veins. Seed less than a grain of wheat, with five tuberculated angles, dropping out of the calyx when ripe.

2. *Oxybaphus glabrifolius*, or smooth-leaved umbrella-wort: leaves heart-shaped, glaucous, smooth; panicle corymbose. Flowers in terminal tufts; stamens shorter than the corolla. Native of Peru and New Spain. Cultivated at Madrid. Ortega describes this as a glaucous plant, with the acrid flavour of a *Sedum*; glandular and villous when young, but nearly smooth when full-grown. Leaves acute, entire, rough, with reversed hairs at the edges. Flowers small, purple, in tufts at the top of each branch of the panicle; calyx tipped with red.

3. *Oxybaphus ovatus*, or ovate umbrella-wort: hairy and viscid; leaves ovate; flower-stalks terminal, forked; stamens nearly as long as the corolla; stem erect. Native of elevated spots in Peru. Stem three feet high, clothed with jointed, glandular, viscid, hairs. Corolla red, twice as large as the calyx, till the latter becomes dilated and membranous as the fruit advances. This and the two next are known only from the Flora Peruviana, where the genus is called *Calyxhymenia*.

4. *Oxybaphus prostratus*, or prostrate umbrella-wort: leaves ovate or heart-shaped, downy; flowers axillary and terminal, somewhat corymbose; stem prostrate. Native of hills in Peru. Stem three feet long, striated, slightly downy; branches alternate, forked in the upper part. Flower-stalks from the forks of the branches, bearing from three to eight flowers on little partial stalks; corolla purple.

5. *Oxybaphus expansus*, or spreading umbrella-wort: leaves ovate, smooth; flower-stalks terminal, forked; stamens the length of the corolla; stem erect. Found on very dry hills in Lima. Stem six feet high, striated. Flower-stalks terminal, forked in a corymbose manner, bearing from six to eleven flowers, on unequal partial stalks, which are but slightly viscid; calyx downy and glutinous; corolla purple, somewhat bell-shaped.

6. *Oxybaphus aggregatus*, or three-flowered umbrella-wort: leaves lanceolate; flower-stalks axillary, solitary; calyx with about three flowers. Native of New Spain: it flowered in 1798 at Madrid. Stem a foot high or more, branched from the very base, striated, leafy. Leaves nearly sessile, about two inches long, opposite, lanceolate, thickish, wavy, smooth, rough-edged. Flower-stalks axillary, sometimes from the forks of the branches, solitary, short, drooping when in fruit; calyx bell-shaped, with unequal ovate segments, containing usually three flowers, rarely two or four, which are sessile, without any other perianthium; corolla reddish.

OXYCA'NI, in ancient geography, a people of India, who occupied the territory now called Hajykan, a circar or division of Sindy.

OXYCE'DRUS, *f.* in botany. See JUNIPERUS.

OXYCOC'CUS. See VACCINIUM.

OXYCRATE, *f.* [formed of the Gr. *ὄξύς*, sharp, sour, and *κραννύμι*, I mix.] A mixture of water and vinegar. The usual proportion is one spoonful of vinegar to five or six of water.—*Oxycrate* is proper to assuage, cool, and refresh. They make fomentations of *oxycrate*, clysters of *oxycrate*, &c. *Chambers*.—Apply a mixture of the same powder, with a compress prest out of *oxycrate*, and a suitable bandage. *Wifeman*.

OXYCRO'CEUM, *f.* [from the Gr. *ὄξύς*, sharp, sour, and *κροκος*, saffron.] A preparation used in plasters, for fractures,

fractures, and to form calluses; composed chiefly of saffron, with gums dissolved in vinegar.

OX'YD, or **OXIDE**, *f.* The term used in chemistry, to denote a very numerous class of bodies formed by the union of certain bases with a smaller proportion of oxygen than what is necessary for their conversion into acids. The most remarkable of these bodies are what were formerly called *metallic calces*, and have for their base some metallic substance. It is in this state that metals are often contained in the ores, from which they are extracted, and converted into the metallic form, by the process called *reduction*. Metals are converted into oxyds by combustion, and by solution in acids; and many of them assume this form from the action of the atmosphere alone, but more readily when this is assisted by moisture. See the article **CHEMISTRY**, vol. iv. p. 165. and **MINERALOGY**, vol. xv. p. 478.

OXYDA'TION, or **OXIDATION**, *f.* The process by which bodies are converted into oxyds.

OXYDER'CIA, *f.* [from the Gr. *ὀξύς*, sharp, and *δερμα*, to see.] Medicines to help the sight.

OXYDRA'CÆ, in ancient geography, a people of India, who inhabited the district now called Ouch, near the confluence of the Acesines (Chunaub) with the Indus.

OXYGA'LA, *f.* [from the Gr. *ὀξύς*, sharp, four, and *γάλα*, milk.] Sour milk. The Turks use this as a popular drink, and call it *igur*. Vigenere says, they drink four milk diluted with water; which is found to cool and nourish better than the milk alone.

OXYGAR'UM, *f.* A word used by the ancients to express a mixture of vinegar and *garum*, which is a pickle for preserving fish, or a simple mixture of sea-salt and water.

OX'YGEN, *f.* [Greek.] A principle existing in the air, of which it forms the respirable part, and which is also necessary to combustion.—*Oxygen*, by combining with bodies, makes them acid; whence its name, signifying “generator of acids.” *Todd*.

It appears, by M. Klaproth's extracts from a Chinese book written in the year of our era 756, that the Chinese had some faint notions of oxygen. They called it “the impure part” of air; and said that it combined with sulphur, charcoal, and metals; that it may be extracted from saltpetre by means of heat, and from the black stone called *he-tan-ché*. They seem to have thought likewise that it was a constituent of water.

OXYGEN GAS is the *dephlogisticated air* of Dr. Priestley, the first discoverer of it; the *vital air* of others. Under the article **CHEMISTRY**, vol. iv. p. 193, 4. we have given the various processes for obtaining it in a pure state. In this state it exhibits the following characteristic properties. It is permanently elastic at all known temperatures; colourless, transparent, and without smell and taste. It is respirable, and may be breathed for some time without inconvenience. Its specific gravity, compared to atmospheric air, is as 1111 to 1000; to hydrogen as 15 to 1. At a mean temperature and pressure, 100 cubic inches weigh 33·888 grains.

This important *element* is very generally diffused throughout nature. It exists in the atmosphere, and in water; it is often found in combination with metallic bases, and it constitutes one of the ultimate principles of almost all animal and vegetable matter. It is essential to the respiration of animals, and is frequently absorbed by plants, contributing to the healthy performance of some of their most intricate functions. Dr. Davy (Lect. at the Royal Institution, Mar. 7, 1812.) has demonstrated, that oxygen-gas forms one-fifth of the air of the atmosphere, and is the principle necessary for combustion and respiration. In its pure form it produces a number of brilliant results, by acting upon inflammable bodies; the metals burn in it brilliantly and absorb it, and it is a constituent part of most acids and alkalies. Mr. Davy shewed a beautiful experiment, in which the same oxygen, by being combined with sulphur, formed an acid, and, by being ab-

stracted from the sulphur by potassium, which took place with vivid combustion, formed an alkali. Mr. Davy entered into some general views respecting the manner in which the oxygen of the atmosphere, and that dissolved in waters, were renovated. Oxygen is absorbed, and carbonic acid is produced, in the respirations of animals, in combustion and in fermentation; vegetables, in the sunshine, absorb carbonic acid, and evolve oxygen. Mr. Davy combated the idea that this function of vegetable life was not sufficient to supply oxygen equivalent to that consumed. There is no other mode known in which carbonic acid is decomposed in the processes of nature; and, did not vegetables absorb it, it must be constantly accumulating, which is known not to be the case. A great part of the solid surface of the globe is covered with plants, and light is essential to their healthy growth, and therefore great quantities of oxygen are produced in countries where there is little animal life. Fishes, he stated, will live in confined portions of water containing aquatic plants; and the oxygen they absorb is compensated for by the plants, which decompose the carbonic acid afforded in their respiration. This view of the connection of plants and animals in their action upon air, is not only supported by many proofs, but is likewise, says Mr. Davy, conformable to the analogy of nature; it proves to us that the meanest weed, the most poisonous plant, is not without its uses in the economy of things. The different parts of the atmosphere are mingled by winds; the carbonic acid not consumed by sound plants is carried into the waters, dissolved by rain, mists, and dews; the sea is kept in agitation by waves and tides, and its influence upon the air constantly exerted; the storm and the whirlwind assist in this beneficent ministration; and the harmony displayed in such diversified combinations, offer a striking instance of the wisdom and perfection of the arrangements connected with the preservation of life in the system of the globe.

It will create no surprise, therefore, in our readers, when they are told that the inhalation of this gas, emphatically called *vital air*, has been recommended in cases of catalepsy, epilepsy, and consumption. Many cures have been effected by it within our own knowledge; but it may become a dangerous engine in the hands of unskilful persons: it is a remedy not to be trifled with.

Mr. Thenard has recently been able to combine oxygen with acids to an almost-unlimited extent, chiefly by means of the peroxyd of barium. His general method was, to dissolve the peroxyd in the acid intended to be oxygenized, and afterwards to separate the barytes by means of sulphuric acid; the oxygen was thus transferred from the peroxyd of barium to the acid; and, by repeating the operation, he found that additional doses could be added. In this way he oxygenized the nitric, muriatic, phosphoric, and other, acids; and, by taking advantage of its other properties, the muriatic acid in particular, was oxygenized even so far as to contain 64 atoms of oxygen to 1 of muriatic acid. These oxygenized acids combine with the different bases, and neutralize them; but they are by no means permanent, giving off their superfluous oxygen by the application of heat, &c. By similar methods M. Thenard has been able to combine additional doses of oxygen with many of the metallic oxyds. *Annales de Chimie*, tome ix.

OXYGENATED MURIATIC ACID, or **OXYMURIATIC ACID**. See the article **CHEMISTRY**, vol. iv. p. 218. It is now called **CHLORINE**, (from *χλωρός*, Gr. green,) in consequence of some new properties discovered in it, and the absence of others it was supposed to possess.

Sir Humphry Davy, in his Chemical Lectures at the Royal Institution, divides all substances not yet decomposed, into two great classes; supporters of combustion, and combustible bodies; and, in the first class, he says, there are only two substances as yet known; oxygen, and *chlorine*, hitherto called oxy muriatic acid.

Sir H. Davy's new theory is the following: That oxy-

muriatic acid is a substance hitherto undecomposed, and therefore must at present be considered as an *element*; that it contains no oxygen, at least none has ever been extracted from it; that it unites with most metals and salifiable bases, forming the *muriats*, which therefore are not (like the sulphats, nitrats, &c.) compounds of an *oxydated* base and an acid, but are composed merely of the base and of oxymuriatic acid. Thus, for example, common salt, or muriat of soda, when perfectly dry, is, according to this hypothesis, composed, not of soda and muriatic acid, but of sodium and oxymuriatic acid, and so of the rest. Oxymuriatic acid will, however, unite with oxygen, forming a very singular compound, whose properties have been discovered by sir H. Davy. This eminent chemist therefore gives the name of *chlorine* to oxymuriatic acid, and of *euchlorine* to the compound of, oxymuriatic acid and oxygen, which will be presently described.

Chlorine has the following properties: Its colour is, as its name imports, greenish-yellow. It has a peculiar suffocating odour, and, when respired, is instantly fatal: even when largely diluted with atmospheric air, it produces highly deleterious effects, such as cough, catarrhal affection, and great irritation of the lungs. These are circumstances which render much caution necessary in collecting and examining the gas. One hundred cubic inches of chlorine, at a mean temperature and pressure, weigh 76 grains. At the temperature of 60° Fahrenheit, one volume of water dissolves about two of chlorine: the solution has the odour and colour of the gas: its taste is nauseous and astringent. By means of Wolfe's apparatus, water may be conveniently saturated with this gas: the contents of the first bottle should be rejected as containing a portion of muriatic acid, which passes over during the distillation. When a burning wax-taper is plunged into a bottle of chlorine, the brilliancy of its flame is greatly impaired; it exhibits a dull red light, and throws off a large quantity of charcoal.

The attraction of chlorine for the metals is in most instances extremely energetic; when copper-leaf, or antimony, or arsenic in powder, are thrown into the gas, they immediately enter into vivid combustion, and form binary compounds; and, if the oxyds of these and many other metals be heated in chlorine, oxygen is expelled, and similar compounds of the metal and chlorine result.

The metallic *chlorats* may be formed by dissolving the oxyds of the different metals in chlorine acid. They do not possess any very remarkable properties, except those common to all the chlorats, or muriats, viz. of giving out oxygen when heated, and of detonating when thrown on burning coals. The chlorat of silver, mixed with a little sulphur, and struck slightly, detonates with considerable violence.

From the action of chlorine, or oxymuriatic acid gas, on ammonia under peculiar circumstances, a very singular product, exceeding all others in detonating quality, is obtained. This compound, now called *detonating oil*, was discovered by Dulong, a French chemist; and an extensive series of experiments has been made upon it by Messrs. Porret, Wilson, and Kirk. To obtain it, fill a small jar with chlorine, and transfer it into a basin containing a solution of nitrat or muriat of ammonia a little warmed; the gas will slowly become condensed, and the liquor rise up in the jar; an oily-like film will form on its surface, which increases and collects into globules, which at length fall through the liquor: this is the explosive compound. It explodes violently at 212° Fahrenheit; the most violent explosions, however, are produced from it when it is touched cold with inflammable bodies: a portion of it, for example, the size of a pin's-head, being brought in contact with olive-oil, the vessel is broken into fragments by the violence of the explosion; its effects are indeed so violent, as to have given rise to severe accidents; hence the propriety of wearing a mask and gloves, and of taking care that the vessel in which it is formed, or the instrument by which it is removed, shall be perfectly clean and

free from combustible matter. It is singular, that a number of inflammable substances do not cause this curious substance to explode, such as charcoal, alcohol, or ether; and, among the inflammable bodies which either do or do not cause it to explode, it does not appear that any analogy can be traced. From a series of analytic experiments made by Messrs. Porret, Wilson, and Kirk, it appears that this compound consists of chlorine, nitrogen, and hydrogen: the hydrogen, they suppose, by its affinities to the other elements, serves as the medium of union; and the great explosive power of the compound they conceive owing to the action of oxymuriatic acid condensed in the combination, but at the same time retained only by a weak affinity. It is not improbable that it may be a hyper-oxymuriate of ammonia. The preparation of this compound is extremely hazardous, and requires the greatest precaution.

It has been found, by experiment, that all seeds vegetate most rapidly when steeped in oxymuriatic acid. One instance will suffice. The seeds of *Lepidum sativum* germinated after six or seven hours when put into oxymuriatic acid, whereas, when lying in common water, they required from thirty-six to thirty-eight hours. Seeds twenty or thirty years old, brought from the Bahama Islands, Madagascar, &c. which constantly refused to germinate, very readily in this way vegetated, and produced plants which grew up very successfully. As every gardener cannot obtain this acid, Mr. Humboldt proposes a very easy method to procure it without difficulty. He took a cubic inch of water, a tea-spoonful of common muriatic acid, two tea-spoonfuls of oxyd of manganese; mixed it, and placed the seeds in them. The whole was allowed to digest with a heat of 18—30° of Reaumur. In this the seeds germinated excellently; but it is necessary to take the seeds out as soon as the corkle appears. That the seeds are not injured by the acid, is proved by the many plants which have been treated in this way under the inspection of Mr. Jacquin, and in which vegetation went on extremely well.

It was in the year 1811 that sir H. Davy discovered the gaseous compound of chlorine and oxygen. Its colour is more intense than that of chlorine; a circumstance which induced him to call it *euchlorine*, from *eu* and *χλωρος*. To obtain this gas, some oxymuriate of potash should be introduced into a very small glass retort, and a mixture of equal parts of muriatic acid and water poured upon it. Twenty grains of the crystallized oxymuriate to half an ounce of the dilute acid, are good proportions. On the cautious application of a very gentle heat, the euchlorine passes over, and must be collected in the mercurio-pneumatic apparatus. The smell of this gas differs from, and is much less disagreeable than, that of chlorine; but it is unrespirable. Water takes up eight times its volume of euchlorine, and forms a lemon-yellow solution. Its weight, compared with that of hydrogen, is as 33 to 1. One hundred cubic inches weigh seventy-five grains. When heated to a temperature between 100° and 150°, it expands with explosion, and is resolved into its constituent parts; viz. two volumes of chlorine and one of oxygen. It exerts no action upon those metals which inflame in, and energetically combine with, chlorine. If copper leaf, for instance, be introduced into pure euchlorine, it is not even tarnished; but, if heat be applied so as to decompose the gas, the metal is instantly ignited, and burns as in a mixture of two parts of chlorine and one of oxygen. Phosphorus an inflamed taper, and sulphur in a state of combustion, immediately decompose euchlorine, and exhibit the same phenomena as when burned in an artificial mixture of its elementary gases. The term *chlorine* should now supersede that of *oxymuriatic acid*, not merely on account of its brevity and propriety, but as founded upon an obvious and unalterable character of the body it represents, namely, its colour; besides, it would be absurd to call a body *oxymuriatic acid* which exhibits no acid characters, and in which neither oxygen nor muriatic

matic acid have hitherto been proved to exist. See Willdenow's Principles of Botany and Vegetable Physiology, Edinb. 1811. Davy's Lectures at the Royal Institute, 1812. Aikin's Account of recent Discoveries in Chemistry, 1814. Accum's Chemical Amusements, 3d edit. 1818.

OXYGON, *f.* [from the Gr. *ὄξυς*, sharp, and *γωνία*, a corner.] In geometry, a triangle having three acute angles.

OXYGO'NIAL, or **OXYG'ONOUS**, *adj.* Belonging to an oxygen; having three acute angles.

OXYLAP'ATHUM, *f.* in botany. See **RUMEX**.

OXYLOBIUM, *f.* [from the Gr. *ὄξυς*, sharp, and *λόβος*, a pod or legume; alluding to the sharp point or beak of that part.] In botany, a genus of the class decandria, order monogynia, natural order papilionaceæ, *Linn.* (leguminosæ, *Juss.*) Generic characters—Calyx: perianthium inferior, somewhat two-lipped, in five deep segments, without appendages; the three lower ones rather more deeply serrated. Corolla: papilionaceous, of five petals; standard roundish, broad, with a short claw; wings obovate, a little shorter than the standard, oblique at the base, with short linear claws; keel compressed, as long as the wings, of two heart-shaped petals cohering at their summits, with two short, linear, distinct, claws. Stamina: filaments ten, awl-shaped, ascending, all enclosed in the keel; antheræ roundish. Pistillum: germen ovate; style awl-shaped, ascending, permanent, and finally hardened; stigma simple. Pericarpium: legume ovate, turgid, acute, of one cell. Seeds: several, roundish, kidney-shaped, inserted into the margin of each valve at the dorsal suture.

—*Essential Character.* Calyx deeply five-cleft, somewhat two-lipped; corolla papilionaceous; keel compressed, nearly as long as the spreading standard; style ascending; stigma simple; legume ovate, inflated, pointed, of one cell, with several seeds. There are three species.

1. *Oxylobium arborescens*, or tall oxylobium: leaves linear-lanceolate; bractes permanent, at the top of the flower-stalk; corymbs dense; legume scarcely longer than the calyx. Found by Mr. Brown in Van Diemen's Land; brought to Kew-garden in 1805, where it flowers from April to June, and is kept in the green-house. The stem is shrubby or arborescent.

2. *Oxylobium ellipticum*, or oval-leaved oxylobium: leaves elliptic-oblong; bractes below the top of the flower-stalk, deciduous; corymbs dense; legumes twice the length of the calyx. Discovered first by the late Mr. David Nelson, in Van Diemen's Land, from whence it was brought to Kew by Mr. Brown in 1805. It is kept in the green-house, and flowers most part of the summer. From the plate and description of Labillardiere, the stem is shrubby, nine feet high, with upright silky branches that are sometimes whorled. Leaves imperfectly-whorled, near an inch long, elliptical, silky beneath, tipped with a small point. Flowers numerous, in dense short silky corymbs. We presume the corolla is yellow; but Labillardiere, having described from his dried specimens only, generally omits that particular. The legume is clothed with dense twisted yellowish hairs, which are very sensible hygrometers.

3. *Oxylobium cordifolium*, or heart-leaved oxylobium: leaves ovate, somewhat heart-shaped, loosely hairy; umbels terminal, sessile, of few flowers. Discovered in New South Wales by Sir Joseph Banks, in the course of his celebrated voyage. Seeds were imported by Mr. Loddige, who raised plants from them about 1804 or 1807. This shrub is kept in the green-house, and blossoms throughout the summer, producing plenty of seeds, by which, or by cuttings, it is readily increased. It is of humble growth, with numerous, partly-whorled, round, hairy, purplish, leafy branches. Flowers of a rich deep-orange, verging towards scarlet, from three to six in each close terminal umbel. *Brown in Ait. Hort. Kew*, vol. iii.

OXYMEL, [from the Gr. *ὄξυς*, sour, and *μέλι*, honey.] A mixture of honey and vinegar boiled to the consistence of a syrup:—In fevers, the aliments prescribed

by Hippocrates, were ptisans and decoctions of some vegetables, with *oxymel*, or the mixture of honey and vinegar. *Arbuthnot*.

Simple Oxymel is composed of two pounds of clarified honey, and a pint (lb.) of acetic acid (distilled vinegar), boiled in a glass vessel by a gentle heat into the consistence of a syrup. Simple oxymel dissolved in barley-water, forms a pleasant and cooling beverage in fevers and inflammatory affections. It is often added to gargles in cynanche tonsillaris, and is a common article with other remedies in catarrhal complaints.

Oxymel of Squills is prepared by boiling three pounds of clarified honey in two pints of vinegar of squill in a glass vessel, over a gentle fire, to a proper consistence. This is principally employed as an expectorant, and, as such, is very useful in humoral asthma, and chronic coughs. It is generally given in some aromatic distilled water, to prevent the nausea which it is apt to induce; in large doses it is given to excite vomiting, and at the same time to clear the chest, in hooping-cough.

Oxymel of Verdigris, consists, according to the Dublin College, of the following ingredients: Prepared verdigris, one ounce; wine vinegar, seven fluid ounces; and clarified honey, fourteen ounces. Dissolve the verdigris in the vinegar, and strain it through a linen cloth; add the honey, and boil the mixture to a proper thickness. This preparation is detergent and escharotic. In the above state it is used for taking down fungous flesh; and, considerably diluted, it is an useful stimulant to foul ulcers, which it clears, and excites to a more healthy action.

OXYMO'RON, *f.* [Greek.] A rhetorical figure which seems to imply a contradiction; as when Ovid (viii. 47) says of Althea, *Impietate pia est*.—Some elegant figures and tropes of rhetoric, biting sarcasms, sly ironies, strong metaphors, lofty hyperboles, paranomases, *oxymorons*, lie very near upon the confines of jocularity. *Barrow*.

OXYOIDES, *f.* in botany. See **OXALIS**.

OXYO'PIA, *f.* [from the Gr. *ὄξυς*, sharp, and *ὀψις*, vision.] A peculiar acuteness of sight sometimes observed in fair persons.

OXYPET'ALUM, *f.* [from *ὄξυς*, sharp, and *πέταλον*, a petal.] In botany, a genus of the class pentandria, order digynia, natural order contortæ, *Linn.* (apocynæ, *Juss.* aclepiadæ, *Brown*).—*Essential Character.* Corolla with a short inflated tube; the limb in five deep segments, each with a ligulate appendage above; crown of the stamens of five roundish, simple, fleshy, leaves; antheræ tipped with a membrane; masses of pollen linear, pendulous, attached to the curvature of the processes, which are subsequently turned upwards; stigma with an elongated deeply-divided point.

Oxypetalum fragrans, the only species, discovered by Sir Joseph Banks, in 1768, near Rio Janeiro. A twining shrub, with opposite heart-shaped leaves. Umbels between the footstalks, somewhat corymbose. Flowers sweet-scented. *Brown in Wern. Transf.* vol. i. p. 41.

OXYRIN'CHITES, in ancient geography, a nome of Egypt, in Heptanomia, to the left of the Nile, on the borders of Libya.

OXYRIN'CHUS, a town of Egypt, the capital of the preceding nome, took its name from a fish, called by the Greeks *ὀξύρυγχος*, which was an object of worship to the Egyptians, and which had a temple in this nome. This city became episcopal, and was much celebrated in the earlier ages of the church. Baillet says that it contained 20,000 nuns and 10,000 monks, whence we may infer that the remaining population was very numerous; but this establishment contributed in process of time to the diminution of the inhabitants and the decline of the place. Nothing remains of this city in the village called Benesch, built on its ruins, but some fragments of stone pillars, marble columns in the mosques, and a single column left standing, along with its capital, and parts of the entablature, which show that it is the fragment of a

X x

portico

portico of the Composite order. "Thus, Oxyrinchus, once a metropolis, surrounded by a fertile plain, two leagues off the Lybian range of hills, has disappeared beneath the sand; and the new town has been obliged to retreat from this desolating invasion, leaving to its ravages house after house; and the inhabitants must at last be driven beyond the canal Jusuf, on the border of which they will be still menaced." Denon's Travels in Egypt, vol. i.

OXYRRHODINE, *f.* [from the Gr. *οξύς*, sour, and *ῥόδον*, rose.] A mixture of two parts of oil of roses and one part of vinegar, stirred together for some time. To these are sometimes added distilled waters. It is used for inflammations, and to dry up tetters. Scultetus prescribes it as follows: Two whites of eggs beaten, one ounce and a half of vinegar of roses, four ounces of rose-water, and two ounces of oil of roses.—The spirits, opiates, and cool things, readily compose *oxyrrhodines*. *Floyer on the Humours*.

OXY'S, *f.* in botany. See **OXALIS**.

OXYSACCHARUM, *f.* [from the Gr. *οξύς*, sour, and *σάκχαρον*, sugar.] A liquid medicine, composed of sugar and vinegar. The name is more peculiarly given to a syrup prepared with vinegar, the juice of four pomegranates, and sugar; used to cool, refresh, and resist the malignity of peccant humours.

OXYSTELMA, *f.* in botany. See **PERIPLOCA**.

OXYTROPIS, *f.* [from the Gr. *οξύς*, sharp, and *τροπή*, carina, or keel.] In botany, a genus of plants instituted by Monf. A. P. Decandole, in his History of the Astragali, &c. 1802. The species of this genus are furnished with a mucronated keel, and a legume divided into two compartments by a partition originating in the upper suture. Of these several have been removed from **ASTRAGALUS**, several which Pallas had described under **PHACA**, and some not formerly published; in all thirty-three species. See those articles.

OYACA/CHA, a town of South America, in the province of Quito: twenty-five miles east of Quito.

OYAMBRE. See **CAPE OYAMBRE**, vol. iii.

OYAPOOK, a river of Guiana, which runs into the Atlantic near Cape Orange.

OYE, a town of France, in the department of the Straits of Calais, situated on a river, a branch of the Aa, to which it gives name; formerly in possession of the English: five miles west of Gravelines, and seven east-north-east of Calais.

O'YE, (Norder and Sander,) two small islands of Denmark, in the North Sea, two and three miles north of Nordstrand.

OYER, a town of Norway: eighty-eight miles north of Christiania.

OYER, *f.* [Fr. to hear.] A word which seems to have been anciently used for what we call *assises*. Hence,

OYER AND TERMINER is a commission directed to the judges and other gentlemen of the county to which it is issued, by virtue whereof they are empowered to *hear and determine* treasons, and all manner of felonies and trespasses. See **ASSISES**, vol. ii. and **JUSTICE**, vol. xi. p. 558, 60.

OYES, *f.* [*oyez*, hear ye, Fr.] The introduction to any proclamation or advertisement given by the public criers both in England and Scotland. It is often thrice repeated:

Fairies, black, grey, green, and white,
Attend your office and your quality.
Crier hobgoblin, make the fairy *O Yes*. *Shakespeare*.

The crier of a court.—Good faith! he looks like an *O Yes*. *Suckling's Goblins*.

O'YEST. See **UYSTE**.

OYL CREEK, a river of Pennsylvania, which runs into the Alleghany in lat. 41. 26. N. lon. 72. 43. W.

OYLET-HOLE, *f.* [from *oillet*, Fr. but *EYELET* is better, as being English. See that word.]

Distinguish'd flashes deck the great,
As each excels in birth or state;
His *oylet-holes* are more and ampler;
The king's own body was a fampler.

Prior.

OY'ON, a town of Spain, in the province of Alava: twenty-two miles south-south-east of Vittoria.

OYONNAX, a town of France, in the department of the Ain: seven miles north of Nantua, and twelve south-west of St. Claude.

OY'SSEL, a town of France, in the department of the Lower Seine: seven miles south of Rouen.

OY'STER, *f.* [*οστρα*, *οστρε*, Sax. *oystre*, old Fr.] A bivalve testaceous fish.—There may be many ranks of beings in the invisible world as superior to us as we are superior to all the ranks of being in this visible world; though we descend below the *oyster* to the least animated atoms discovered by microscopes. *Watts's Improv. of the Mind*.—The world's mine *oyster*, which I with sword will open. *Shakespeare's M. Wives of Windsor*.—Rich honesty dwells like your miser, sir, in a poor house; as your pearl in your foul *oyster*. *Shakespeare*.

For sundry curious particulars on the subject of oysters, see the article **OSTREA**, p. 32, 3, 4. The oyster-fishery, in the river Medway, is regulated by stat. 2 Geo. II. c. 19. and a court is kept for that purpose at Rochester yearly, where, by a jury of free dredger-men of the oyster-fishery, the same is to be inquired into; and they may make rules and orders when oysters shall be taken, what quantities in a day, and to preserve the brood of oysters, &c. and may impose penalties not exceeding 5*l*. Also water-bailiffs shall be appointed to examine boats, &c. By stat. 31 Geo. III. c. 51. amended by 48 Geo. III. c. 144. for regulating oyster-fishing in general, fine and imprisonment may be inflicted on persons unlawfully fishing for oysters. And those who steal them are punishable as felons, by seven years transportation.

FOSSILE OYSTERS. See the article **CONCHOLOGY**, vol. v. p. 31.

OYSTER BA'Y, a township of New-York, situated in Queen's county, Long-island, extending from the sound south to the Atlantic Ocean, and including Lloyd's Neck, or Queen's-village, and Hog-island. It contains 4548 inhabitants, of whom 134 are slaves.

OYSTER BA'Y, a harbour for small vessels, in the south-west limits of Barnstable, Massachusetts. It derives its name from its excellent oysters.

OYSTER CREEK, a river of North Carolina, which runs into the Atlantic in lat. 34. 50. N. lon. 76. 45. W.

OYSTER CREEK, a river of New Jersey, which runs into the Atlantic in lat. 39. 44. N. lon. 74. 20. W.

OYSTER HARBOUR, a bay on the south-west coast of New Holland, and north-part of King George the Third's Sound, discovered by Capt. Vancouver in the year 1791; and so called from the plenty of oysters found there. Oyster Harbour is rendered admissible alone for vessels of a middle size, by the shallowness of the water on the bar, extending from shore to shore, on which were found seventeen feet water only, although the depth increased from five to seven fathoms on each side. The deep water within the harbour did not seem of any great extent. In both these harbours the communication with the country is rendered unpleasant, by the shallow depth of water in most places extending to a great distance from the shore. This inconvenience could be easily remedied, should it ever be an object so to do, by wharfs. Lat. 34. 52*°* S. lon. 118. 15. E.

OYSTER HAVEN, a harbour on the south coast of Ireland: three miles east of Kinsale Harbour.

OYSTER I'SLAND, in the bay of Bengal, near the coast of Aracan. Lat. 30. 11. N. lon. 92. 43. E.

OYSTER I'SLAND, a small island near the west coast of Ireland, in Sligo Bay: four miles west-south-west of Sligo.

OYSTER

OYSTER ISLAND HARBOUR, a bay or harbour on the Atlantic, on the coast of Massachusetts. Lat. 41. 35. N. lon. 70. 24. W.

OYSTER RIVER, a sandy bay, just within the south head of Mercury Bay, in New Zealand.

OYSTER RIVER, a branch of the Piscataqua, in New Hampshire.

OYSTER-SHELL, *f.* The hard substance that encloses the oyster.—Another mass held a kind of *oyster-shell*, and other bivalves. *Woodward*.—For the properties of oyster-shells, see the article *OSTREA*, p. 34 of this volume.

OYSTER-TUB, *f.* A tub to contain oysters:

Where *oyster-tubs* in rows

Are rang'd beside the posts, there stay thy haste. *Gay*.

OYSTER-WENCH, **OYSTER-WIFE**, or **OYSTER-WOMAN**, *f.* A woman whose business is to sell oysters. Proverbially, a low woman.—Off goes his bonnet to an *oyster-wench*. *Shakespeare*.

Who can despair to see another thrive

By loan of fixpence to an *oyster-wife*? *Bp. Hall*, *Sat.* iv.

The *oyster-women* lock'd their fish up

And trudg'd away, to cry No bishop.

Hudibras.

OYSTER-WORM. See *OSTREA*, p. 32.

OYSTERMOUTH, a seaport and parish in the hundred of Swansea, and county of Glamorgan, South Wales, is situated on a small promontory, which forms the western boundary of Swansea-bay, in the Bristol Channel. The eastern extremity of the parish is called Mumble Point, opposite to which, at a short distance from the shore, a light-house has been lately erected. This place might be made an excellent station for shipping at a very trifling expense, either by walling-in the sounds between the Mumble Head and the shore, or by running a pier out under the east point of Mumble Hill. Vessels bound for Falmouth with coals from Swansea generally lie here when waiting for wind and convoy, frequently to the number of a hundred and fifty sail at one time. Along the shore hence to Swansea, a railway has been constructed, by which coals and manure are brought down, and lime returned from the limestone quarries, which are situated close to the village of the Mumbles, and where several lime-kilns are established. In digging the stone of these quarries many human bones of large dimensions have been discovered; and tradition says this spot was formerly the site of a chapel, but no vestiges of it now remain. The existence of such a building, however, is not improbable, as the sea has made great encroachments on this part of the bay. A large wood called Crow's Wood, frequently mentioned in ancient records, has been submerged, and traces of it are still evident in the sand at low-water. Vast quantities of shell-fish, but particularly oysters, are caught, or dragged, on the coast here: hence the origin of the term Oyster-mouth as the designation of the parish, which, according to the parliamentary returns of 1811, contains 200 houses and 761 inhabitants.

On a knoll or eminence east from the church stand the ruins of Oystermouth-castle, supposed to have been erected by the Norman Beaumonts, who conquered Gowerland. It has suffered less from the ravages of time than any ruin in this part of the country, the principal walls being as yet in good condition, and most of the apartments entire. The general figure is polygonal, and the ramparts are conspicuously lofty; but there are no flanking-towers except on each side of the entrance-gateway. Here, according to tradition, the chancery-court for the seignory of Gower was anciently held. This edifice is now the property of the duke of Beaufort, as lord of the seignory; and it is much resorted to by parties of pleasure from Swansea and the neighbourhood. In one of the dungeons of the castle is a circular stone pillar, into which almost every visitor sticks a pin, conformably to an

old custom, practised from time immemorial. The whole ruin is covered with a profusion of ivy.

Westward from Oystermouth is the parish of Pen-Arth, part of which is conjectured to have been anciently the site of a considerable town, as many foundations of houses are dug up among the sands, and there is still a village to the south of them, called South-gate, and also a farm-house to the north, called Norton or North-town. Here are also very extensive remains of a castle situated near the mouth of a small rivulet, which divides the parish of Pen-Arth from that of Pen-Maen. The gateway is almost entire, and is a very fine specimen of ancient architecture. Between this fortress and the sea, on the sands, is a rock called "The Three Cliffs," from the resemblance to three sugar loaves placed in a line. In the centre of this rock is a curiously-formed arch, supposed to have been excavated by the sea; and not far from hence is a singular cavern in the cliff, called "Bacon's Hole." This cavern is situated nearly midway between the water and the summit of the rock, and is inaccessible from below in any state of the tide; but there is a narrow and very steep path leading down to it from above, by which, though the attempt is fraught with the utmost danger, many persons descend. *Topographical Dictionary of Wales*, 1811.

OZABA'LA, a town of Japan, in the island of Nippon: thirty-six miles north of Meaco.

OZÆ'NA, *f.* [from *ὄζη*, Gr. a fetid smell.] A foul ulcer situated within the cavity of the nose, and frequently accompanied with caries.

OZAMA, a river of Hispaniola, which runs into the sea below St. Domingo. See *ISABELLA RIVER*, vol. xi. p. 394.

OZANAM (James), an eminent French mathematician, was descended from a family of Jewish extraction which had been long converted to the Christian faith, and some branches of which had held different offices in the parliament of Provence. He was born in the sovereignty of Dombes, in the year 1640. Being a younger son, his father designed him for the church, that he might enjoy some small benefices which belonged to the family. In the course of his education, some mathematical books happening to fall into his hands, at first excited his curiosity, and then inspired him with a love for that science; and, though he had no master to instruct him, he made so great a progress in it, that, at the age of fifteen, he wrote a treatise of the mathematical kind, which was never printed, but contained things which he thought proper to insert in the works that were afterwards published by him. Out of obedience to his father, rather than from inclination, he studied divinity four years; but, upon the death of that parent, he gave up his theological pursuits, and devoted himself entirely to the mathematics. Afterwards he went to Lyons, where he commenced mathematical tutor for his support, and acquired many pupils, and a considerable share of reputation. Here he was seduced into a passion for gaming, which was increased by the success he met with; yet his love of play did not originate in avaricious principles, and he displayed, upon many occasions, a remarkable generosity of temper. Fortunately, M. Daguesseau, father of the chancellor, invited M. Ozanam to Paris, with a promise of his countenance and recommendation. Such a flattering patronage M. Ozanam eagerly accepted, and set out without delay for the capital. On his journey thither, he fell into company with an unknown gentleman, who became an admirer of his scientific accomplishments, and also accidentally discovered his fondness for gaming; upon which he remonstrated freely with him on the ruinous consequences of such a habit, assuring him, that, by the proper exercise of his talents and qualifications, he might not only rise to high reputation, but make a fortune, at Paris. In that city he was received with strong marks of esteem; and he soon afterwards married a young lady, with little or no fortune, but who had inspired him with a passion

a passion by her modesty, virtue, and sweet temper. With her he enjoyed an uncommon degree of domestic happiness so long as she lived; and he had twelve children by her, the greatest part of whom died young.

For several years M. Ozanam derived a considerable income from teaching the mathematics at Paris, principally to young foreigners; and he lived happy in the acquaintance and esteem of men of character and literature. In the year 1701 he sustained an irreparable loss by the death of his wife; and this misfortune did not come alone: for, about the same time, the breaking-out of the war, on account of the Spanish succession, proved the occasion of depriving him of almost all his pupils, who were obliged to quit Paris. These accumulated distressing circumstances reduced him to a melancholy state; under which, however, he received some relief and amusement from the honour of being admitted, in the same year, an *élève* of the Royal Academy of Sciences. Afterwards, when solicited to receive under his instructions some foreign noblemen, he refused to engage with them, being possessed of a persuasion that he should not live long enough to go through their intended course. He died of a stroke of apoplexy in 1717, at the age of seventy-seven.

M. Ozanam was distinguished by a mild and calm disposition, a cheerful temper under his greatest distresses, and a generosity almost unparalleled. His manners were simple and irreproachable; and he was sincerely pious, and zealously devout; but with theological controversies he studiously avoided to meddle; and was accustomed to say, "that it was the business of the Sorbonne to discuss, of the pope to decide, and of a mathematician to go to heaven in a right line." He published a great number of useful books: such as, 1. *Practical Geometry*, containing the Theory and Practice of Trigonometry, Longimetry, &c. 1684, 12mo. 2. *Tables of Sines, Tangents, and Secants, and the Logarithms of Sines and Tangents, and of Numbers from Ten to Ten Thousand*, &c. 1685, 8vo. 3. *A Treatise of Lines of the first Order; of the Construction of Equations; and of Geometrical Places*, &c. 1687, 4to. 4. *The Use of the Compasses of Proportion*, &c. with a Treatise on the Division of Lands; 1688, 8vo. 5. *The Use of an universal Instrument, or the easy and exact Resolution of Problems in practical Geometry without any Calculations*, 1688, 12mo. 6. *A General Method for Drawing Dials*, &c. 1693, 12mo. 7. *A Course of Mathematics, comprehending all the most useful and necessary Branches of this science*, 1693, in five volumes, 8vo. 8. *A Treatise on Fortification, containing the ancient and modern Methods of the Construction and Defence of Places*, &c. 1694, 4to. 9. *Mathematical and Philosophical Recreations, containing numerous useful and pleasing Problems in Arithmetic, Geometry, Optics*, &c. 1694, 2 vols. 8vo. reprinted with additions by Montucla, in 4 vols. 8vo. and translated into English by Dr. Hutton, 1803. M. Ozanam was also the author of various papers in the *Journals des Sçavans*, the *Memoires de Trevoux*, and the *Memoires of the Academy of Sciences*, which are particularized in *Hutton's Math. Dict.*

O'ZAR, a town of Persia, in Segestan: 186 miles south-east of Zareng.

O'ZAS, a town of Italy: five miles west of Carmagnola, and ten south of Turin.

OZELL (John), a writer to whose industry, if not to his genius, the world lies under considerable obligations, received the first rudiments of his education from Mr. Shaw, an excellent grammarian, and master of the free-school at Ashby de la Zouch, in Leicestershire. He afterwards completed his grammatical studies under the Rev. Mr. Mountford, of Christ's Hospital, where, having attained a great degree of perfection in the dead languages, viz. the Latin, Greek, and Hebrew, it was next the intention of his friends to have sent him to the university of Cambridge, there to finish his studies, with a view to

his being admitted into holy orders. But Mr. Ozell, averse to the confinement of a college-life, and perhaps disinclined to the clerical profession, solicited and obtained an employment in a public office of accounts, with a view to which he had taken previous care to qualify himself by a most perfect knowledge of arithmetic in all its branches, and a great degree of excellence in writing all the necessary hands. He still, however, retained an inclination for polite literature; and, by entering into conversation with foreigners abroad, and a close application to reading at home, he made himself master of most of the living languages, more especially the French, Italian, and Spanish; from all which, as well as from the Latin and Greek, he has favoured the world with many valuable translations. He gave a complete English version of the dramatic pieces of that justly-celebrated French writer, Moliere; besides some others from Corneille, Racine, &c. the titles of which are to be found in the *Biographia Dramatica*.

Mr. Ozell had the good fortune to escape all those vicissitudes and anxieties in regard to pecuniary circumstances, which too frequently attend on men of literary abilities; for, besides that he was, from his earliest setting out in life, constantly in the possession of very good places, having been for some years auditor-general of the city and bridge accounts; and, to the time of his decease, auditor of the accounts of St. Paul's cathedral, and St. Thomas's Hospital, all of them posts of considerable emolument; a gentleman, who was a native of the same county with him, who had known him from a school-boy, and it is said lay under particular obligations to his family, dying when Mr. Ozell was in the very prime of life, left him such a fortune as would have been a competent support for him, if he should at any time have chosen to retire from business entirely, which however it does not appear that he ever did. Our author died October 15, 1743, and was buried in a vault of St. Mary, Aldermanbury; but what year he was born in, and consequently his age at the time of his death, are particulars that we do not find on record.

Mr. Ozell seems to have had a more exalted idea of his own abilities than the world was willing to allow them; for, on his being introduced by Mr. Pope into the *Dunciad*, he published a very extraordinary advertisement, signed with his name, in a paper called *The Weekly Medley*, Sept. 1729, in which he expresses his resentment, and at the same time draws a comparison, *in his own favour*, between Mr. Pope and himself, with respect both to learning and to poetical genius. The advertisement at length may be seen in the notes to the *Dunciad*. "But though (says his biographer) we cannot readily subscribe to this self-assumed preference, yet, as Mr. Coxeter informs us that his conversation was surprisingly agreeable, and his knowledge of men and things considerable, and as it is probable that, with an understanding somewhat above the common rank, he possessed a great share of good-nature, we will readily allow, that a person of this character might be much more amiable than one of a greater brilliancy of parts, if deficient of these good qualities." *Biog. Dram.*

O'ZEM, [Heb. one that fasteth.] A man's name. *Judith* vi.-x.

O'ZEMAN, a town of Asiatic Turkey, in Natolia, between Amasieh and Tocat.

OZENE, in ancient geography, a name given in the "Periplus of the Ærythrean Sea," as well as in Ptolemy, to the city now called OUGËIN; which see.

OZERNAI'A, a fortress of Russia, in the government of Upa, on the Ural: sixty-four miles east of Orenburg. — Another, forty miles west of Orenburg.

OZERNOV'SKOI, a cape of Russia, on the eastern coast of Kamtschatka: thirty-two miles north-east of Ukinskoi.

OZI'AS, [Heb. strength from the Lord.] A man's name. OZIG'INA,

OZIG'INA, an ostrog of Russia, on the Indigirda: 144 miles north-north-east of Zashiverik. Lat. 69. 30. N. lon. 142. 22. E.

OZINO, a town of Japan, in the island of Nippon: twenty-five miles north of Meaco.

OZINOV'SKOI, a town of Russia, in the government of Perm, on the Kama: sixteen miles north-north-east of Oia.

O'ZLEWORTH, a village in Gloucestershire, three miles south-east from Dursley, and eighteen south from Gloucester, is very remarkable for the number of foxes killed in one year in the reign of queen Elizabeth, which amounted to two hundred and thirty-one. *England's Gaz.*

OZ'MA, a town of Bulgaria, on a river of the same name: twenty-one miles south of Nicopoli.

OZ'NI, *f.* [Heb.] A man's name.

OZ'NITE, *f.* A descendant of Ozni.

OZOHOW'K, a town of Poland, in Volhynia: fourteen miles south-south-east of Kreminiek.

OZ'OLÆ, or **OZOLI**, a people who inhabited the eastern parts of Ætolia, anciently called *Ozolca*. This tract of territory lay at the north of the bay of Corinth, and extended about twelve miles northward. They received their name from the bad stench (ὀζῆ) of their bodies, or of their clothing, which was the raw hides of wild beasts; though some derive it from the stench of the stagnated water in the neighbouring lakes and marshes. The name of Ozolæ, on account of its indelicate signification, highly displeased the inhabitants, and they exchanged it soon for that of Ætolians. *Herodotus*.

OZOLA'VA, one of the larger Navigator's Islands, in the South Pacific Ocean. The inhabitants greatly resemble those of Maoua. Lat. 14. S. lon. 171. 25. W.

OZOPHYLLUM, *f.* [named by Schreber, from the Gr. ὀζω, to stink, and φύλλον, a leaf; in allusion to the unpleasant scent of its foliage when bruised.] In botany, a genus of the class monadelphia, order pentandria, natural order of trihilatæ, (melizæ, *Juss.*) Generic characters—Calyx: perianthium one-leafed, five-toothed,

acute, very small. Corolla: petals five, with long claws converging in form of a tube; borders oblong, blunt, spreading. Stamina: filaments cylindrical, sheathing the style, five-toothed at top; antheræ five, oblong, erect. Pistillum: germ five-lobed, surrounded by a gland; style filiform, higher than the corolla; stigma capitate. Pericarpium: five-celled. — *Essential Character*. One-styled; calyx five-toothed; petals five, long; filaments sheathing the style, five-toothed at top; teeth antheriferous; stigma one; capsule five-celled.

Ozophyllum foetidum, a solitary species. It is a shrub of ten feet high or more, and often four or six inches in diameter. The bark is green, and smooth; the wood white, tender, and fragile. The branches garnished with alternate leaves; each leaf is digitated, having three large lobes, and growing on a footstalk of five or six inches long; the lobes of the leaves are green, smooth, soft, and oval, and terminate in a long point; the middle lobe is larger than the rest, being sometimes more than a foot long, and four inches wide; each lobe is divided by a longitudinal nerve, which is prominent beneath. The flowers spring from the bosoms of the leaves, at the extremity of the twigs and branches; their common footstalk is more than a foot long, and divides at its summit into several smaller ones, on each of which are placed alternate, sessile, flowers: calyx green; corolla white, each petal being about an inch long, and as it were glued or united to each other longitudinally by their borders, so as to form a kind of tubular figure, with the upper part spreading: these petals cover a white membranaceous tube, which on its upper part divides into five short filaments supporting at their points the anthers. This shrub is a native of the forests of Guiana; flowering in February. The leaves, when bruised, emit a disagreeable smell, much resembling that of Stramonium.

OZUNIC'ZE, a town of Lithuania, in the palatinate of Wilna: thirty miles south-south-east of Bresslaw.

OZ'ZEK. See **OSCHATZ**.

P.

P IS the fifteenth letter and eleventh consonant of the English alphabet. It is a labial consonant, formed by a slight compression of the anterior part of the lips; as *pull, pelt, &c.*

P and B are so like each other, that Quintilian declares, that, in the word *obtinuit*, his reason required him to put a *b*, but that his ears could hear nothing but a *p*, *optinuit*: hence in ancient inscriptions, and old glossaries, it appears that these two letters have often been confounded. Several nations still pronounce one for the other, the Welch and Germans particularly, who say, *ponum vinum*, for *bonum vinum*. Plutarch observes, it was usual for those of Delphi to say βαλειν for πάλειν, βιγγον for πιγγον; and, among the Latins, as often as an *f* followed, the *b* was changed into a *p*, as *seribo, scripsi*.

When *p* stands before *t* or *f*, its sound is lost; as in the words *psalms, psychology, ptolemaic, ptisan, account, &c.* When placed before *h*, they both together have the sound of *f*; as in *philosophy, physics, &c.* and this is generally the case in words derived from the Greek. In the transition of words from one tongue to another, P, Ph, F, B, and V, often glide one into the other, on account of their great labial affinity: hence Scaliger says, happy are they to whom *vivere* and *bibere* are the same thing. See also the beginning of the letter B, vol. ii. p. 590.

St. Jerome observes on Daniel, that the Hebrews had no *p*; but that the *ph* served them instead thereof; adding, that there is but one word in the whole Bible read with a *p*, viz. *apaduo*.

VOL. XVIII. No. 1233.

P was used among the ancients as a numeral letter, signifying the same with the G, viz. 100; according to the verse of Ugutio, "P similem cum G numerum monstratur habere." Though Baronius thinks it rather stood for 7. When a dash was added at top of P, it stood for 400,000. The Greek π stood for 80.

This letter is very often used by the Latins as an abbreviation: thus, P stands for Publius, pondo, &c. P. C. for Patres Conscripti; P. R. for Populus Romanus; P.R.S. for Prætoris Sententia, &c.

Among physicians, P stands for *pugil*, or the eighth part of an handful; P. Æ. *partes æquales*, or equal parts of the ingredients; otherwise denoted by ā or ana. P. P. signifies *Pulvis Patrum*, that is, Jesuit's Powder, or the Cortex Peruvianus in powder; which is so called, because first brought into Europe by those fathers; and *pp. t præparatus*, prepared.

P, in music, is the initial of *piano*, (Ital.) soft, for which it stands; and *pp*, for *pianissimo*, very soft. P, on French coins, denotes those struck at Dijon.

P is the Greek form of the letter R. Constantine first displayed this Greek monogram , and subsequently

this  on a shield in the imperial arms, expressive of the figure of the cross, and exhibiting at the same time the two first letters of the word ΧΡΙΣΤΟΣ, CHRIST. This device he had impressed on his helmet, in which St. Helena had caused some of the true nails of the cross to be enclosed,

Y y

enclosed, and on the shields of his soldiers; and, so early as the commencement of the fourth century, the standard of Rome wholly gave place to the Labarum, or banner of the cross.

PA, a city of China, of the second rank, in Se-tchuen: 695 miles south of Pekin. Lat. 31. 31. N. lon. 106. 24. E.

PA, a city and fortress of China, of the second rank, in Pe-tche-li: forty-five miles east-north-east of Paoting, and fifty south of Pekin.

PA, a town of Thibet: 450 miles east of Lassa. Lat. 28. 18. N. lon. 98. 34. E.

PA DEL ZOC'CO, a cape on the coast of Inner Carniola: two miles west-south-west of Trieste.

PA'A, a town of the island of Ceram, and capital of a district, abounding in sago.

PA'AGE, *f.* [old Fr. from the low Lat. *paagium*.] A toll for passage through the grounds of another person. *Obsolete*.—Trade was restrained, or the privilege granted on the payment of tolls, passages, *paages*, pontages, and innumerable other vexatious imposts, of which only the barbarous and almost unintelligible names subsist at this day. *Burke's Abridg. of Eng. Hist.*

PAAKO'LA, a town of Sweden, in the government of Ulea: six miles north of Kemi.

PAALAVAN'KA, a town of Hindoostan, in Golconda: thirty miles north-west of Damapetta.

PAAR'AI, [Heb. *opeu*.] A man's name.

PAAR'DEBERG, (or the HORSE MOUNTAIN, so called from the number of wild horses, or zebras, that formerly frequented it.) A mountain of the Drakenstein district, in Southern Africa, which is a continuation of Paarl Mountain to the northward.

PAAR'L, a village in the district of Drakenstein, in Southern Africa, situated at the foot of a hill that shuts in the valley of Drakenstein on the west side. It consists of about thirty habitations, disposed in a line; but so far detached from each other, with intermediate orchards, gardens, and vineyards, as to form a street from half a mile to a mile in length. About the middle of this street, on the east side, stands the church, a neat octagonal building, covered with thatch; and at the upper end is a parsonage-house, with garden, vineyard, and fruit-groves, and a large tract of very fine land. The village is overhung by blocks of granite, the paarl, and the diamond. *Barrow's Africa*, vol. ii.

PAA'TIS, a town of Sweden, in the government of Abo: ten miles north of Abo.

PAA'TOCK WA'TER, a river of Scotland, which runs from Loch Paatock to Loch Laagan, in the county of Inverness.

PAATPASSAR, a small cirar of Bengal, watered by the Ganges, between Dacca and Booshnah.

PAAVO'LA, a town of Sweden, in the government of Ulea: twenty miles east of Braksted.

PAAW (Peter), a physician and anatomist, was born at Amsterdam in 1564. When he had finished his scholastic education, he was sent to Leyden at the age of sixteen, where he attended the medical courses for the space of four years, and thence proceeded to Paris for farther improvement. He afterwards commenced his travels for the purpose of visiting other celebrated schools; and, after spending some time in Denmark, and at Rostock, where he received the degree of doctor in 1587, he repaired to Padua, and attended the dissections of Fabricius ab Aquapendente. Paaw was naturally of a grave and serious disposition: he possessed an acute and retentive memory, and was therefore well able to profit by these advantages of education; and, accordingly, his great acquirements were soon acknowledged, on his return to Leyden, by an appointment to a medical professorship in that university in 1589. His whole ambition was centred in the prospect of supporting the dignity and utility of this professorship, and he obtained the approbation and esteem both of the public and his colleagues. He died, universally regretted, in August 1617, at the age of fifty-four. Anatomy and

botany were the departments which he most ardently cultivated, and Leyden owes to him the establishment of its botanic garden.

Paaw left the following works: 1. *Tractatus de Exercitiis, Lacticiniis, et Bellariis*; Rost. 2. *Notæ in Galenum, de Cibis boni et mali succi*; ibid. These two pieces appear to have been his inaugural exercises. 3. *Hortus publicus Academiae Lugduno-Batavæ, ejus Ichnographia, Descriptio, Usus, &c.* Lugd. Bat. 1601. 4. *Primitiæ Anatomicae de humani corporis ossibus*, ibid. 1615. 5. *Succenturiatus Anatomicus, continens Commentaria in Hippocratem de Capitis Vulneribus. Additæ sunt Annotationes in aliquot Capita Libri 8vi C. Celsi*; ibid. 1616. 6. *Notæ et Commentarii in Epitomen Anatomicum Andree Vesalii*; ibid. 1616. The following appeared after his death: 7. *De Valvulâ Intestini Epistolæ duæ*; Oppenheim, 1619; together with the first century of the Epistles of Fabricius Haldanus. 8. *De Peste Tractatus, cum Henrici Florentii additamentis*; Lug. Bat. 1636. 9. *Anatomicae Observationes selectiores*; Hafniæ, 1657, inserted in the third and fourth centuries of the Anatomical and Medical Histories of T. Bartholin. He also left in manuscript a "*Methodus Anatomica*," which was in the library of M. de Vick of Amsterdam. *Eloy Dict. Hist. de la Médecine*.

PABBA'Y, or PAPAY, one of the Bishop's Islands, among the Hebrides. Lat. 56. 50. N. lon. 7. 32. W.

PABBA'Y, one of Western Islands of Scotland, about nine miles in circumference; and five miles north from North Uist. Lat. 57. 55. N. lon. 7. 12. W.

PABBA'Y, one of the Small Hebrides, near the west coast of Lewis. Lat. 58. 11. N. lon. 6. 45. W.

PABIAN'ICE, a town of the duchy of Warfaw: thirty-two miles east-north-east of Siradia.

PAB'LO (St.), a lake in the jurisdiction of Otavalo, in the province of Quito, three leagues in length, and about half a league broad. Its waters are discharged into Rio Blanco.—A town of Mexico, in New Navarre: 170 miles west of Casa Grande.—A town of New Mexico: seventy miles east of Sumas.—A town of South America, in the province of Moxas: 140 miles north-west of Trinidad.—A town of Mexico, in the province of New Biscay: 130 miles south-west of Pairal.—A town of Mexico, in the province of Veraguas: twenty-two miles south-west of Remedios.

PABNEIKIR'CHEN, a town of Austria: four miles north-west of Grein.

PABOON, an island of Africa, in the river Gambia, nine miles in length, belonging to the kingdom of Yani.

PABOU', a town of Canada, on the north coast of Chaleur Bay: twenty miles south-west of Cape Gaspe.

PAB'ULAR, *adj.* [*pubulum*, Lat.] Affording aliment or provender.

PABULA'TION, *f.* [*pubulum*, Lat.] The act of feeding, or procuring provender. *Cockeram*.

PABULATORY, *adj.* Affording aliment; belonging to provender. *Bailey*.

PAB'ULOUS, *adj.* [*pubulum*, Lat.] Alimential; affording aliment.—We doubt the air is the *pubulous* supply of fire, much less that flame is properly air kindled. *Brown's Vulg. Err*.

PAB'ULUM, *f.* [Latin.] Food; support. *A technical word*.—Which seems the sole use of oil, air, or any other thing that vulgarly passeth for a *pubulum* or food of that element, [fire.] *Bp. Berkeley's Siris*.

PA'CAL, *adj.* [from the Lat. *pax*, *pacis*, peace.] Bringing peace. *Bailey*.

PACA'LIA, *f.* in Roman antiquity, the festivals celebrated in honour of the supposed goddess or patroness of peace.

PACALON'GA, a town on the north coast of the island of Java. A merchant belonging to the Dutch East India Company resides here to purchase sugar: thirty miles west of Samarang.

PACA'JES, or PACAX'ES, a town of Peru, and capital of

of a jurisdiction in the diocese of La Paz, containing some rich silver-mines. The air is sometimes temperate, sometimes cold, and rarely hot; the pastures are good, and cattle form the principal riches and commerce. It is eighty miles south-west of La Paz.

PACAMORES, a nation of Indians in South America, on the banks of the river Amazon.

PACATED, *adj.* [*pacatus*, Lat.] Appeased; pacified.

PACATIANUS (Titus Julius Marinus), an usurper, who excited the Gauls to revolt in his favour, in the reign of the emperor Philip; but he was defeated and put to death in the year 249 by the troops which raised Decius to the throne. There are medals of Pacatianus still existing. See **ROME**.

PACATION, *f.* [from *paco*, Lat.] The act of appeasing. *Not in use.*

PACATUS (Latinus Drepanius), a Latin poet and orator, who flourished in the fourth century, was a native of Drepanum, in Aquitania. He was in habits of intimacy with Ausonius, who consulted him on his own writings, and has addressed several pieces to him. When Theodosius the Great visited Rome, in the year 388, after the defeat of Maximus, Pacatus was deputed from Gaul to congratulate him on his victory. On this occasion he pronounced a panegyric oration before the emperor and senate, which is extant, and in the course of which he said, that, if the elder Brutus could be permitted to revisit the earth, the stern republican would abjure, at the feet of Theodosius, his hatred of kings, and ingenuously confess that such a monarch was the most faithful guardian of the happiness and dignity of the Roman people. Pacatus was afterwards created a proconsul, and in 393 was appointed superintendent of the imperial domain. The orator Symmachus addressed several letters to him, and Sidonius Apollinaris mentioned him with applause. He was probably a Pagan. None of his poems remain; his Panegyric on Theodosius was printed in 1651, separately, and it is contained in the *Panegyrici Veteres*. It is reckoned eloquent for the age in which it was written; more characterised by force of expression and imagination than by taste and purity of style, and its best passages bearing some resemblance to the manner of Tacitus. *Moreri. Gibbon.*

PACAUDIÈRE (La), a town of France, in the department of the Rhône and Loire: twelve miles north-west of Roanne, and twelve west of Charlieu.

PACCHIONI (Antonio), a learned physician and anatomist, was born at Reggio in 1644. He received his first education in his native city; and, having embraced the medical profession, he went to Rome, where he attended upon the celebrated Malpighi, and was introduced by him to practice. Through the recommendation of that physician he settled at Tivoli, where he practised with reputation for six years. He was then invited to Rome, and was associated by Lancisi in his explanation of the plates of Eustachius. In this city he devoted himself to anatomical enquiries, and was much occupied in dissections. In 1701 he published a work of temporary celebrity, "*De Duræ Meningis Fabrica et Ufa*;" Romæ, 8vo. In this treatise he advanced an hypothesis concerning the muscular and contractile nature of the dura mater, which he supposed, by means of its connection with the tentoria, to act by alternate compression upon the brain and cerebellum. In 1705 he published an "*Epistolary Dissertation*," addressed to Lucas Schroëckius, concerning the conglobate glands of the dura mater, and the lymphatics proceeding from them. His opinions involved him in controversies with other anatomists, and produced other publications of his own. In his "*Disertationes Physico-anatomicæ, novis Experimentis et Lucubrationibus auctæ et illustratæ*," Romæ, 1721, 8vo. he has given his final notions on his favourite subject, and continues to maintain the muscular nature and action of the dura mater. Though his opinions have not been received by later anatomists, they are supported with ingenuity, and his

enquiries contributed to a more accurate knowledge of the parts concerned. Pacchioni died at Rome in 1726. He was a member of the academies of Bologna and Sienna, and of the society *Naturæ Curiosorum*. An edition of all his works, printed and manuscript, with figures, was published at Rome in 1741, 4to. *Eloy Dict. Halleri Bibl. Anatom.*

PACCIAU'DI (Paolo Maria), an historian and antiquary, was born at Turin in 1710. He entered into the order of Theatines, and became librarian to Philip duke of Parma. After a studious and retired life, occupied solely in the duties of his station, he died of an apoplexy in 1785. He was a correspondent of the Academy of Inscriptions and Belles-Lettres. The works of this learned man are, 1. *De Cultu S. Joannis Bapt. Antiquitates Christianæ*, 4to. 1755. 2. *Monumenta Peloponnesiaca*, 2 vols. 4to. 1761. 3. *Memorie de' Gran Maestri dell ordine Gerofolimitano*, 3 vols. 4to. and several dissertations on particular objects of antiquity. *Gen. Biog.*

PACE, *f.* [*pas*, Fr.] Step; single change of the foot in walking:

Behind her Death,

Close following *pace* for *pace*, not mounted yet

On his pale horse.

Milton's P. L.

Gait; manner of walk.—He himself went but a kind of languishing *pace*, with his eyes sometimes cast up to heaven, as though his fancies strove to mount higher. *Sidney.*

He saw Menalcas come with heavy *pace*;

Wet were his eyes, and cheerless was his face. *Addison.*

Degree of celerity. To *keep pace*, is not to be left behind.—Hudibras applied his spur to one side of his horse, as not doubting but the other would keep *pace* with it. *Addison.*

To-morrow, and to-morrow, and to-morrow,
Creeps in this petty *pace* from day to day,
To the last syllable of recorded time;
And all our yesterdays have lighted fools
The way to dusky death.

Shakespeare's Macbeth.

The beggar sings ev'n when he sees the place

Beset with thieves, and never mends his *pace*. *Dryden.*

Marcia could answer thee in sighs, keep *pace*

With all thy woes, and count out tear for tear. *Addison.*

Step; gradation of business. *A gallicism*.—The first *pace* necessary for his majesty to make, is to fall into confidence with Spain. *Temple*.—A measure of five feet. The quantity supposed to be measured by the hinder foot from the place where it is taken up to that where it is set down.—Measuring land by walking over it, they styled a double step; i. e. the space from the elevation of one foot to the same foot set down again, mediated by a step of the other foot, a *pace* equal to five foot; a thousand of which *paces* made a mile. *Holder on Time*.—The violence of tempests never moves the sea above six *paces* deep. *Wilkins's Math. Magick*.—The motion or progression of a horse.—The most common *paces*, and those which are natural to the horse, are the walk, the trot, and the gallop. There is likewise another *pace* which is acquired by horses, called the *amble*, but which in some appears to be almost natural to them. In some cases it is not uncommon for horses to mix their different *paces*, and by this means to go in a sort of shuffle betwixt the walk, trot, amble, and gallop; but, where the horse has a good and proper *pace*, he moves with steadiness in these several modes of progression without mixing them in any degree whatever. *Chambers.*

They rode, but authors having not

Determin'd whether *pace* or trot;

That's to say, whether tollutation,

As they do term it, or succussion.

Hudibras.

To **PACE**, *v. n.* To move on slowly.—The moon rose in

in the clearest sky I ever saw, by whose solemn light I
paced on slowly without interruption. *Pope.*

He soft arrived on the grassy plain,
And fairly *paced* forth with easy pain.

Spenser.

The nymph, obedient to divine command,
To seek Ulysses, *pac'd* along the sand.

Pope.

To move:

Remember well, with speed so *pace*,
To speak of Perdita. *Shakespeare's Wint. Tale.*

To PACE, *v. a.* To measure by steps:

Where is the horse that doth untread again
His tedious measures with th' unbated fire
That he did *pace* them first? *Shakespeare.*

To direct to go; to regulate in motion:

If you can, *pace* your wisdom
In that good path that I would wish it go,
And you shall have your bosom on this wretch. *Shakespeare.*

PACE, or PAICE (Richard), a learned English priest and eminent statesman, was born about the year 1482, at or near the city of Winchester, as is generally supposed. He was educated at the expense of Thomas Langton, bishop of that diocese, who employed him, while yet a youth, in the capacity of his amanuensis. By the proficiency which Pace made in learning, and the genius which he discovered for music, he recommended himself to the good graces of his patron, who generously determined to afford him the best advantages for literary improvement. For this purpose he sent him to the university of Padua, at that time the most famous seminary of literature in Europe, with a handsome allowance to defray his expenses. In this place he was much assisted in the prosecution of his studies by Cuthbert Tunstall, afterwards bishop of Durham, and by William Latimer. After his return to England, he went to Queen's College, Oxford, of which his patron, bishop Langton, had been provost; and he was there soon taken into the service of Dr. Bainbridge, the successor of Langton in the provostship. This patron, who was promoted to the archbishopric of York, and made a cardinal, he accompanied to Italy, where Bainbridge was poisoned by a priest, out of revenge for having received a blow from him in the moment of passion. Of the manner of the cardinal's death, and of the measures which were taken to discover those who were concerned in it, Pace transmitted to king Henry VIII. a particular account. Upon his return home, he was sent for to court, where his talents and accomplishments recommended him so powerfully to the king, that he appointed him secretary of state, and employed him in various important negotiations, and foreign embassies. His being engaged in state-affairs, however, did not prevent him from entering into holy orders; and, in the year 1514, he was first made prebendary of York, and afterwards archdeacon of Dorset. In 1515, Henry VIII. being alarmed at the progress which the arms of Francis I. king of France, were making in Italy, sent Pace on an embassy to the court of Vienna, for the purpose of engaging the emperor Maximilian, by the payment of considerable sums of money, to attempt the expulsion of the French from the duchy of Milan. Having prevailed upon him to embark in that undertaking, Pace went into Switzerland, where, by the same means of persuasion he induced some of the cantons to furnish Maximilian with troops. After the failure of this expedition, and the conclusion of peace between the French king and the emperor, the latter, who was very necessitous, made a proposal of resigning the imperial crown in Henry's favour; but Pace, who was perfectly acquainted with the emperor's motives and character, gave the king timely warning that the sole view of that prince in making such a liberal offer, was to draw money from him. In the year 1519, upon the death of the emperor, when the kings of France and Spain declared themselves candidates for the

imperial throne, Henry determined to become their competitor, and sent Pace his ambassador into Germany, to watch over his interests at the diet of the empire. On this occasion he was loaded with caresses by the German princes and the pope's nuncio; but he was soon sensible that he could hope for no success in a claim which he had been so late in preferring; and Henry's vanity led him to console himself for his disappointment, by imputing it to that circumstance alone. Pace's services were rewarded in the same year with the deanery of St. Paul's, London, in succession to Dr. Colet; and about the same time he was made dean of Exeter.

In the year 1521, our author was presented to a prebendal stall in the church of Sarum; and, upon the death of pope Leo X. towards the close of that year, cardinal Wolsey sent him with proper instructions to Rome, believing that he had a favourable opportunity of offering himself a candidate for the papal chair. Before Pace's arrival at Rome, however, the election had taken place; and Adrian bishop of Tortosa, formerly preceptor to the emperor Charles V. had been chosen pope. Upon the death of that pontiff, in 1523, Pace was employed to negotiate a second time on Wolsey's behalf; but with no better success than before, the suffrages of the conclave being given to Clement VII. Unable to obtain the grand object of his ambition, the cardinal employed Pace in soliciting from the pope an enlargement of his legatine powers, which his holiness deemed it good policy to grant. Afterwards, Pace was sent ambassador to Venice, where he acquitted himself with great ability and success, so "that it is hard to say," observes Wood, "whether he procured more commendation or admiration among the Venetians, both for dexterity of his wit, and especially for the singular promptness in the Italian tongue." But, notwithstanding the abilities with which he sustained his character as ambassador, Wolsey conceived a displeasure against him, of which he experienced the bitter effects. For two years the ambassador received no instructions from the king or council relative to the objects of his appointments, nor any remittances for the support of his expenses, notwithstanding the repeated applications which he made to England. Pace also received private instructions from his friends at home, that the cardinal had become inveterately hostile to him. This usage and intelligence had such an effect upon Pace, that he fell sick, and lost his intellects. Information of his condition having been brought to the king, he immediately gave directions for his being brought home; where he was so carefully attended by physicians, at the king's command, that his faculties were in a considerable degree restored, and he was able to direct his attention to literary pursuits. Soon after this, while the cardinal was absent from court, Pace's friends found means to introduce him to the king, then residing at Richmond; who expressed much satisfaction at his recovery, and admitted him to a private audience, in which he took the opportunity of remonstrating against the cardinal's unjust treatment of him. Wolsey, being called upon by Henry to vindicate himself against this charge, well knew how to manage his influence, so as to obtain an easy victory over the humble complainant. He summoned Pace before him; and, "sitting in judgment," says Wood, "with the duke of Norfolk, and other states of the realm, not as a defendant, but as a judge in his own cause, did so bear out himself, and weigh down Pace, that he was forthwith commanded to the Tower of London as prisoner; where he continuing for the space of two years, or thereabout, was at length by the king's command discharged." Pace's malady was so much increased by the cruel and unjust treatment which he met with, that, during the time of his imprisonment, and after his release, he never recovered his senses, excepting at intervals. He resigned his deaneries of St. Paul and Exeter a little before his death; and, retiring to Stepney, breathed his last there in 1532, when he was not quite fifty years of age.

Pace was held in high esteem by the learned men of his time, particularly sir Thomas More and Erasmus, the latter of whom styles him "utriusque literaturæ calen-tissimus," and addressed more letters to him than to any one of his learned friends and correspondents. Stow, in his *Annales*, under the year 1521, calls him "A right-worthy man, and one that gave in counsel faithful advice; learned he was also, and endowed with many excellent parts and gifts of nature; courteous, pleasant, and delighting in music; highly in the king's favour, and well heard in matters of weight." Pace learned languages with extraordinary facility; and not only spoke several of the modern tongues, but understood Latin, Greek, Hebrew, Chaldee, and Arabic. Camden, in his *Remains*, under the head of "Wife Speeches," relates the following anecdote of him: "A noble man of this time, in contempt of learning, said, that it was for noble men's sons enough to wind their horn, and carry their hawk fair, and to leave study and learning to the children of mean men. To whom the forefaid Richard Pace replied, Then you and other noblemen must be content that your children may wind their horns, and keep their hawks, while the children of mean men do manage matters of estate." The first work which he published treats of the benefits which are derived from learning, under the title of "*De Fructu qui ex Doctrina percipitur Liber*," 1517, 4to. and dedicated to dean Colet. This book was written by our author at Constance, while he was ambassador in Swisserland; and, since he took the opportunity of inveighing against drunkenness as a great obstacle to the attainment of knowledge, the people of that place, who were too much addicted to that practice, considered it intended to reflect upon them; they therefore procured a keen answer to it to be written, apologizing for themselves, and their customs in drinking. Our author's next printed work, in order of time, was "*Oratio Pace nuper-ime composita et Fœdere percussio inter Henricum Angliæ Regem, et Francorum Regem Christianissimum, in Æde Pauli Londini habita*," 1518, 4to. This was followed by, 3. *Epistolæ ad Edvardum Leem, et ad Erasmus Rot.* 1520, 4to. 4. *Præfatio in Ecclesiasticen recognitum ad Hebraicam Veritatem, et Collatum cum Translatione LXX. Interpretum, et Manifesta Explicatione Causarum Erroris ubique incidit*, 4to. 5. *Exemplum Litterarum ad regem Henricum VIII.* An. 1526; inserted in Robert Wakefield's *Syntagma de Hebræorum Codicum In corruptione*. 6. A treatise, in 1527, against the unlawfulness of the king's marriage with the widow of his brother prince Arthur, in which he very honestly delivered his opinion relating to the divorce, without any apprehension of giving offence. Pace was also the author of several translations, and, among others, one from English into Latin of the Sermon of Fisher bishop of Rochester, preached on the day when the writings of Luther were publicly burnt, printed at Cambridge, 1521, 4to. and a translation from Greek into Latin of Plutarch's piece *De Commodis ex Inimicis capiendis*. *Pitæus de Illust. Ang. Script.* *Wood's Athen. Oxon.* vol. i.

PA'CED, *adj.* Having a particular gait:

Revenge is sure, though sometimes slowly *pac'd*;
Awake, awake, or sleeping, sleep thy last. *Dryden.*

Perfect in paces; spoken of horses, and thence applied to persons, but generally in a bad sense, as *thorough-paced*.—She's not *paced* yet; you must take some pains to work her to your manage. *Shakespeare's Pericles.*

PA'CEM, a town on the north coast of the island of Sumatra, the capital of a kingdom of the same name, dependent on Acheen. It contains about 500 families: 120 miles south-east of Acheen.

PA'CER, *f.* One that paces.—A horse that is perfect in his paces.—His horse too, which was a *pacier*, was adorned after the same airy manner, and seemed to share in the vanity of the rider. *Spectator*, N° 104.

PACH'A. See BASHAW, vol. ii.

VOL. XVIII. No. 1233.

PACHACA'MA, or PACHACAMAC, a town of Peru, in the audience and jurisdiction of Lima, situated in a valley of the same name. This valley is about twelve miles south from Lima, and was celebrated before the conquest of Peru, on account of a temple dedicated to the Sovereign Creator of all things, whom the yncas called *Pachacamac*. Pizarro is said to have taken from this temple an immense quantity of gold, besides what the soldiers had pillaged. It is thirty miles south-south-east of Lima. Lat. 12. 30. S.

PACHAMAC'LI, a town of European Turkey, in Romania: forty miles south of Filippopoli.

PACHE'A, a small island in the Bay of Panama.

PACHE'CO (Francisco), a Spanish painter, who owes his celebrity more to the ingenuity and talents of his scholars Cano and Velasquez, and to his theory and writing, than to his superiority as an artist. He was the pupil of Luis Fernandez; but, though partial to the great style, does not appear to have studied it in Italy. With sufficient correctness of outline, judgment in composition, dignity of character, propriety of costume, observance of chiaroscuro, and perspective, Pacheco displeases by want of colour, timidity of execution, and dryness of style. Seville possesses the best of his historic performances; of his numerous portraits, those of his Wife and Miguel Cervantes were the most praised. As a man of literature, he possesses considerable erudition, and wit and humour as a writer of epigrams. *Fuseli's Pilkington.*

PACHE'QUE, a small island on the south-west side of the Bay of Panama.

PACHER'RY, a town of Meckley: ninety miles south-south-east of Munnypour.

PACHE'TE, a circar of Bengal, bounded on the north by Curruckdeah; on the east by Burwan and Bishunpour; on the south by Midnapour, and on the west by Sillee, Tomar, and Ramgur: about seventy miles long, and from twelve to forty broad. Rogonatpour is the capital.

PACHE'TE, a fort of Bengal, which gave name to the above circar: six miles north-east of Rogonatpour. Lon. 86. 55. E.

PA'CHI, or PA'GI-HOU'TOC, a town of Thibet: seventy miles south-east of Hami.

PACHI'CA, a town of Peru, in the government of Buenos Ayres, on the coast: 100 miles west of Lipas. Lat. 22. S.

PACHI'NUS, or PACHYNUS, now *Passaro*, a promontory of Sicily, projecting about two miles into the sea, in the form of a peninsula, at the south-east corner of the island, with a small harbour of the same name.

PACHI'RA, a town of Peru, in the diocese of Truxillo, six miles north of Payta.

PACHI'RA, *f.* in botany. See CAROLINEA.

PACHITE'A, a river of South America, which joins the Maranon at 3° 26', and is esteemed the most beautiful of all its tributary streams. It rises in 10° 46', first running east, then north, and in the early part of its progress it is called the *Pozuzu*, especially at its confluence with the Mayro, where it forms a noted haven, from which there is an open navigation to the Maranon.

PACHIUT'LA, a town of Mexico, in the province of Tlascala.

PACHO'MIUS, a saint in the calendars of the Greek and Latin churches, and the institutor of the cenobitic life in the fourth century, was a native of Thebais, or Upper Egypt, and born of Gentile parents, who educated him in their religion. When he was twenty years of age, he was forced to bear arms in the war of Constantine against Maxentius, and by that means had the first opportunity of meeting with many Christians, whose extraordinary hospitality and kindness to himself and some of his fellow-soldiers in distress, made a powerful impression upon his mind. No sooner, therefore, was the war at an end, than he made it his business to enquire particularly concerning the principles and manners of this sect; with which he was so well satisfied, that he became

Z z

a convert

a convert to the Christian faith; and, after having been instructed as a catechumen, was admitted within the Christian pale by baptism. Afterwards he became the disciple of a solitary named Palemon, from whose example he practised all the austerities of that unnatural system of superstition of which St. Anthony had lately proved the parent. Having formed the design of establishing a community of persons subject to the same rules of an ascetic life, he fixed his abode at Tabenna in Upper Egypt, on the banks of the Nile, where he built a monastery, and established rules of discipline, which, it was seriously believed in the dark ages, were dictated to him by an angel. In a short time, the fame of his sanctity drew to him such numbers of disciples, that his house overflowed, and he was obliged to erect new ones, from time to time, till the Upper Thebais was filled with monasteries of his order. Various are the accounts of the numbers of persons who embraced his rule, and some of them, no doubt, are highly exaggerated; but, upon a moderate computation, he had peopled his cells with not fewer than seven thousand of these useless and pernicious drones; and his monastery at Tabenna alone contained fourteen hundred of them. Pachomius died in the year 350, or, according to others, in 360. In his life, written by an ancient Greek author, and translated into Latin by Dennis le Petit, the reader who delights in tales of wonder may meet with food for his credulity in the accounts which it relates of the miracles wrought by this saint. Among other things we are told, that, when he had occasion to cross the Nile, the crocodiles attended, in obedience to his summons, and carried him from one bank to the other. In Benedict of Aniana's *Codex Regularum*, there are preserved eleven "Letters" of Pachomius, written with great simplicity, and addressed, as Gennadius observes, to the superiors of the monasteries founded by him. In his life, mentioned above, may be seen his rules of discipline, pretended to have been divinely communicated to him; and in the fourth volume of the *Bibl. Patr.* a larger collection of rules, concerning the habits, the diet, the employment, and the discipline, of monks, which is commonly said to have been translated from Pachomius's original, in the Egyptian language, into Greek, and from Greek into Latin by St. Jerome. To this Egyptian saint are attributed some excellent "Moral Precepts," which were published in Latin by Gerard Vossius, in the appendix to his edition of the works of Gregory Thaumaturgus, and are also inserted in the fourth volume of the *Bibl. Patr. Fabricii Bibl. Eccl. Cave's Hist. Lit.* vol. i.

PACHO'RE, a town of Hindoostan, in the circar of Gohud: ten miles north-north-east of Ahar.

PACH'SU, a small island in the Mediterranean Sea, near the coast of Epirus, and in European Turkey. It lies south of Corfu, and was subject to Venice.

PACHU'CO, a town of Mexico. It is famous for silver-mines: Gemelli says, that in the space of six leagues there are not less than a thousand. One of them, called Trinity, is supposed to be as rich as any in Mexico; there having been taken from it, in ten years time only, above forty millions of silver. It is forty-five miles north-north-east of Mexico. Lat. 20. 45. N. Lon. 100. 42. W.

PACHYMER (George), a Greek historian of the fourteenth century, was born at Nicæa, of a Constantinopolitan family. He entered into the church, in which, as well as in the state, he bore offices of importance under the emperors Michael Palæologus and Andronicus the elder. At the age of nineteen he accompanied the former when he took possession of Constantinople, in 1261. He is supposed to have died about 1310. Pachymer composed in thirteen books a portion of Byzantine History, containing the reign of Michael, and that of Andronicus down to his twenty-third year. It usefully fills the space from the narratives of Nicetas and Acropolites to that of Cantacuzenus; and, being composed by one who was a witness to what he records, is considered as a work of authority. This history was published with a Latin ver-

sion by father Poussines at Rome in 1666-69, in folio; and was translated into French by the president Cousin. To Pachymer is also attributed a Paraphrase on the Epistles of Dionysius the Areopagite, and a Treatise on the Procession of the Holy Ghost. A Compendium of Aristotelic Philosophy was published from his MS. at Oxford in 1666. *Vossii Hist. Græc. Gen. Biog.*

PACHYPHYLLA, *f.* in botany. See NICOTIANA.

PACHYSANDRA, *f.* [so named by Michaux from the Gr. *παχυς*, thick or clumsy, and *ανδρ*, a man; in allusion to the thickness of the stamens.] In botany, a genus of the class monoecia, order tetrandria, natural order tricocca, *Lin.* (euphorbia, *Juss.*) Generic characters—*I.* Male. Calyx: perianthium of three oval concave upright leaves, one of them external, and rather the smallest. Corolla: petals two, oval, concave, rather larger than the calyx. Stamina: filaments four, erect, thrice as long as the petals, very thick, compressed, and somewhat club-shaped; antheræ incumbent, oblong, of two cells, finally curved. *II.* Female. Calyx: perianthium of three close-pressed oblong acute leaves, one of them external. Corolla: petals four, smaller than in the male, closely pressed to the germen. Pistillum: germen superior, rather globose, with three furrows; styles three, recurved, with a longitudinal furrow above; stigmas linear, flattish. Pericarpium: capsule nearly globular, three-lobed, crowned with three spreading horns from the permanent styles, of three cells. Seeds two in each cell, oblong, smooth, pendulous from the summit of the cell.—*Essential Character.* Male: Calyx of three leaves; petals two; stamens thrice as long as the petals. Female: Calyx of three leaves; petals four; styles three; capsule with three horns, and three cells; seeds two in each cell.

Pachysandra procumbens, the only species. It was gathered by Michaux on the western side of the Alleghany mountains, in North America. The root is fibrous and perennial. Stem herbaceous, procumbent in the lower part, then ascending, round, smooth, leafy above, about a span high, scarcely branched. Leaves alternate, stalked, ovate, about two inches long, smooth, veiny, and ribbed; entire at the base, bluntly and broadly toothed in the upper part. Spike simple, solitary; from the base of the stem erect, rather lax, two inches long, composed of about two female flowers, and four times as many male ones above them. Corolla finely fringed; capsule somewhat downy. Michaux remarks, that the character of this genus is almost the same as that of *Buxus*, but the habit totally different. *Boreali-Amer.* ii. 177. t. 45.

PA'CIAN, a saint in the Roman calendar, and bishop of Barcelona, was descended from a noble Spanish family, and flourished about the year 370. He had been a married man; and left a son, who will be noticed at the end of this article. St. Jerome says of Pacian, that "he was no less famous for the sanctity of his life, than for the eloquence of his discourse; and that he wrote many books, among which there is one, entitled *Cervus*, or the Stag, and some treatises against the Novatians." He died at an advanced age, under the reign of the emperor Theodosius the Great, and before the year 390. With respect to his book entitled *Cervus*, it appears to have been a satirical piece, written against the Pagans, and abounding in wit and eloquence; but no remains of it have reached modern times. There are still extant, attributed to Pacian; 2. Three Letters to Sempronian, a Novatian, which are probably the treatises mentioned by Jerome. 3. An Exhortation to Repentance. 4. A Discourse concerning Baptism, addressed to Catechumens; though doubts are entertained respecting the genuineness of the last-mentioned piece. They were edited by John de Tilly, at Paris, in 1538, 4to. by Paul Manutius at Rome, in 1564, folio; and they are inserted in the fourth volume of the *Bibl. Patr.* A more correct edition of the whole, (excepting the Discourse on Baptism,) collated with a manuscript of about the year 800, was afterwards given in the second volume of the Collect. Max. Concl. Hispan.

Hispan. illustrated with numerous learned notes. Dupin thus characterizes the writings of Pacian: "His exhortations are lively and persuasive; his thoughts well weighed; his proofs solid; his manner of writing pleasant; his style elegant, and the periods short. In a word, these little tracts may pass for master-pieces in their kind; and the two exhortations, or discourses, may be looked upon as perfect models of popular preaching."

Pacian's son, named FLAVIUS DEXTER, was the person to whom Jerome inscribed his Catalogue, and at whose request it was drawn up. He filled several high offices in the empire, and for some time was prefect of the prætorium. He had a place in Jerome's catalogue, as an ecclesiastical writer; though it is not universally allowed that the work mentioned by that father is now extant. *Fabrizii Bibl. Eccles. Cave's Hist. Lit.* vol. i. *Lardner's Cred.* part ii.

PACIFEROUS, *adj.* [from the Lat. *pax*, *pacis*, peace, and *fero*, to bring.] Producing peace. *Cole.*

PACIFIC, *adj.* Peace-making; mild; gentle; appeasing.—God now in his gracious *pacifick* manner comes to treat with them. *Hammond on Fundamentals.*

Returning, in his bill
An olive-leaf he brings, *pacific* sign! *Milton.*

PACIFIC O'CEAN, or SOUTH SEA, that vast ocean which separates Asia from America. It is called *Pacific*, from the moderate weather which the first mariners who sailed in it met with between the tropics; and it was called the *South Sea*, because the Spaniards crossed the Isthmus of Darien from north to south. It is properly the Western Ocean, with regard to America.

This ocean fills the grandest concavity of the globe, occupying nearly half of its surface, from the eastern shores of New Holland to the western coast of America; and it is diversified with several groups of islands, which seem, as it were, the summits of vast mountains emerging from the waves. Separately considered, this immense concavity receives but few rivers; the chief being the Amur from Tartary, and the Hoan-ho and Kian-ku from China, while the principal American rivers run towards the east. This ocean, considered as the boundary of the Russian empire, washes the shores of the government of Irkutsk, from Tchukotkoy Nofs, or Cook's Straits, to the frontiers of China; or, in other words, from the mouth of the river Aimakan, that is, from 65° to 45° N. lat. It is divided into two great parts. That lying eastwards from Kamtskatka, between Siberia and America, is eminently styled the *Eastern* or the Pacific Ocean; that on the west side from Kamtskatka, between Siberia, the Chinese Mongoleys, and the Kurilly Islands, is called the Sea of Okhotsk. From the different places it touches, it assumes different names: thus, from the place where the river Anadyr falls into it, it is called the Sea of Anadyr; about Kamtskatka, the Sea of Kamtskatka; and the bay between the districts of Okhotsk and Kamtskatka, is called the Sea of Okhotsk, the upper part of which is termed the Penjinskian Sea, as it approaches the mouth of the river Penjina.

PACIFICAL, *adj.* [*pacificus*, Lat.] Mild; gentle; peace-making.—For what sin was I sent hither among soldiers, being by my profession academical, and by my charge *pacifical*? *Sir H. Wotton*, (Lett. 1615.) *Rem.* p. 439.

PACIFICATION, *f.* [Fr. from *pacify*.] The act of making peace.—He sent forthwith to the French king his chaplain, chusing him because he was a churchman, as best sorting with an embassy of *pacification*. *Bacon's Hen. VII.*—The act of appeasing or pacifying.—A world was to be saved by a *pacification* of wrath, through the dignity of that sacrifice which should be offered. *Hooker.*

PACIFICATOR, *f.* Peace-maker.—We have seen England become the *pacifactor* of the continent, and rival monarchs sue for our alliance. *Warburton's Sermons.*

PACIFICATORY, *adj.* Tending to make peace.—

All churches did maintain intercourse and commerce with each other by formed, communicatory, *pacificatory*, commendatory, synodical, epistles. *Barrow's Unity of the Church.*

PACIFICUS, in mythology, an epithet of Jupiter, synonymous with *Salamines* among the Syrians, derived from the Hebrew "Salman," which generally signifies *pacatus fui*.

PACIFICUS MAXIMUS, a Latin poet, was born at Ascoli, of a noble family, in 1409: the time of his death is not known; but his poems were printed at Florence in 1489, under the title of "Heccatelligiam, five Elegiæ. This edition is now very scarce; that of Parma, with his other works, in 1691, is purged of many licentious passages that occur in the former. He mentions the venereal disease in his poems before the discovery of the New World by Columbus.

PACIFIER, *f.* One who pacifies. *Hulock.*

TO PACIFY, *v. a.* [*pacifier*, Fr. *pacifico*, Lat.] To appease; to still resentment; to quiet an angry person; to compose any desire.—The Most High is not *pacified* for sin by the multitude of sacrifices. *Eccles. xxxiv. 19.*—O villain! to have wit at will upon all other occasions, and not one diverting syllable now at a pinch to *pacify* our mistresses. *L'Estrange.*

Nor William's pow'r nor Mary's charms
Could or repel or *pacify* his arms.

Prior.

PACING, *f.* The act of moving slowly and easily.

PACINISCO, a town of Naples, in Lavora: eleven miles east-south-east of Sora.

PA'CIO (Giulio), a distinguished jurist and philosopher, was born at Vicenza in the year 1550. From an early age he was distinguished for his proficiency in letters; and, being destined for the study of the law, he was sent to Padua, where he studied under the ablest masters. On his return to Vicenza, his propensity to enquiry led him to peruse the writings of the Reformers, for which he was accused to the bishop, who gave orders for his apprehension. He therefore took refuge at Geneva, where, being destitute of other means of support, he opened a school for children. In 1578 he was chosen professor of jurisprudence in that city. In 1585 he was invited to a professorship at Heidelberg; and on his acceptance of that office he delivered an oration, "De Juris Civilis Difficultate ac Docendi Methodo," which he afterwards printed, signing himself *Beriga*, from a country-house belonging to his family. He remained at Heidelberg till 1595, when he quitted it for Sedan, where the duke of Bouillon had established an academy: in this he held the logical chair till the war broke out, which obliged him to return to Geneva. Soon after he was elected principal of the college of Nismes: thence he removed to the professorship of civil law at Montpellier, where he had as a domestic pupil the celebrated Peiresc. It was the great object of the pupil to bring back his master to the Catholic faith; and for this purpose he wished to fix him, with a large stipend, at the university of Aix; but for many years the attempts for his conversion and change of abode were continued without effect. At length, however, he rejected a flattering invitation from the university of Leyden, because he had again become a Catholic. In 1616 he removed to Valence in Dauphiné, where he occupied the chair of the celebrated Cujas, with a high salary. About the year 1619, he published a work concerning the dominion of the Adriatic Sea, on account of which he was honoured by the republic of Venice with the order of St. Mark; it also procured him a pressing invitation to a professorship at Padua, which he accepted for a short time; but, after this, in 1621, he returned to Valence, where he continued his professional labours till his death, in 1635.

The works of this writer are numerous, and chiefly on legal or philosophical topics, in both of which sciences he was profoundly versed. He published new and accurate

versions of several of Aristotle's works, which have ranked as models of translations. The great honours and emoluments which he received, and the contests which subsisted among the most famous universities to obtain possession of him, sufficiently prove that he was one of the most considerable scholars of that period. The titles of his most important works are, 1. *De Contractibus*. 2. *Synopsis Juris*. 3. *De Jure Maris Adriatici*. 4. *Corpus Juris Civilis*. He wrote a treatise on arithmetic at the age of thirteen. *Niceron*.

PACIVIRI, *f.* in botany. See **CARINA**.

PACK, *v. n.* [*pack*, Teut. *pacquet*, Fr.] A large bundle of any thing tied up for carriage.—Thémistocles said to the king of Persia, that speech was like cloth of Arras opened and put abroad, whereby the imagery appears in figures; whereas, in thoughts, they lie but as in *packs*. *Bacon*.—A *pack* of wool is a horse's load, containing seventeen stone and two pounds, or 240 pounds weight. *Chambers*.

Our knight did bear no less a *pack*
Of his own buttocks on his back.

Hudibras.

A burden; a load.—But, when they took notice how stupid a beast it was, they loaded it with *packs* and burdens, and set boys upon the back of it. *L'Esrange*.

I rather chose

To cross my friend in his intended drift,
Than, by concealing it, heap on your head
A *pack* of sorrows. *Shakespeare's Two Gent. of Verona*.

A due number of cards.—It is wonderful to see persons of sense passing away a dozen hours together in shuffling and dividing a *pack* of cards. *Addison*.

Women to cards may be compar'd; we play
A round or two; when us'd, we throw away,
Take a fresh *pack*.

Granville.

A number of hounds hunting together.—Two ghosts join their *packs* to hunt her o'er the plain. *Dryden*.

The fury fires the *pack*; they snuff, they vent,
And feed their hungry nostrils with the scent. *Dryden*.

A number of people confederated in any bad design or practice.—You panderly rascals! there's a knot, a gang, a *pack*, a conspiracy, against me. *Shakespeare's M. Wives of Windsor*.—Never such a *pack* of knaves and villains as they who now governed in the parliament. *Clarendon*.—Bickerstaff is more a man of honour than to be an accomplice with a *pack* of rascals that walk the streets on nights. *Swift*.—Any great number, as to quantity and pressure: as, a *pack* of troubles, corrupted by the vulgar into a *peck* of troubles.—A loose or lewd person, [*pæca*, from *pæcan*, Sax. to deceive, by false appearances. *H. Tooke*.] It was probably a cant term.—Some lofsels, some naughty *paches*. *Skellon*.—Young wanton wenches and beguines, nunnies and naughty *paches*. *World of Wonders*.

To **PACK**, *v. a.* [*packen*, Teut.] To bind up for carriage.—What we looked upon as brains, were an heap of strange materials, *packed* up with wonderful art in the skull. *Addison*.

Resolv'd for sea, the slaves thy baggage *pack*,
Each saddled with his burthen on his back.

Dryden.

To send in a hurry:

He cannot live, I hope, and must not die,
Till George be *pack'd* with post-horse up to heav'n.

Shakespeare.

To fort the cards so as that the game shall be iniquitously secured. It is applied to any iniquitous procurement of collusion. [This and the following sense are to be referred, as Mr. H. Tooke has shown, to the Saxon *pæcan*, to counterfeit, to act collusively, so cheat.]—There be that can *pack* cards, and yet cannot play well; so there are some that are good in canvasses and factions, that are otherwise weak men. *Bacon's Essays*.

The judge shall job, the bishop bite the town,
And mighty dukes *pack* cards for half a crown. *Pope*.

To unite picked persons in some bad design.—The expected council was dwindling into a conventicle; a *packed* assembly of Italian bishops, not a free convention of fathers from all quarters. *Atterbury*.

When they have *pack'd* a parliament,
We'll once more try th' expedient:
Who can already muster friends,
To serve for members to our ends.

Hudibras.

To **PACK**, *v. a.* To tie up goods:

The marigold, whose courtier's face
Echoes the sun, and doth unlace
Her at his rise, at his full stop
Packs and shuts up her gaudy shop.

Cleveland.

To go off in a hurry; to remove in haste. *A cant word*.—The wind no sooner came good, but away *pack* the galleys with all the haste they could. *Carew*.—A thief kindled his torch at Jupiter's altar, and then robbed the temple: as he was *packing* away with his sacrilegious burden, a voice pursued him. *L'Esrange*.

Poor Stella must *pack* off to town,
From purling streams and fountains bubbling,
To Liffy's stinking tide at Dublin.

Swift.

To concert bad measures; to confederate in ill; to practise unlawful confederacy or collusion.—Go, *pack* with him. *Titus Andronicus*.—That this so profitable a merchandise riseth not to a proportionable enhancement with other less beneficial commodities, they impute partly to the eastern buyers *packing*, partly to the owners not venting the same. *Carew*.

PACK'-CLOTH, *f.* A cloth in which goods are tied up.

PACK'-HORSE, *f.* A horse of burden; a horse employed in carrying goods.—It is not to be expected that a man, who drudges on in a laborious trade, should be more knowing in the variety of things done in the world, than a *pack-horse*, who is driven constantly forwards and backwards to market, should be skilled in the geography of the country. *Locke*.

Ere you were queen, ay, or your husband king,
I was a *pack-horse* in his great affairs. *Shakespeare*.

PACK'-SADDLE, *f.* A saddle on which burdens are laid.—Your beards deserve not so honourable a grave as to stuff a butcher's cushion, or to be entombed in an ass's *pack-saddle*. *Shakespeare's Coriol*.—The bunch on a camel's back may be instead of a *pack-saddle*, to receive the burthen. *More against Atheism*.

PACK'-STAFF, *f.* A staff by which a pedlar occasionally supports his pack.—It is probable, that the phrase, "as plain as a *pike-staff*," is a corruption of the word before us. Yet none of our lexicographers have noticed *pack-staff*. *Todd*.—A *pack-staffe* epithet, and scorned name. *Marsden's Scourge of Vill*.

Some say, my satires over loosely flow,
Nor hide their gall enough from open show;
Not, riddle like, obscuring their intent;
But, *pack-staffe* plaine, uttering what thing they ment.

Bp. Hall.

PACK'-THREAD, *f.* Strong thread used in tying up parcels.—Girding of the body of the tree about with *pack-thread* restraineth the sap. *Bacon's Nat. Hist*.

About his shelves

Remnants of *pack-thread*, and old cakes of roses
Were thinly scatter'd. *Shakespeare's Rom. and Juliet*.

PACK'-WAX, *f.* [more frequently written *pax-wax*.] Several parts peculiar to brutes are wanting in man, as the strong aponeuroses of the neck called *pack-wax*. *Ray*.—Along each side of the neck of large quadrupeds runs a stiff robust cartilage, which butchers call the *pax-wax*. *Paley's Nat. Theol*.

PACK'AGE,

PACKING-PRESSES.

2

J. Russ. sculp.

1. M. Peck's Packing press. 2, 3. Wheelton and Bowler's Packing press.

Engraved for the Encyclopædia Londinensis &c.

PACK'AGE, *f.* A duty set and rated in a table taken of goods and merchandises; and all goods not specified in the table, are to pay for package-duties after the rate of one penny in the pound, according as they are valued in the book of rates. *Chambers.*

PACK'ER, *f.* One who binds up bales for carriage.—*Packers* are really, what their title expresses, *packers* as well as pressers of all sorts of bale-goods (intended for exportation) for the great trading-companies and merchants, for which they are answerable, if they should receive any damage through bad package. Besides this, several of them are considerable dealers. *Chambers.*

PACK'ERSFIELD, a township of New Hampshire, Cheshire-county, east of Keene, on the head branches of Ashuelot-river, containing 1076 inhabitants: eighty-six miles west of Portsmouth.

PACK'ET, *f.* [*paquet*, Fr.] A small pack; a mail of letters.—There passed continually *packets* and dispatches between the two kings. *Bacon's Hen. VII.*

Upon your late command
To guard the passages, and search all *packets*,
This to the prince was intercepted. *Denham.*

A small bundle, as of a mountebank's medicines.

PACK'ET, or **PACKET-BOAT**, a vessel appointed by the government to carry the mail of letters, packets, and expresses, from one kingdom to another, by sea, in the most expeditious manner.—People will wonder how the news could come, especially if the wind be fair when the *packet* goes over. *Swift.*—The *packet-boats*, under the direction of the postmaster-general of Great Britain, carry the mails from Dover to Calais, from Falmouth to Lisbon, from Harwich to Helvoetsluys, and from Park-gate to Dublin. *Chambers.*

To **PACK'ET**, *v. a.* To bind up in parcels.—My resolution is to send you all your letters well sealed and *packeted*. *Swift.*

PACK'ING, *f.* The art of the packer; the art of compressing goods into a small compass for the convenience of carriage.

PACK'ING, *f.* [from *to pack*, in the sense of cheating.] A trick; a cheat; a falsehood.—We do hope to find out all your tricks, your plots and *packing*. *Milton on the New Forcers of Conscience.*

What excuse
Can we make to the duke, what mercy hope for,
Our *packing* being laid open? *Massinger.*

PACK'ING-CLOTH, *f.* A coarse kind of cloth for packing goods, &c. Mr. Thomas Winter, of Shacklewell, took out a patent, in the year 1801, for the manufacture of a coarse cloth for packing goods, covering rooms, &c. This cloth consists of waste tan (after it has been used for the purposes of tanning) boiled and bruised; of the waste shreds, parings, or scrapings, of leather, also boiled and bruised to a pulp; and of the short hair of animals, prepared so that it may interweave and unite with the other ingredients. Certain proportions of these are well mixed, adding to the mass a small quantity of refuse tow; and then the whole is well beaten together with stampers and a little water. When well blended, it is conveyed into vats, and warm water (made glutinous by previously boiling in it pieces of skin) added by degrees. It is then moulded in frames like those of paper-makers; and, when dried, is fit for use. *Rep. of Arts*, vol. xvi.

PACK'ING-PRESS, or **PACKER'S PRESS**, *f.* The presses used by packers for bringing their goods into a manageable shape, previous to packing them for conveyance or stowing away, are of various kinds, and have been for many years in a progressive state of improvement. The two following we shall select, as being well suited to the purpose.

Mr. John Peck, of the New Road, near the Adam and Eve, produced a press, about the year 1795, which was considered to be so ingenious by the Society of Arts in the Adelphi, that, upon his giving up the invention to

the public, by declining to take out a patent, they voted him a reward of thirty guineas. This press appears to render the operation of packing much less laborious, and to expedite the business very much. One very considerable improvement is, that much time will be saved by its being a double-press; for it will very readily be perceived, that when the lower package has been sufficiently pressed, as the bed or presser is raised, (another package being thereon,) the upper package begins to be pressed as that one underneath is relieved, and so, alternately, during the whole operation. On the annexed Plate, at fig. 1. A A is the frame of the press. B, B, the large screws, which, in this press, contrary to those in common use, are fixed and immovable. C, a circular iron bar, extending beyond the sides of the press, and having thereon two worms or endless screws, E, E, which work in two toothed wheels fixed to the nuts. By turning the winch D, the nuts and bed are driven up and down the screws, as may be found necessary. F, a stage, suspended from the bed, and on which the men stand who work the press; such a stage may, if found necessary, be fixed at the other end of the bar, another winch being put upon the square shoulder, G. The bed of this press must be formed of two pieces of strong wood, which are held together by screws and nuts, passed through them, as shown at h, h, h, h.

Messrs. Wheildon and Bowler, of Throgmorton-street, and of Bear-lane, near Blackfriars-bridge, London, took out a patent for a packing-press in April 1796. "The principle on which our invention is founded (say the patentees) is the applying of a chain, cog, or any other kind of wheel or wheels, of various forms and sizes, and placed in various situations, (to be worked by a handle or handles,) which may be affixed or annexed to any kind of press or presses, for the purpose of power in pressure, which has the advantage of compressing any substance capable of pressure into less compass, with less labour, than the presses now in use. Their component parts may be made of wood, iron, brass, or any other substance or substances capable of being brought to the shape and uses hereafter described." Fig. 2. represents a perspective view of this press. A is a handle that gives motion to the machinery, by turning the pinion B. C is another handle, for a quicker motion, which is annexed to the axis of a larger pinion D; and E is another handle, which is occasionally fixed to the axis of the spur-wheel F, to be worked by a man standing in a hole beneath it; and on the same axis is a pinion G, which acts in a tooth and cog-wheel H, and which is fixed to the bottom of the screw I. K is a chain, which is connected with the cogs of the wheel H, and to the cogs of the wheel L, which turns the other screw M, (which screws rest on pivots,) and which causes the nut N to come down exactly level upon the substance to be pressed or packed with an astonishing power of pressure; and, by turning the handle or handles the contrary way, it causes the nut N to rise to its proper station. O O is a frame, with the multiplying wheels fixed therein, which is annexed to an end of the press; or it may be carried to its side, if necessary; and it may be inclosed with a covering or case, to keep it from dirt or injury. P P is a frame for a platform or case, to be fitted to or upon it, which covers the whole of the bottom machinery. Fig. 3. represents a front-view of part of the machinery, (with the screws broken off,) and a cog-wheel applied to the centre, to work instead of the chain, as before specified. A is a handle, as before, that, by turning, gives motion to the pinion B. C is the handle connected with the axis of the pinion D, and is made to shove in and out of the teeth of the spur-wheel F. E is another handle, to be occasionally fixed to the axis of the spur-wheel F, to be worked as before described; and on the same axis is a bevel-pinion G, which acts in a bevel-face wheel H, which is likewise cogged round its edge, and is fixed to the bottom of the screw I, which gives motion to the centre cog-wheel K, which gives motion to the other cog-wheel L, &c. as in fig. 2.

PACK'INGTON MAG'NA, a village in Warwickshire: three miles south of Colehill.

PACK'INGTON PARVA, a village near the above. Here is Packington-hall, a seat of the earl of Aylesford. The house stands on the south side of the road, and the park on the north side. A large arch is turned over the road, wide enough for a carriage to pass over, in order to have a communication between the house and the park without going through the road. The house is modern, and appears to be built in a good taste; but its low situation must deprive it of any extraordinary prospect. The road was turned to the south side of the house, by act of parliament, in 1764.

PAC'MOTE BA'Y, a bay on the east coast of the island of Martinico.

PAC'CO COTIN'GA. See COSTUS.

PAC'CO SERO'CA. See ALFINIA.

PAC'OLET, a small river of America, in South Carolina, which unites with Broad-river, thirty miles above Tyger river, and twenty-four south of the North Carolina line. On this river are the famous Pacolet-springs, seventeen miles above its confluence with Broad-river.

PAC'OLET, a town of Rutland-county, Vermont, containing 2233 inhabitants.

PAC'ORI (Ambrose), a French practical writer, whose works are held in esteem by pious Catholics, was born of obscure parents at Ceaucé in the Lower Maine, about the year 1650. His inclination leading him to the ecclesiastical profession, after receiving the requisite education, he was admitted to deacon's orders, and became president of the college in his native place, where, at the same time, he taught the classics and philology. In this situation, from what motives we are not informed, an attempt was made to poison him by one of his pupils, from which he narrowly escaped; and, thinking his life no longer safe at Ceaucé, he resigned his post, and retired into Anjou. Soon afterwards, cardinal Coislin, bishop of Orleans, appointed him to the presidency of his seminary at Mehun, which he retained for eighteen years, during which he procured the establishment of many seminaries in the diocese of Orleans, for the education of young persons designed for the clerical profession. Upon the death of the cardinal, he was obliged to quit his post; when he withdrew to Paris, where he spent the remainder of his life in retirement, and died in 1730, when he was about eighty years of age. By the purity of his manners he reflected lustre on his learning and abilities, which were very respectable; but so excessive were his modesty and humility, that he could never be persuaded to enter into priest's orders, of the importance of which he entertained a very exalted idea. He was the author of a great number of pious and practical treatises, which, though written in a heavy and prolix style, have had considerable popularity among certain classes of religionists. The principal of them are, 1. Salutary Advice to Parents relative to the proper Education of their Children, 12mo. 2. Dialogues on the sacred Observance of Sundays and Festivals. 3. Christian Directions for an uniformly holy Practice. 4. The Christian's Day Work. 5. Christian Reflections. *Ladvoat's Dict. Hist. et Bibl. portatif.*

PAC'ORUS, the name of two kings of Parthia. Also the name of the eldest of the thirty sons of Orodes king of Parthia, sent against Crassus, whose army he defeated, and whom he took prisoner. He took Syria from the Romans; and supported the republican party of Pompey, and of the murderers of Julius Cæsar. He was killed in a battle by Ventidius Bassus, B. C. 39. on the same day (9th of June) that Crassus had been defeated.

PACOURA, *f.* in botany. See WILLUGHBEIA.

PACOUR'NA, *f.* [one of Aublet's unexplained names, which has since been changed to HAYNEA by Willdenow, in honour of Frederic Theophilus Hayne, a German botanist, author of an elegant work entitled *Termini Botanici*, published by the former at Berlin, in quarto, with coloured plates.] In botany, a genus of the class syngenesia, order polygamia-æqualis, natural order

of compositæ capitatæ, *Lim.* (cinarocephalæ, *Juss.*) Generic characters—Common calyx globose, imbricated; with numerous, elliptic-oblong, upright, acute, spinous, scales. Corolla compound, tubular, uniform, florets all equal, perfect, fertile, monopetalous, funnel-shaped, with a regular, five-cleft, acute, spreading, limb. Stamina: filaments five, capillary, the length of the tube; antheræ acute, the length of the limb, united into a cylinder. Pistillum: germen obovate; style thread-shaped, the length of the stamens, very slender; stigmas two, acute, reflexed. Pericarpium: none, except the permanent calyx. Seeds solitary, obovate; down simple, sessile, short, spreading. Receptacle: fleshy, chaffy; its scales roundish, concave, longer than the seeds, which they separate from each other.—*Essential Character.* Receptacle fleshy, chaffy; down simple, short; calyx ovate, with imbricated, straight, spinous, scales.

Pacourina edulis: the only species. Found flowering in the month of June, on the banks of a river exposed to the influx of the sea, near Courou, in Guiana, by Aublet, from whose Herbarium specimens were communicated by sir Joseph Banks. No other botanist, as far as we know, has ever gathered this plant. No account is given of the original generic name, which has the appearance of being French, and therefore in honour of some person; but Willdenow thought proper to change it. The specific name, *edulis*, is meant to express that the receptacle is eatable, as well as the whole plant, according to Aublet, but he does not say whether raw or boiled. Its habit is that of a Cnicus or Sonchus. Root perennial. Stems several, somewhat branched, leafy, round, smooth, often zigzag, three feet high. Leaves alternate, large, ovate-oblong, greyish, smooth, veiny, fringed with little irregular spinous teeth, their base running down into a winged footstalk, which embraces the stem. Flowers solitary, opposite to each leaf, sessile, scarcely an inch in diameter, bluish. The young foliage is slightly downy. *Aublet Guian.* p. 800. t. 316.

PACT, *f.* [*pacē*, Fr. from *pactum*, Lat.] A contract; a bargain; a covenant.—The queen, contrary to her *pact* and agreement concerning the marriage of her daughter, delivered her daughters out of sanctuary unto king Richard. *Bacon.*

PACTA VALAM'. See TRICHOSANTHES.

PAC'TION, *f.* [*Fr. pactio*, Lat.] A bargain; a covenant.—The French king sent for Matthew earl of Levenox, to remove the earl of Arraine from the regency of Scotland, and reverse such *pactions* as he had made. *Hayward.*—There never could be any room for contracts or *pactions* between the Supreme Being and his intelligent creatures. *Cheyne.*

PAC'TIONAL, *adj.* By way of bargain or covenant.—The several duties, that by God's ordinance are to be performed by persons that stand in mutual relation either to other, are not *pactional* and conditional; as are the leagues and agreements made between princes; but are absolute and independent: wherein each person is to look to himself, and the performance of the duty that lyeth upon him, though the other party should fail in the performance of his. *Sanderson's Cases of Conscience.*

PACTYTIOUS, *adj.* Settled by covenant.

PACTOLUS, in ancient geography, a river of Asia, which had its rise on Mount Tmolus, in Lydia, watered the plain adjoining to Sardis, traversed that town, and ran into the Hermus, which discharged itself into the gulf of Smyrna. This river is said to have contained a quantity of gold. As to the fable related concerning it, we refer to MIDAS. The kings of Persia obtained possession of the Pactolus and its treasures by Cyrus's conquest of Lydia. Xerxes drew gold from the Pactolus, and this valuable metal was furnished by it in the time of Herodotus; but it afterwards failed, long before the time of Strabo. The gold of the Pactolus was derived from the mines of Mount Tmolus; and, when these were exhausted, the supply of the river was discontinued. This river was, according to Varro and Chrysostom, the chief source of the wealth of Cræsus.

PACU'VIUS (Marcus), a Latin tragic poet, was a native of Brundisium, and is said to have been the sister's son of Ennius. He flourished about B. C. 154. and was the friend and guest of C. Lelius. In the rude state of the Roman theatre he obtained great reputation; and his tragedy of "Orestes" is particularly mentioned by Cicero as having been heard with loud applause. He also composed satires, and had a talent for painting. In advanced age he retired from Rome to Tarentum, where he died, having nearly reached his ninetieth year. A few fragments only of his works are left, which have been published in the *Corpus Poetarum Latinorum* of Vossius.

PA'CY, a town of France, in the department of the Eure, on the Eure, formerly surrounded with walls: eight miles south-west of Vernon, and eleven east of Evreux.

PACZANO'W, a town of Poland, in the palatinate of Sandomirz: twenty-eight miles east of Sandomirz.

PAD, *f.* [from *paad*, Sax. whence likewise *paað*, or *path*.] The road; a foot-path.—We have seen this to be the discipline of the state, as well as of the *pad*. *L'Estrange*. The squire of the *pad* and the knight of the post Find their pains no more baulk'd, and their hopes no more croft. *Prior*.

An easy-paced horse.—Let him walk afoot with his *pad* in his hand; but let not them be accounted no poets who mount and shew their horsemanship. *Dryden's Ded. to Juv.*—I would have set you on an easier *pad*, and relieved the wandering knight with a night's lodging. *Pope's Lett.*—A robber that infests the roads on foot.—A low soft saddle; a cushion or bolster; properly, a saddle or bolster stuffed with straw; [from *paja*, Span. straw.] Tremellius was called *seropha*, or fow, because he hid his neighbour's fow under a *pad*, and commanded his wife to lie thereon; he swore that he had no fow but the great fow that lay there, pointing to the *pad* and the fow his wife. *Camden*.

We shall not need to say what lack Of leather was upon his back; For that was hidden under *pad*.

Hudibras.

To **PAD**, *v. n.* To travel gently.—To rob on foot; to lurk about the highways in order to rob.—Sermons, said I; give them me; my boy shall carry them in his portmanteau, and ease you of that luggage. But, said he, suppose your boy should be robbed. That's pleasant, said I; do you think there are parsons *padding* upon the road for sermons? *Dr. Pope's Life of Bp. Ward*, 1697.—To beat a way smooth and level.

PAD'-NAG, *f.* An ambling nag.—An easy *pad-nag* to ride out a mile. *Dr. Pope*.

PA'DA, a town of Hindoostan, in the circar of Gangpour: thirty miles east of Gangpour, and sixty north-east of Sumbulpour. Lat. 21. 58. N. lon. 84. 39. E.

PA'DAN-A'RAM, [Heb. the Plains of Aram.] Another name for MESOPOTAMIA, which see.—But perhaps *Padan Aram* was only the north-west part of Mesopotamia. *Brown's Dict. Bible*.

PADANG', a seaport town on the west coast of the island of Sumatra. This is the head settlement which the Dutch possess on this island, and is governed by a director and council. The fort is situated within forty yards of the north bank of the river, being a square, with four bastions of stone, and the walls about nine feet high. On the south side of the river are high mountains, which extend to the sea-coast. The water is very good; and cattle and fruit plentiful and cheap. Lat. 0. 40. S. lon. 99. 48. E.

PADANG', a small island in the Eastern Indian Sea, near the west coast of Borneo. Lat. 0. 33. S. lon. 109. 21. E.

PADANG GOO'CHIE, a river of Sumatra, which divides the Lampoon-country, or a portion of the southern extreme of the island, from Passumnah, near the sea-coast.

PAD'AR, *f.* Grouts; coarse flour. *Not used*.—In the bolting and sifting of near fourteen years of such power and favour, all that came out could not be expected to

be pure and fine meal, but must have amongst it *padar* and bran in this lower age of human fragility. *Wotton*.

PADASJO'KI, a town of Sweden, in Tavastland: thirty-six miles north-east of Tavasthus.

PADA'TO, a town of Mexico, in the province of Culiacan: forty miles north-west of Culiacan.

PAD'BERG, a town and citadel of the duchy of Westphalia: four miles south of Stadtberg, and five east of Brilon.

PAD'BURY, a village in Buckinghamshire, three miles south-east of Buckingham, on a river that runs into the Ouse, the bridge over which was erected in 1742, in pursuance of an act of parliament.

PAD'DER, *f.* A robber; a foot-highwayman.—If he advanced himself by a voluntary engaging in unjust quarrels, he has no better pretence to honour than what a resolute and successful *padder* may challenge. *Collier*:

Worse than all the clattering tiles, and worse Than thousand *padders*, is the poet's curse; Rogues that in dog-days cannot rhyme forbear; But without mercy read to make you hear. *Dryden*.

PAD'DER, in geography. See **PUD'DAR**.

PAD'DINGTON, a parish and village in the hundred of Olifinston, and county of Middlesex, is situated at the north-western extremity of London. The parish, which extends about two miles in length, is bounded by Kensington, St Margaret's Westminster, and St George's Hanover-square, on the south; by Wilford on the north; by Marybone on the east; and by Kensington, and a detached part of Chelsea, on the west. According to a survey, its area comprises 1197 acres, 3 roods, and 30 perches, of which about one hundred acres are laid-out as garden-ground, and the remainder is occupied by houses, and appropriated to pasturage.

The village of Paddington stands about a mile to the north of Tyburn-turnpike. Like most of the other villages connected with the metropolis, it has increased greatly in extent of late years; and, since the opening of the canal in 1801, (see vol. xiii. p. 130.) has become a place of considerable commercial importance. This canal, which derives its name from the parish, branches off from the Grand Junction canal near Norwood; and, passing through the parishes of Ealing, Northall, Greenford, Perivale, Harrow, Acton, Fulham, Twyford, and Wilford, as well as the detached parts of Chelsea and Kensington, terminates at this village in a large basin, on the sides of which are convenient wharfs and warehouses, belonging to the Paddington-canal company. The advantages of this cut must be obvious to every one at all acquainted with the inland navigation of this country. By entering the Grand Junction canal, it affords to Paddington, directly or indirectly, a navigable communication with almost every trading or manufacturing town in the kingdom. The Regent's Canal, which connects the Paddington Canal with the river Lea, and consequently with the Thames below London, was opened on the 1st of August last. This canal, which has been nearly seven years in making, unites all the principal canals in the kingdom with the river Thames. From its commencement, to the termination at Limehouse, it extends nearly nine miles, and within that space are comprised 12 locks and 37 bridges. The construction of the former is on so excellent a principle, that only three minutes and a half are occupied in passing each of them. The work was projected by J. Nash, esq. the royal architect, under whose superintendence it has been completed. The tunnel under Islington-hill is about three quarters of a mile in length, and passes beneath the bed of the New River.

Paddington manor in ancient times constituted part of the possessions of Westminster Abbey. At the dissolution it was annexed to the bishopric of Westminster; and, when that see was abolished, which was soon after its establishment, Edward VI. transferred it to Ridley bishop of London, and his successors, along with the advowson of the church, which is supposed to have first become parochial

rochial about the same time. The church, since that period, has been twice erected: first by Sir Joseph Sheldon, lessee of the manor, little more than a century ago; and again in 1791, by the parish, under the authority of an act of parliament. It is a square building, with a projecting wing on each side, and a portico of the Doric order fronting the south. Several persons of note lie buried both in the church and in the surrounding cemetery; among whom are John-Henry marquis of Landown, Dr. Geddes, and the celebrated statuary Banks.

Paddington parish, according to the late parliamentary returns of 1811, contains 935 houses, and a population of 4609 persons. A charity-school, established here in 1802, for thirty boys and the same number of girls, is supported by voluntary contributions; and there are several alms-houses for the accommodation of the poor, the gifts of various benefactors. And Mrs. Wakefield adds, the strange custom is observed, on the Sunday before Christmas-day, of throwing bread from the church-steeple, to be scrambled for by the populace, in consequence of a gift from two maiden ladies.

Craven-hill, near this place, is named from that lord Craven who so nobly exerted himself at the calamitous periods of the plague and the great fire of London. He gave a piece of ground as a burial-place for those who died of the pestilence, which was exchanged for a field on this estate, still liable to the same use, should that awful sickness ever again visit London.

Baywater is a hamlet in this parish. The public tea-gardens here, were the gardens of the late Sir John Hill, who here cultivated his medicinal plants, and prepared from them his tinctures, essences, &c. The reservoir at Baywater was intended for the supply of Kensington palace; and the property was granted to the proprietors of the Chelsea water-works, on their engaging to keep the basin before the palace full. The wheel at Hyde-Park wall, near Knightsbridge-chapel, was made for the conveyance of this water. The conduit at Baywater belongs to the city of London, and supplies the houses in and about Bond-street which stand upon the city-lands. The Queen's Lying-in Hospital, instituted in 1752, for delivering poor women, married or unmarried, was removed here in 1791 from its former situation near Cumberland-street. It is an excellent institution.

Tyburn is another hamlet in this parish; as to which, see the article LONDON, vol. xiii. p. 118 and 576. See also Lyfons's Environs of London, 1795, and Suppl. 1811. Priscilla Wakefield's Perambulations in London; Lambert's London; the Ambulator, &c.

To PAD'DLE, *v. n.* [*patouiller*, Fr.] To row; to beat water as with oars.—*Paddling* ducks the standing lake desire. *Guy*.—To play in the water.—A wolf, lapping at the head of a fountain, spied a lamb *paddling* a good way off. *L'Estrange*.—The brain has a very unpromising aspect for thinking: it looks like an odd sort of bog for fancy to *paddle* in. *Collier*.—To finger.—Or *paddling* in your neck with his damn'd fingers. *Shakespeare's Hamlet*.

To PAD'DLE, *v. a.* To feel; to play with; to toy with:

But to be *paddling* palms and pinching fingers,
As now they are, and making practis'd smiles,
As in a looking-glass: Oh! that is entertainment
My bosom likes not. *Shakespeare's Wint. Tale*.

PAD'DLE, *f.* [*pattal*, Welsh.] An oar, particularly that which is used by a single rower in a boat.—The *paddles* used by the natives of Africa, America, and some of the islands in the South Sea, are made of light wood of various shapes, but mostly shorter and broader in the blade than our oars; and, instead of rowing with them horizontally like an oar, they manage them very dexterously in a perpendicular manner, either for rowing or steering. *Chambers*.—Any thing broad like the end of an oar. A small iron instrument for digging holes in the earth.—Have a *paddle* upon thy weapon. *Deut.* xxiii. 13.

PAD'DLE-STAFF, *f.* A staff headed with broad iron.—Besides the *paddle-staff* and other ceremonies. *Bp. Hall*.

PAD'DLER, *f.* One who paddles:

He may make a *paddler* in the world,
From hand to mouth, but never a brave swimmer.

Beaum. and Fletcher.

PAD'DOCK, *f.* [*parjuc*, Sax. a park.] A small inclosure for deer or other animals.—Delectable country-seats and villas environed with parks, *paddocks*, plantations, &c. *Evelyn*.

PAD'DOCK, *f.* [*pada*, Sax. *padde*, Dutch.] A great frog or toad.—The *paddock*, or frog-*paddock*, breeds on the land; is bony and big, especially the she. *Walton*.

Where I was wont to seek the honey-bee,

Working her formal rooms in waxen frame;

The grisly toad-stool grown there mought I see,

And loathed *paddocks* lording on the same. *Spenser*.

PAD'DOCK-PIPE, *f.* in botany. See *EQUISETUM*.

PAD'DOCK-STOOL, *f.* [from *paddock*, a toad.] A toad-stool; a kind of poisonous mushroom.

PADDY, [Indian.] Rice in the husk, whether dry or green.—More writers than one have made the mistake of considering *paddy* as an inferior kind of rice. It is nothing but the rice in the husk; and it is indeed surprising that such an error should not have been long ago corrected. *Bertolacci's View of Ceylon*, 1818.

PADDY (for Patrick), a familiar term or nick-name, which is given to a native of Ireland; as John Bull is applied to an Englishman, and Sawney (Alexander) to a Scotchman.

PA'DENS, *f.* A sort of bitter almonds from Persia, which are used at Surat for money, about sixty of which pass for one pice, which is less than a halfpenny.

PADEPAT'NAM, a town of Hindoostan, in the Carnatic: thirty-five miles south-south-east of Tanjore.

PA'DER, a river of Westphalia, which rises near Paderborn, and, about three miles from the town, being joined by two other streams, forms the Lippe.

PADERBORN, a duchy of Germany, in the circle of Westphalia, has the county of Lippe on the north and west; Hesse-Cassel and Waldeck on the south; and Munster, with the duchy of Westphalia, on the west. Its greatest length from east to west is about forty miles; and its breadth, where widest, thirty: some parts of it yield good pasture, and breed abundance of cattle; but it is not very fruitful in corn. There is a heath called the *Seme* or *Sende*, of great extent, but very barren and desolate. There are, however, good iron-mines in the country, with salt and medicinal springs, plenty of deer and other game; and it is watered with several rivers abounding in fish, as the Weser, the Dimer, the Diver, the Nette, the great Emmer, the Lippe, the Alme, and the Pader. It contains fifty-four parishes, in which are twenty-five market-towns, and sixteen monasteries. The Roman Catholic is the predominant religion of the country, but there are also many Protestants in it. The bishopric was erected by Charlemagne, towards the close of the eighth century, and the cathedral was consecrated by pope Leo in person, anno 796. The bishop was sovereign of the country, a prince of the empire, and suffragan of the archbishop of Mentz. His revenue was about 30,000 pounds a-year, and he was able to raise 3000 men. In 1802, this bishopric was given to the king of Prussia; and, by the peace of Tilsit, 1807, became a province of the new kingdom of Westphalia. In 1815, by the treaty of Vienna, it was given back to the king of Prussia.

PADERBORN, the capital of the above bishopric. It stands forty miles north-west of Cassel, fifty south-east of Munster, and sixty south-west of Hanover; being a large, populous, well-built, and well-fortified, city. Its name is compounded of *pader*, a rivulet, which rises just under the high altar of the cathedral, and *born*, a spring. It was one of the Hanse-towns; and, till 1604, an imperial city. The cathedral is a grand fabric, inferior to few in the empire. There is a gold crucifix in it of sixty pounds weight, presented by Otho II. The university.

of

of which the Jesuits had the direction, was founded in 1592; and the walls were built in the beginning of the eleventh century. In 1530 an attempt was made to introduce Lutheranism; but sixteen of the principal citizens who had embraced it were executed, and the rest obliged to abjure it. Duke Christian of Brunswick carried off from hence, in 1692, the silver images of the twelve apostles, and the silver coffin of St. Lotharius; and had them coined into money, with this inscription, "God's Friend, the Priest's Enemy." The trade of this town, though formerly great, is now inconsiderable; and the inhabitants subsist mostly by agriculture and breeding of cattle. This city was chosen by Charlemagne as a place of abode, when he wished to put an end to the Saxon war of thirty years' duration; accordingly he fixed his camp here, and erected it into a bishopric, which was confirmed by pope Leo. Hence the town became considerable, and several diets were assembled here. At present it has much declined, and its trade is become insignificant. Besides the cathedral, it has a collegiate and two parish churches. Lat. 51.40 N. lon. 8.54 E.

PADERNA, a town of Portugal, in the province of Algarve: nine miles north-east of Silves.

PADEW', a town of Poland, in the palatinate of Sandomirz: thirty-two miles south-west of Sandomirz.

PAD'ICHAM, a township of Lancashire, with 2118 inhabitants, including 965 employed in trade and manufactures: six miles north-east of Blackburn.

PADIL'LA (Lorenzo de), a Spanish antiquarian of great eminence, who was one of the historiographers to the emperor Charles V. He took infinite pains in preserving Roman inscriptions, and ascertaining the classical geography of Spain. His papers upon this subject came into the hands of Florian de Ocampo, who is said to have availed himself of them ungenerously, without acknowledging his obligation. Among other works he left a General History of Spain, in four parts. A few sheets which have accidentally been preserved, prove that it had been committed to the press, though the impression, it cannot now be known why, was never completed. The manuscript exists in the Dominican library of St. Paul, at Cordova. Padilla is also one of the earliest genealogical writers of the Spaniards, having been led to this subject in the course of his antiquarian researches. *Gen. Blog.*

PAD'NUM, now *Bondeno*, a town on the Po, where it begins to branch into different channels.

PAD'LEE, a town of Hindoostan, in Guzerat: ten miles south of Durrampour.

PAD'LOCK, *f. [padde, Dut.]* A lock hung on a staple to hold on a link:

Let all her ways be unconfin'd;
And clap your *padlock* on her mind.

Prior.

To PAD'LOCK, *v. a.* To fasten with a padlock.—Let not such an unmerciful and more-than-legal yoke be *padlocked* upon the neck of any Christian. *Milton's Colapserion.*

PAD'MA, or **PEDMA**, in mythology, an attribute of the Hindoo deity Vishnu, which in pictures and statues is generally seen in one of his four hands, in the form of a lotus, for which *lovely aquatic padma* is a Sanscrit name. Pedma is a name of Lechemy, consort of Vishnu, as is also Pedmala, and Pedmalaya. Pedma-devi, meaning "goddess of the lotos," is a name likewise given to Lechemy, and sometimes to Parvati, the consort of Siva. Pedma-nabha, and Pedmachma, denoting "lord or possessor of the pedma, or of Lechemy," are other names of Vishnu. One of the eighteen sacred mythological poems is named Padma Purana. See **PURANA**.

PADO'GI, *f.* A punishment used in Russia. The body of the criminal is stripped to the waist, and then laid upon the ground; one slave holds the head of the person to be punished between his knees, and another the lower part of the body; then rods are applied to the back

till some person gives notice to desist, by crying out, Enough! This punishment is considered in Russia merely as a correction of the police, exercised on the soldier by military discipline, by the nobility on their servants, and by persons in authority over all such as are under their command. After the accession of Elizabeth to the throne of Russia, the punishments were reduced to two kinds, viz. the padogi and the knout.

PADO'LA, a town of Italy, in the Cadorin: twelve miles north-north-east of Cadore.

PADONGMEW', a town of Birmah, on the Irawaddy: six miles south-west of Prone.

PA'DOR, a town of Africa, in Damel, on the Senegal. Lat. 16.40 N. lon. 14.20 W.

PADOUCAS, a western branch of the river Missouri. The Indians inhabiting its banks are called Padoucas, and said to have been of Welsh origin.

PADRA'MA, a small island near the coast of Sardinia. Lat. 40.38 N. lon. 9.53 E.

PAD'LAN BA'Y, a bay on the south-east coast of Cochinchina. Lat. 11.24 N. lon. 108.40 E.

PADRE'AH, a town of Hindoostan, in Guzerat: ten miles north of Baroach.

PADRO'ENS, a town of Portugal, in the province of Alentejo: thirteen miles west of Mertola.

PA'DRI, *f.* in botany. See **BIGNONIA**.

PA'DRON (El), a town of Spain, in Galicia, on the Ulla; anciently called *Iria Flavia*: fifteen miles south of Santiago.

PADSHAWPOUR, a town of Hindoostan: thirty miles south of Delhi.

PAD'STOW, or **PETROCKSTOW**, a market and seaport town in the county of Cornwall, is situated on the west side of Padstow haven, near the mouth of the river Camel or Allan, which falls into the Bristol channel. It is distant 243 miles west-south-west from London, and 30 miles west-by-south from Launceston. This town is of considerable antiquity; and is said to be the spot where St. Patrick founded the first religious house in Cornwall, when he arrived from Ireland, in the year 432. It was first called *Petrockslow*, from St. Peter, and afterwards *Adelslow*, from king Athelstan, who, according to tradition, conferred many privileges on the inhabitants. The market is on Saturday; and here are two fairs, April 29, and Oct. 2. The harbour is among the best on the north coast, though much obstructed by sand, except in the middle channel, by which vessels of large burden may enter, and find a commodious anchorage. Padstow is governed by a portreeve, assisted by a certain number of the most respectable inhabitants. Its chief support is derived from the share it possesses in the pilchard-fishery, and the custom of the numerous small vessels which resort to the harbour in the event of contrary winds, or stress of weather. From this port also large quantities of slate are exported and carried coastwise. This place is convenient for sea-bathing; and machines, for the accommodation of the public, are to be had of course.

The church is an ancient gothic structure, dedicated to St. Petroch, or Patrick, from whom the town has its name. Here is also a Sunday-school, well supported; and, lately, a national daily school. This parish, in 1811, contained 237 houses, and 1498 inhabitants.

Humphrey Prideaux, dean of Norwich, the author of the *Connection of the Old and New Testaments*, was a native of Padstow; and Prideaux-castle is, as we believe, still occupied by a descendant of that learned and worthy divine. It is a fine old (manorial) house, beautifully situated near the town, and commanding an extensive view of the harbour, town, and country round.

The country from hence to St. Ives is both fruitful and pleasant, and several other gentlemen's houses are met with; the sands are also very agreeable to the eye, and to travel upon. The hills are fruitful of tin, copper, and lead, all the way on the left hand; the product of which is carried to the other shore, so that we have little

to say of it here. The chief business on this shore is the herring-fishery: the herrings about October come driving up the Severn sea and from the coast of Ireland in prodigious shoals, and beat all upon this coast as high as Bideford and Barnstaple in Devonshire; and are caught in great quantities by the fishermen, chiefly on account of the merchants of Falmouth, Foy, Plymouth, and other ports on the south.

Not far from Padstow lies the respectable and immaculate borough of St. Michael's, which we introduced to the notice of our readers at vol. xv. p. 322. *British Directory*, vol. iv. *Beauties of England*, vol. ii.

PADUA, a city of Italy, and capital of the Paduan, situated on a small river, which runs into the Brenta. The Romans granted the inhabitants the right of citizens, and leave to choose a senate. It was destroyed by Attila, repaired by Narfes, and again destroyed by the Lombards: often ravaged, and as constantly re-established. In 1406, it was taken from the duke of Milan by the Venetians, and, with the territory, annexed to that republic. See PADUAN.

Padua is of large extent, and is intersected by a canal. It is in the form of a triangle, measuring 1735 paces in length and 1450 in breadth, and is surrounded with broad ditches 7000 paces in circumference, with twenty bastions, and walls 6200 paces in contour. The town is besides encircled, at the distance of a mile, with the *spiata*, or esplanade, which was made by the government of Venice, anno 1513, after the war with the emperor Maximilian; but the fortifications were in a very bad condition at the commencement of the French war, and have since undergone some reparation. The houses, which are very high, distinguish themselves but very little in point of architecture, and have on each side low arcades or piazzas, which have hitherto much favoured nocturnal assassinations. The following belong to the principal buildings: The palace della Raggione, or the town-house, represents an oblique quadrangle; it is supported by galleries, resting on 56 large, and 580 small, red-and-white pillars of marble; at the east and west ends are two staircases, 50 steps high, which lead to an arched saloon, without any supporting pillars. This fabric is 256 feet in length, 86 broad, and 75 high, and is the most spacious in the world. As a foundation of this structure, in the year 1132, large piles were driven into the ground, and their interstices filled-up with masonry to a level with its surface. The foundation remained in this state until the year 1209, that it might settle and become firm and compact. In that year the walls were raised up to the windows; and in 1218 they were totally completed. In the year following the saloon was roofed; and in 1306 it was arched with great art, and covered with lead, after the plan of friar John, a monk well skilled in architecture. This saloon contains, besides the elegant bust of the Roman historian Livy, a native of Padua, many inscriptions and busts of celebrated persons; for example, that of Livy Halys, an emancipated slave of Levia, fourth daughter of Livy; that of Redaw; of the philosopher and poet Speroni; of the marchioness of Obizzi, killed, anno 1661, on account of her chastity; of the chaste Paduan lady Bianco de Rossi, murdered on the grave of her husband by the voluptuous Ezzelin; and over the door is an inscription of the celebrated philosopher and physician Peter of Abano. Of peculiar value are the many paintings *al fresco*, of which the uppermost row alone contains 319. Near the town-house is the palace of the *podesta*, or chief-justice of the city, and remarkable on account of its pending saloon of the Doric order in the second story, and of its good paintings. The palace of the commandant, built in the Ionic and Corinthian orders, with a large portal of the Doric order, by Falconetto, is a master-piece of architecture; its front was begun in 1599, by the commandant Auton Priuli, and completed, anno 1605, under Stephen Viario. The turret above the portal contains a clock of curious workmanship, made in the year 1428;

which points out, besides the hour of the day, the days of the month, the motion of the sun through the signs of the zodiac, and the aspects of the moon. The inside of the palace displays great magnificence and convenience; it has fine paintings, and a public library, placed in a large saloon, called the Giant's Hall. At the entrance of the court-yard, near the church-yard of the dome, stands the splendid triumphal arch, erected in honour of the commandant Alvise Valeresio, for having rendered signal services to the city during the plague in the year 1631. It was built by the statuary and architect John Baptist della Scala. Close to the palace of the commandant are the public institutions for advancing money on pledges, which were founded by Vincenzo Datto, a nobleman and mathematician of Padua, and are supposed to be the most ancient in Italy. The front of this edifice was completed in 1618; the portal is adorned with four Doric pillars, and the superior part of the building embellished with as many, but of the Composite order. The above public institutions were erected in 1491, which occasioned twelve pawnbrokers' shops, kept by Jews, to be shut up, since the former demanded only five per cent. interest, while the latter exacted twenty. In the Lord's Square, as it is called, stands the lodge or council-hall, with two staircases of marble; it was begun to be built, 1494, after a model of the architect Alexander Bassano, and the whole was finished in 1761; it contains several good paintings.

The college, or university, built in a noble style by Sansovino and Palladio, during the years 1493 and 1552, at the expense of the Venetian government, goes also by the appellation of *Il Bo*, on account of an inn that stood here formerly with the sign of a bullock; it contains many statues and coats of arms of celebrated persons. This university, which formerly enjoyed great celebrity, was founded by the emperor Frederic II. during his disagreement with the pope. From a *lyceum*, which it was in the year 1020, it enjoyed great repute till 1200; and the said emperor erected it, 1222, into an university, and endowed it with all the privileges formerly enjoyed by the university of Bologna, together with other immunities. In the year 1260, the university became a separate body, entirely distinct from the burghers of the town, and governed itself according to its peculiar statutes; obtaining in 1262 the confirmation of pope Urban IV. and in the year 1345 that of pope Clemens. It is indebted for its rapid progress, during the period from 1308 to 1404, to the prince of Carara, its former sovereign; in the last-mentioned year it came under the Venetian dominion. Its new sovereigns studied unremittingly its welfare, appointing the most celebrated professors, and augmenting the various salaries; so that the university dates its golden age from this period. The number of students frequently amounted to 8000; they formed forty different countrymanships, among which the German, French, English, Polish, and Greek, were the most numerous, and enjoyed peculiar prerogatives, which in part still exist. This university has at all times formed celebrated men; and among its scholars are to be numbered Plutarch, Galileo, and Columbus: we may also mention Gabriel Fallopius, who, in 1551, was professor of anatomy and surgery of this place, well known from the discovery he made of the *tube Fallopiana*. See vol. vii. Since the year 1722 this university has been on the decline; the number of students at present amounts scarcely to 600, among whom are several Jews, Turks, and Greeks, studying physic. The salaries of the professors are rated at from 300 to 2000 silver ducats per annum, and all the lectures are given gratis; it is however to be lamented that the vacations last near six months. The anatomical theatre was built in 1594, in the form of an inverted cone, after the plan of Fra Paolo Sarpi. It may contain 600 persons, seated on benches, placed in the form of an amphitheatre, so that they are able clearly to discern the operations of the professors. The instruments belonging to experimental philosophy, collected by the celebrated mathematician mar-

quis John Polani, are as complete as any in Europe; but the cabinet of natural history, presented to the academy by Valisneri, is of little importance. The school for midwifery, founded by D. Aloysius Calza, of Bologna, which is enriched with all the anatomical preparations, &c. of John Baptist Morgagni, may be classed among the first institutions of that kind. The botanical garden is not very spacious, but situated on an agreeable spot, between the churches del Santo and St. Justina, on a small rivulet. It has a circular form, 250 feet in diameter, and contains a most complete collection of plants, both indigenous and exotic; it was laid-out anno 1545, after a plan of the architect Andrew Riccio, and was the first botanical garden in Europe. An observatory has been lately erected for the benefit of astronomy, on the tower of the *old citadel*, which is 130 feet high, and was formerly the residence of the noted tyrant Ezzelin. Near this observatory is the new school for civil architecture, for the instruction of carpenters, masons, and statuarys, the most diligent and skilful of whom obtained annually from the old government a gold prize-medal of the value of four zechins. The chemical laboratory, with an auditory belonging to it, was established at the expense of the Venetian government, by the learned count Mark Carban, of Cephalonia. A public school of agriculture, with a very extensive garden, situated near the convent of hermits, for the purpose of making new experiments, was instituted in 1761. The academy of sciences, founded as early as the year 1520, was publicly and solemnly confirmed in the year 1779, under the title of *Accademia della Scienze, Lettere, et Arti, di Padova*. The seminary generally known by the name of *Accademia Delia*, is entirely of a military nature: it owes its origin to the commandant of Padua, Peter Duodo. Its emblem is the isle of Delos, with the motto, *Nunc tandem immota*. The academicians must all belong to the nobility of Padua, and their number not exceed sixty; but the academy, at present, is on the decline, and has not even a professor of mathematics and military architecture. The new theatre is remarkable partly on account of its great size and masterly architecture, and partly on account of its excellent and convenient disposition, decorations, and paintings. It was built by the architect John Gloria, and opened for the first time in the year 1751. Operas are most frequently given here in the summer-season; for it is as lively here at this season as it is in winter at Venice, to which place the opulent of Padua resort during the winter. A great number of the rich and principal inhabitants of Upper Italy visit Padua during the fair, which lasts three weeks, beginning on St. Anthony's-day, in the middle of June.

Among the principal buildings, including ninety-six churches, twenty-two monasteries, twenty-three nunneries, sixteen hospitals, and several other public oratories and charitable corporations, the following deserve peculiar notice; viz. The metropolitan church, which, from the year 1524 until 1754 has gradually obtained its present form, contains some good paintings by Giotto (the restorer of the art of painting), by Campagnola, Palma the younger, Bassano, &c. Divine service is performed in this church by twenty-seven noble canons, twelve noble sub-canons, and other inferior ecclesiastics; its revenues amount to upwards of 100,000 scudi. The library of the canons contains a number of rare editions and good manuscripts. The great and rich church of St. Anthony of Padua, commonly called *Il Santo*, was built with from six to eight small domes or cupolas, in the Gothic style, by the celebrated architect Niccolo of Pisa. It is indeed only the second in rank; but, considering its tutelary saint, who is the patron of the city, its riches, its numerous paintings and sculpture, with which it is rather encumbered than adorned, it may be classed among the most magnificent churches, not of this town only, but of all Italy. In the church we notice the chapels del Santissimo, of St. Anthony, and of the apostle Jacob, &c. Farther, the bronze girandole eleven feet high, standing

upon a pedestal of white marble four feet high, and containing a universal collection of sculpture; it was completed in a space of ten years by the architect and sculptor Andrew Riccio, who obtained for it 3720 Venetian liras. It has likewise splendid altars and monuments; and in the church-square stands the statue of the celebrated Venetian general Erasmus de Narni, called Gattamelata, on horseback, and deserves peculiar attention. This statue, which the state caused to be erected in honour of the general for his eminent services, stands on a pedestal of bronze, and is the work of Donatello, an artist of Florence.

The school of St. Anthony, as it is called, contains some elegant paintings *al fresco* by Titian. The next in rank, but superior with regard to architecture, is the church of Santa Justina, which belongs to the nuns of the order of St. Benedict, and was built by Andrew Riccio, properly called Andrew Crispus Brionius. In the year 1501 the old building began to be demolished; and in 1515 the foundation of the present church was laid. Interior magnificence has been united with noble simplicity; and, notwithstanding the brilliancy of its external ornaments of metal, paintings, and sculpture, yet the main purpose of the whole, and the character of a sanctuary of the Divinity, have not been lost sight of; so that at the entrance of this fabric no confusion of objects obstructs a general survey of its structure. It is 368 feet in length, 252 in breadth, and 133 feet high. Exclusively of all this, it possesses a whole well of very profitable jewels, namely, the bones of martyrs who were executed in the square before the church; and of these jewels the French did not think proper to rob them; nor, of course, have their new masters, the Austrians. Among these precious relics are to be reckoned the supposed or pretended corpses of the evangelist Luke and the apostle Matthew. Equally splendid and tasteful are the abbey of the Benedictines, and the convent, with its six court-yards, provided with covered passages and colonnades. This building possesses also paintings of great value. The library contains upwards of 52,000 volumes, and is remarkable for its elegant saloon, and sculpture in wood; yet the monks visit it by far less frequently than they do their cellars, which are filled with the choicest wines. In the above-mentioned church-square, which contains four fields, the fair is kept, together with horse-races and a market for cattle. It is all round adorned with statues of celebrated personages, natives of Padua. The church of the Hermits of St. Austin was the first in Padua; it was roofed with tiles in the year 1306. This church possesses a real treasure in paintings by the greatest masters; viz. by Guido Reni, Femicelli, Treviso, Stephen dall'Arzere, Guariento, Andrea Mantegna, Niccolo Pizzolodi, &c. The monks of this church possess a good library, consisting chiefly of rare manuscripts. The church St. Annunziata nell'Arena was painted entirely *al fresco*, about the year 1306, by Angelotto, under the direction of Dante the poet, who at that time arrived in Padua. In the spacious and oval area before the church stands the elegant palace of the Venetian family Foscari, the outer walls of which are the remains of an ancient amphitheatre. The church of the Dominicans is extremely ill built, but possesses some valuable paintings and sculpture. Farther, the churches of St. Andrew, of St. Giorgio nel Cimiterio di St. Antonio, of St. Sebastian, of St. Battista dalle Nani, of St. Giovanni di Verdara, appertaining to the knights of Malta, of Santa Magdalena, of St. Massino, the church of the seminary Santa Maria di Vanzo, the convent St. Francisko, the church of St. Michael, and that of the association of St. Rocco, all contain valuable remains of excellent paintings. But the house Camillo, in the parish of St. Daniel, possesses the most important collection of paintings in Padua. The library of the Olivetan convent, near St. Benedetto Novello, is remarkable only for having been founded by the poet Tasso.

Of the seven gates of the town, three only, which were built

built at the expense of the republic of Venice, deserve to be noticed, on account of their elegance, and the resemblance they bear to triumphal arches; namely, the gate of St. John, on the road to Vicenza, which was built by the architect John Maria Falconetta, and is adorned externally with four Corinthian pillars, and towards the town with as many pilasters; the Porta Savanarola, by the same, is of the Composite order, has four pillars, and a double attic foundation; and, lastly, the Portello, on the road to Venice, which is the neatest of all, and built by an unknown architect. Its external front consists of eight double-fluted columns of the Composite order.

The number of the inhabitants of this fine city is estimated at 40,000; they are in general poor, from a propensity to indolence and begging. The usual professions are very sluggishly carried on; and the sail-cloth manufacture, which was so celebrated through all Italy for the goodness and strength of its fabric, is at present but very indifferent. Commerce, which, if carried on with more activity, might, on account of the Anthony-fair, become important, is at present of no consideration, and almost entirely in the hands of the Jews. Padua is twenty-two miles west of Venice, and fifty east-north-east of Mantua. Lat. 45. 24. N. lon. 10. 52. E.

PADUAN', a country of Italy, bounded on the north by the Trevisan, on the east by the dogado of Venice, on the south by the Polesino, and on the west by the Vicentin; about thirty-five miles from north to south, and twenty-eight from east to west; and including the above splendid city. The air is wholesome and pure, except the few places situated near the salt-marshes. The greatest part of the soil is flat; and even the mountains bear a closer resemblance to hillocks than mountains, and produce grapes of excellent flavour, oranges, and other fruit. Exclusive of corn, hemp, rice, lemons, oranges, figs, dates, peaches, melons, artichokes, spinach, and all kinds of vegetables; the whole face of the country is chiefly planted with vines; which, according to the Italian custom, wind round the willows, elms, poplars, &c. and are also planted along the walks, reaching in the form of garlands from one tree to another, and serve as borders to the corn-fields. Farther we find here numerous commons for the breeding of cattle, and an abundance of mulberry-trees for the culture of silk, the trade of which is very considerable. In short, this country may with justice be termed a second Paradise, and the garden of Europe. The inhabitants of the Paduan are 300,000 in number; and the four rivers, viz. the Adige, Brenta, Bachiglione, and Musona, notwithstanding their overflowing their banks, subjecting the inhabitants to great losses, yet contribute much to the flourishing condition of this country, as they greatly promote navigation and commerce, and drive a great number of mills. In 1405, this country came under the dominion of Venice; and was afterwards declared, by the peace of Bologna, in 1529, to belong *for ever* to this state. The French republicans, however, unsettled many of these everlasting treaties; and, in 1797, the Paduan was given by them to the emperor, and became a part of Maritime Austria; in the year 1805, this territory was resumed by the French, when Napoleon became Emperor of France and King of Italy. By the late peace, 1815, it has been restored to Austria. The chief places, after Padua, are—Anguillara, Arquà, Campo St. Pietro, Cittadella, Este, and Montefelice. *Oppenheim's Hist. of Maritime Austria*, 1798. *Eustace's Classical Tour in Italy*, 1813.

PADUAN, *f.* Among medalists, a modern medal made in imitation of the antique; or a new medal struck with all the marks and characters of antiquity. The name is taken from *Paduan*, *Paduanus*, a famous Italian, who succeeded so well in the imposture, if it may be so called, that the best judges are at a loss to distinguish his medals from the genuine ones. This Paduan was thus called from the place of his birth, Padua: his proper name was *Giovanni Cavino*; others say, *Louis Le*; he flourished in the seventeenth century. See the article *ΜΕΔΑΛ.* vol. xiv. p. 828.

PADUANINO, an Italian painter, whose real name was DARIO VAROTORI, but he is better known under the one by which we have designated him. He was born at Verona in 1539; and, at first, attached himself to the study of architecture, but afterwards received instructions in painting from Paul Veronese, and became a very skilful artist. His fame rests principally upon the pictures he painted for the churches in Venice and in Padua, whence his name; but there are many very graceful and agreeable productions of his, upon a smaller scale, scattered about, and some few are found in this country. They indicate a lively and brilliant genius; and exhibit the gay effect of the Venetian style, which he adopted in a pleasing manner. He was renowned for his piety as well as for his ingenuity; and, in the act of returning thanks at the shrine of the Virgin, in Padua, for having been miraculously preserved when a scaffold had broken and fell with him, he was smitten with apoplexy, and died at the age of fifty-seven, anno 1596.

He left a son, ALEXANDER VAROTORI, called also *Paduanino*, who was not so successful as his father, though he was not without merit. He died in 1650, at the age of sixty.—A daughter also of Dario's excelled in portraiture. Her name was *Chiari*, and she is highly praised by Rodolfi.

PADUASOY', *f.* [*Padou de soye*, Fr.] A kind of stuff made originally, it is supposed, at Padua, and composed of nearly equal parts of cotton and silk.—He was dressed that day in as high a style as the clerical function will allow; in a *paduasoy* gown, square velvet cap. *Sheridan's Life of Swift*.

PAD'ULA, a town of Naples, in the province of Otranto: four miles north of Nardo.

PAD'ULA, a town of Naples; in the Principato Citra: fourteen miles north of Policastro.

PA'DUS, *f.* in botany. See PRUNUS and SIBEROSYLON. PA'DUS, in ancient geography, a river often called *Eridanus*, especially by the Greeks. It is famous for the fable of Phaeton (Ovid). It rises in Mount Vesulus, in the Alps Cothice, from three springs, dividing the Cisalpine Gaul into the Transpadana and Cispadana, (Strabo); and, swelled by other rivers falling into it, on each side, from the Alps and Appennines, it discharges itself with a course from west to east, at seven mouths, into the Adriatic. The lake through which it discharges itself into the sea, is called by the natives the *Seven Seas*. The origin of the name has been traced by etymologists to a corruption of the Celtic *boden*, whose root is *bod*, or *pot*, and refers to its height and depth. According to Pliny it received thirty rivers; but Cluvier reckons as many as forty; under which number they must have comprehended many torrents which become dry in summer. It is now called the *Po*.

PADU'SA, the most southern mouth of the Po, considered by some writers as the Po itself. It was said to abound in swans; and from it there was a cut to the town of Ravenna. *Lempriere's Classical Dict.*

PADU'TI, a town of Naples, in Calabria Citra: four miles east of Rosano.

PÆ'AN, *f.* [from the Gr. *παῖναι*, to praise, or *παινέω*, to cure.] A hymn in honour of Apollo, either as a song of praise for a victory by his means, or addressed to him as the inventor and patron of the healing art. But the word has been generalized, and applied to any hymn in honour of the gods. The acclamation *Io*, which generally accompanied *Pæan* as the burden of the song, means *Jupiter*, *Io Pater*; an abbreviation of the tetragrammaton *יהוה*, *Jehovah*. *MS. Gleanings in Etymology*, communicated by the Author.

O may I live to hail the glorious day,
And sing loud *pæans* through the crowded way. *Rosecommon.*
See from each clime the learn'd their incense bring;
Hear in all tongues consenting *pæans* ring. *Pope.*

PÆAN, or Pæon, is also a name of a foot in the ancient poetry;

poetry; so called, as commonly supposed, because appropriated to the hymn *Pæan*; though Quintilian derives the name from its inventor *Pæon*, a physician.—There were four kinds of feet called *pæans*. The first consists of four syllables, one of which is long, and the rest short, as *colligere*; the second is composed of a short, a long, and two shorts, as *resolvere*; the third, of two long, a short, and a long, as *communeant*; and the fourth, of three short and one long, as *temeritas*. *Chambers*.

PÆCIIA, *f.* in ichthyology, a name given by Schoeneveldt to the *Cobitis fossilis*.

PÆDARETUS, a Spartan who, on not being elected in the number of the 300 sent on an expedition, &c. declared, that, instead of being mortified, he rejoiced that 300 men better than himself could be found in Sparta. *Plutarch*.

PÆDERIA, *f.* [so called by Linnæus from *pæderos*, an opal, in allusion to the transparency and changeable colour of its berry.] *OPAL-BERRY*; in botany, a genus of the class pentandria, order monogynia, natural order of contortæ, (rubiacæ, *Juss.*) Generic characters—Calyx: perianthium one-leaved, turbinate, five-toothed, permanent. Corolla: one-petalled, funnel-form, hirsute within; border five-parted, small. Stamina: filaments five, awl-shaped, very short, from the middle of the tube; antheræ oblong, shorter than the corolla. Pistillum: germen roundish; style capillary, bifid, the length of the corolla; stigmas simple. Pericarpium: berry brittle, ovate, inflated. Seeds: two, ovate.—*Essential Character*. Contorted; berry void, brittle, two-seeded; style bifid. There are two distinct species.

1. *Pæderia foetida*, or stinking opal-berry: stamens included. Stem twining, filiform, smooth, and even. Leaves opposite, petioled, cordate, acuminate, quite entire, nerved, spreading a little, paler underneath, an inch long, very smooth, and even. When the plant is young the leaves are lanceolate; but, in its more advanced state, they are ovate. Flowers axillary, in brachiate panicles, coming out successively. Calyx superior, smooth; segments acute, erect, several times shorter than the corolla. Tube of the corolla inflated, white-tomentose on the outside, within purple, white-villose at top. Fruit, a berry crowned with the calyx, globular, when unripe green, very smooth and brittle, commonly two-celled, sometimes, but rarely, three-celled. Seeds two or three. Frequently the calyx is seven-leaved, and the corolla seven-cleft; sometimes the calyx is six-leaved. It is now-and-then found with seven stamens. In drying the plant turns black. It is a native of China, the East Indies, and the island of Mauritius. It is a climbing shrub, with long, smooth, slender, twining, compound, leafy branches, spreading to a great extent over the neighbouring bushes and trees. Rumphius says the leaves are very foetid when rubbed, or when the sun shines upon them, insomuch that those who pass by where the plant grows are greatly annoyed with the smell. This plant is said to have been brought to Kew in 1806, but has not yet flowered. One of Linnæus's specimens from China, on which the shining berries, though dried, are very beautiful, has heart-shaped leaves, exactly like Kämpfer's plate, with very downy stalks both to the leaves and flower. Most specimens accord with the figures of Rumphius and Lamarck; yet we do not see sufficient grounds to distinguish theirs, as a species, from that of Kämpfer.

2. *Pæderia fragrans*, or fragrant opal-berry: stamens not included; leaves elliptical; panicles corymbose; germen downy; tube of the corolla smooth. Gathered in woods in the island of Mauritius by Commerçon, who, taking it for a new genus, named it *Danais*, in allusion to the history of the Danaides, who murdered their husbands; "because," says he, "where the flowers of this plant are luxuriant, the male or the female organs are rendered abortive." This is abundantly distinct from the first species, in its more-elliptical and brighter-coloured leaves; but more especially in its corymbose downy panicles.

downy germen and calyx, and longer more-slender corolla, whose tube is quite smooth, even though the limb be sometimes slightly hairy at the back. The flowers are said to have the scent of a Narcissus, but even more delightful; their colour is red.

PÆDEROTA, *f.* [derivation unknown.] In botany, a genus of the class diandria, order monogynia, natural order of perfonatæ, (scrophulariæ, *Juss.*) Generic characters—Calyx: perianthium five-parted; leaflets linear, equal, spreading, permanent. Corolla: one-petalled, somewhat wheel-shaped, four-cleft, blunt; upper lobe wider, generally emarginate. Stamina: filaments two, filiform, ascending, shorter than the corolla; antheræ converging, ovate, acute, two-valved. Pistillum: germen ovate; style awl-shaped, bent down, the length of the stamens, permanent. Pericarpium: capsule ovate, longer than the calyx, two-celled, opening at top. Seeds: very many, roundish.—*Essential Character*. Corolla four-cleft; calyx five-parted; capsule two-celled. There are three species.

1. *Pæderota Ageria*: leaves ovate-acuminate; helmet of the corollas bifid. Stems simple; the lower leaves alternate, dry, wrinkled, not shining; helmet bifid and entire, ascending. Native of Italy and Carniola. It has the trivial name from Agerius, who first found it near Vicenza.

2. *Pæderota Bonarota*: leaves roundish-ovate; helmet of the corollas entire. Root branched, fibrous, perennial. Stems round, simple, villose, erect. Leaves opposite, acutely-serrate. Corolla yellow, four lines in length, with the lip equally trifid. The cells of the capsule separate in such a manner, that they might be taken for two capsules, if it were not for the single receptacle. Seeds rufous, twenty-five at most in a cell.

3. Micheli's No 2. t. 15. f. 2. with a rounder leaf, is a variety of this. Scopoli has given eight varieties. These are natives of the mountains of Austria, Carniola, and Italy. Micheli named these plants *Bonarota*, from Filippo Bonarota, senator of Florence, fellow of the Botanic Academy there, &c.

3. *Pæderota minima*, a doubtful species: leaves oblong, entire, opposite: flowers axillary, opposite; teeth of the calyxes hirsute within. This has the appearance of *Elatine* hydropiper. Stems an inch and a half high, seldom branched, rooting at the base. Leaves blunt, quite entire, naked. Flowers sessile, solitary. Calyx five-cornered, bell-shaped, with the teeth hirsute within. Native of the East Indies, where it was found by Koenig, on whose authority it is placed in this genus.

4. *Pæderota racemosa*. See *HEMIMERIS montana*.

PÆDO-BAPTISM, *f.* [from the Gr. *païs*, *παῖς*, infant, and baptism.] Infant-baptism, or that conferred on children. Hence,

PÆDO-BAPTISTS are those who maintain that baptism should be administered to infants, as practised in the church of England. In support of this opinion, they plead, that if infants, under the Christian dispensation, were excluded from the privilege of baptism, the Christian institution must appear, in this respect, to be less complete and perfect than that of the Jews; and it is not likely, by arguing *a priori*, that God would appoint an external sign of peculiar distinction and benefit for children under the patriarchal and Jewish constitution, without any similar appointment under the Christian dispensation, more especially as the first proselytes to Christianity, and those in particular who were converted from among the Jews, would naturally expect some token of distinction and privilege, comprehending their children, and resembling in its design, though milder in its nature, that which Christianity had abrogated. This expectation was farther encouraged by the very condescending and affectionate manner in which our Lord expresses himself concerning infants; particularly when he says, Mark x. 14. *Of such is the kingdom of God*; which some understand to signify, that the rights and privileges of the Christian church belong to such.

Mr. Wall has endeavoured to show, from the books of

the Jews themselves, and those of others that understood the Jewish customs, and have written concerning them, that it was the custom of the Jews before our Saviour's time, (and, as they affirm, from the beginning of their law,) to baptise as well as circumcise any proselyte that joined them from other nations, and with him, at his desire, his infant children likewise. Moreover, the advocates for infant-baptism urge more directly the argument from circumcision after this manner: The covenant made with Abraham was a covenant of grace, by which spiritual and eternal blessings were promised to him; (see Matt. xxii. 31, 32. Heb. xi. 6. Rom. iv. 11-17. Gal. iii. 6-18, 29.) and, as such, comprehended both Jews and Gentiles, and their seed. Circumcision was instituted by God as a token of that covenant, and, as such, he commanded that it should be administered to the infant offspring of his covenant-people. Gen. xvii. 1-4. And yet, though the covenant endureth, that ancient token of it is abolished; nor is there any external sign or seal of it, under the Christian dispensation, except baptism. We have, therefore, reason to think, that this ordinance was intended to succeed circumcision, as it resembles it in many respects, and seems to be called the *circumcision of Christ*, by the apostle Paul, Col. ii. 11, 12. And, inasmuch as circumcision was administered to infants, in token of this covenant, baptism, being its substitute and antitype, ought to be administered to infants likewise. Consult *Acts* ii. 39. *Rom.* xi. 17, &c.

The Pædo-baptists acknowledge that there is no direct and express command to baptise infants; but, appealing to the history of the administration of baptism, they apprehend, that they have been able to trace such intimations at least of infant-baptism, in the earliest ages of the church, as may, to a high degree of probability, prove it to be an apostolic, and consequently divine, institution.

Tertullian, about one hundred years after the apostles, though he advises parents to defer baptising their children, except when their lives were in danger, speaks of the practice as generally received and observed in his time. Cyprian, about one hundred and fifty years after the apostles, is allowed by all to speak expressly of infant-baptism as generally used in the church; and there are many passages that expressly refer to infant-baptism in the works of Origen, who was born of Christian parents; and, as his father was martyred in the year 202, when he was seventeen years old, the remoter Christians of his family must have been nearly contemporary with the apostles. In the Apostolic Constitutions also, which are allowed to be very ancient, express mention occurs of infant-baptism, as commanded by Christ.

Such are the arguments in favour of infant-baptism. See, on the other side, the article ANABAPTISTS, vol. i. and BAPTISM, and BAPTISTS, vol. ii. See also, on this subject, Wall's History of Infant-Baptism, 4to. Wall's Defence of the History against Gale, &c. 8vo. Towgood's Baptism of Infants, a reasonable Service. Fleming's Plea for Infants, &c.

PÆDO'PEIA, *f.* [from the Gr. *παις*, a child.] That part of physic which prescribes the proper management of children.

PÆDOTHYS'IA, *f.* [Greek.] An inhuman custom, that prevailed amongst the ancient heathens, of sacrificing their children. Thus it is related in the Scriptures, that the king of Moab, being besieged by the Israelites in his capital, and reduced to great straits, took his eldest son, that should have reigned in his stead, and offered him for a burnt-offering upon the wall; on which the siege was raised. 2 *Kings* iii. 27. From Phœnicia this cruel practice passed into Europe and Africa, and spread itself far and wide; and it is reported that the Mexicans are at present guilty of it.

PÆMA'NI, a people of Belgic Gaul, supposed to dwell in the present country at the west of Luxemburg.

PÆ'NA, in ancient geography, an island of the Atlantic Ocean, west of the province of Tingitana.

PÆNO'E, *f.* in botany, the name of a very large tree which grows in Malabar. The resin, discharged from the root, bark, fruit, and other parts of this tree, when boiled with oil, is used either for a hard or liquid pitch; and is, in the Indian sacrifices, sometimes burnt instead of incense. The kernels of the fruit, when bruised, and, in conjunction with warm water, levigated on a marble, strengthen the stomach, remove a nausea and vomiting, and cure the cholera morbus.

PÆN'ULA, or **PEN'ULA**, *f.* Among the ancient Romans, a thick short close-bodied garment, used for a defence against cold and rain.

PÆ'ON, a celebrated physician, who cured the wounds which the gods received during the Trojan war. From him physicians are sometimes called *pæonii*, and herbs serviceable in medicinal processes *pæonia herba*.

PÆO'NIA, *f.* [so named by the ancients, in memory of Pæon the physician, whom Homer records as having cured Pluto with this herb, when he was wounded by Hercules; but, says Dr. Smith, "we presume its virtues are altogether reserved for such august occasions, they having never been made manifest on any other, as far as we can learn."] The *παιωνία* of Dioscorides evidently appears, by his very particular description, to be our *P. officinalis*. What he distinguishes by the appellation of male and female, are now acknowledged to be two species, though Linnæus considered them as varieties of one.] **PÆONY**; in botany, a genus of the class polyandria, order trigynia, natural order of multifloriqueæ, (ranunculaceæ, *Juss.*) Generic characters—Calyx: perianthium five-leaved, small, permanent; leaflets roundish, concave, reflex, unequal in size and situation. Corolla: petals five, roundish, concave, narrower at the base, spreading, very large. Stamina: filaments numerous (about three hundred), capillary, short; antheræ oblong, quadrangular, erect, four-celled, large. Pistillum: germs two to five, ovate, erect; styles none. Stigmas compressed, oblong, blunt, coloured. Pericarpium: capsules as many, ovate-oblong, spreading and reflex, tomentose, one-celled, one-valved, opening longitudinally inwards. Seeds several, oval, shining, coloured, fastened to the opening future.—*Essential Character.* Calyx five-leaved; petals five; styles none; capsule many-seeded.

1. *Pæonia albiflora*, or white-flowered peony: leaves ternate; leaflets lobed, shining; germs in threes, smooth. Root brown, composed of a few cylindrical or fusiform tubers, a span in length, united at top; the flesh white, with little taste. Stem from a radical leafless sheath, two feet high, the thickness of a reed, slender, round, with scarcely-conspicuous grooves descending from each petiole down both sides; green tinged with red, naked at bottom. Leaves alternate, on long round petioles, channelled above. The whole plant is very smooth, and shining. The stem is often three-flowered, with the axils of the upper leaves putting forth long fastigate peduncles. The calyx is raised above the floral leaf on a very short thick peduncle, and is four-leaved; the two outer leaflets narrow, green, acuminate; the two inner broad-concave, subacuminate, pale-red. Petals eight, very large, milk-white, oval, concave. Stamens about a hundred and fifty, with the filaments as well as antheræ yellow. Antheræ oblong, erect, four-grooved. Seeds, when ripe, of a yellowish testaceous colour, and oval-globular.

It differs from the common peony (*P. officinalis*) remarkably: 1. in having the stem more slender, rounder, scarcely grooved, more rigid; whereas, in *P. officinalis*, it is torosely six or seven grooved; 2. in having the leaves larger, biternate, with broader smoother leaflets, shining very much on both surfaces, undivided, with the veins scarcely prominent underneath; whereas, in that, the leaves are subtriquinate or triternate, with the primary leaflets bifid, the lateral ones frequently accompanied by a smaller accessory leaflet; 3. in having the floral leaf more remote; 4. in the colour of the flower, and especially the pleasant smell, like that of Narcissus; 5. in the smoothness

smoothness of the germs; and 6. in having the root and herb more inspid. It also flowers later. Native of Siberia; well known among the Daurians and Mongols, on account of the root, which they boil in their broth, and the seeds, which they grind and put into their tea: they call the plant *djehina*; in Russian it is *marjin koren bjehyi*.

Of this species Messrs. Anderson and Sabine, in the Linn. Transf. vol. xii. and the Hort. Transf. vol. ii. have described several varieties.

α. *P. vestalis*. This variety, obtained by Mr. Sabine from Messrs Lee and Kennedy under the name of *albiflora*, perhaps more common among our gardens than any other, is to be distinguished by its white eight-petalous corolla, rarely and slightly tinged with pink at the base. Cymes of two or three flowers; the middle flower is the strongest, the earliest, and always the shortest. This observation indeed applies to most of the species. Leaves broader, more flat and shining: and these and the stem, together with the petioles, are altogether of a darker hue than most of the others. The stigmas are of a dull yellow.

β. *P. candida*. Mr. Sabine found this variety at Mr. Knight's nursery, in the King's Road, Chelsea. He had it from the Liverpool botanic garden under the name of *sibirica*; but it is not the plant which generally gets that name; and it differs from the foregoing in having its leaves and stalks less of a purple hue, in its disposition to have fewer flowers on the cyme, and in the stigmas being flesh-coloured instead of yellow. The plant, too, seems weaker. The flowers of this as well as the foregoing go off white (a florist's term); but this has rather a greater dash of pink in its opening corolla.

γ. *P. Tatarica*. Mr. Sabine got this variety from Mr. Biggs, who cultivated it in the botanic garden of the late Mr. Swainson of Twickenham. Another plant of the same was presented to him by the late Sir Joseph Banks, whose hands were always extended to promote objects of science. The original, we believe, was imported by the late Mr. Bell of Brentford, to whom we are indebted for the introduction of several pæonies, by means of his correspondence with Pallas. It came from Tartary. Its hue, though darker, a good deal resembles that of *vestalis*; but its flowers are larger, with a greater number of petals, which retain a pale pink colour till they drop. The stigmas are of a pink colour, like those of *candida*.

δ. *P. Sibirica*. Raised from seed by Messrs. Loddiges and sons, and said to come from Siberia through Pallas. Leaves yellowish-green, and flowers quite white even in the bud; is altogether divested of that purple taint in the stalks, leaves, and germens, so observable generally in this species. It also bears the largest flowers.

ε. *P. rubescens*. This plant was purchased by Mr. Ronalds, nurseryman, of Brentford, at the sale of the late Mr. Bell's collection. Sir Abraham Hume has the same plant, and we believe from the same source, under the name of *Tatarica*. This is the most diminutive variety, and with flowers of the darkest colour. The leaves are small, obtuse, concave or channelled on the upper surface.

ζ. *P. uniflora*. Messrs Loddiges had seeds of this plant from Pallas. It is to be distinguished from the other varieties by the narrowness of its leaves, and a disposition to produce only one flower on the stalk; in this particular, however, we doubt its constancy. The petals are white, slightly tinged with pink at their base; stigmas dull-yellow.

η. *P. Whitleji*. This beautiful plant was imported in 1808 from China by Mr. Whitley, nurseryman, of Fulham. The stems are full three feet high; leaves rugose, and less shining than is usual in the species; flowers full double, having the outside petals reddish, and the inside ones pale straw-coloured, the whole becoming nearly white before they drop off, emitting a scent somewhat like that of elder-flowers. It flowers about the middle of June.

θ. *P. Humei*. Introduced by Sir Abraham Hume, bart. from China, through the means of Captain Welsford, in 1810. The largest of all the herbaceous pæonies, the stems sometimes exceeding four feet in height; flowers extremely double, reddish in colour, somewhat similar to the following, but larger and almost scentless. Cymes commonly of three flowers; leaflets broader than any other of the species, much pitted, and rugose.

ι. *P. fragrans*. Introduced from China in 1805 by Sir Joseph Banks. This variety is conspicuous in its upright slender stalks, leaves more pale and narrower than those of the other two double ones, scabrous, and obsoletely-ferrated on the margin. It flowers the latter end of June, the latest of all the pæonies, of a pale rose-colour, giving out an agreeable scent similar to that of the rose. The central petals are longer than the others, and erect.

These varieties are hinted at by Loureiro in his *Flora Cochinchensis*. He states that the pæony is found both wild and cultivated over all the Chinese empire, chiefly in the northern provinces; and concludes, "*Sunt alie multae varietates (fortasse species) quas non vidi.*" We may look for an increase to our acquisitions from that quarter.

2. *Pæonia officinalis*, or common peony: leaves doubly-pinnate, sublobed: leaflets oblong, veined underneath. (See BOTANY Plate VI. fig. 8.) The roots of the common or female peony are composed of several roundish thick knobs or tubers, which hang below each other, fastened with strings: the stalks are green, about two feet and a half high; the leaves are composed of several unequal lobes, which are variously cut into many segments; they are of a paler green than those of the male peony, and are hairy on their under side; the flowers are smaller, and of a deeper purple colour. According to Haller, the root is glandular; the leaves firm, shining, pinnate, with the pinnae pinnate in two pairs, and an odd one at the end; the pinnules ovate-lanceolate, also half-lobed and half three-lobed, confluent with the middle nerve. Stem a foot high, branched. According to Scopoli, the leaves are decomposed; the leaflets lanceolate, acuminate, sessile, decurrent, lobed, and simple.

This is certainly the *παιονία θηλεία*, or female pæony, of Dioscorides, so named, of course, without any idea of the real sexual distinctions in the parts of fructification. He celebrates it as useful in promoting natural discharges when deficient, and restraining some of them when too abundant. The flavour of the root is acrid, bitter, and foetid, and its qualities are reported to be narcotic and dangerous, which we can readily believe.

Native of several parts of Europe, as Switzerland, Dauphiné, Carniola, Piedmont, Silesia; also of Mount Ida, China, and Japan. It was cultivated here in 1562, according to Turner.

Several varieties of the female pæony with double flowers, differing in size and colour, are cultivated in the English gardens. These plants also vary much in different countries. Pallas informs us that the native plant of Mount Caucasus differs considerably from that which is cultivated in gardens. Loureiro mentions some varieties in China, and says that there are many others. Such as are well-defined, and worth notice, are now treated as distinct species, which has increased the number from five to eleven; and the farther additions which have been made to this genus in the Linn. Transf. vol. xii. have augmented them to fourteen. We shall here notice the varieties of this (female) species, as set down in the volume referred to.

α. *P. Sabini*. A few years ago no person knew that a plant of the single-flowered *P. officinalis* existed in this country. Mr. Sabine had the good fortune to discover one in the corner of an old garden at Great Berkhamstead in Hertfordshire, where it possibly had remained undisturbed many years. The flowers are precisely of the same colour with those of the common double-red, but the petals expand a few days earlier. The leaves are less waved.

waved. The petals of all the single-flowered varieties are more inflexed than those of the pubescent species, being formed into the shape of a cup contracted at the mouth. An abundant supply of plants of this variety has been imported from Holland since the peace, not differing materially from Mr. Sabine's plant.

β. *P. rosea*. This variety was observed by Mr. Sabine in the Oxford Botanic Garden along with the plant that follows. We cannot obtain any account of their history: they have in all probability been very old tenants of that garden; perhaps since the days of Morrison, in the latter end of the seventeenth century; nor do they seem to have found their way out of it, till Mr. Sabine was obligingly presented with roots of them by Mr. Professor Williams. This has very broad undulated and obtuse leaflets, of a dark hue, tinged with red on the edges, and with a few slight hairs on the ribs of the under surface. Flowers of a pleasant rose-colour; germens densely tomentose, diverging at the apex. Stem erect, as tall as var. α, flowering a fortnight earlier, about the middle of May.

γ. *P. blanda*. Obtained, as before mentioned, from the Oxford garden. The leaflets of this variety are likewise broad, though less so than the preceding; also much less undulated, and of a peculiarly-pale-green colour for a plant of this species: and, like those of the *rosea*, furnished with a few hairs on the back of the leaf. Stalks spreading; petioles reddish; flowers of same colour, and same time of flowering, as the preceding; germens generally three, upright at first, and finally diverging.

δ. *P. rubra*: double red pæony. To this variety we may apply the words of Besler, "vulgatissima est omnium pæoniarum;" and we may add, without exaggeration, "the most splendid of all flowers." Even the fine double pæonies from China, rich and magnificent as they are, cannot be compared for brilliancy with this common inhabitant of almost every cottager's garden in England. Nothing but its extreme vulgarity, and the extraordinary fecundity of its roots, could have brought this beautiful plant into the neglect it has suffered for a century past. The first account given of it is in the edition of Lobel's *Icones*, 1581. Camerarius writes, in 1588, "id est flore pleno quæ ante paucos annos apud nos est cœpta coli;" from which we may conclude that it was at that time a recent discovery. The gardens of Europe have been enriched with it, therefore, upwards of two centuries.

ε. *P. carnescens*, or double flesh-coloured pæony. This beautiful variety is not of so old an introduction as the preceding. Morrison gives us the first account of it, in 1699. The flower opens of a fine rose-colour, and afterwards becomes pale-flesh; it is not so common as the preceding, but nevertheless is too well known among the gardeners to require any further description.

ζ. *P. albicans*, or double white pæony. Tabernæmontanus records this variety in 1590; it therefore must have come into notice nearly about the same period as the double red. The flower of this bursts forth of a pale-pink, and at length becomes almost quite white; is very common along with the double red in most of the old gardens, from which even neglect and bad treatment will not banish them.

3. *Pæonia corallina*, or entire-leaved pæony: leaves twice ternate; leaflets ovate, undivided. Follicles downy, recurved. Native of the south of Europe. Dr. Sibthorp had wild specimens communicated to him by an apothecary of Zante. It was also discovered in a wild state by Francis Bowcher Wright, esq. in the rocky clefts of the island called Steep Holmes, in the Severn, in August 1803; whence this species has found a place in English botany. Gerard says he found it at Southfleet, Kent, which his editor, Johnson, rudely denies. Rustic gardens often abound with this flower, in its proper single state; the seed-vessels being admired, and long preserved for the decoration of the cottage chimney-piece, on account of

their shining pink inside and black polished seeds, contrasted with the red remains of numerous abortive ones, ranged along the edges.

This is the *πæωνία ἄφρη*, or male pæony, of Dioscorides, whose leaves he compares to those of a walnut-tree; a sufficient indication of their ovate undivided simply-pinnate form, by which the species is clearly distinguishable from the last. The qualities of the two plants probably differ but little.

4. *Pæonia humilis*, or dwarf Spanish pæony: leaves twice ternate; leaflets in three deep linear segments, downy beneath. Follicles hairy, nearly erect. Clusius records this as a native of Spain; Gerard speaks of it as known in the English gardens in his time. Retzius describes the stem a foot and half high, simple, smooth, angular, and green. Leaves in very narrow segments, acute; glaucous above; whiter and downy beneath. Petals of a deeper red than those of *P. corallina*.

5. *Pæonia peregrina*, or crimson-flowered small pæony: leaves twice ternate; leaflets elliptic-oblong, decurrent, lobed; glaucous and hairy beneath; follicles erect, downy. Native, probably, of the south of Europe. It is a plant of much humbler growth, and smaller dimensions, than any of this genus that we have hitherto mentioned; and is essentially distinguished, if we mistake not, by its decurrent leaflets, whose main ribs unite far above the base. The flowers are of an elegant, but not very deep or bright, crimson, scarcely three or four inches in diameter, often double, with linear internal petals, like a double anemone. It appears to be rather of recent introduction among us, and we have some suspicion of its having been brought from Siberia. The flowers are produced in May or early in June; and the roots are quite hardy.

6. *Pæonia Daurica*, or glaucous Daurian pæony: leaves pinnate; leaflets elliptical, obtuse, glaucous, somewhat wavy; stem herbaceous. Native of Siberia, from whence it was procured, in 1790, by the late Mr. Bell. This, like the rest, is a hardy perennial, flowering in May or June. Stem about two feet high. Flowers large and handsome, of a purplish rose-colour, with copious yellow stamens, and two pistils. Follicles ovate, divaricated, downy, about an inch and a half long.

7. *Pæonia laciniata*, or jagged-leaved pæony: leaves biternate; leaflets acutely lacinate; germs smooth. Root tuberous, difform, very large, descending by cylindrical processes a span in length, yellowish without, white within, both fresh and dry, having a very strong smell and taste of bitter almonds or peach-kernels. Root-leaves none, but red awnless sheaths; whence rise the stems, which are several, from eighteen to twenty-seven inches in height, the thickness of the little finger, round, very smooth, alternately and frequently leafy above, without any stipules at the petioles. Leaves on a flat petiole channelled above, almost ternate, but with the partial petioles so margined with the leaf running along them, that they may be called tripartite. The upper leaves towards the flower are gradually larger and less gashed; the last are three-cleft, with the middle segment five-cleft. At the calyx itself are two linear leaflets, bifid or trifid at the tip. Flower nodding a little; the calyx has three lanceolate leaflets, equal to the corolla in length, purple at the base, leafy and reflex at the end; and three inner leaflets ovate-acuminate and concave; corolla handsome, spreading a little, deep rose-coloured, with a slightly vio-rose smell, six-petalled, in gardens frequently seven-petalled; stamens about two hundred and fifty: filaments bristle-shaped, weak, twice as long as the antheræ, which are large, erect, oblong, curved a little, longitudinally four-grooved, abounding very much in a pale-yellow pollen. Germs three or four, very frequently five, conical, smooth, green, with a sessile crescent-shaped reflex purple stigma. Native of all Siberia, in mountainous woods. In the gardens at Peterburgh it flowers sooner than the other species, namely, about the end of May.

The

The root dried is used by the Mongols and some Tartars as sauce for their meat; and Boetcher, an army-surgeon, found it to be useful in intermittent fevers.

8. *Pæonia hybrida*, or mule pæony: leaves ternate-multifid; segments linear; germs three, pubescent. This has nearly the stature of the last, and is much taller than the next. Stem the thickness of a finger, obscurely channelled (which is not in *P. laciniata*), more rigid, naked at bottom, as that is, hence up to the flower leafy, rather more copiously than in the preceding. Petioles above concave-channelled, thicker and stiffer than in *P. laciniata*, trifid. Leaves trichotomous-multifid, linear, the middle trifid, divided into 14—24—14; the lateral ones into 14—22—9, or thereabouts; the uppermost leaves smaller, divided into about eighteen clefts; the floral ones five-cleft and ten-cleft. Calyx sessile; green, with the edge and middle purple. Petals seven, large, wide, less oblong than in *P. laciniata*, but of a deeper red colour between that and *P. tenuifolia*, more coriaceous than in that, and of a more globular figure. Stamens thirty to forty or more, with smaller antheræ, commonly shrivelling and destitute of pollen. Germs three, conical-convex, pubescent, with crescent-shaped, very red, stigmata.

This plant is supposed to have originated in the botanic garden at Petersburg, from the seeds of *P. tenuifolia* sown in the same bed with *P. laciniata*; and it is conjectured to be a mule between them, since it has not ever produced ripe seeds. It occurs of a much smaller size in some parts of Siberia.

9. *Pæonia tenuifolia*, or slender-leaved peony: leaflets linear, many-parted; germs two, tomentose. Root creeping, putting forth tuberous fibres, with tubercles the size of a hazel-nut, white, fleshy, of a bitterish taste. Stem scarcely a foot high, and commonly single, but in the garden eighteen inches high, and several from the same root, but fewer than in *P. laciniata*. Root-leaves none, stem round, very-obscurely grooved, smooth, as is the whole plant, naked at bottom, having there only a few sheathing scales. Leaves frequent, alternate, the upper ones gradually less, on a round petiole, channelled above, quinate: leaflets cut into very-many narrow segments. Flower sessile at the uppermost leaf, subglobular, accompanied by two leaflets, one multifid, the other simple, both dilated at the base. Calyx five-leaved; leaflets concave-gibbous, two of them exterior and acuminate. Petals eight, spreading, oval, very-deep red. Stamens about a hundred and twenty, with pale filaments, and erect, oblong, deep-yellow, antheræ. Germs two or three, conical, villose, with a crested, reflex, vertically-flat, rose-coloured, stigma. Capsules, in the wild plant, commonly two, in the gardens three, ovate-oblong, tomentose, red, when they open reflex and spreading, coriaceous. Seeds oblong, first yellow, then brown, about six in number, fastened to the opening suture. Native of Ukraine. Introduced in 1765 by Mr. William Malcolm.

10. *Pæonia moutan*, Chinese tree-pæony, or moutan: stem woody, perennial; leaflets oblong-ovate; glaucous and somewhat hairy beneath; the terminal one three-lobed; germens numerous, distinct. Native of China, where it is one of the most favourite objects of horticulture, as may be seen by the paper-hangings, screens, porcelain, and other ornamental productions of art, brought from that country. It is depicted on such with double blossoms, either of a rose-colour, crimson, purple, white, or even of a golden-yellow. The first only has been introduced into this country, by sir Joseph Banks, in 1789. Collectors who have had means of communication with China, particularly the late Charles Greville, and sir Abraham Hume, have anxiously endeavoured to obtain some of the other varieties, but in vain; except that the gentleman last-mentioned procured a shrubby pæony with a single flower, more beautiful than the double, of which we shall presently speak as a distinct species. The moutan proves tolerably hardy in England, though, like many other plants from the same country which blossom

early in our spring, it requires the protection of a glass frame at that season. The shrubby stem is peculiar to this and the next species, among all those hitherto known, and forms a large bush, spreading several feet in diameter. Leaves on long stalks, alternate, large, and spreading, twice or thrice ternate in an opposite manner, deciduous; their leaflets tapering at the base, acute, entire, occasionally lobed, veiny; glaucous and very sparingly hairy beneath; the terminal ones three-lobed. The scales of the leaf-buds are pale-crimson. Flowers terminating the branches, solitary, six or eight inches broad, known to us in a very double state only, consisting of innumerable jagged rose-coloured petals, with a few stamens, with yellow antheræ, remaining unchanged, and a greater or less number of germens, all separate and distinct. The smell of the flower is generally unpleasant; but a sweet-scented variety, of the same colour, is cultivated by Messrs. Lee and Kennedy.

11. *Pæonia papaveracea*, or poppy-fruited pæony: stem woody, perennial; leaflets oblong-ovate; glaucous and slightly hairy beneath; the terminal one three-lobed; germens about six, closely combined into a globe. This blossomed in 1808 in the fine collection of the late lady Amelia Hume, at Wormleybury, having been introduced a year or two before from China. It differs in no respect as to stem and foliage from the preceding. The flowers however differ, in being nearly single, with scarcely more than five petals, which are very large, white or blush-coloured, with a large purple spot at the base of each, vying with the beauty of a gum cistus. The stamens also are copious and all perfect. But the most remarkable difference exists in the pistil, which consists of six germens, rarely more, all closely compressed together into a globe, like a poppy-head, and even enveloped in one common integument. The appropriate number of stigmas, one to each germen or cell, crowns this globe. Whether this can possibly be a variety, is doubtful. Dr. Sims is induced to consider it, if natural, as amounting to a generic distinction.

12. *Pæonia decora*, or handsome pæony: leaflets tripartite-lacinate, oblong-obtuse, hairy beneath; stigmas bent back. This and the two succeeding species are nearly allied to each other: it is, however, frequently a much easier task to determine a species than to describe it.

Our present plant we do not hesitate to refer to that which Clusius obtained from Constantinople; as the description which he and the succeeding writers give of it agrees with ours, and it also comes from the same quarter. It is remarkable for the elegant stateliness of its habit. Each stalk, accompanied by its horizontal leaves, diminishing as they ascend, and terminated by its flower, (which is rather smaller than is usual in the genus,) supported on a long peduncle, exhibits somewhat of a pyramidal figure. Its leaflets are constantly more or less longitudinally inflexed or concave: in this respect it resembles the *P. humilis*, but differs from it in the leaflets being broad and obtuse. The foliicles are less pubescent than those of the two following species, but more so than those of the preceding; they are very large, and at maturity diverge widely, but do not become so much recurved as those of *P. arietina*. We have only observed two varieties.

α. *P. Pallasii*: leaflets narrow-oblong. Seeds of this plant were received by Messrs. Lee and Kennedy from Pallas, probably from the Crimea, where he spent the latter years of his life. The name he gave it, if any, has been lost; they called it *byzantina*; its flower has a fine deep-rose colour, in shape and appearance not unlike that of *Papaver somniferum*; the seedlings came up without exhibiting any apparent variation.

β. *P. elatior*: leaflets broad-oblong. First observed in the nursery of Messrs. Chandler and Buckingham, who believe they got it from Holland. It differs from the preceding in the leaves being somewhat broader, and the plant altogether more robust and rather more pubescent; unquestionably a mere variety.

13. *Pæonia arietina*, or ram-headed pæony: leaflets trilobated, pinnatifid, decurrent, long-oval, hairy beneath; follicles rough, spreading out. A large species, the stem being from two feet to two feet and a half high. Its distinguishing characters consist in the leaflets being decurrent, often even confluent, and in the germens being arched and frequently recurved, suggesting a resemblance to rams' horns. It seems to have been well known to the old authors, as will appear in describing the varieties.

α. P. Andersonii: flowers rose-colour. Named by Mr. Sabine, owing to his having obtained it from Mr. A. several years ago. Though not common about London, probably having been banished with contempt for its single flower, it is nevertheless still to be seen in remote parts of the country in the gardens of old baronial mansions: in such situations we knew it many years ago in Aberdeenshire, where it is still to be found under the name of the single pæony, and the only species with single flowers we ever observed in those parts. From analogy we presume it to be a native of the Levant. Its flowers are of a bright but deep rose-colour, resembling most those of *Daurica*; and appear very handsome over its abundant, dark, though glaucous, leaves.

β. P. Oxoniensis: flowers pale flesh-colour. This is probably No. 6. *Ger. Em.* p. 981. as to the description; "in our London gardens bearing flowers of a pale whitish colour, very single, resembling the female wilde peony;" although the figure of No. 6 is that of another species (*humilis*). And, from Parkinson's notice of it, we presume it must have been among the gardens in his days, though no-where to be found three years ago in this country but in the Oxford Botanic Garden, where it seems to have existed unnoticed and unknown since the time of Morison, whose description of it is very satisfactory: "*quam in horto alimus, cujus folia latiuscula lanugine alba utrinque obsita sunt; flores simplices primo emergentes subcarnei, deinde in albos transmutantur.*" Mr. Sabine was indebted to the liberality of Mr. Professor Williams for roots of it from the Oxford botanic garden. From Clusius we learn that this is a native of valleys on the highest mountains in Crete; which its habit confirms, having all that woolly-like softness in its young stalks and leaves so peculiar to the plants of that island. This is among the earliest of pæonies; comes out of the ground of a pale glaucous-green colour, destitute of the ruddy taint so common in the genus. Petals of a beautiful pale bluish-colour, crisp, and lacerated in a greater than usual degree. Follicles almost reflexed when ripe, less woolly and of a lighter colour than those of var. *α*. Roots of a pæony have been imported by Messrs. Chandler and Buckingham from Holland which prove to be this plant. It flowers from the middle to the end of May.

14. *Pæonia mollis*, or soft pæony: leaflets ovate-lanceolate, very woolly and soft beneath; follicles erect. This is an entirely-new species. It was raised by Messrs. Loddiges and sons, of Hackney, from seeds obtained from Pallas, and said to be from Siberia; although, from its appearance, we should rather suspect it to have come from the Crimea, where that respected naturalist spent the latter years of his life. From Messrs. Loddiges it has found its way into the gardens of the curious under the mistaken name of *anomala*. We distinguished it three years ago in Mr. Sabine's collection as a truly-distinct species; and it has been reserved for us (says Mr. Anderson) first to describe it. This plant is at first sight distinguishable from its congeners by its short rigid upright stalks, the dark bluish-green colour of its leaves, which are flat, compact, very much divided, the laciniae crowded, overlapping each other, very woolly on the under-side, nowise bordered with red, as in most of the others, and the lateral leaflets being almost sessile, the exterior side of each disposed to be decurrent. It is the most dwarf of all our species, seldom reaching eighteen inches in height, even in our gardens. The stalks, as well as the primary petioles, are

nearly smooth. The flower is small, of a dark dull purplish red, by no means handsome.

The three last species, which are added by Mr. Anderson, we have described nearly in the words of his "Monograph," in the 12th vol. of the *Linn. Trans.* This was almost the last act of that very useful writer's life; for Mr. Sabine says, in his Postscript, "Two days after the preceding account had been brought to its present state by the diligence and industry of my most valued friend, he was accidentally killed by a fall from a carriage. This melancholy event happened on the 10th of January, 1817, near his own house, at West Ham; and the superintendence of this paper, in consequence of that misfortune, has fallen on me alone: thus the gratification I had enjoyed in assisting him in the composition, and which would have been complete had we been able to see the result of our enquiry placed in the pages of the *Transactions* of the Society, was suddenly destroyed; and that, which would have afforded me so much pleasure, has now been a task accompanied with the most painful recollections."

Propagation and Culture. The male peony is chiefly propagated for the roots, which are used in medicine; for the flowers, being single, do not afford near so much pleasure as those with double flowers, nor will they abide near so long in beauty. All the sorts with double flowers are preserved in gardens for the beauty of their flowers; which, when intermixed with other large growing plants, in the borders of large gardens, will add to the variety; and the flowers are very ornamental in basins or flower-pots, when placed in rooms. They are all extremely hardy, and will grow in almost any soil or situation, which renders them more valuable; for they will thrive under the shade of trees, and, in such places, they will continue much longer in beauty.

They are propagated by parting their roots, which multiply very fast. The best season for transplanting them is towards the end of August, or the beginning of September; for, if they are removed after their roots have shot out new fibres, they seldom flower strong the succeeding summer. In parting these roots, always observe to preserve a bud upon the crown of each offset, otherwise they will come to nothing; nor should you divide the roots too small, (especially if you have regard to their blowing the following year;) for, when their offsets are weak, they many times do not flower the succeeding summer, or at least produce but one flower upon each root; but, where you would multiply them in quantities, you may divide them as small as you please, provided there be a bud to each offset; but then they should be planted in a nursery-bed, for a season or two, to get strength, before they are placed in the flower-garden.

The single sorts may be propagated from seeds (which they generally produce in large quantities, where the flowers are permitted to remain), which should be sown in the autumn, soon after they are ripe, upon a bed of light fresh earth, covering them over, about half an inch thick, with the same light earth. The spring following the plants will come up, when they should be carefully cleared from weeds, and, in very dry weather, refreshed with water, which will greatly forward their growth. In this bed they should remain two years before they are transplanted, observing in autumn, when the leaves are decayed, to spread some fresh rich earth over the beds about an inch thick, and constantly to keep them clear from weeds. When you transplant them, (which should be done in September,) you must prepare some beds of fresh light earth, which should be dug, and well cleaned from the roots of all noxious weeds; then plant the roots therein six inches asunder, and about three inches deep. In these beds they may remain until they flower, after which they may be transplanted where you design they should grow. It is very probable there may be some varieties obtained from the seeds of these plants, as is common in most other flowers; so that those which produce beautiful flowers may be placed in the flower-garden, but
such

such as continue single or ill-coloured may be planted in beds, to propagate for medicinal use.

PÆONIDES, a name given to the daughters of Pierus, (who were defeated by the Muses,) because their mother was a native of Pæonia.

PÆONITES, *f.* A name given by some writers to the stone called by others *pæonites*, and esteemed of great use to women in labour. It seems to have been called *pæonites*, from Pæonia, in Macedonia, where it was found.

PAES, a river of Lapland, which runs into the North Sea in lat. 70. N.

PAESIELLO (John), an eminent Italian musician and composer, was born at Tarento, in the kingdom of Naples, on the 9th of May, 1740. He was particularly noticed in his youth by his sovereign, and afterwards patronised by the principal potentates of Europe. Pensioned by more than one sovereign, he enjoyed an ample fortune. Placed above want from the age of thirteen, and free from all domestic cares, he was enabled to execute a great number of works.

From his early youth he gave way to the fire of his invention, which art could hardly restrain, much less confine to rule. His wildness, however, was never grotesque, ungraceful, crude, wild, or offensive to cultivated ears; but consisted of the most happy flights of fancy, pleasing melodies, and new effects of accompaniment. He at first worked at little dramas in the Neapolitan jargon, so different from good Italian, that it is totally unintelligible to the rest of Italy. He composed for the burletta a comic opera in Italian, as early as 1765, *Amore in Ballo*; and, in 1766, *Le Nozze Turbate*. In 1770, (says Dr. Burney,) we heard at Naples his comic opera called *Le Trame per Amore*, in which, though the singing was but indifferent, and out of nine characters there was not one good voice, yet the music pleased us extremely. The symphony, consisting of only one movement, was truly comic, and contained a perpetual succession of pleasing passages. The airs were full of fire and fancy, the ritornels abounding with new passages, and the vocal parts in elegant and simple melody, such as might be remembered and carried away after the first hearing, or be performed in private by a small band, or even without any other instrument than a harpsichord or pianoforte. From that time he continued improving in his style, both in serious and comic operas; and the public all over Europe was not insensible to his transcendent merit, and he was justly regarded at the head of vocal composition, as Haydn of instrumental. In 1770 he was the only composer in Naples who could make head against the high favour in which Piccini then stood, after his *Buona Figliuola*.

He composed twenty-seven grand operas, fifty-one comic operas, eight intermezzos, and an infinite number of cantatas, oratorios, masses, motets, Te Deums, &c. seven symphonies for the emperor Joseph II. several pieces for the piano, for the queen of Spain; and many theatrical pieces for the court of Russia.

It may be said, that Paësiello invented his style particularly for the comic opera. His principal serious operas are, the *Olympiad*, *Pyrrhus*, *Elfreda*, *Dido*, and *Proserpine*. In the magical kind, what can be more affecting and tender than his celebrated duo in the *Olympiad*? Nothing can be more noble or dignified than his *Pyrrhus*: several fragments of his *Proserpine* are chefs-d'œuvre. The scene where one of the nymphs of Ceres loses her speech at the moment of divulging the secret of the gods, or the Rape of Proserpine, is one of the happiest traits of genius. In another style, what can be more natural or touching than his *Nina*, more picturesque than his *Barber of Seville*, more simple or more naïve than his *Molinara*; or, to conclude, what melody more rich than his *Frascatana*, and his celebrated piece of *King Theodore*.

Fertile in invention, correct in his designs, happy in the choice of his chords, judicious in his accompaniments and images, varied in his melodious turns, and contrasted in his details, yet always keeping in view the strictest unity;

this great master observes the strictest propriety, and never commits an excess. Exact without servility, natural without negligence, at once full of art and simplicity, he is always diversified, and always the same.

Paësiello not only showed himself superior in the serious and comic opera, but also in sacred music. He has left in the library of the king's chapel a collection of twenty-six masses, of which several are master-pieces.

Paësiello was not only a great musician, but possessed a great fund of information: he was well versed in the dead languages, and conversant in all the branches of literature, and on terms of friendship with the most distinguished persons of the age. Endowed with a great mind, and which his eminent talents and the great reputation he enjoyed in Europe raised above all the meaner passions of the soul, he knew neither envy nor rivalry. He died at Naples the 5th of June, 1816, aged seventy-six. That city rendered him funeral honours, in causing to be executed a mass for the dead, found amongst his papers. The same evening his *Nina* was performed at the opera; and the king of Naples, and the whole court, deigned to be present, to display the interest they felt for an illustrious composer, who, for half a century, honoured modern Italy. *Eloge delivered at the Royal Institute, by the Chev. le Sueur, Superintendent of Music to the King of France.*

PÆSTUM, in ancient geography, a town of Lucania, called also *Neptunia* and *Posidonia* by the Greeks, where the soil produced roses which blossomed twice a-year. The ancient walls of the town, about three miles in extent, are still standing, and likewise venerable remains of temples and porticoes. The Sinus Pæstanus, on which it stood, is now called the *Gulf of Salerno*.

PAEZ (Pedro), a man deservedly eminent in the history of the Jesuits and of Abyssinia, was a Castilian, born at Toledo, of a noble family. He entered the society; and, having completed his studies, was sent to India in the year 1588. The Portuguese, in Abyssinia, were at this time without a patriarch, or any spiritual assistant, so difficult was it to introduce them into that kingdom, every entrance into which was in possession of the Turks or Moors. To this mission Paez and P. Antonio de Montferrat were appointed. They were made prisoners on their way, and sent to the court of the king of Xael, by whom they were kindly treated; but, being himself tributary to the pacha of Yemen, and bound by treaty to send him all the Portuguese who might fall into his hands, they were sent to Canaan, the capital, where the pacha resided. At first their captivity was easy; but afterwards they were treated with great barbarity, in hopes that he might obtain a very large ransom for their liberty. At length the viceroy of India obtained their deliverance, upon the payment of a thousand crowns; and they returned to India, where Montferrat soon afterwards died.

Paez was more successful in his second attempt: he entered Abyssinia very safely in 1603; and, instead of busying himself with court-intrigues, and seeking court-favour, he remained quietly among his flock, translating into Abyssinian a Compendium of the Christian Doctrine, which had been written by Marcos George. He instructed some children; and the king of the country, hearing of their proficiency, sent for the master and his scholars to exhibit before him: he was delighted with their performance, and became himself a thorough convert to the Roman-catholic faith; but the zeal which he showed in behalf of the new religion, led to his deposition and untimely death. Other revolutions followed: when things, however, were become quiet, Paez undertook to build a palace at Gorgora, a rocky peninsula on the south side of the lake of Dembea. He was himself architect, mason, smith, and carpenter; and produced a building which was the astonishment of those who beheld it. A spring-lock, which he fixed upon one of the doors, saved the king's life, when an attempt was made to assassinate him. The last triumph which Paez enjoyed, was that of seeing the king put away all his wives except one, and receiving

ceiving his general confession. Having done this, he returned to his convent, saying his *Nunc dimittis*. His release was indeed at hand. Immediately on his arrival he was seized with a fever, and died on the 3d of May, 1622. Mr. Southey adds, "Paez died in time to be spared the mortification of witnessing misconduct and violence on the part of the Jesuits which he could not have prevented, and which ruined the cause of Rome and of civilization in Abyssinia." *Gen. Biog.*

PA'GÆ, in ancient geography, a town of the territory of Megara, situated towards the north, on a small gulf formed by an extension of the Gulf of Corinth, and called *Mare Alcyonium*.

PAGAHM', once a magnificent city of the Birman empire, on the Irawaddy; but now its remains are merely numerous mouldering temples, and the vestiges of an old brick fort, the ramparts of which are still to be traced. The town of Neoundah, about four miles to the north, which may be called a continuation of Pagahm, has flourished in proportion as the latter has decayed. Pagahm is said to have been the residence of forty-five successive monarchs, and was abandoned 500 years ago, in consequence, as it is said, of a divine admonition; but, whatever may be its true history, it was certainly once a place of no ordinary splendour. The temple of Pagahm rises upwards with a heavy breadth almost to the top, and then terminates abruptly in a point, which gives to the buildings a clumsy appearance. Many of the most ancient temples at this place are not solid at the bottom; a well-arched dome supports a ponderous superb structure; within, an image of Gaudma sits enshrined. Four Gothic door-ways open into the dome, in one of which was a human figure standing erect, said to have been Gaudma, and another of the same personage, lying on his right side asleep; both of gigantic structure. These, however, are not the usual attitudes of the divinity; as he is generally depicted sitting cross-legged on a pedestal, adorned with representations of the leaf of the sacred lotus carved upon the base; the left hand of the image rests upon his lap, and the right is pendent. Beyond the suburbs there is a part where the inhabitants are employed in expressing oil from the sesamum-seed: the grain is put into a deep wooden trough, in which it is pressed by an upright timber fixed in a frame; the force is increased by a long lever, on the extremity of which a man sits and guides a bullock that moves in a circle, thus turning and pressing the seed at the same time: the machine was simple, and effectually answered the purpose. Of these mills, there were not less than two hundred within a very narrow compass. From the circumstance of the cattle being in good order, it was concluded that they were fed on the seed after the oil was extracted. The land about Pagahm scarcely yields sufficient vegetation to nourish goats. *Symes's Embassy to Ava*, vol. ii.

PAGALO'AN, a town on the north-west coast of Mindanao.

PAGAME'A, *f.* in botany, a genus consisting of only one species, whose fruit was judged by Jussieu to be not sufficiently ascertained; it belongs to the rubiaceæ of that author. Aublet describes the berry as of two cells, with two seeds, convex on one side, flat on the other, one of them frequently abortive. Each of these seeds, when cut across, is found to have two cells, with a kernel in each cell.

Pagamea Guianensis is a shrub seven or eight feet high, growing on the top of the Serpent-mountain, in Guiana, and bearing flowers, as well as fruit, in August. The branches spread every way, and are knotty, leafy at the extremities. Leaves opposite, in pairs, crossing each other, stalked, lanceolate, pointed, entire, about three inches long, single-ribbed and veiny, smooth and pliant. Flowers in short, loose, axillary, stalked, spikes; corolla white, funnel-shaped, equally four-cleft, downy within. No reason is given for the name, nor any thing said about the qualities or uses of the plant; except that the wood

is hard, and of a yellowish colour. The trunk is only five inches in diameter. *Aublet*, p. 112. t. 44.

PA'GAN, *f.* [paganus, Sax. *paganus*, Lat.] A heathen; one not a Christian.

Baronius derives the word *paganus* from *pagus*, a village; because, when Christians became masters of the cities, the heathens were obliged, by the edicts of Constantine and his sons, to go and live in the country villages, &c. and hence it might, in time, extend to all heathens; or the word might come from *pagus*, in regard the peasants were those who adhered longest to the idolatry of the heathens, as being neglected by the first preachers of Christianity.—Religion did first take place in cities; and in that respect was a cause why the name of *paganus*, which properly signifieth a country people, came to be used in common speech for the same that infidels and unbelievers were. *Hooker's Ecc. Pol.*—But this is mere supposition; for, although the principal cities where the apostles converted the heathens, are mentioned in their *Acts*, and other ancient authors, it does not follow that the villages were left in want of instruction. The case seems to be this: the Latin word *paganus* signifies, properly, "any one who does not bear arms," in opposition to *miles*, a soldier; and hence it is concluded, that the primitive Christians metaphorically applied the word *paganus*, pagans, to all those who were not "soldiers of Christ," *qui non militabant sub vexillo Christi*. Etymological Gleanings, MS.

Salmasius will have the word come from *pagus*, considered as originally signifying *gens*, or nation; whence he observes, we say indifferently, pagans, or gentiles.

PA'GAN, *adj.* Heathenish:

The secret ceremonies I conceal,

Uncouth, perhaps unlawful to reveal;

But such they were as *pagan* use required.

Dryden.

PAGAN' (Peter), a distinguished poet of the sixteenth century, was born at Wanfrid, in Hesse; and, being educated with great care, he exhibited, at an early age, much literary taste, and a particular turn for poetry. In the year 1550 he received the degree of bachelor in philosophy; and he became poet to the emperor Ferdinand. To the study of poetry he joined that of history, and was elected professor of both in the university of Marburg. He died at Wanfrid, on the 29th of May, 1576. Besides many pieces of poetry on miscellaneous subjects, he left "*Historia terginorum Romanorum et Albanorum fragmentum*," in verse, which contained the history of the three Horatii and the three Curiatii.

PAGAN' (Blaise-François, Comte de), an eminent military engineer, was born at Avignon in the year 1604. He entered into the army at twelve years of age, and distinguished himself in a variety of actions. He was patronised by his near relation, the constable de Luynes, whom he had the misfortune to lose at the siege of Montauban, at which he was also deprived of the sight of an eye by a musket-shot. At the passage of the Alps, and the barricades of Suza, he placed himself at the head of a determined band, and, having gained the summit of a steep mountain, he cried out "This is the road to glory," and instantly slid down the mountain; and, being imitated by his men, they arrived first at the barricades and carried them. When the king, Louis XIII. laid siege to Nanci in 1633, Pagan had the honour to attend him in drawing the lines and forts of circumvallation. In 1642 he was sent to the service of Portugal, in the post of field-marshal, and there he had the misfortune to lose his other eye. Though disabled from serving his country in the active duties of a warrior, he was intent upon augmenting its glory, by extending the boundaries of military science. Having from his youth closely applied to mathematical studies, with a particular view to the science of fortification, he now employed the whole force of his active mind in speculations of this kind, and in 1645 published his "*Traité des Fortifications*:" this was regarded as the best work that had ever been written on the subject;

and it is said, that whatever improvements have been made since, have been derived chiefly from this treatise, as conclusions from its principles. In 1651 he published his "Theoremes Geometriques," which show an extensive and deep knowledge of all the parts of the mathematics. In 1655 he published an "Historical and Geographical Account of the River Amazons, extracted from different Writers;" and we are assured, that, though blind, he drew the chart of that river and the parts adjacent. His other works, published in 1657 and 1658, were "Theorie des Planetes;" and "Tables Astronomiques." By the former he cleared the system from that multiplicity of eccentric circles and epicycles, which astronomers had invented to explain their motions. His astronomical tables are reckoned succinct, and very plain. Pagan died at Paris, November 18, 1685. He was devoted to judicial astrology; but what he wrote on this subject is the only thing which detracts from his high character. He had an universal genius; and, having applied himself entirely to the art of war, and particularly to the branch of fortification, he made much progress in it. He understood the deeper branches of the mathematics; and had so fine a genius for these abstruse speculations, that he read but little on the subject, his own fertile mind supplying him with almost every thing that he wanted. All his works were collected and printed in 12mo. in the year 1669. *Moreri.*

PAGAN CREEK, a river of Virginia, which runs into James River in lat. 37. 5. N. lon. 76. 37. W.

PAG'ANAL, *f.* A country wake. *Cole.*

PAGANALIA, *f.* [from *pagus*, Lat. a village.] Certain rural feasts among the ancient Romans; and thus called, because celebrated in villages. In the paganalia, the peasants went in solemn procession all round the village, making lustrations to purify it. They had also their sacrifices, wherein they offered cakes on the altars of the gods.—Halicarnassus and St. Jerome refer the institution of the *paganalia* to Servius Tullius. They were held in the month of February. *Chambers.*

PAGANALIAN, *adj.* Belonging to country wakes. *Cole.*

PAGANICA, a town of Naples, in Abruzzo Ultra: eight miles north-north-west of Aquila.

PA'GANISH, *adj.* Heathenish.—The peremptory knife of popish, worse than *paganiſh*, pruners. *Bp. King's Vitis Palati.* 1614.—They observed and solemnized their *paganiſh* pastime and worship. *Bourne's Antiq. Comm. People.*—He [Pope Gregory] would not suffer verse to be sung, or rather, perhaps, would not let it be sung as verse, (which his canto firmo, or notes of equal length, would most effectually prevent,) because it was gay and *paganiſh*. *Mason on Church Music.*

PA'GANISM, *f.* The worship and discipline of pagans; the adoration of idols and false gods.—The gods of *paganiſm* were either men, as Jupiter, Hercules, Bacchus, &c. or fictitious persons, as Victory, Fame, Fever, &c. or beasts, as in Egypt, crocodiles, cats, &c. or, finally, inanimate things, as onions, fire, and water, &c. *Chambers.*

To PA'GANIZE, *v. u.* To render heathenish.—God's own people were sometimes so miserably depraved and *paganiſed*, as to sacrifice their sons and daughters unto devils. *Hallywell's Melampyr.* 1681.—This way of *paganiſing* a future state was unavoidable in the plan of Telemachus, as it was also in that of Fontenelle's Dialogues. But it was something to be serious in his paganism. Thus much may be said for the French Homer. *Hurd on Addison's Tatler*, No 156.

To PA'GANIZE, *v. n.* To behave like a pagan.—This was that which made the old Christians *paganiſe*. *Milton's Animad. Rem. Defence.*

PAGAPATE, *f.* in botany. See SONNERATIA.

PAGAR/CHUS, *f.* [Gr. formed of *pagus*, village, and *αρχη*, command.] Among the ancients, a petty magistrate of a *pagus*, or little district, in the country.

PAG'ASA, a town of Magnesia, in Macedonia, with VOL. XVIII. No. 1235,

an harbour and a promontory of the same name. The ship Argo was built there, as some suppose; and, according to Propertius, the Argonauts set sail from that harbour. From that circumstance, not only the ship Argo, but also the Argonauts themselves, were ever after distinguished by the epithet of *Pagaseus*.

PAGE, *f.* [Fr. from *pagina*, Lat.] One side of the leaf of a book.—If a man could have opened one of the *pages* of the divine counsel, and seen the event of Joseph's being sold, he might have dried up the young man's tears. *Bp. Taylor.*—A printer divides a book into sheets, the sheets into *pages*, the *pages* into lines, and the lines into letters. *Watts.*

Thy name to Phœbus and the muses known,
Shall in the front of every page be shewn. *Dryden.*

PAGE, *f.* [Mr. Horne Tooke contends, that "pack, patch, and page, are the past participle *pacch*, (differently pronounced, and therefore differently written with *k*, *ch*, or *ge*,) of the Saxon verb *pæcan*, to deceive by false appearances; and, as servants were contemptuously called harlot, varlet, valet, and knave; so were they contemptuously called *pack*, *patch*, and *PAGE*." Diverſ. of Purley, ii. 369.—This etymon, ingenious as it may seem, is hardly the true one of *page*. Henry Stephens, and others, have derived it from the Greek *παῖς*, as first signifying a boy, afterwards, a servant. Hence perhaps the derivation of it by others, from the Lat. *pagus*, a village; with the remark that, in Languedoc and Gascony, a countryman is called *page*. See this appellation confirmed in Dict. de la Langue Toulousaine, 1638. *Todd.*] A boy-child:

A doughter hadden they betwix them two,
Of twenty yere, without any mo,
Saving a child that was of half-yere age,
In cradle it lay, and was a propre *page*. *Chaucer.*

A boy-servant; a young boy attending, rather in formality than servitude, on a great person.—He had two *pages* of honour, on either hand one. *Bacon.*—Philip of Macedon had a *page* attending in his chamber, to tell him every morning, Remember, O king, that thou art mortal. *Wake's Prep. for Death.*

Pages following him,
Even at the heels, in golden multitudes. *Shakespeare.*
Where is this mankind now? who lives to age
Fit to be made Methusalem his *page*? *Donne.*

To PAGE, *v. a.* To mark the pages of a book.—To attend as a page:

Will these moss'd trees,
That have outliv'd the eagle, *page* thy heels,
And skip when thou point'st out? *Shakespeare.*

PA'GEANT, *f.* [Of this word the etymologists give no satisfactory account. It may perhaps be *payen geant*, a pagan giant, a representation of triumph used at return from holy wars; as we have yet the Saracen's head. *Dr. Johnson.*—Mr. H. Tooke considers *pageant* as merely the present participle *pæceand*, of the Sax. *pæcan*, to deceive; *pacheand*, *pacheant*, *pageant*. Div. of Purl. 370. *Todd.*] A statue in a show.—Any show; a spectacle of entertainment.—The poets contrived the following *pageant* or machine for the pope's entertainment; a huge floating mountain that was split at the top in imitation of Parnassus. *Addison.*

This wide and universal theatre
Presents more woeful *pageants* than the scene
Wherein we play. *Shakespeare's As you Like it.*

It is used in a proverbial and general sense for any thing showy without stability or duration:

Thus unlamented pass the proud away,
The gaze of fools, and *pageant* of a day. *Pope.*

The breath of others raises our renown,
Our own as soon blows the *pageant* down. *Young.*

PA'GEANT, *adj.* Showy; pompous; ostentatious; superficial:

Were the ambitious, she disdain'd to own
The pageant pomp of such a servile throne. *Dryden.*

To PA'GEANT, *v. a.* To exhibit in show; to represent.—That feast of love and heavenly-admitted friendship, the seal of filial grace, became the subject of horror and glouting admiration, *pageanted* about like a dreadful idol. *Milton.*

With ridiculous and awkward action,
Which, slanderer, he imitation calls,
He *pageants* us. *Shakespeare's Troil. and Creff.*

PA'GEANTRY, *f.* Pomp; show.—Inconveniences are consequent to dogmatizing, supposing men in the right; but, if they be in the wrong, what a ridiculous *pageantry* is it to see such a philosophical gravity fet man out a solecism! *Gov. of the Tongue.*

Such *pageantry* be to the people shewn;
There boast thy horse's trappings and thy own. *Dryden.*

PAG'ET's PO'RT, a small harbour within the great sound in Bahama-island, and in the most easterly part of the found.

PAG'HAN, or PAGHANMEW. See PEGONGMEW.

PAGHKATAKAN', a town of New Jersey, on the Papachton. Lat. 42. 8. N. lon. 74. 40. W.

PAG'I (Anthony); a French Franciscan monk, and a very able ecclesiastical historian and chronologer, was born at Rogues, a small town near Aix in Provence, in the year 1624. He embraced the monastic life at Arles, in 1641; and, after going through the usual courses of philosophy and divinity, officiated for some time as preacher, with great acceptability: he was also much occupied in the confessional; and was four times elected provincial of his order. These employments, however, did not prevent him from applying very assiduously to the study of chronology and ecclesiastical history, in which he succeeded so well, as to become one of the most able critics of his time in those branches of learning. In 1682, he published a piece entitled "Disertatio hypatica, seu de Consulibus Cæsareis," 4to. which abounds in curious remarks, and throws considerable light on the chronology of the consulates. But his most considerable work consists of a criticism on the Annals of Baronius, in which he follows that learned cardinal year after year, and rectifies an infinite number of mistakes, both in his chronology and in his facts. It is entitled "Critica Historico-Chronologica in Universos Annales Ecclesiasticos Eminent. et Rev. Cæs. Card. Baronii, in qua rerum narratio defenditur, illustratur, suppletur, Ordo Temporum corrigitur, innovatur, et Periodo Græco-Romana, nunc primum concinnata munitur, &c." 4 vols. folio. This work is distinguished by profound learning, solid and judicious criticism, moderation, and candour; and the simple style in which it is written is well adapted to chronological narration. It extends to the year 1198, where Baronius finishes. In compiling it, father Pagi received considerable assistance from the abbé de Longuerue. The first volume made its appearance at Paris in the year 1689, and the three following were not printed till after the author's death, under the care of his nephew, the subject of the next article, when they were committed to the press at Geneva, in 1705. A new edition of the whole was published at the same place, in 1727. Father Pagi also published an edition of the Sermons of St. Anthony of Padua; in Latin, in 1685; and two answers to criticisms on his Dissertation on the Consulates; one, accompanying that collection of sermons, and the other in the Journal des Sçavans for November 11, 1686. He died at Aix, in 1699, about the age of seventy-five, equally beloved for his amiable manners and respected for his profound learning.

PA'GI (Francis), nephew of the preceding, and a member of the same religious community, was born at

Lambesc in the year 1654. He commenced his studies at Toulon, under the fathers of the oratory, and made so great a proficiency in the belles-lettres, that his uncle was induced to send for him to Aix, where he then resided. Francis applied with such ardour and assiduity to the study of history, under his uncle's instructions, that he was soon able to afford him valuable assistance in his great work, and was properly entrusted with the care of editing the three last volumes of it, as we have seen above. After he had executed this task, he employed himself in writing a work of his own, which he published under the title of "Breviarium Historico-Chronologico-Criticum, Illustriora Pontificum Romanorum Gestæ, Conciliorum generalium Acta, &c. complectens," 4 vols. 4to. The first and second of these volumes made their appearance in 1717, the third in 1718, and the fourth not till after the author's death, when it was published by Anthony Pagi, the second of that name, and nephew to our author. This work, which comprises the history of the popes, and of the general councils, together with numerous details relative to the discipline, the rites, &c. of the church, displays much learned and curious research, and is drawn up in a style that is correct and neat. The author, however, is a zealous advocate for the highest claims of the pretended successors of St. Peter; and maintains so uniformly and steadily the infallibility of the pope, his superiority over councils, the right of appeals to the court of Rome, and the papal power of anathematizing sovereigns, that it should seem that his work was undertaken for the express purpose of defending those opinions. The author died in 1721, in the sixty-seventh year of his age, having passed through the principal offices of trust and honour in his order.

His nephew, ANTHONY PAGI, was born at Martigne in Provence, and entered among the Jesuits, whom he afterwards quitted, and became provost of Cavaillon. He published, 1. A History of the Revolutions of the Low Countries, 1727, 12mo. 2. The History of Young Cyrus, 1736. 12mo. He was a writer not destitute of talents and genius; but his style is diffuse, romantic, and culpably negligent. *Gen. Biog.*

PAGIET'TA, a town of Naples, in Abruzzo Citra: five miles south of Langiano.

PAGIEL, [Heb. the prayer of God.] A man's name.

PAG'INA, *f.* [Latin.] In botany, the whole surface of any part of a plant, including the border.

PAG'INAL, *adj.* [pagina, Lat.] Consisting of pages.—An expression proper unto the *paginal* books of our times, but not so agreeable unto volumes or rolling books; in use among the Jews. *Brown's Vulg. Err.*

PAG'LESHAM, a village in Essex, on the east side of the Stambidge, is separated by a creek from Wallesea, or Walfleet-island, part of which is in its parish.

PA'GLIA, a river of Italy, which runs into the Tiber a few miles below Orvieto.

PAGLIANEL'LO, a town of Naples, in Lavora: fourteen miles north-east of Capua.

PAGLIA'NO, a town of Naples, in Abruzzo Ultra: fifteen miles east-south-east of Aquila.

PAGLIAPO'LI, a town of Naples, in Calabria Ultra: four miles east of Gierace.

PA'GLION, a river of France, which runs into the Mediterranean a little to the east of Nice.

PAGNI'NUS (Sanctes), an Italian Dominican monk, distinguished for his skill in oriental and biblical literature, was descended from a respectable family, and born at Lucca, in the year 1466 or 1470. At the age of sixteen he took the habit in a convent of the Dominican order, and applied with extraordinary diligence to the study of the learned languages, and of divinity. He not only made himself master of the Latin and Greek, but also of the Hebrew, Chaldee, and Arabic, tongues. As he particularly excelled in the knowledge of Hebrew, he was sent by his superior to teach it in a monastery at Lyons, where he spent the greatest part of his life. Here he distinguished

tinguished himself by his zeal in defending the catholic church against the attacks of the reformers; and laboured to prevent the numerous Italian families which had settled in this city from being converted by the emissaries of the Waldenses and Lutherans. But what principally contributed to his celebrity, was the design which he undertook, and accomplished, of making the first modern translation into Latin of the Old Testament from the original Hebrew, and of the New Testament from the Greek. To this design he was led from a firm conviction that the Vulgate translation, as it has descended to modern times, is greatly corrupted from the state in which it was left by St. Jerome. It was his object, therefore, to produce a new translation, in which the Vulgate should be followed whenever fidelity to the originals permitted. No sooner was his intention announced, than it met with the approbation of pope Leo X. who had that confidence in the learning and abilities of Pagninus, that he promised to furnish the necessary expenses for completing his work. From a letter of Francis Picus of Mirandola to the author, it appears, that he commenced his version of the Hebrew Scriptures in 1493; and, after employing five-and-twenty years upon it, finished it in 1518. He then applied to the translation of the Apocryphal Books, and the New Testament, both of which he rendered from the original Greek before the year 1521. At length the whole work was published at Lyons, in 1528, under the title of "Veteris et Novi Testamenti nova Translatio, per Sanctum Pagninum nuper edita, approbante Clemente VII." 4to. accompanied with the licenses of popes Adrian VI. and Clement VII. On this work many high commendations have been bestowed by the most learned rabbis, who have decidedly given it the preference to all other translations of the sacred Hebrew writings; and also by many eminent Christian critics, catholic and protestant; and, among others, by Leusden, Erpenius, Buxtorf, and the learned Huet bishop of Avranches. On the other hand, Genebrard, father Simon, and others, while they agree with later translators and commentators on the scriptures, in acknowledging that Pagninus has given proof in it of great learning and abilities, contest its claims to the superior excellence which the former attribute to it. Father Simon pronounces it to be obscure, barbarous, and full of solecisms; and maintains that it sometimes changes the sense of the text. This version, however, afterwards underwent repeated impressions. In the same year the author published "Liber Interpretationum Hebraeorum, Aramæorum, Græcorumque Nominum, quæ Arcanis sacrisque in Litteris inveniuntur, ordine alphabetico, ut inventu cuncta sint perfacilia," 4to. which has been added to the subsequent editions of that work. Pagninus also published, 3. *Thesaurus Linguae Sanctæ*, 1529, folio; which was reprinted by Robert Stephens, under the title of, *Thesaurus Linguae Sanctæ contrafictior et emendatior*, 1548, 4to. and an abridgment of the same was published at Antwerp in 1616, 8vo. 4. *Isagoges, seu Introductionis ad Sacras Litteras Liber Unus*, 1528, 4to. and reprinted in 1536, folio, with an historical preface by Symphorien Champier. 5. *Hebraicarum Institutionum Libri Quatuor*, Sanc. Pag. Luc. Audt. ex Rabbi David Kimhi priore parte fere transcripti, 1526, 4to. of which an abridgment was printed at Paris by Robert Stephens, in 1546, 4to. 6. *Enchiridion Expositionis Vocabulorum Haruch, Targum et multorum aliorum Librorum, Hebraicæ Linguae, aliisque Libris apprime accommodatum*, &c. 1523, folio. 7. *Isagogæ ad sacras Litteras et ad mysticos Scripturæ Sensus*, &c. being a continuation of the "Isagoges" above-mentioned, and reprinted with the same in 1536, folio. 8. *Catena argentea in Pentateuchum*, in six large volumes, 1536. 9. *Catena argentea in totum Pfalterium, Hebræorum, Græcorum, et Latinorum, continens Commentaria*, in three large volumes. 10. *Annotamenta in totum Vetus Testamentum*. 11. *Isagogæ Græcæ*, &c. 1525, 2 vols. folio; and he left behind him a number of manuscripts. Pagninus died at

Lyons in 1536, at the age of sixty-six; and, when his obsequies were celebrated, a great number of the principal people of the city attended, out of respect to his memory. Buxtorf, who made much use of his *Thesaurus* in forming one of his own, calls him "Vir linguarum orientalium peritissimus." Luther spoke of him with great applause. *Simon's Crit. Hist. Le Long's Biblia Sacra*, vol. i.

PA'GNY SUR MOSEL'LE, a town of France, in the department of the Meurthe: four miles north of Pont à Mousson, and nine south-south-west of Metz.

PA'GO, an island in the Adriatic, near the coast of Dalmatia or Morlachia, about twenty miles long and six broad, with several villages. The ancient geographers have left us no description of it; though (as Fortis observes) its form, extent, and rich produce, unquestionably deserved it. And this is the more unaccountable, as we know the Romans were well acquainted with it; and on the other islands adjoining to it are many vestiges of buildings, inscriptions, tiles, and hewn stones, all sure signs of Roman habitations. Its figure is remarkably irregular, its breadth being in no proportion to its length; for one of the extremities, called *Punta di Lodi*, is above ten miles long, and less than one broad. Almost all the circumference is dismal, without trees or any kind of visible plants or grass, steep, craggy, and uninhabited. On entering the lake through the channel that communicates with the sea, nothing is to be seen either on the right or left but bare hanging rocks, so disfigured on the outside by the violent percussion of the waves, that the stratification is hardly distinguishable. The channel, or inward bay, of Pago, is not a harbour; on the contrary, it is a very dangerous station, and even inaccessible in winter, when the north wind blows with such fury, that the inhabitants of the town dare not stir out of their houses, and much less the few that are scattered over the country. The sky appears always cloudy in that season, by the thick mist that arises from the re-percussion of the waves on that long chain of rough and hollow rocks. One particular circumstance, which distinguishes it from all the other islands of the Adriatic, is a large internal salt-water lake, fifteen miles long from south to north, into which the sea enters by a canal not above a quarter of a mile. This lake is frequented by the tunny-fish, which, when once in, cannot return again to the sea. There are also two smaller lakes on the island: one near Vlassich, abounding in fish, particularly eels; and one near the hamlet of Slabine.

In this island the winter is dreadfully cold, and the summer scorchingly hot. Those who have been there in the winter-time speak of it as a Siberia quite covered with snow and ice, and always exposed to the cold north wind; and, in the hot season, it is thought equal to the most scorching parts of the world. The naked rocks, which not only form the organization, but also the superificies, of almost all the island; the narrowness of the valleys; the reverberation of the water of the lake, generally quite calm in summer; multiply the heat so prodigiously among those stones, that the vines, which are planted all round the lake, ripen their grapes by the beginning of August; and the other products that grow there anticipate the usual time of maturity in the same manner. The meteors are exceedingly irregular in the summer-time; sudden whirlwinds are frequent, and heavy showers of rain: the last are hurtful to the inhabitants of one part of the island, and are favourable to the cultivation of the opposite end. They cultivate neither corn nor oil on this island; but it produces plenty of wine, and an immense quantity of salt. The other products are wool, honey, and a little salt fish. The quantity of wine amounts annually, on a medium, to 40,000 Venetian barrels; and from the hulks they distil 2000 barrels of *rakia*, or brandy. The salt, in 1663, amounted to 800,000 Venetian sters. The salt-works are well contrived and well kept; they extend along a shallow pool, which forms the eastern extremity of the lake within, for four miles in length and about

about half a mile in breadth. On the sides of this fen the best part of the vines lie; but the upper part of the hills on each side is altogether naked and barren. The soil at the foot of the hills, where the vines are planted, is full of gravel and small stones; and hence the wine is of good quality. The air is not unhealthful, notwithstanding the vicinity of the salt-pits; for the frequent high winds carry off the noxious exhalations. The greatest part of the people of Pago live by working in the salt-pits, and have a comfortable subsistence regularly paid by the government: it is therefore a very important circumstance for the inhabitants of the city to have a dry summer; and hence the ignorant vulgar look upon rain as a mischief brought upon the country by the force of witchcraft. In consequence of this idea, they elect a friar to exorcise the meteors, and keep the rain off the island. If, notwithstanding the poor friar's endeavours, the summer happens to be rainy, he loses his reputation and his bread; but, if two or three dry seasons follow successively, he meets with great reverence and advantage. Part of the salt-works belongs to the government, and the rest to private proprietors; they are meliorated every year; and for that end the public lends money to those proprietors who want it, and who, without that assistance, could not make the requisite improvements. The great quantity of sage and other odoriferous plants with which the island is covered, furnishes most excellent food for the bees, and the honey of whom forms no inconsiderable branch of trade; it is generally carried to Fiume, and sold again there as the honey of that country. The same pasture among those barren rocks maintains a large number of sheep and goats; and the wool which is very bad, and cheefe, make small articles for export.

The northern part of the island, called *Novaglia*, which depends on the government of Arba, is well supplied with water, and has good pastures on its low grounds, by which means its black cattle are larger and better than on any of the neighbouring islands, or of Littoral Dalmatia. The island has actually neither wood to burn, nor for any other purpose, excepting the northern end, called *Punta di Loni*, which is abundantly supplied with all sorts. Among the rest there are very fine roots and trunks of old olive-trees, which would furnish excellent materials for the cabinet-makers and sculptors. The soil of the island, that is, of the land lying on the declivity and at the bottom of the hills, is very gravelly and light; but on the northern extremity, where there are plains, though somewhat stony, yet the land is better and stronger, and might be cultivated to bear corn of all sorts. The whole number of inhabitants scarcely amounts to 3500, which bears no proportion to the extent of ground, if the naked barren hills that cover almost the whole did not account for it. The greatest part of this population lives in the city of Pago, which is said to contain about 3000 inhabitants. Lat. 44. 40. N. lon. 15. 10. E.

PAGO, the chief town of the above island, built by the Venetians in the year 1468. The name of Pago is found in older writings; but then it was a village, and situated in an unhealthful and inconvenient spot, now called *Terra Vecchia*, or The Old Town. *Kessa*, or *Kissa*, or *Kussa*, was the name of the capital of this island in the barbarous times, and probably comes from the corruption of *Cissa*, or *Gissa*. The Venetians took it from the Croats in the end of the 16th century, and demolished it. At that time it appears that the southern part, where Pago now stands, was not much inhabited. This city has undergone many revolutions. The difficulty of access to it, and the bad accommodation that strangers meet with, make it very little frequented; hence the inhabitants are as wild and unpolished as if they lay at the greatest distance from the sea, and the commerce of polite people. The gentry, who pretend to show their manners different from those of the vulgar, are truly grotesque figures, both in their dress and behaviour, and insolent pretensions: the ignorance of the clergy is incredible.

There are two convents of friars in Pago, and one of nuns; and several churches, all in very bad order, and ill served.

PAG'OD, or PAGO'DA, *f.* [a corruption of *poutghad*, which in the Persian signifies "a house of idols." Fryer's Travels. *Dr. Johnson*.—Sir T. Herbert writes it *pagotha*: "Many *pagothaes* or idol places for worship. Within these is built a *pagotha*. They adore *pagothas*, in shape not unlike Pan and Priapus." Travels, p. 48, 116, 373. Todd.] An Indian idol.—Miserable Indians idolatrously adoring their devilish *pagodes*. *Bp. Hall's Character of Man*.—They worship idols called *pagods*, after such a terrible representation as we make of devils. *Stillingfleet*.—The temple of the idol. We should be inclined to restrict the word *pagod* to the idol, and to apply *pagoda* to the temple; but the following example is against us:

See thronging millions to the *pagod* run,
And offer country, parent, wife, or son.

Pope.

The pagodas, or pagod-temples, of China, are lofty towers, consisting sometimes of nine stories, each story more than twenty feet high. See the representation, under the article CHINA, opposite p. 484. The pagodas of Hindoostan, on the contrary, are mostly square stone buildings, not very lofty, and crowned with a cupola. Within they are very dark; for they have no windows, and only receive their light through the entrance. The image of the idol stands in the deepest and darkest recess of the temple; it is of a monstrous shape, and of uncouth dimensions, having many arms and hands. Some of these idols have eight, and others sixteen, arms; with a human body, and the head of a dog, with drawn bows and instruments of war in their hands. Some of them are black, others of a yellowish hue. In some pagodas there are no images, but only a single black polished stone, lying upon a round altar, covered with flowers and sandal-wood, which were strewed upon it. Greater veneration is manifested for these stones than for the idols themselves. Their worship of these divinities consists in throwing themselves upon the ground, and making their salam, or salutation, with their hands, and ejaculating their prayers in silence in that posture. The offerings which they are accustomed to present to their gods consist of flowers, rice, pieces of silk and cotton, and sometimes gold and silver. Every thing is laid before the idols, and is taken care of by the Brahmins, who profit the most by it; for, to adopt the words of an elegant and accurate historian, "in all the great pagodas of India the Brahmins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no want." For a description of some of these curious buildings, see the article HINDOOSTAN, vol. x. p. 170, and the Plates there referred to.

PAGODA is also the name of a gold coin, current in several parts of India. The silver pagodas, struck at Narasingua, Bishnagur, &c. usually bear the figure of some monstrous idol: whence their names. They are of various values.

Accounts are kept at Madras, or Fort St. George, on the Coromandel coast, in pagodas, fanams, and cash; 80 cash = 1 fanam, and 42 fanams = 1 pagoda. Such is the mode of reckoning used by the East-India Company, and other European merchants; but, among the natives, the value of the pagoda varies from 44 to 46 fanams. The gold coins are star or current pagodas; and the silver coins, Arcot rupees. The star-pagoda weighs 52.56 English grains, and the gold is 19½ carats fine; it therefore contains 42.048 grains of fine gold, and is worth 7s. 5½d. sterling; but it is commonly valued at 8s.

In the Mysore country, and particularly at the capital, Seringapatam, accounts are kept in Canter-raia pagodas, and palams, called by the English Canterbury pagodas and fanams. This pagoda is an imaginary money; and the fanam, which is a real coin, is the tenth part of the pagoda. The coins are gold mohurs, which pass for four pagodas; sultany pagodas, coined by Tippoo Sultan; and other

other pagodas, coined by Hyder Ally, and by the rajah of Myfore, all passing for 13 fanams; also, sultany-rupees, and rajah-rupees, 26 of which pass for 7 sultany-pagodas; copper dudos, called by the English dubs, 260 of which are the market-price for a sultany-pagoda. The shroffs, when they exchange copper for gold or silver, pay at the rate of 234 dudos for a pagoda; but, when they change gold and silver for copper, they receive 240; whilst the price fixed by government is 182 dudos per pagoda; and the other coins exchange in proportion. At Pondicherry, the coins are gold pagodas, and silver rupees and fanams. A pagoda weighs 9 fanams; so that three rupees are equal in weight to 10 pagodas; $7\frac{1}{2}$ pagodas weigh a French mark, or 3778 English grains. In short, the value of the pagoda varies, according to its fineness and the places where it is current, from 5s. 8 $\frac{1}{2}$ d. to 8s. 5d.

The pagoda differs in shape from all European coins: it has a convex side with prominent dots, and a flat side which generally bears a figure, and in some three figures, of Indian idols. The star-pagoda is marked on the convex side with a star; other pagodas are marked with a crescent, or with an initial letter; the pagodas of Masulipatam and Pondicherry have nothing on the convex side but the dots. Tippoo's pagodas have no figure on the flat side, but a legend, which is translated thus, "Mahomet, he is the authority of equity," with the date of the Hegira; on the convex side, the name of the place where it was coined, and generally the initial of Hyder. *Kelly's Universal Cambist.*

PAGODA-BA'Y, a bay on the east coast of Cochin-China. Lat. 12. 21. N. lon. 109. 4. E.

PA'GON, or ST. IGNATIUS, one of the Ladrone-islands, about thirty-six miles in circumference: thirty miles north of Amalagan.

PAGOO'R, a town of Bootan: sixteen miles south of Tassafudon.

PAGOU'A BAY, a bay on the east coast of the island of Dominica. Lat. 15. 18. N. lon. 61. 19. W.

PAGOY'UM, a word used by Paracelsus and his followers, to express an imaginary being, which presides over, or is the occasion of, diseases whose causes are less known, and which have been supposed to arise from enchantment. Such is the doctrine of this strange writer, and on this subject he has written a treatise called "Pagoyus."

PA'GUL, a town of Africa, in Whidah: six miles north-west of Sabi.

PAGURUS, *f.* in entomology, a division made by some authors in the Cancer tribe. See CANCER.

PA'HA-CA'CHON, a town of Thibet: 100 miles south-west of Hara-Toubê.

PAHA-TOM'KIN, a mountain of Thibet. Lat. 34. 30. N. lon. 91. 44. E.

PAHANG', PAHAN, or PAN, a seaport-town of Malacca, on the east coast; called by the Portuguese *Paon*, and by the Arabs *Fân*. It is situated about four leagues from the sea, and inhabited only by nobility, the people dwelling only in the suburbs. This place, which is not very large, is enclosed by a wall, made of the trunks of trees joined close together, and about twenty-four feet in height, strengthened at each end with a bastion, but not filled with earth. The streets are fenced on both sides with hedges of reeds, and planted with cocoa and other trees; so that Pahang looks more like an assemblage of gardens belonging to a suburb, than a regular city. The houses likewise are generally built with reeds and straw; only the king's palace is of wood; for Pahang was formerly the capital of a kingdom which lay between Johor and Patany, but at present it makes a part of Johor. The river is broad, but not navigable for galleys, except at high-water. The adjacent country is very low, but fruitful enough; producing pepper, eagle and kalambak woods, gold, nutmegs, mace, sapan-wood, diamonds, and hog-stones, reckoned more efficacious than the be-

zoar-stones. Deeper in the country, elephants are very numerous. Lat. 3. 40. N. lon. 103. 36. E.

PAHANG', or PU'LO PAHAN, a small island in the Eastern Indian Sea, near the coast of Malacca: five miles east from the town of Pahang.

PAHARGUN'GE, a town of Bengal: ten miles south-west of Beyhar.

PA'HATH-MO'AB, in scripture-history, was probably a city built near to the place where Ehud routed the Moabites. Joshua and Joab were two of its ancient princes: 2812 persons belonging to Pahath-Moab returned from Babylon with Zerubbabel, and 200 more with Ezra. *Ezra* ii. 6. viii. 4. Some would have Pahath-Moab to be the name of a man; and it is certain that one of that name sealed Nehemiah's covenant of reformation. See Neh. x. 14. *Brown's Dict. Bible.*

PAHA'VENS, a town of Persia, in the province of Irak: thirty miles west of Jeshd.

PA'HICH, a town of Arabia, in the province of Hedjaz: sixty miles south-east of Medina.

PAH'IE, *f.* One of the classes of canoes or boats used by the inhabitants of the islands in the South Sea. The pahie is of different sizes, from thirty to sixty feet long, but very narrow; a transverse section of it resembles the spade of cards, the whole being much wider in proportion to its length. The largest pahies are used for fighting, in which case they are fitted with a stage or platform.

PA'HO, a river on the west coast of the isle of Celebes, which runs into the straits of Macassar in lat. 3. 10. S. lon. 119. 52. E.

PA'HVA, a small island on the coast of Finland, with a town. Lat. 60. 29. N. lon. 21. 30. E.

PAHVITTRAM', a town of Hindooftan, in the Carnatic: fourteen miles east-south-east of Coveriporum.

PAJACK', *f.* A corn-measure in Russia, equal to nearly a bushel and a half of Winchester-measure.

PAJA'NA, a lake of Sweden, in the province of Tavastland, above 100 miles in length.

PAIANEL'LI, *f.* in botany. See BIGNONIA.

PAJ'AROS. See PAXAROS.

PAI'AS, a town of Asiatic Turkey, in the government of Marasch, in the bay of Alexandretta: five miles west of Alexandretta, and twenty-five south-west of Marasch.

PAJAU'NY, a town of Hindooftan, in Oude: thirty miles west of Kairabad.

PAICHAM', a town of Chinese Tartary. Lat. 42. 42. N. lon. 120. 22. E.

PAI'DORFF, a town of the duchy of Stiria: six miles north of Muehrau.

PAI'GLE, *f.* [*parahsis*, Lat.] A kind of cowslip; the double cowslip.—Blue harebells, *pagles*, pansies, calaminth. *B. Jonson's Masques.*

PAIJA'LA, a town of Sweden, in West Bothnia: eighty-six miles north of Tornea.

PAIL, *f.* [*paila*, Span.] A wooden vessel in which milk or water is commonly carried.—In the country when wool is new-shorn, they set *pails* of water in the same room to increase the weight. *Bacon.*

New milk that all the winter never fails,
And all the summer overflows the *pails*. *Dryden.*

PAI'LFUL, *f.* The quantity that a pail will hold.—Yond same cloud cannot chuse but fall by *pailfuls*. *Shakespeare*.—When an house is on fire, we must every one cast in his *pailful* to the quenching of the flames. *Bp. Hall.*

PAI'LLS, a town of France, in the department of the Arriege: eighteen miles west of Mirepourt.

PAI'LLY, a town of Hindooftan, in Vissapour: five miles south-south-west of Sattarah.

PAILMAIL, *f.* The same with *pallmall*, a beater or mallet to strike the ball.—A stroke with a *pailmail* beetle upon a bowl, makes it fly from it. *Digby on the Soul.*

PAIM'POL, a town of France, in the department of the North Coasts: seven miles east of Treguier.

PAIN, *f.* [*πῶνις*, Gr. *pæna*, Lat. *peine*, Fr. *pin*, Sax.] Punishment denounced.—There the princesses, determining to bathe themselves, thought it was so privileged a place, upon *pain* of death, as no-body durst presume to come thither. *Sidney*.

On *pain* of death no person be so bold,
Or daring hardy, as to touch the list. *Shakespeare*.

Penalty; punishment.—Because Eusebius hath yet said nothing, we will, by way of mulct or *pain*, lay it upon him. *Bacon*.—Sensation of uneasiness.—As the *pains* of the touch are greater than the offences of the other senses; so likewise are the pleasures. *Bacon*.

Pain is perfect misery, the worst
Of evils; and, excessive, overturns
All patience.

Milton's P. L.

[In the plural.] Labour; work; toil.—One laboureth and taketh *pains*, maketh haste, and is so much the more behind. *Eccles. xi. 11*.—The *pains* they had taken was very great. *Clarendon*.—Some natures, the more *pains* a man takes to reclaim them, the worse they are. *L'Estrange*.—A reasonable clergyman, if he will be at the *pains*, can make the most ignorant man comprehend what is his duty, and convince him that he ought to perform it. *Swift*.—Labour; task. The singular is, in this sense, obsolete.

The fame with *pains* we gain, but lose with ease,
Sure some to vex, but never all to please. *Pope*.

He soft arrived on the grassy plain,
And fairly paced forth with easy *pain*. *Spenser*.

Tone *paine* in a cottage doth take,
When t'other trim bowers do make. *Tusser*.

When of the dew, which th' eye and ear do take
From flowers abroad, and bring into the brain,
She doth within both wax and honey make:
This work is hers, this is her proper *pain*. *Davies*.

When a lion shakes his dreadful mane,
And angry grows, if he, that first took *pain*
To tame his youth, approach the haughty beast,
He bends to him, but frights away the rest. *Waller*.

Uneasiness of mind, about something absent or future; anxiety; solicitude.—Great *pain* [in the margin, fear] shall be in Ethiopia. *Ezek. xxx. 4*.—If the churchless were once thus settled, we need then be in less *pain* for the religion of our prince. *Lestie*.

It bid her feel
No future *pain* for me; but instant wed
A lover more proportion'd to her bed. *Prior*.

The throes of childbirth.—She bowed herself and travailed; for her *pains* came upon her. 1 *Sam. iv. 19*.

To **PAIN**, *v. a.* To afflict; to torment; to make uneasy.—Excess of cold, as well as heat, *pains* us, because it is equally destructive to that temper which is necessary to the preservation of life. *Locke*.

She drops a doubtful word, that *pains* his mind,
And leaves a rankling jealousy behind. *Dryden*.

[With the reciprocal pronoun.] To labour. *Little used*.—Though the lord of the liberty do *pain himself* to yield equal justice unto all, yet can there not but great abuses lurk in so absolute a privilege. *Spencer on Ireland*.—He *pained himself* to raise his note. *Dryden*.

PAIN'S HILL. See WALTON-UPON-THAMES.

PAI'NA SCHYL'LI, *f.* in botany. See ACANTHUS.
PAINBEUF, a seaport-town of France, and principal place of a district, in the department of the Lower Loire, situated at the mouth of the Loire: twenty-one miles west of Nantes, and twenty north-north-west of Mache-coul. Lat. 47. 17. N. lon. 1. 57. W.

PAINE (Thomas), a famous political writer, was born at Thetford, in Norfolk, on the 29th of January, 1736-7. His father, who was the son of a small farmer, followed the trade of a stay-maker, and was by religious profession a Quaker. His mother was a member of the church of England, and daughter of an attorney at Thetford. They were married at the parish-church of Euston, near Thetford, the 20th of June, 1734. His father, by this marriage out of the society of Quakers, was disowned by that community. Mr. Paine received his education at the grammar-school at Thetford, under the Rev. Wm. Knowles; and one of his school-mates at that time was the late counsellor Mingay. At this school his studies were directed merely to reading, writing, and arithmetic; and he left it at thirteen years of age, to be put apprentice to his father.

In the year 1756, when near twenty years of age, he went to London, where he worked some time in Hanover-street, Long Acre, with Mr. Morris, a well-known stay-maker. In 1758, he removed to Dover, where he worked at his trade for near twelve months. In April 1759 he settled as a master stay-maker at Sandwich; and Mr. Oldys says that he formed a little congregation at his own house, to whom he preached as an independent minister. On the 27th of September following he married Mary Lambert, the daughter of an exciseman of that place. In April 1760, he removed with his wife to Margate, where she died shortly after; and he again mingled with the crowds of London.

In July 1761, disgusted with the toil and little gain of his late occupation, he renounced it for ever, and determined to apply himself to the profession of an exciseman, towards which, as his wife's father was of that calling, he had some time turned his thoughts. At this period he sought shelter under his father's roof at Thetford, that he might prosecute, in quiet and retirement, the object of his future course. Through the interest of Mr. Cockedge, the recorder of Thetford, after fourteen months of study, he was established as a supernumerary in the excise, about the age of twenty-five. In this situation, at Grantham and Alford, &c. he did not continue more than two or three years, when he relinquished it, in August 1765, and commenced it again in 1766. In this interval he was teacher at Mr. Noble's academy, in Leman-street, Goodman's Fields, at a salary of 25l. a-year. In a similar occupation he afterwards lived for a short time, at Kensington, with the Rev. Mr. Gardnor. Speaking of the improvement he gained in the above capacities, and some other lowly situations he had been in, he made this observation: "Here I derived considerable information; indeed, I have seldom passed five minutes of my life, however circumstanced, in which I did not acquire some knowledge." During this residence in London, he attended the philosophical lectures of Martin and Ferguson, and became acquainted with Dr. Bevis, of the Temple, a great astronomer. In these studies and the mathematics he soon became a proficient. At this time he was desirous of taking orders; but, being merely an English scholar, he could not obtain any certificate of qualification. Being violently moved, however, with a spirit of preaching, he wandered about for a while as an itinerant methodist; because, though restored to his rank in the excise, he was not fixed in an employment.

In March 1768, he was settled as an exciseman at Lewes in Sussex; and there, on the 26th of March, 1771, married Elizabeth Ollive, shortly after the death of her father, whose trade of a tobaccoist and grocer he entered into and carried on. In this place he lived three years, in habits of intimacy with a very convivial set of acquaintance, who were entertained with his witty sallies, and informed by his more serious conversations. In politics he was at this time a Whig, and notorious for that quality which has been defined perseverance in a good cause and obstinacy in a bad one.

In April 1774, the goods of his shop were sold to pay his debts. As a grocer, he trafficked in excisable articles; and, being suspected of unfair practices, was dismissed the excise, after being in it twelve years. Yet, at the time he was an exciseman at Lewes, he was so approved for doing his duty, that Mr. Jenner, principal clerk in the Excise-office, London, had several times occasion to write letters from the Board of Excise, thanking him for his assiduity in his profession.

Here Mr. Cobbett stops to remark, that Paine, being turned out of the excise, and barred the church, began to write against church and state; calling the excise a "hell-born monster," and tythes the "whore of Babylon."

In May following (1774), Mr. Paine and his wife separated by mutual agreement; articles of which were finally settled on the 4th of June. Which of them was in this instance in the wrong, or whether either of them were so, must be left undetermined: this I can assert, (says Clio Rickman,) that Paine always spoke tenderly and respectfully of his wife; and sent her several times pecuniary aid, without her knowing even whence it came. Mr. Oldys, on the contrary, says, that she paid him 35l. sterling, upon condition that he would trouble her no more, nor claim any part of the property she might thereafter acquire. From Oldys's account, it is evident that Mr. Paine married for the sake of getting his debts paid, (by means of the property which Miss Ollive inherited from her father,) and that he cared nothing about the woman; in fact, he never cohabited with her, though they lived in the same house for three years. Some persons, perhaps, may recollect a case very similar to this, but in a higher rank of life.

Paine now went again to London; and he soon after procured a recommendation to Dr. Franklin in America. He accordingly sailed in September 1774, and arrived at Philadelphia a few months before the battle of Lexington. He was first engaged as shopman by Mr. Aitkin, bookseller in Philadelphia, at the wages of 20l. a-year. In November 1775, he was employed in a laboratory. He took great pains in experiments for the purpose of discovering some cheap and expeditious method of making saltpetre. He was also the proposer of a plan for the voluntary supplying of the public magazines with gunpowder. On the 10th of January, 1776, was published his "Common Sense." This was eagerly read. On the 19th of December, 1776, he published, in the Pennsylvania Journal, the first number of "The Crisis," intended to encourage the Americans in their opposition to the British government. The Crisis he continued to publish till a cessation of hostilities between America and Britain was proclaimed, on the 19th of April, 1783.

In August 1782, Paine published a Letter to the Abbé Raynal, in consequence of the latter author's publication of his History of the Revolution of America. His next production was a Letter to the Earl of Shelburne, on the effects likely to arise to Great Britain from the independence of America. His labours had not yet received any substantial reward: but, in the year 1785, the state of Pennsylvania, in which he first published Common Sense and The Crisis, presented him, by an act of legislature, with 500l. currency; and New-York gave him an estate at New Rochelle, in the county of Westchester, consisting of more than three hundred acres of land in high cultivation: on this estate was an elegant stone house, 125 by 28 feet, besides out-houses.

After the establishment of the independence of America, feeling his exertions no longer requisite in that country, he embarked for France, and arrived at Paris early in 1787, carrying with him his fame as a literary man, and profound politician. At this time he presented to the Academy of Sciences the model of a bridge which he invented, the principle of which has since been highly celebrated and approved. From Paris he arrived in England on the 3d of September, just thirteen years after his

departure for Philadelphia. Prompted by that filial affection which his conduct had ever manifested, he hastened to Thetford to visit his mother, on whom he settled an allowance of nine shillings a-week. Of this comfortable solace she was afterwards deprived, by the bankruptcy of the merchant in whom the trust was vested. Mr. Paine resided at Rotherham in Yorkshire during part of the year 1788, where an iron bridge, upon the principle alluded to, was cast and erected, and obtained for him among the mathematicians of Europe a high reputation. In the erection of this, a considerable sum had been expended, for which he was hastily arrested by the assignees of an American merchant, and thrown into confinement. From this, however, and the debt, he cleared himself in about three weeks. More or less upon this plan of Mr. Paine's, the different iron bridges in Europe have been constructed.

The publication of Mr. Burke's "Reflections on the French Revolution," produced in reply from Mr. Paine his universally-known work, the "Rights of Man." The First Part of this work was written partly at the Angel at Islington, partly in East Harding-street, Fetter-lane; and finished at Versailles. In February 1791, this book made its appearance in London, and many hundred thousand copies were rapidly sold. It was dedicated to general Washington. The Second Part was published in February 1792. Never had any work so rapid and extensive a sale; and it has been calculated that near a million and a half of copies were printed and published in England.

Thus far we have had the assistance of Mr. Oldys's Life of Paine, which was published at Philadelphia in 1793. Mr. Paine was now residing at the house of Mr. Clio Rickman, another of his biographers, and his great admirer. On the 12th of September, 1792, he sailed for France with Mr. Achilles Audibert, "who came express from the French Convention to my house, (says this biographer,) to request his personal assistance in their deliberations. On his arrival at Calais, a public dinner was provided, a royal salute was fired from the battery, the troops were drawn out, and there was a general rejoicing throughout the town. He has often been heard to remark, that the proudest moment of his life was that in which, on this occasion, he set foot upon the Gallic shore." About the time of his arrival at Paris the National Convention began to divide itself into factions; the king's friends had been completely subdued by the suppression of the Feuillans, the affair of the 10th of August, and the massacre of the 2d and 3d of September; while the Jacobins, who had been hitherto considered as the patriotic party, became in their turn divided into different cabals, some of them wishing a federative government, others, the Enragés, desiring the death of the king, and of all allied to the nobility; but none of those were republicans. Those few deputies who had just ideas of a commonwealth, and whose leader was Paine, did not belong to the Jacobin club. He laboured incessantly to preserve the life of the king, and he succeeded in making some converts to his opinions on this subject; and his life would have been saved, but for Barrere, who, having been appointed by Robespierre to an office he was ambitious of obtaining, and certainly very fit for, his influence brought with it forty votes: so early was corruption introduced into this assembly.

Paine's opinion upon this subject was always the same; and in 1804 he thus speaks of it: "With respect to the revolution, it was begun by good men on good principles; and I have ever believed it would have gone on so, had not the interference of foreign powers distracted it into madness, and sown jealousies among the leaders."

"I was one of the nine members that composed the first Committee of Constitution. Six of them have been destroyed: Sieyes and myself have survived; he by bending with the times, and I by not bending. The other survivor joined Robespierre, and signed with him the warrant for my arrest. After the fall of Robespierre, he

was

was seized and imprisoned in his turn, and sentenced to transportation. He has since apologized to me for having signed the warrant, by saying, he felt himself in danger, and was obliged to do it. Herault Sechelles, an acquaintance of Mr. Jefferson's, and a good patriot, was my *suppléant* as a member of the Committee of Constitution; that is, he was to supply my place, if I had not accepted, being next in number of votes to me. He was imprisoned in the Luxembourg with me, was taken to the tribunal, and to the guillotine; and I, his principal, was left.

"There were but two foreigners in the Convention, Anarcharis Cloots and myself. We were both put out of the convention by the same vote, arrested by the same order, and carried to prison together the same night. He was taken to the guillotine, and I was again left. Joel Barlow was with us when we went to prison.

"Joseph Lebon, one of the vilest characters that ever existed, and who made the streets of Arras run with blood, was my *suppléant* member of the convention for the department of Calais. When I was put out of the convention, he came and took my place. When I was liberated from prison, and voted again into the convention, he was sent to the same prison, and took my place there; and he went to the guillotine instead of me. He supplied my place all the way through.

"One hundred and sixty-eight persons were taken out of the Luxembourg in one night, and a hundred and sixty of them guillotined the next day, of which I know I was to have been one; and the manner I escaped that fate is curious, and has all the appearance of accident. The room in which I was lodged was on the ground-floor, and one of a long range of rooms under a gallery, and the door of it opened outward and flat against the wall; so that, when it was open, the inside of the door appeared outward, and the contrary when it was shut. I had three comrades fellow-prisoners with me: Joseph Vanhuile, of Bruges, since president of the municipality of that town, Michael Robins, and Bassini of Louvain. When persons by scores and by hundreds were to be taken out of prison for the guillotine, it was always done in the night, and those who performed that office had a private mark or signal, by which they knew what rooms to go to, and what number to take. We, as I said, were four, and the door of our room was marked, unobserved by us, with that number in chalk; but it happened, if *happening* is a proper word, that the mark was put on the door when it was open and flat against the wall, and thereby came on the inside when we shut it at night,—and the destroying angel passed it by. A few days after this Robespierre fell; and the American ambassador arrived and claimed me, and invited me to his house. During the whole of my imprisonment prior to the fall of Robespierre, there was no time when I could think my life worth twenty-four hours: and my mind was made up to meet its fate."

It was during his confinement that he wrote the first part of his "Age of Reason;" of which we need only observe, that whereas, in his Rights of Man, he extols toleration, and says that "all religions are good," in this new work he finds out that "all religions are bad," and the Christian religion the worst of all. Cobbett observes, "It was such works as Common Sense and the Rights of Man that prepared the minds of the ignorant for the reception of that daring and blasphemous publication, the Age of Reason."

After his liberation, he found a friendly asylum at the American minister's house, Mr. Monroe, afterwards president of the United States; and for some years before he left Paris, he lodged at M. Bonville's, associating occasionally with Condorcet, Volney, Mercier, Joel Barlow, &c.

He now indulged his mechanical turn, and amused himself in bridge and ship modelling, and in pursuing his favorite studies, the mathematics and natural philosophy. "These models," says a correspondent of that time, "exhibit an extraordinary degree not only of skill, but of taste in mechanics, and are wrought with extreme

delicacy entirely by his own hands. The largest of these, the model of a bridge, is nearly four feet in length; the iron-work, the chains, and every other article belonging to it, were forged and manufactured by himself. It is intended as the model of a bridge which is to be constructed across the Delaware, extending 480 feet, with only one arch. The other is to be erected over a narrow river, whose name I forget, and is likewise a single arch, and of his own workmanship. He was offered 3000*l.* for these models, and refused it. He also forged himself the model of a crane of a new description, which, when put together, exhibited the power of the lever to a most surprising degree."

Paine was always desirous to retire and end his days in America, where his chief property lay. Accordingly he bade adieu to France and to Europe in 1802. "I arrived (says he) at Baltimore on the 30th of October, 1802; and you can have no idea of the agitation which my arrival occasioned. From New Hampshire to Georgia (an extent of 1500 miles) every newspaper was filled with applause or abuse. My property in this country has been taken care of by my friends, and is now worth six thousand pounds sterling; which, put in the funds, will bring me 400*l.* sterling a-year."

In the spring of 1804, he retired to his estate at New Rochelle, mentioned in a former part of this article. In January 1809, he became very feeble and infirm, so much so as to be scarcely capable of doing any thing for himself. During this illness he was visited by many very well-meaning persons, who wished to have the honour of converting so noted a person; but their labour was thrown away upon this incorrigible unbeliever. Dr. Manley, who attended him during his last illness, observed that he would call out, during his paroxysms of pain, "O Lord, help me! God, help me! Jesus Christ, help me! &c." The doctor, therefore, addressed him in the following manner: "Mr. Paine, your opinions, by a large proportion of the community, have been treated with deference; you have never been in the habit of mixing in your conversation words of course; you have never indulged in the habit of profane swearing; you must be sensible that we are acquainted with your religious opinions as they are given to the world. What must we think of your present conduct? Why do you call on Jesus Christ to help you? Do you believe that he can help you? do you believe in the divinity of Jesus Christ? Do you believe, or wish to believe, that Jesus Christ is the son of God?" After a short pause, he answered very coolly, "I have no wish to believe on that subject."

The following anecdotes of a lighter nature, are given on the authority of Mr. Clio Rickman.—One afternoon, a very old lady, dressed in a large scarlet-hooded cloak, knocked at the door, and enquired for Thomas Paine. He was asleep. Thinking it a pity to make an old woman call twice, the servant took her into Mr. Paine's bed-room, and awoke him: he rose upon one elbow; then, with an expression of eye that made the old woman stagger back a step or two, he asked, "What do you want?" She said, "I come from Almighty God to tell you, that if you do not repent of your sins, and believe in our blessed Saviour, you will be damned; and"—"Poh, poh, it is not true!" cried Paine; "you were not sent with any such message: Jarvis, make her go away; the Almighty would not send such a foolish ugly old woman about with his messages: go away: go back: shut the door."—A Mr. Hargrove, minister of a sect called the New Jerusalemites, accosted him with, "Sir, my name is Hargrove; I am minister of the New Jerusalem church; we, sir, explain the scripture in its true meaning: the key has been lost these four thousand years, and we have found it." "Then," said Paine, in his own neat way, "I think by this time it must be somewhat rusty."

About the 4th of May, symptoms of approaching dissolution were very evident to himself; and he became too

too infirm to take any thing, complaining of much bodily pain : he expired on the 8th of June. He was interred on his own farm; and a stone was placed at the head of his grave, according to the direction in his will, with the following inscription :

THOMAS PAINE,

Author of "Common Sense."

Died June 8th, 1809, aged 72 Years and 5 Months.

See Oldys's (Pennsylvania) Life of Paine, 1793, abridged by Cobbett, 1798. Cheetham's (New York) Life of Paine, 1810. Clio Rickman's Life of Paine, 1819. Gent. Mag. Nov. 1811. Monthly Mag. July 1819. Beauties of Cobbett, Part I.—In referring to this last pamphlet, we are led to remark, that Mr. Cobbett has lately changed his opinions upon the subject of Paine's life and conversation; for, upon his late return from America, he brought with him a box of bones, which he states to be those of Thomas Paine, and over which he proposes to erect an honorary monument in this country, when the people of this country shall have furnished him with the money he deems sufficient for that purpose. Many persons question the identity of the bones; we do not: but we shall quote one more paragraph from the Beauties of Cobbett, which indeed we take to be one of the chief of his beauties: "People should always endeavour to be *consistent*, at least when interest does not interfere." Beauties, Part III.

PAINFUL, *adj.* Full of pain; miserable; beset with affliction:

Is there yet no other way, besides
These *painful* passages, how we may come
To death. *Milton's P. L.*

Giving pain; afflictive.—Evils have been more *painful* to us in the prospect, than by their actual pressure. *Addison's Spectator.*

I'm sick of this bad world!
The daylight and the sun grow *painful* to me. *Addison.*
Difficult; requiring labour.—When I thought to know this, it was too *painful* for me. *Psalms lxxiii. 16.*

The *painful* service,
The extreme dangers, and the drops of blood
Shed for my thankless country, are requited
But with that surname. *Shakespeare's Coriol.*

Industrious; laborious; exercising labour.—Great abilities, when employed as God directs, do but make the owners of them greater and more *painful* servants to their neighbours: however, they are real blessings, when in the hands of good men. *Swift.*

To dress the vines new labour is requir'd,
Nor must the *painful* husbandman be tir'd. *Dryden.*

PAINFULLY, *adv.* With great pain or affliction.—Laboriously; diligently.—Such as sit in ease at home raise a benefit out of their hunger and thirst that serve their prince and country *painfully* abroad. *Raleigh's Essays.*

The robin-redbreast *painfully*
Did cover them with leaves. *Children in the Wood.*

PAINFULNESS, *f.* Affliction; sorrow; grief.—No custom can make the *painfulness* of a debauch easy or pleasing to a man; since nothing can be pleasant that is unnatural. *South.*

With diamond in window-glass she graved,
Ere she die, and end this ugly *painfulness*. *Sidney.*

Industry; laboriousness.—*Painfulness* by feeble means shall be able to gain that which, in the plenty of more forcible instruments, is, through sloth and negligence, lost. *Hooker.*

PAINIM, *f.* [*paganus*, Lat. *paenime*, old Fr. of the 12th century, for *paganisme*; whence, *payen*.] A pagan; an infidel. *Obsolete.*—The cross hath been an ancient bear-

ing, even before the birth of our Saviour, among the *painims* themselves. *Peachment.*

Whole brigades one champion's arms o'erthrow,
Slay *painims* vile that force the fair. *Tickell.*

PAINIM, *adj.* Pagan; infidel:

Champions bold
Defy'd the best of *painim* chivalry
To mortal combat, or career with lance. *Milton's P. L.*

The Solymeian sultan he o'erthrew,
His moony troops returning bravely smeared
With *painim* blood effus'd. *Philips.*

PAINGLESS, *adj.* Free from pain; void of trouble.—He frequently blest God for so far indulging to his infirmities, as to make his disease so *painless* to him. *Fell.*

The deaths thou show'st are forc'd:
Is there no smooth descent? no *painless* way
Of kindly mixing with our native clay? *Dryden.*

PAINOM JE'UNG, a town of Thibet, on the Painom-tchieu: 122 miles south-south-west of Lassa, and 160 north of Beyhar. Lat. 29. N. lon. 89. 8. E.

PAINOM-TCHIEU, a river of Thibet, which runs into the Burhampooter five miles south of Sgigatchee-Jeung.

PAINOUC, a town of Chinese Tartary. Lat. 41. 56. N. lon. 119. 49. E.

PAINPONT, a town of France, in the department of the Morbihan: six miles south-east of Moron.

PAINSHAW, a township of England, in the county of Durham, with 1399 inhabitants: eight miles north of Durham.

PAINSTAKER, *f.* Labourer; laborious person:
I'll prove a true *pains-taker* day and night;
I'll spin and card, and keep our children tight. *Gay.*

PAINS-TAKING, *adj.* Laborious; industrious.—The Galicians are a plodding *pains-taking* race of mortals, that roam over Spain in search of an hardly-earned subsistence. *Swinburne's Trav. through Spain.*

PAINS-TAKING, *f.* Great industry.—A poor gratitude for your *pains-taking*. *Beaumont and Fletcher's Span. Curate.*

PAINSWICK, a small market-town, in the county of Gloucester, is seated on the southern declivity of Sponebed-hill, at the distance of six miles south-south-east from the city of Gloucester, and 101 miles west-by-north from London. It is a town of considerable antiquity, being mentioned in Domesday-book under the name of *Wiche*. The manor then belonged to Roger de Lacy, who, joining in the rebellion excited by Robert Curthose against his father, was deprived of all his possessions. On this event Painswick became the lordship of *Pain Fitz-John*, from whom it derived the former part of its present designation. Since that period it has been inherited by several noble personages, and, among others, by the lords Talbot.

Painswick consists of several streets, very irregularly built. The church, dedicated to St. Mary, is the only edifice worthy of notice. This building has a nave, a chancel, and a north and south aisle, with a tower and spire at the west end, rising to the height of 174 feet. Its style of architecture is mixed and incongruous; the south aisle, which is modern, is supported by Doric pillars, and the entrance is beneath an Ionic portico, while the body of the church is in the pointed style. The spouts under the battlements of the north aisle represent singularly-grotesque heads of demons. In the chancel are several monuments of the Jerningham family. The church underwent a thorough repair in 1743, when a handsome altar-piece was put up.

Painswick has a nominal market on Tuesdays; and two fairs, Tuesday in Whitsun-week, and the 19th of September. According to the parliamentary returns of 1811, the town and parish contain 674 houses, and a population

tion of 3201 persons, a great proportion of whom are employed in the woollen-trade.

Above the town, on the summit of Sponebed-hill, is an ancient entrenchment, designated by the different appellations of Kembisburly Castle, King's Barrow, and Castle Godwin. This fortification is of a square shape, and has a double ditch and vallum. The inner rampart incloses an area of about three acres, and, as well as the outer one, is still of considerable height, though both have of late years suffered great dilapidation for the sake of the stones employed in constructing them. This encampment is supposed to have been of Roman origin, as coins of that people are frequently dug up within its area. It was afterwards, however, occupied by earl Godwin, during the insurrection made for the expulsion of all foreigners from the kingdom; and again by the royalist army, after the siege of Gloucester, in the time of the grand rebellion. The position of this entrenchment, in a military view, is excellent, as, from its loftiness, it has a prospect over the vale to Malvern-Hills, Shropshire, Worcestershire, Herefordshire, and Monmouthshire.

Shepcombe is a hamlet in the parish of Painswick, three miles from the church. In the reign of Edward VI. there were several insurrections in the west; at which time sir Anthony Kingston was lord of the manor. He caused a gallows to be erected for the insurgents upon Shepcombe-green; and made a prison at Painswick, to secure all sorts of offenders; he gave three pieces of land, now called *Gallows-lands*, one to maintain the gallows, the second to keep two ladders in readiness, the third to provide halters; and, that nothing in so necessary a business might be wanting, provided the tything-man of Shepcombe should be hangman, that he should enjoy an acre of land in this tything for his service.

Haresfield parish, to the westward of Painswick, contains some vestiges of antiquity. On the high ridge of hills which shelter the village is a very singular entrenchment, conjectured to have been a station of the Romanized Britons. It extends on one side 600 yards in length, and is defended by a single vallum fifteen feet high. Connected with this work is another, (partly in the parish of Standish,) which incloses the bold promontory called Beacon-hill by a "transverse vallation fifty feet deep, and containing fifteen acres." At Harescomb is the site of an ancient castle of the Bohuns. *Beauties of England and Wales*, vol. v. *Bigland's Hist. of Gloucestershire*, vol. ii. *Wilkes's British Directory*, vol. iv. *England's Gazetteer*, vol. i. ii.

To PAINT, *v. a.* [*peindre*, Fr. *pinto*, Ital. *pintar*, Span. *penta*, Icel. *pingo*, *picus*, Lat.] To represent by delineation and colours:

We'll have thee, as our rarer monsters are,
Painted upon a pole. *Shakespeare's Macbeth.*

To cover with colours representative of something:

Who fears a sentence, or an old man's faw,
Shall by a *paint*ed cloth be kept in awe. *Shakespeare.*

To represent by colours, appearances, or images.—Till we, from an author's words, *paint* his very thoughts in our minds, we do not understand him. *Locke.*

Whether the charmer sinner it or faint it,
When folly grows romantic, we must *paint* it. *Pope.*

To describe; to represent.—The lady is disloyal. Disloyal! The word is too good to *paint*-out her wickedness. *Shakespeare.*—To colour; to diversify:

Such is His will that *paints*
The earth with colours fresh,
The darkest skies with stores of starry lights. *Spenser.*

To deck with artificial colours in fraud or ostentation.—Jezebel *paint*ed her face and tired her head. *2 Kings*, ix. 30.

Hath not old custom made this life more sweet
Than that of *paint*ed pomp? are not these woods
More free from peril than the court itself? *Shakespeare.*

To PAINT, *v. n.* To lay colours on the face:

Oh! if to dance all night, and dress all day,
Charm'd the small-pox; or chas'd old age away,
To patch, nay ogle, might become a faint,
Nor would it sure be such a sin to *paint*. *Pope.*

PAINT, *f.* Colours representative of any thing.—The church of the Annunciation looks beautiful in the inside, all but one corner of it being covered with statues, gilding, and *paint*. *Addison on Italy.*

Poets are limners,

To copy out ideas in the mind;
Words are the *paint* by which their thoughts are shown;
And nature is their object to be drawn. *Granville.*

Colours laid on the face.—Together lay her pray'r-book
and her *paint*. *Anon.*

Arts on the mind, like *paint* upon the face,
Fright him that's worth your love from your embrace.
Young.

Pigment. Colours ready prepared for artists and house-painters, and sold by colourmen. See the article PAINTING.

PAINT, a town of the United States, in Fayette-county, in the state of Ohio; with 534 inhabitants.—A town of Highland-county, in the same state; with 775 inhabitants.

PAINTED LADY, *f.* in botany. See DIANTHUS.

PAINTED-LADY PE'A. See LATHYRUS.

PAINTED POST, a town of the state of New-York: thirty miles east of Bath.

PAINTEN, a town of Bavaria, in the principality of Neuburg: ten miles east-south-east of Dietfurt, and eleven west of Ratibon.

PAINTER, *f.* One who professes the art of representing objects by colours.—Beauty is only that which makes all things as they are in their proper and perfect nature; which the best *painters* always chuse by contemplating the forms of each. *Dryden.*—A naval term.—*Painter* is a rope employed to fasten a boat either alongside of the ship to which she belongs, or to some wharf or key. *Nautical Terms in Hawke'sworth's Voyages.*

PAINTER'S HARBOUR, a port on the west coast of the island of Cape Breton. Lat. 46. N.

PAINTING, *f.* The art of representing objects by delineation and colours.—If *painting* be acknowledged for an art, it follows that no arts are without their precepts. *Dryden.*

'Tis in life as 'tis in *painting*,
Much may be right, yet much be wanting. *Prior.*

Picture; the painted resemblance:

This is the very *painting* of your fear;
This is the air-drawn dagger which you said
Led you to Duncan. *Shakespeare's Macbeth.*

The *painting* is almost the natural man:
For, since dishonour trafficks with man's nature,
He is but outside: pencill'd figures are
Ev'n such as they give out. *Shakespeare's Timon.*

Colours laid on:

If any such be here
That love this *painting*, wherein you see me smeared,
Let him express his disposition. *Shakespeare's Coriol.*

TREATISE ON PAINTING.

By an admirable effort of human genius, PAINTING offers to the eye every thing which is most valuable in the universe. Its empire extends over every age and country. It presents to us the heroic deeds of ancient times, as well as the facts in which we are more conversant; and distant objects, as well as those which we daily see. In this respect, it may be considered as a supplement to Nature, which gives us only a view of present objects.

Mr. Shee, in the notes to his *Rhymes on Art*, maintains the superiority of painting over poetry; but the argument is idle and absurd. The powers of the painter and of the poet are both creative; and, when employed under the inspiration of real genius, the effects of both are eminently striking. In some instances, the painter has the advantage of the poet, and in others the reverse may be stated. If the former exceeds the latter in the exactness with which his conceptions are embodied, the latter often presents pictures to the imagination which the former cannot express by the utmost force of his art. The painter can only catch a particular instant, while the poet can exhibit the progress of an action; and, though the artist may boast of the superiority of imitation over description, he must know that "the poet's eye in a fine frenzy rolling" often sees more than lines and colours can possibly exhibit. Which has the precedence, we shall not decide; but we shall hope that the partnership which has so long subsisted between poetry and painting will not now be interrupted.

The painter who is distinguished for noble and profound conceptions; who, by means of a perfect delineation, and colours more capable of fixing the attention than dazzling the eye, conveys to the spectators the sentiments with which he himself was inspired; who animates them with his genius, and makes a lasting impression on their minds; this artist is a poet, and worthy to share even in the glories of Homer. But, if he seek only to please or astonish by the illusion of colours, he must rest contented with the secondary merit of flattering the eye with the variety and opposition of tints, or of making an industrious assemblage of a great multiplicity of objects. It is in painting as it is in poetry: the man who clothes trivial or common ideas in verse, exercises the profession of twisting syllables into a certain measure; the poet, who clothes in good verse ideas and sentiments that are merely agreeable, professes an agreeable art. But he who, by the magic of verse, of ideas, of imagery, or of colours, adds sublimity to the sublime objects of nature, is a great poet and a great painter. He deserves the crown which the nations have decreed to Homer, Virgil, Milton, Raphael, and the statuary who modelled the ancient Apollo. It is reasonable to place in the same class those who have expressed the same ideas, whether it be in verse or in colours, on brass or on marble. The painter and statuary, who excel in their professions, deserve all the respect due to genius: they are of the number of those men whom nature, sparing of her best gifts, grants but occasionally to the inhabitants of the earth. If they are sublime, they elevate the human race; if they are agreeable only, they excite those sweet sensations necessary to our happiness.

HISTORY OF ANCIENT PAINTING.

The desire of imitation appears to be so congenial to the mind, that one can scarcely imagine there could have been any lengthened period of time when it was not called into action, as an agent, either of amusement, of information, or of instruction. Of drawing or painting more particularly, it appears reasonable to suppose, that it must have been adopted for either or all of these purposes in

the earliest stages of human society, though in its very simplest and rudest form.

It is to be imagined that men must naturally, and very early, have conceived an idea of the first principles of the art of painting: the shadow of each plant and animal, and of every object in nature, must have afforded them the means of conceiving, and pointed out the possibility of imitating, the figures of all bodies. In accordance with this idea, Pliny tells a story, which makes love the origin of painting: he says that one Corinthia, a girl of Sicyon, being in love with a certain youth who was to depart the next day, and finding him asleep near a lamp that was burning, the shadow of his face, which appeared on the wall, seemed so like him, that she was incited to draw the extremities of it; and thus made a portrait of her lover.

The savage nations, an emblem of what men were in the infancy of society, possess the first rudiments of this art, even before those which are useful and almost necessary to existence: their naked bodies are covered with punctures of various forms, into which they infuse indelible colours. The next demand for this art, is to preserve the memory of warlike exploits. It is more natural to form some representation of an action, than to give an account of it by means of arbitrary characters. Hence the picture-writing of the Mexicans, and the more complex hieroglyphics of Egypt.

Plato, who lived 400 years before the Christian era, informs us that painting had been practised in EGYPT for ten thousand years; that some of the productions of that high antiquity were in existence; and that they bore an exact resemblance to those which the Egyptians executed in his time. Without regarding the period of ten thousand years mentioned by Plato, it is reasonable to consider it as an indeterminate period, which carries us back to very remote antiquity.

The figures, either in the painting or sculpture of Egypt, were extremely stiff; the legs were drawn together, and the arms were pasted to the sides. It appears that their only model was their mummies, and that their skill in anatomy was derived from embalming them. They were extremely incorrect in every part of the head; they placed the ears much higher than the nose. Besides, they gave the face the form of a circle instead of an oval; the chin was short and rounded; the cheeks excessively so; and they turned upwards the corners of the mouth and eyes. Some of these faults may be ascribed to the formation of the human face in Egypt; but the placing of the ears could only be founded in caprice or ignorance.

The exactness of the Egyptian proportion is much celebrated; but, although we grant that they observed the proper length of the different parts of the human body, they were still defective artists, since they did not observe the breadth, and were moreover ignorant altogether of the shape and size of the muscles. Works converted to religious purposes chiefly occupied the Egyptian painters. They had figures for imitation from which they would not depart, and those figures were monstrous: the bodies of animals with the heads of men; the bodies of men with the heads of animals; or, if the figure was more agreeable to nature in its parts, yet it was so deformed and imaginary, as to have nothing similar to it as a whole.

The monuments of Egyptian painting with which we are best acquainted (says Winklemann) are the chests of mummies. These works have resisted the injuries of time, and are still submitted to the examination of the curious. The white, made of white-lead, is spread over the ground

OF

of the piece; the outlines of the figure are traced with black strokes, and the colours are four in number; namely, blue, red, yellow, and green, laid on without any mixture or shading. The red and blue prevail most; and those colours seem to have been prepared in the coarsest manner. The light is formed by leaving those parts of the ground where it is necessary covered with the white-lead, as it is formed by the white paper in some of our drawings.

In Upper Egypt there seems to have existed a kind of colossal painting, which has never been examined except by travellers who were no great critics in the art. Winklemann had some reason to express a desire that those remains of antiquity, with regard to the manner of working, the style, and the character, had been accurately explored. Walls of twenty-four feet in height, and pillars of thirty-two feet in circumference, are wholly covered with those colossal figures. According to Norden, they are coloured in the same manner with the mummies: the colours are applied to a ground prepared in manner of fresco; and they have retained their freshness for many thousand years. Winklemann adds, that all the efforts of human skill and industry could make as little impression on them as the injuries of time.

It appears that the chief employment of the Egyptian painters was on earthen vessels, on drinking cups, in ornamenting barges, and in covering with figures the chests of mummies. They painted also on cloth; and Pliny informs us that they likewise painted the precious metals; that is to say, they varnished or enamelled them. It is doubtful what this art was, but most probably it consisted in covering gold or silver with a single colour.

But, in Egypt, the knowledge of what is most desirable in art, selection, never appears to have operated far. When a specific form of character was once adopted, there it remained, and was repeated unchanged for generations. Little action was given to figures, and no attempt at all at expression. Pliny says, that the statues made by the Egyptians in his time differed in no respect from those made by them a thousand years before. Of their painting, a few figures remain to us; but their date is by no means clear. Two of them, seen at Thebes, and described by Bruce, are supposed by him to be of the time of Sesostris, (about 700 years B.C.) who is said to have beautified and restored that city; but this is mere conjecture. Of these paintings, he remarks, that they may be compared with good sign-paintings of his day.

The Persians were so far from excelling in the arts, that the paintings of Egypt were highly esteemed among them, after they had conquered that country. The carpets of Persia were of great value in Greece, even in the time of Alexander the Great, and these were adorned with various figures; but this is no proof that they were well executed, any more than a demand for several of the Chinese productions is at present a proof of the taste of that people in the arts. It was the fabrication of the silk, and not the truth of the representation, which made the Greeks admire the carpets of the Persians.

The Persians as well as the Arabians had some knowledge of mosaic-work. This is only valuable when it copies, in a manner that cannot be destroyed, the works of a great master; but, if the Persians had no good pictures to copy into mosaic, it was of no consequence to be able to arrange in a solid manner pieces of flint one beside another. There is only one Persian painter whose name has descended to posterity; and he is preserved, not because he was a painter, but because he accommodated the ancient doctrine of the two principles to the Christian religion. Besides, it is doubted whether *Munes* was a Persian or a Greek, and it is still less known whether he was a painter. He is praised in Asia for drawing straight lines without a ruler.

In the reign of Ninus and Semiramis, king and queen of Assyria, about 2000 years before the commencement of the Christian era, we have but a glimpse of the art;

and are then immersed in the same obscurity as before, where nought but conjecture, and arguments drawn from subsequent events, are the guides. Diodorus Siculus relates, (lib. ii.) "that Semiramis, having thrown a bridge over the Euphrates at Babylon, erected a castle at each end of it, and enclosed them by three walls of considerable height, with towers upon them: these were built of brick, painted and burnt. These paintings exhibit a very great advance in the arts for that early period; for he says, "the bricks were painted before they underwent the fire;" (so that, if this account be correct, here was enamel as well as painting;) "and that not only there were single figures of animals represented in colours, but they were also combined in groups; one, a hunting-piece of considerable length, wherein the queen herself was represented on horseback, throwing her dart at a panther; and near her Ninus striking a lion to the earth with his spear." They were of great extent, covering walls, and towers attached to them. One other mention of painting is found in the same author, concerning the same period, and under the guidance of Semiramis; and that is, of paintings in the temple dedicated to Belus, and founded by her. In them were represented monstrous figures, exhibiting hermaphrodites and centaurs, or unnatural combinations, probably allusive to the idolatry of the time. Diodorus also mentions the situation of the arts in Egypt at about the same period, where probably they had attained nearly the same degree of cultivation; sculpture, as best serving religious purposes, being in both countries carried much farther than the sister art of painting.

From Egypt the arts were supposed to have been transplanted to GREECE, where a more genial culture awaited them; where they had not to struggle with such impediments as arose from the government and habits of Egypt; and where alone, in the more early period of the world, they are found to have been fully brought into action. In other countries, where any trace is visible of them wrought before the Greeks had exhibited their power, the best exemplars are little better than hieroglyphics; and, most probably, they never far exceeded the efforts of youthful learners of the present day.

It is, doubtless, to the Greeks alone we are indebted for the highest cultivation which the imitative arts have known. In sculpture they attained so high a pitch of excellence, as to remain unrivalled to this moment; and it is probable that, as far as relates to the perfect imitation of a *single figure*, in taste, in expression, and in execution, the same may be said of their painting: but there is much reason to conclude that, in many branches of that art, they are surpassed by the moderns.

Pliny, after smiling at the claims of the Egyptians, who said that the art had been known and practised in Egypt 6000 years before it was introduced into Greece, says that it was not practised in Greece till after the siege of Troy; a circumstance certainly not credible, if the story above related of Semiramis be true; and if Homer be correct in imputing so much of sculpture as he does to the artists of that period; or the amusements of Penelope, of Andromache, and of Helen, at their looms, be at all founded in fact. It is not probable that so much of other arts, particularly of weaving coloured designs, should exist, without some advance being made at the only source whence it is natural to imagine they could arise. It is vain to discuss the point; nor is it of much consequence whether it were at Corinth or at Sicyon that the practice of drawing first attracted particular notice. But, as Mr. Fuseli has beautifully observed, in his first lecture, "if ever legend deserved our belief, the amorous tale of the Corinthian maid, who traced the shadow of her departing lover by the secret lamp, appeals to our sympathy to grant it."

The first essays, then, of this delightful art, were merely outlines of a shade, such as are still made use of in that agent of the science of physiognomy termed a *filhouette*; with no line within, no shade, or colour; and they were therefore

therefore called *skiagrams*. The next step was to the *monogram*, or lines within the outline; and afterwards to the *monochrom*, or outlines filled up with one single colour. This, by study, and a more scientific mode of proceeding, advanced to the *polychrom*, or picture of many colours; and at length was perfected by that harmony of tone, so exalted in the hands of Apelles and his contemporaries.

Pliny mentions the name of Saurias, as one who practised the earliest stage of the art, and of his drawing the figure of a horse; and of Philocles the Egyptian, Cleantes of Corinth, Ardices of the same place, and Telephanes of Sicily, who advanced to the monographic. Cleophantes of Corinth is said to have been the first who practised the monochromatic, and his colour to have been that of a pounded tile. In concurrence with him, or after him, wrought Hygiemon, Dinias, and Charmas; and probably one of these improved the monochromatic style, so as not to make a whole picture, containing many figures, of one colour in every part, but varied the colours, so as to characterise the different objects introduced. According to Quintilian, (lib. ii. c. 3.) "they could so manage the single colour which they used in the monochromatic style, as to give every appearance of relief to parts;" but, by what means, as light and shade appear not to have been observed, he does not say. After these came Eumarus the Athenian, and Cymon of Cleonea; to the latter of whom Pliny gives the praise of having greatly advanced the art, by giving variety of attitudes to his figures, attending to the folds of draperies, and more discriminately marking the joints and veins of the body than had been done by his predecessors.

To the existence of none of the above-mentioned artists does Pliny, or any other author, affix a date; but he contends, and with reason, for that of an established and important fact in the history of the art, viz. that about the 56th olympiad, or little better than 700 years before the Christian era, Candaules king of Lydia purchased a picture painted by Bularchus, called the Battle of the Magnetes, and gave for it its weight in gold; a sufficient proof of the high esteem the art was held in at that time; though we ought by no means to deduce from it, that Bularchus had arrived at any other degree of perfection than what placed him among the best of *his day*; and it tells but very little as to the actual state of the art at the time: since, in its infancy, the patron could only be guided in his judgment by what had preceded; and the best, though moderate, has always received the highest eulogiums from those who, of necessity, are ignorant of superior exertions.

Whatever was the degree of excellence to which the immediate successors of this fortunate painter carried the art, we must be content to remain entirely ignorant of it. Possibly the confusions of civil anarchy and of foreign wars, which followed this period, and brought Athens, and indeed all Greece, near to destruction, prevented in a great degree the exercise of an art, which requires the fostering aid of peace, of science, and of patronage flowing from the hand of power.

When intestine commotion had subsided, and Xerxes had been driven out of Greece, then the depression under which her inhabitants had groaned, was removed, and her spirit revived, exalted by a sense of its own dignity and importance. Genius then stepped forth from its retreat, encouraged and rewarded. The liberal arts, aided by the general cultivation of mind which then took place, were summoned to assist in erecting monuments to the heroic deeds of the national heroes; and again we are enabled to trace the steps of painting, still weak and tottering in her gait at first, but soon advancing with amazing rapidity towards the highest point she is supposed ever to have reached.

Sculpture was most probably practised with continued success, even during the times of distress and warfare. The necessities of the idolatrous religion, which so pow-

erfully controlled the Greeks, might alone have required the exertion of all the talents the country could produce. We can no otherwise account for the immense advance which that art is found to have made before painting, at the period of which we are speaking. Phidias, who was the most renowned among sculptors, guided the hand of his brother Panæus, (the first painter whose name occurs after the re-appearance of the art,) in adorning the walls of the portico called Pœcile at Athens, where he painted the Battle of Marathon, and introduced into it the portraits of the principal commanders, both Greek and Persian. But how great was the difference between their powers! The former, among other works, had produced those in the temple of Minerva, called the Parthenon, which to this day remain a source of admiration and of envy; while that of the latter, as described by Pausanias, (Attics, lib. i. c. 16.) exhibit his art still in its infancy: although Pliny observes, that the painters were then supplied with colours better suited to their purpose; and thus proves that the practice of it had continued in cultivation, however slow its progress. To Panæus, however, Greece was indebted for an anxious zeal to advance the art he practised to a more equal station with sculpture; and in his time prizes were instituted at Delphos and at Corinth for its encouragement; where he himself contended, but was excelled by Timagoras of Chalcis.

Just so far as to have become the partial and humble rival of sculpture in bas-relief, with the exception of colour, had painting at this period proceeded; and even Polygnotus of Thasos, who succeeded Panæus, advanced it no farther than a more vivid imagination, acting upon the same system, might rationally be supposed to have done. He also was employed to paint in the Pœcile at Athens, and in the Lescœ, or public hall, at Delphos. Three of his pictures in the latter place are minutely described by Pausanias. The same imperfect elemental principle is their basis as in that of his predecessor, or rather perhaps his contemporary; at least in part; for Pliny says Polygnotus was prior to the 90th olympiad, and Phidias is known to have died in the first year of the 91st, (432 years B.C.) The pictures by Polygnotus which were at Delphos were works of immense labour, from the number of figures introduced in each; but they were entirely without any idea of composition, perspective, or *chiaro-scuro*. Each figure had its appropriate action, consistent with its history and character; but no connection in lines with its neighbour: and, that the observer might be at no loss of time in considering whom they represented, the painter had placed a name to every figure. They were arranged in rows, beside or over each other; and Pausanias, in describing them, begins at one end, and proceeds with an individual enumeration of them to the other, and then speaks of other figures *over* these; but whether they diminished in size, does not appear. Yet Polygnotus was a man endowed with uncommon talents, and certainly advanced his art very far in point of expression and action in his figures, and in ideal colouring. Of this, his figure of the demon Eurynomus, in one of the pictures above-mentioned, viz. of Ulysses consulting the shade of Tiresias in Hades, is a sufficient proof. "His colour," says Pausanias, "is between black and azure, like that of flies who infest meat; he shows his teeth, and sits upon the skin of a vulture." Pliny also says of this artist, that he was the first who dressed his female portraits in gay colours; and he has been highly complimented by Lucian, who invokes his aid to accomplish his perfect woman. "Polygnotus," says he, shall open and spread her eyebrows, and give her that fine glowing decent blush, which so inimitably beautifies his Cassandra. He likewise shall give her an easy flowing dress, with all its delicate wavings; partly clinging to her body, and partly fluttering in the wind."

It could not be many years after the time of Polygnotus, or perhaps it was even during his life, that another

ther step in advance was made in the art of painting, by Apollodorus of Athens; whose name is particularly mentioned by Pliny, as having discovered the principle of beauty, or rather having first adopted it in painting; for it had long been known and practised in sculpture. From this period, the art assumes its most essential character, and its most pleasing one; making man its object, not individual men; the genus, not the species; except in the more humble work of portraiture. By this sentiment Pliny must himself have been actuated, when he says that, "before Apollodorus, none were worthy of record as artists; and that no picture had till then been produced which a man might take pleasure in observing for any length of time."

The system of Apollodorus, to whatever height he bore it, was eagerly embraced by his pupil and successor, Zeuxis of Heraclea; of whom his master did not deem it derogatory to himself to say, (in some verses which he wrote,) that "the art of painting had been stolen from its professors, and practised by Zeuxis alone." Uniting the simple but energetic style of Polygnotus with the peculiar selection and taste of his master, he certainly appears to have surpassed both. It is the remark of Quintilian, that he considered the poetic unity of character adopted by Homer, in the descriptions of his heroes, as his model; and gave to each individual he painted the peculiar distinction of a class. This must have been his object, at least, in the picture of Juno, which he painted for her temple at Agrigentum, according to a vow which the inhabitants of that place had made. For, before he began the picture, he desired to see all the most beautiful maidens of the city; and from them he chose five whose form he most admired; intending to exhibit the most perfect combination of female forms, by selecting and adopting the most beautiful parts of each.

Among the principal productions of Zeuxis are enumerated, a figure of Penelope, wherein he is said not only to have given her a becoming person, but also to have expressed the qualities and affections of her mind; another, of Jupiter on his throne, accompanied by the gods; Hercules strangling the serpents in his cradle, in the presence of Alcmena and Amphictyon; and of a wrestler, or champion, with which he himself was greatly delighted, and wrote underneath it, "that it would be more easily envied than imitated." Having acquired great riches, he refused to paint any longer for money, and gave away his pictures; declaring they were above all price. Of him and his rival Parrhasius, it is difficult to say which carried the art to the greatest extent, or was most vain-glorious. The story which Pliny relates of their contest, by no means settles the former; as both their pictures were mere matters of imitation, and could have little to do with their real excellencies, except in colouring. But, if the fact be true, it is a wonderful instance of their perfection in that point, and totally excludes the possibility of belief in what he says concerning the colouring materials with which they were acquainted, viz. only four; and those impure and imperfect in themselves. A curtain might, indeed, be of a dull colour; and possibly such an one Parrhasius might have imitated with such materials, and so perfectly as to have deceived Zeuxis; but it is to be presumed, the luscious transparency, colour, and brilliancy, of the grape, in those days, were not very widely different from what it now exhibits; and those pure qualities can only be imitated by the purest and most perfect of colours. Zeuxis, indeed, having himself mistaken the painted curtain of Parrhasius for a real one, was obliged to acknowledge himself surpassed; or must have submitted to the inference, that his penetration was not superior to that of the birds whom he had deceived. It was remarked, in favour of Parrhasius, that he had a purer eye to proportion and symmetry, which he is said to have reduced to rule; that he rounded the boundaries of his figures into their grounds better than those who had preceded him; and that he superadded the charms of grace

in the action of the body and features, and in the disposal of hair and draperies. As the vanity of Zeuxis led him to have his name embroidered in gold upon the border of his robe, when he attended at the Olympian games; that of Parrhasius induced him to wear a purple robe and a golden garland; to bear a staff wound round with tendrils of gold; and to have sandals tied to his feet and ankles with golden straps. He styled himself *Abrodiatus*, the dainty or delicate, and declared he was descended of Apollo; and that he had nightly visits by Hercules, while he was painting a picture of that divinity. The emperor Tiberius was so delighted with a picture of his, of an Archigallus, or chief-priest of Cybele, that he kept it constantly in his own room, and valued it at 60,000 sesterces, 484l. 10s. Pliny mentions many of his works; and also that, though he was thus skilful, he was excelled, according to the opinion of the Samians, by Timanthes, in a picture of Ajax at the award of the armour of Achilles to Ulysses; whereon he simply remarked, that his regret was only, that such a hero as Ajax should have been overcome a second time by a man unworthy of the honour!

The quality for which Timanthes is renowned, is vigour of imagination. This aided him to fill the decided corporeal forms, now fixed as characteristic, with passion; and it is sufficiently illustrated by that well-known circumstance of the peculiar action given by him to his figure of Agamemnon, in the picture representing the sacrifice of Iphigenia; and by the mode in which he embodied the idea of grandeur in stature, in a small picture of a Cyclops; viz. by introducing some satyrs, supposed to be of the usual size of man, measuring the length of the giant's thumb with a thyrsus. One of his pictures remained at the time Pliny wrote, about 400 years afterwards, in the Temple of Peace, at Rome. He calls it the portrait of a prince; and says "it is so perfect, and so full of majesty, that it appears to comprise every thing desirable in the art of painting."

The art continued advancing by rapid degrees at this period. Nature, in form, in colour, and expression, was the guide; and to develop her beauties the sole object of the artists. Eupompus sufficiently displayed this basis, in his advice to Lyfippus the sculptor, who enquired of him, whom among his predecessors he should make the objects of his imitation. "Behold," said the painter, showing his friend a multitude of characters passing by, "behold my models! From nature, not from art, by whomsoever wrought, must the artist labour, who hopes to attain honour and extend the boundary of his art." (Pliny, lib. xxxiv. c. 8.)

To such a pitch of excellence was painting at this time advanced among the Greeks, that it was thought worthy of being ranked at the head of the liberal arts; and was ordered to be taught to the sons of the higher classes, in preference to all other things, according to Pliny, but forbidden to be practised by slaves. Such was the honour done to it, by the influence which the painter Pamphilus of Amphipolis had acquired. Of him it is remarked, that he was the first who proved the value which the art acquired, by an union with science and literature; and to him Apelles, the unrivalled hero of Grecian painting, was indebted for his initiation to its mysteries.

This extraordinary man (Apelles) appears, if we give full credit to the traditions concerning him, to have been endowed with a more perfect combination of rare talent and excellent qualities, than has, either before or since, fallen to the lot of any other. He had, besides, the peculiar felicity of being born at that period when his country was at its highest pinnacle of cultivation; so that mankind saw in him the happy union of a perfect mind, strengthened and guided by the best assistance education could possibly afford. Not only as an artist is he extolled above all others, but equally so as a man; for his gentleness, his amiability, generosity, and magnanimity. Pliny places the time when he flourished in the 12th olympiad, (328 years B.C.) and adds, that he became so consummate

mate in the art, that he alone enriched it more than all his predecessors had done; and compiled several books upon it, wherein he illustrated its principles. It is agreed by all writers who speak of him, that in him the art of painting reached its acmè. He himself indeed acknowledged, that he was surpassed by several artists in different branches of its practice; by Amphion in disposition, by Asclepiodorus in proportion, &c. but that, in the combination of the whole, he excelled them all.

That Apelles was a most powerful and agreeable painter, and that he must have given a degree of taste, of grace, of life, and effect, to his figures, which had never till then been equalled in their union, is evident, since it is the general unvarying opinion of all writers who have mentioned him; and they are neither few nor weak. As many of his pictures were preserved at Rome in the time of Pliny, he had an opportunity of judging for himself; as far at least as their condition after such a lapse of time (nearly 400 years) would allow him; but the tribute which he pays to the excellence of his *mind*, is, of course, deduced from the reports of others. There appears in the latter no extravagant hyperbole which leads to disbelief; and his generous conduct towards so powerful a rival as Protogenes, well deserves the honourable mention made of it. Being highly delighted with a picture of Jalyfus, painted by that artist, he sailed to Rhodes on purpose to visit him; where, finding him neglected and in poverty, he purchased some of his works, and declared that he intended to sell them as his own. Roused to a recognition of the talents of their fellow-citizen by such powerful testimony as that of Apelles, they raised him from his humble situation to rank and fortune. The well-known contest of these two friendly artists, in the lines they drew as designatory of themselves, exhibiting that taste and skill which they knew none but themselves possessed, stands upon well-founded testimony as a fact. The tablet whereon they were drawn remained untouched, was taken to Rome, and was there seen by Pliny himself; who speaks of it, as having the appearance of a large blank surface; the extreme delicacy of the lines rendering them invisible, except on a close inspection. They were drawn with different colours, one upon, or rather within, the other. To judge from his account of it, it might be supposed that all the beauty lay in the extreme delicacy of the points which had been used, and of the hands which had applied them; but it is reasonable to suppose, that the first direction of the line might have some principle of beauty for its guide, by which, as well as by the neatness of its execution, Protogenes was instantly moved to the declaration, that none but Apelles could have drawn it!

Beloved, honoured, and employed, by Alexander, Apelles had the happiness of enjoying that fulness of renown to which he was so justly entitled. Alexander, the envy and admiration of the world, treated the painter with the familiarity of a friend; ordained that none other should presume to paint his likenesses; frequently visited him; and crowned his favours by a sacrifice to friendship of a most uncommon nature among men: depriving himself of a beloved object, his favourite Campaspe, and giving her to gratify the affection of one whom he so much esteemed.

The pictures produced by this exalted artist were numerous, and are mentioned pretty much at length by Pliny, lib. xxxv. cap. 10. But, perhaps the best comment upon his talents as a painter, will be found in the character Mr. Fuseli has given of him. He places him in that rank where every thinking mind will be gratified to find him. "The name," he observes, "of Apelles in Pliny, is the synonym of unrivalled and unattainable excellence; but the enumeration of his works points out the modification which we ought to apply to that superiority: it neither comprises exclusive sublimity of invention, the most acute discrimination of character, the widest sphere of comprehension, the most judicious and best-balanced composition, nor the deepest pathos of expression; his great prerogative consisted more in the union than the

extent of his powers; he knew better what he could do, what ought to be done, at what point he could arrive, and what lay beyond his reach, than any other artist. Grace of conception, and refinement of taste, were his elements, and went hand in hand with grace of execution, and taste in finish; powerful, and seldom possessed singly, irresistible when united." That our readers may judge for themselves of the propriety of these remarks, we will enumerate, from Pliny, the pictures of which he speaks, and which, of course, may be supposed to convey a very just idea of the class of subjects generally chosen by Apelles. Of Alexander the Great, and his father Philip, the portraits he painted were very numerous; some single, and some accompanied by other figures. One, in the temple of Diana at Ephesus, of Alexander launching thunder, is highly extolled for its effect, and the boldness of its relief; "the hand which was raised appearing to come forward, and the lightning to be out of the picture." In another of the same king, he was represented in a triumphal chariot, near him the figure of War with his hands tied behind his back. This, and another Alexander, accompanied by Castor and Pollux, and a figure of Victory, were preserved by Augustus in the forum. Many other portraits are mentioned; viz. of Antiochus king of Syria; of Antigonus; Archelaus, with his wife and daughter; Abron, an effeminate debauchee; Clytus on horseback, armed, except his head, with an attendant delivering his helmet to him; and of Megabyfus, a priest of the temple of Diana at Ephesus, sacrificing, in his pontifical vestments. In subjects of fancy, are, a Diana surrounded by her nymphs, attending at a sacrifice; Neoptolemus, son of Achilles, on horseback, contending with Persians; Hercules with his back towards the observer, and his head turned round so as to show his face; a horse painted in competition with other painters, and said to have excited living horses to neigh; and, lastly, his renowned picture of Venus rising from the sea; which, being taken to Rome, was dedicated by Augustus in the temple of Julius Cæsar; and several Greek epigrams upon it are preserved in the Anthologia. So great was its perfection, that no artist could be found who would undertake to restore the lower part of it, when by accident it had been injured; and of another of the same subject, begun for the inhabitants of his native island, (Cos,) and of which he had only finished the head and breasts when he died. Pliny says that no painter would fet his hand to complete it, through a fearful acknowledgment of this great master's superiority. Other pictures and designs of his are mentioned by different authors; but these are sufficient to show the general tendency of the subjects on which he employed the extraordinary powers of imitation he was endowed with. The bare mention of them is sufficient to prove the critical acumen of our learned professor of painting; but, doubtless, they are fully capable of admitting, indeed they require, all that grace and taste in conception and execution for which he was renowned, to compensate for their want of pathos.

What was omitted by Apelles, was supplied by his contemporary, Aristides of Thebes. Unable to rival him in harmony and grace of colour and execution, and qualified by nature to display the influence of the *passions*, Aristides followed in the steps of Timanthes. His was the power of impressing form with soul, of fixing upon, and representing with effect, those impassioned actions of the body, which are the result of the more amiable or violent emotions of the mind. So effective was the earnestness of a suppliant portrayed by him, that "his voice seemed to escape from the picture;" and not only was he capable of representing the more simple emotions of the passions, but their most complex unions were also subject to his skill. An expression, in which are discoverable maternal affection, anxious for the benefit of its offspring, amidst the pangs of certain and approaching death, was produced in his picture of a woman who had received a mortal wound upon her breast, endeavouring to prevent her infant, eager
for

for its nourishment, from sucking her blood instead of milk. (Pliny, lib. xxxv. c. 10.) The mind dwells with apprehensive commiseration on the bare relation of the image; and great indeed must have been the discriminative power of mind, and of hand, to execute justly so difficult a task. Although Aristides appears to have most delighted in subjects which afforded him an opportunity of displaying his knowledge of the human mind, and its pathognomic influence upon the body; such are his pictures above mentioned, and those of a sister dying for love of her brother, and of one suffering under the languishments of illness; yet he sometimes ventured upon a more extended field; and in one instance painted a picture of a battle between the Greeks and Persians, in which were introduced a hundred figures, and was paid, by Mnason king of Elatea, ten pounds weight of silver for each of them. In another he represented a race of chariots with four horses; of which Pliny observes, "you would almost think the wheels were in motion, such was the energy of action in the picture."

At this time, the art of painting was upheld in Greece by a great number of ingenious men, renowned for their distinctive excellencies. Asclepiodorus, for the beauty of symmetry: Protogenes, for exquisite skill in execution and finish: and in him the art received one of the highest tokens of regard it was ever favoured with; for, when Demetrius Poliorcetes was besieging the city of Rhodes, and might have taken it by assailing it on the part where Protogenes resided, he forbore, lest he should do any injury to his works; and, when the Rhodians delivered the place to him, and requested him to spare the pictures of their admired artist, he replied "that he would sooner destroy the images of his forefathers than the productions of Protogenes."

With these artists, and a few others, as Nicias, Nicomachus, Mnason, Aristodemus, &c. all nearly contemporaries, this delightful art arrived at its utmost height; and, though it continued to be practised by a succession of ingenious men, many of whose names are handed down to us, and who contended against the formidable difficulties presented by the scenes of luxury and confusion which opposed them, yet their efforts to uphold its dignity were in vain. When the country, weakened by domestic broils, became subjugated by the Romans, its arts and its energies expired with its liberties; the spirit which animated the arts in Greece being removed, they fell to rise no more, at least for ages. But the cycle of nature will have its course in the arts, as well as in governments, and in man himself. All sublunary things have within them the seeds of their own destruction; and, having reached the acme of excellence in their kinds, their further progress in existence can only be retrograde.

The ROMANS were later in cultivating the arts and sciences than any other great and powerful nation; and none of them seem to have been the natural growth of the soil, except the art of war; all the rest were brought in by conquest. In Italy, however, as well as in Greece, it appears not improbable that painting was practised at an early period, but in a rude and very imperfect mode: little, however, is known of its actual progress there; and that little partaking more of antiquarian curiosity, conjecture, and doubt, than of utility or certainty. Pliny, indeed, says that there were paintings existing at Andrea in his time, executed before the foundation of Rome. But, after a lapse of 800 years, how much of this may not be attributed to error in the tradition he recorded? The earliest traceable and satisfactory account of the art being practised in Rome, is in the year 450 of the city, or 303 years before our era; when Fabius, a noble patrician, painted the temple of Salus: and he and his family thence obtained the surname of *Pictor*. It is not improbable that Fabius had travelled in Greece, and there had the happiness to see the elevated station of the art at that time; he might even have seen Apelles himself, employed upon those works which brought honour upon his coun-

try, and secured immortality for himself. Yet the city does not appear to have much profited by this example; nor to have obtained renown for its artists, either in number or in quality. Pliny mentions none other after Fabius, till, on the lapse of 150 years, Pacuvius the poet amused his declining years with painting the Temple of Hercules in the Forum Boarium. Although it is evident that, about this time, Greek paintings were introduced into Rome, either to gratify curiosity, or adorn the triumphs of generals who had been engaged in Sicily or Greece, yet no emulation to cope with the artists of those countries was exhibited by the Romans. That warlike people were too much occupied in schemes of aggrandisement and military fame, to devote much attention to the arts; and it was not till the time of the emperors, that they experienced any thing like encouragement in Italy.

After the reduction of Greece to the Roman power, the city of the conquerors became the emporium of honour, employment, and consequent profit, to artists; but that only in a gradual advance. First of all, the plunder of the ancient residence of taste satiated as well as astonished the comparatively-uncultivated inhabitants of Italy; and no employment would be found for domestic artists, when the views of all admirers of art were directed to another country for a supply of their wants. Afterwards the men themselves who had in vain laboured to continue the arts in that once favoured but now unhappy country, quitted it, to ensure their own existence; till, by degrees, Rome, become the mistress of the world in policy, assumed the controul of the arts. Still its own native citizens were content to allow themselves an inferior share in its praise; since the principal part of the artists, either in painting or sculpture, who practised in Italy, are supposed to have been Greeks.

Antiquaries, under the influence of varying circumstances, have at different times attached priority of cultivation to different countries. Such is the case with the regions of Italy. Etruria has been, and is still, most generally considered as the nurse of the arts in that country; but the discovery of painted vases in the southern parts of Italy, and in Sicily, being more frequent than in Etruria, has led many to imagine, of late, that painting was practised in those countries previous to its cultivation in the more northern provinces. But very little argument can be derived from this circumstance; as it appears to us, that the designs and execution of those curious monuments of art, only testify the previous existence of some superior powers in the art; as the extension of taste in our own manufactories, or the attempts at it, proves the existence of the art of painting, and its higher or more direct cultivation, in this country. The paintings upon those vases are, it is true, so inferior, as to the extent of art they exhibit, that they merit only to be classed among the productions of the earliest periods; but that, perhaps, is more owing to the artists who executed them being desirous of proceeding only so far as would answer a specific purpose, and by no means aiming to attain the degree of perfection at which the art had actually arrived at the time. If this opinion be correct, there is no arguing concerning the state, or antiquity, of the art of painting from Etruscan vases. The use of their hieroglyphics, for so the figures employed upon them may be termed, like those of the Egyptians, or like letters, admit of little improvement, or indeed of alteration, in themselves; and allow only of being changed in effect, by new combinations. They may therefore, or they may not, have been executed at a period comparatively late, when considered with regard to the history of painting properly so called; and certainly may be regarded, rather as an offset than as attached to the main stems in its growth; or as an extraneous application of part of the art, rather than the art itself.

Where the Greeks first settled in Italy, or where the most free communication was held with the mother-country, there it is most likely the arts transplanted would be first cultivated; but they do not appear to have arrived

at any great degree of excellence in any part of that country, previous to the conquest of Greece by the Romans; and it must still remain a doubt, whether Etruria or Calabria was the parental abode of the arts of Italy. They appear certainly to have received more cultivation in the former of those districts than in the latter, particularly sculpture; at least, there is something like evidence of the culture of it in Pliny, who mentions, "that the little brazen images, dispersed all over the country, were wrought in Tuscany in very ancient times."

Whencesoever it were that Rome acquired the little taste she felt for art, or rather the slight degree of emulation which animated her citizens to enter the paths of tasteful cultivation, it is certain, that, during the period of her existence as a republic, the impetus was very weak, and the progress, of course, of little or no extent. The practice of painting after the days of Pacuvius, before mentioned, was held to be effeminate and disgraceful; and it was not subsequently engaged in by any respectable men. The result, of course, was a testimony to the wisdom of the Greeks; who, in order to enhance the merit of the art, ordained, that none but such as Roman pride excluded should presume to practise it. From being regarded as contemptible, it actually became so; whereas in Greece, being raised in rank and esteem, it became truly worthy of both. But what this powerful city could not acquire by her own genius, she endeavoured, after her generals became acquainted with the riches of Greece and Sicily, to treasure up from the spoils of those countries. Some of those generals to increase the splendour of their triumphs, and others for private or for public ornament, carried pictures as well as statues to Rome, and exhibited them to the people; and others again caused pictures to be painted of their successful battles, to stimulate the admiration and applause of the people; and, thus tacitly acknowledging the value of the art, upbraided their fellow-citizens for neglecting the cultivation of it.

It would be natural to suppose that, when the fierceness and severity of republican independence gave way to the suavity and more refined manners of a court devoted to one person; when literature and science were highly cultivated, and the example of Greece was before them; that the Romans would not fail to blend the pursuit of the elegant arts with the refined luxuries in which they indulged. But that does not appear to have been the case to any great degree. Had it been so, Pliny, who does not easily lose sight of the honour of his country, would not have failed to mention it; particularly as it came so near the time in which he lived. He gives only the names of a few painters then practising, or who had practised, being native artists; and accompanies it with a lamentation "that the art was dying." *Lib. xxxv. cap. 5.*

As no preparation of art had previously taken place powerful enough to aid the plans of the state, when Augustus saw the use to be made of painting by a monarch, he very wisely endeavoured to adopt what was ready to his hands; and caused two pictures, painted by Apelles, of Alexander victorious, and triumphant, to be carried to Rome, and placed conspicuously in the forum; images of his own power and exaltation, which Claudius Cæsar more openly proclaimed, when he ordered the heads of both pictures to be cut out, and Augustus's portrait placed in their stead. But the Romans, and Roman emperors, whatever subjects they may have created for the pencil, found little native talent able, or sufficiently interested, to convey them to posterity in an honourable manner by painting; and, even in sculpture, their best artists were low indeed in comparison with the Greeks; at least, no Roman artists' names of great repute are handed down to us. Both arts were diverted to unworthy objects: they continued to fall in every valuable quality, and painting most of all; till at length the irruptions of the northern nations put an end to both Grecian and Roman efforts; and barbarism, from which Greece is not yet redeemed, usurped the stations of luxury and refine-

ment. For near a thousand years, did the glorious title of the cultivator of intellectual power, the leader among nations, in whatever was most adapted to do honour to human nature, appertain to that highly favoured country: for a period approaching two thousand, has she suffered degradation and depression, even almost to annihilation. Yet her present inhabitants are represented by travellers as still the same animated and ardent race, although bending to the strong hand of power, and, unhappily, under the influence of a government and religion, whose tenets forbid the extension of human knowledge, and whose power is upheld by ignorance and superstition.

Italy, overcome by the same wild anarchy with Greece, groaned not under the weight of the despotic spoiler more than half the time which her predecessor in the race of nations has bowed, ere the dawns of science beamed upon her, and roused her from the state of torpor to which she had been reduced. Even then, Greeks had the honour of stimulating her to the cultivation of her native powers; till at length that flame was kindled, which, by a gradual accumulation of strength, warmed Italian breasts, and excited them to emulate in arts those whom their forefathers had subdued in arms. But the country being then under the controul of a system of religion which forbade the introduction of images into her temples, the course and application of study was necessarily changed, and the art of painting became the principal object of attention; whereas that art, highly as it was prized and cultivated by the Grecians in the latter periods of their existence as a ruling power, had remained, as we have seen, for a great length of time nearly unemployed; whilst the sister-art of sculpture, being most subservient to the purposes of an idolatrous religion, was cultivated in so extraordinary a manner, that the accumulation of its productions in statues, bas-reliefs, &c. both in bronze and marble, became prodigious, and not to be imagined by those unacquainted with the fact. Pausanias speaks of 2827 entire statues, in the places which he travelled through, as remaining in his time, besides numerous other works of sculpture; and this was only in a part of Greece, and not till after the Romans had, for 300 years, been plundering the country of innumerable beautiful productions. Rhodes, it is said, could boast of 3000 statues of brass; and Nero took, from Delphos alone, 500 statues. The cause of this vast accumulation of sculpture is apparent, in the patronage that art derived from the government and the priesthood; who found it an useful instrument in moulding the people to their wishes. They were well acquainted with its influence upon the minds of men, when skilfully applied in exciting their sympathies, stimulating their emulation, or assisting in compelling their devotion. The foundation, therefore, of the super-excellence of this art among the Greeks, does not lie very deep for our research. What else could be the result of so much and so constant an employment, for a connected series of hundreds of years, the consequent emulation which must ensue, where so many competitors entered the field; and when, in addition to the influence of government, so many establishments of a religious order were anxious to become conspicuous, by employing them? By its means the priesthood were enriched, and exalted in the eyes of their countrymen; adorers were drawn to their shrines; and their favourite divinities more generally worshipped.

The same sentiments and principles, always present to the ambitious and powerful, and which, under happy auspices, re-act for the benefit of the people, operated near a thousand years afterwards upon the government and church of Rome; when, by the revival of science and of art, these salutary means of strengthening themselves fell into their hands. But, as the second commandment of the decalogue, by which they were, or rather ought to have been, controlled, prohibited the worship of images; their attention was directed to the use which might be made of painting, and sculpture was confined to monu-

mental and ornamental purposes, or nearly so. Thus circumstanced, the result was precisely the reverse of what occurred in Greece. Sculpture, except in a few instances, made a progress only to mediocrity; whilst painting rose, and expanded its beauties to the utmost perfection; and soon followed that period, when, as we have before observed, notwithstanding the high-flown panegyrics of ancient authors upon Grecian art, the doubt is justified, whether its painters were not surpassed by those of Italy and Flanders, who flourished in this latter age of the world.

The word *antique*, when applied to the art of which we are treating, is generally taken to designate such works as were produced before the destruction of the Roman empire. To this period we are now arrived; and it will be thought extraordinary, that there should remain any degree of uncertainty with us respecting the degree of excellence to which the ancient painters carried their art. The following observations are by sir Joshua Reynolds.

"From the various ancient paintings which have come down to us, we may form a judgment with tolerable accuracy of the excellencies and defects of art among the ancients. There can be no doubt, but that the same correctness of design was required from the painter as the sculptor; and, if the same good fortune had happened to us in regard to their paintings, to possess what the ancients themselves esteemed their master-pieces, which is the case in sculpture, I have no doubt but we should find their figures as correctly drawn as the Laocoon, and probably coloured like Titian. What disposes me to think higher of their colouring than any remains of ancient painting will warrant, is the account which Pliny gives of the mode of operation used by Apelles, that over his finished picture he spread a transparent liquid like ink, of which the effect was to give brilliancy, and at the same time to lower the too-great glare of the colour: *Quod absoluta opera atramento illinebat ita tenui, ut id ipsam repercussa claritates colorum excitaret. Et tum ratione magna ne colorum claritas oculorum aciem offenderet.* This passage, though it may possibly perplex the critics, is a true and artist-like description of the effect of glazing or scumbling, such as was practised by Titian and the rest of the Venetian painters: this custom, or mode of operation, implies at least a taste of what the excellence of colouring consists, which does not proceed from fine colours, but true colours; from breaking-down those fine colours which would appear too raw, to a deep-toned brightness. Perhaps the manner in which Corregio practised the art of glazing was still more like that of Apelles, which was only perceptible to those who looked close to the picture, *ad manum intuenti demum appareret*; whereas, in Titian, and still more in Bassano and his imitators, it was apparent on the slightest inspection: artists who may not approve of glazing, must still acknowledge that this practice is not that of ignorance. Another circumstance that tends to prejudice me in favour of their colouring, is the account we have of some of their principal painters using but four colours only. I am convinced that, the fewer the colours are used, the cleaner will be the effect of those colours, and that four is sufficient to make every combination required; two colours mixed together will not preserve the brightness of either of them single, nor will three be as bright as two: of this observation, simple as it is, an artist, who wishes to colour bright, will know the value.

"In regard to their power of giving peculiar expression, no correct judgment can be formed; but we cannot well suppose that men, who were capable of giving that general grandeur of character which so eminently distinguishes their works in sculpture, were incapable of expressing peculiar passions. As to the enthusiastic commendations bestowed upon them by contemporaries, I consider them as of no weight. The best words are always employed to praise the best works: admiration often proceeds from ignorance of higher excellence. What they appear to have most failed in is *composition*, both in regard to the

grouping of their figures, and the art of disposing of the light and shadow in masses. It is apparent that this, which makes so considerable a part of modern art, was to them totally unknown."

We occasionally meet in authors who speak of ancient art, with descriptions of pictures containing many figures, but, in general, its efforts were confined to subjects in which two or three only were required; and it is worthy of remark, that in none of them is there any observation on the contrasts employed in lines, in light and shade, or in colour; nor is there any mention of what is now understood by the term *back-ground*. To guess from these attempts at criticism, we should, at least we might, conclude, that all pictures painted by the Greeks were similar in principle to those found at Herculaneum, of which the best have entirely plain grounds, and others very little variety; which evidently shows that the writers were unacquainted with the art. Their remarks are too vague, too undetermined, appear not to flow from any feeling or knowledge of what art is, but only from common perceptions, alike felt by all of equal understanding. Yet every painter knows, that, without some ingenious management of the ground, quite sufficient to form an object of particular remark, the hand of Alexander would have still adhered to the canvas; and not, as Pliny remarks, have appeared to project before it, or "out of it."

That they discovered to a certain extent the effect of contrasting lights and shades, is evident from Plutarch's observation, that "painters increase the brilliancy of light colours, by opposing them to dark ones, or to shades;" and Pliny has this remarkable general expression, when, having spoken of the painters in the monochromatic style, he adds, "in process of time the art assumed new powers, and discovered (or invented) light and shadow; by gradating which, the colours are alternately heightened or kept down. Afterwards *splendour* was added, which was different from light, and which, because it was a mean between light and shade, they call *tonon*; and the union of the colours, and the transition from one to another, they called *harmogen*;" lib. xxxv. c. 5. Although we see, in these passages, that the three grand requisites for the science of colouring and of *chiaro-scuro*, viz. contrast, tone, and harmony, were felt by the Greeks; that the degrees of light and shade in their own force, and in their approach towards each other, were fully understood; with the value of middle tint, the most difficult and important object of the painter's attention; and that one general hue in the whole work was considered and effected; yet we cannot agree with M. du Bos and others, that we ought hence to conclude, that *chiaro-scuro* was scientifically understood and practised by them to any extent at all approaching that to which it has subsequently been carried by Rembrandt and the Flemish school, or the best among the Italians. Unhappily, very few of their pictures have remained to us; and those we have, we must suppose are the works of inferior artists. Among the twelve pictures, the best of those found at Herculaneum, and all possessed of infinite beauties in taste, in grace, and feeling, there is exhibited in one of them a more compound management of *chiaro-scuro*, in the reduction of tone on parts of the flesh and drapery, than is to be found in any other monument of ancient art; but it is not sufficient to prove that it proceeded from any thing like principle. We have, therefore, no satisfactory proof upon this subject; and it is most rational to conclude, with sir Joshua Reynolds, that this, which makes so material a part of modern art, was unknown to the Greeks (as a science.) "If," he observes, and justly, "the great painters had possessed this excellence, some portion of it would infallibly have been diffused, and have been discovered in the works of inferior artists handed down to us, and which may be considered as on the same rank with the paintings that ornament our public gardens. Supposing our modern pictures

pictures of this rank only were preserved for the inspection of connoisseurs two thousand years hence, the general principles of composition would be still discoverable in those pictures: however feebly executed, there would be seen an attempt to an union of the figure with its ground, some idea of disposing both the figures and the lights in groups. Now, as nothing of this appears in what we have of ancient painting, we may conclude that this part of the art was totally neglected, or, more probably, unknown. They might, however, have produced *single figures*, which approached perfection both in drawing and colouring; they might excel in solo (in the language of musicians), though they were probably incapable of composing a full piece for a concert of different instruments." Reynolds's Notes upon Fresco.

The paintings of the ancient artists were either movable, or on the ceilings or compartments of buildings. According to Pliny, the most eminent were those who painted movable pictures. The latter were either on fir-wood, larch, box-wood, or canvas, and sometimes on marble. When they employed wood, they laid on, in the first instance, a white ground. Among the antiquities of Herculaneum are four paintings on white marble.

Their immovable paintings on walls were either in fresco, or on the dry stucco in distemper. Indeed, all their paintings may be reduced to, first, fresco-painting; secondly, water-colour, or distemper-painting on a dry ground; and, thirdly, encaustic painting.

1. The ancient fresco-paintings appear to have been always on a white stucco-ground, the colours inlaid very deep, and the drawings much more bold and free than any similar performance of modern art. The outlines of the ancient paintings on fresco were probably done at once, as appears from the depth of the incision and the boldness and freedom of the design, equal to the care and spirit of a pencilled outline.

2. In general, the ancients painted on a dry ground, even in their buildings, as appears from the Herculaneum antiquities, most of which are executed in this manner. At Rome and Naples, the first (deepest) coat is of true puzzolana, of the same nature with the *tarras* now used in mortar, required to keep out wet, about one finger thick; the next of ground marble or alabaster, and sometimes of pure lime or stucco, in thickness about one third of the former. Upon this they appear to have laid a coat of black, and then another of red, paint; on which last the subject itself was executed. Such seems to have been their method of painting on walls; but, in their movable pictures, and in the performance of their first artists, and where effect of shade and light were necessary, they doubtless used white.

3. What the *encaustic* or wax painting of the ancients was, has been much disputed. From the works of Vitruvius and Pliny, it appears evidently that it was of three kinds. First, Where a picture, painted in the common way, was covered with a varnish of wax melted, diluted with a little oil, and laid on warm with a brush. Secondly, Where the colours themselves were mixed up with melted wax, and the mixture used while warm. Thirdly, Where a painting was executed on ivory by means of the *cestrum* or *viriculum*.

This art of painting with burnt wax, as it is called, has long been lost to the world; the use of it to painters, in the infancy of the art of painting, was of the utmost consequence; drying-oil being unknown, they had nothing to preserve their colours entire from the injury of damps, and the heat of the sun; a varnish of some sort was therefore necessary; but, being unacquainted with distilled spirits, they could not, as we now do, dissolve gums, to make a transparent coat for their pictures; this invention, therefore, of burnt wax, supplied that defect to them, and with this manner of painting the chambers and other rooms in their houses were furnished; this Pliny calls *encaustum*, and we encaustic painting.

Pliny has given the following brief account of the in-

vention and nature of this art: "*Ceris pingere ac picturam inuere, quis primus excogitaverit non constat; quidam Aristidis inventum putant, postea consummatum à Praxitele; sed aliquanto vetustiores encausticæ picturæ extitere; ut Polygnoti, et Nicanoris, et Arcefilai, Pariorum. Lyfippus quoque, Eginæ, picturæ suæ inscripsit ενκαυστων; quod profectò non fecisset, nisi encaustica inventa. Pamphilus quoque Appellis præceptor non pinxisse tantum encaustica, sed etiam docuisse traditur Pausaniam Sycionium, primum in hoc genere nobilem.*" Lib. xxxv. cap. 11. From this paragraph, we learn that the method of painting in wax, and burning-in the picture, was very ancient; though some imagine that by *ceris* is meant a composition different from wax, and capable of bearing the fire; and that *burning* the picture denotes merely enamelling. Pliny, in the same chapter, informs us, that there were anciently two methods of encaustic painting in use: "*Encausto pingendi duo fuisse antiquatius genera constat, cerâ et in ebore, cestro, i. e. viriculo; donec classes pingi cæperè. Hoc tertium accessit, resolutis igni ceris, penicillo utendi; quæ pictura in navibus nec sole, nec sale, ventisque corruptitur.*" Dr. Parsons maintains, that the *cestrum* was a pointed tool used in modelling or carving upon ivory or wax; and he supposes that there is a contrast between the use of the *cestrum*, and painting ships with a brush, and therefore that the term *pingendi* cannot be understood to mean the laying-on of paint.

However, there is a passage in Vitruvius, lib. vii. cap. 9. which serves to ascertain the nature of the ancient encaustic painting: "*At si quis subtilior fuerit, et voluerit expolitionem minimeam suum colorem retinere, &c.*" that is, "If any one is more wary, and would have the polishing, or painting, with vermilion hold its colour; when the wall is painted and dry, let him take Carthaginian wax, melted with a little oil, and rub it on the wall with a hair-pencil; and afterwards let him put live coals into a chafing-dish, and hold it close to the wax; when the wall, by being heated, begins to sweat, let it be made smooth; afterwards let him rub it with wax-tapers, and clean linen rags, in the same manner as they do the naked marble statues. This the Greeks call *ναυρις*. The coat of Carthaginian wax is so strong, that it neither suffers the moon by night, nor the sun-beams by day, to destroy the colour." From this passage, we learn the ancient method of painting in wax by infusion, more obscurely expressed by Pliny; though Pliny, in another passage, expressly informs us that they used coloured wax; *ceræ tinguntur iisdem his coloribus, quæ inurantur*: that they employed a pencil to lay-on the melted wax; *resolutis igni ceris, penicillo utendi*: that the picture was fixed by infusion; *picturam inuere*. And we learn from Vitruvius, that the whole was cleaned and polished with linen rags.

The Punic or Carthaginian wax, the use of which is ascribed to the ancient painters by Varro, Vitruvius, and Pliny, was said to be the best, as it exceeded in whiteness the Sardinian and Corsican, probably because it was better purified; for the Africans, as we learn from Pliny, were accustomed to use alkali, in order to render this substance whiter, and also to free it, as some have supposed, from all greasy matter. Wax, however, seems to have formed the only ground of wax-painting. The abbé Requeno, who contributed to present encaustic painting to the notice of modern painters, adds mastic; but Lorgna converts his wax into soap, as Bachelier does with the alkali of soda. Astori adds gum and honey, affirming that thus the wax would be rendered much more yielding, and softer for the brush. Requeno seems to assign the exclusive possession of this art to the Greeks and Romans; but we have reason for believing that the knowledge and use of encaustic painting were older than their time, because the Egyptians, who, with the Etruscans, were the parents of the greater part of the inventions known among mankind, and from whom the Greeks derived much of their knowledge, were acquainted with, and

and employed, encaustic painting, in the ancient ages of their greatness and splendour. This fact has been deduced from valuable fragments of the bandages and coverings of mummies painted in this manner. A mummy of this kind is mentioned in a treatise entitled "Antichità della Pittura encaustica;" Rome, 1797. No oil-painting, it is said, perhaps only two or three hundred years old, exhibits a white paint that has kept so well as that seen on the fragment to which we have alluded; and this circumstance sufficiently proves the valuable advantage which that method possesses when compared with the common oil-painting. The wax, instead of becoming black by the contact of the atmosphere, as drying-oil does, acquires increasing whiteness, and, according to its natural quality, is not decomposed in the air, and does not strongly attract the oxygen of the calces, or metallic ashes, which are commonly used in painting. That beautiful white, which may be observed in the Egyptian encaustic above mentioned, is, as the author of the treatise just mentioned apprehends, nothing else but a simple earth, and, according to his chemical experiments, a chalk, (*cereta*), which is also unalterable. If we consider this encaustic fragment, says our author, as belonging to the epoch of the first violent change which the religious system of the Egyptians experienced, it will be a specimen of painting about 2500 years old; for such is the number of the years that have elapsed since Cambyfes overturned the ceremonies and religious worship of the Egyptians, not only by the sword, but by the still more powerful weapons of ridicule. Dead bodies were embalmed there in the time of Herodotus; but the cloth in which they were wrapped, or the bandages bound round them, were no longer painted with sacred characters. The bodies were only enclosed in wooden cases, which were more or less ornamented. If Bochart and Menage be not mistaken, the name *mumia* is derived from *muim*, which signifies wax; and one might therefore believe, that the dress of embalmed bodies was thus named because wax was employed for painting it; and thence it would follow, that the fragment in question may be classed among the oldest. Petronius praises the fresh appearance which the valuable works of Zeuxis and Apelles had, even in his time; but Cicero, on the other hand, speaks of the paintings of the ancients having suffered from blackness. The former is supposed to have spoken of wax-painting, and the latter is presumed to have alluded to paintings in oil. The author, whose sentiments we are now expressing, detached twenty-four grains of the encaustic painting from the above-mentioned Egyptian fragment; and, in his mode of examining it, the mixture of rooth part of a foreign substance would have been discovered with the greatest certainty: he must, he says, have perceived the resin of Requeno, nor could the alkali of Bachelier and Lorgna have escaped his notice. But in this Egyptian encaustic he found nothing except very pure wax, though he varied his analysis in every known method.

From the words of Vitruvius above cited, it appears that the Romans, who copied the Grecian process, which was borrowed from the Egyptians, mixed the wax with an oil to make it pliable under the brush, but no mastic, alkali, or honey, as some have imagined, was employed; what this oil was, it is not easy to ascertain. It does not appear that they used those fat oils which are commonly called drying-oils, because they could have employed those as we do, without the addition of wax, which would have been altogether superfluous. Fat oils which do not dry would not have been proper for that purpose, as they would have kept the wax continually in a soft state. Our author supposes, that the Egyptians, in order to use wax in their encaustic painting, must have combined it with an ethereal volatile oil, of which no traces should afterwards remain; and that, though they might be unacquainted with the art of separating ethereal oils from the many substances which they contain, they certainly were acquainted with a very volatile thin oil produced by

nature, and which in various places issues from the earth. This oil was either that called naphtha, which is an exceedingly volatile oil, that entirely flies off and evaporates, without leaving a single trace behind; or the common spirit of turpentine, which would very well answer the purpose. The encaustum, thus formed, was used in the time of the Romans to cover parts which had been already painted, either with water-colours or in fresco; and it was also, as we have reason to believe, the substance with which Apelles daubed over his paintings, and which, according to Pliny, made them appear as if covered by a thin plate of talc or transparent selenite, and gave the colours a wonderful softness. It might still be employed for preserving paintings in water-colours, or on plaster, and sculptured pieces of marble.

The ancient art of encaustic painting, after having been long lost, was restored by count Caylus, a member of the Academy of Inscriptions in France; and the method of painting in wax was announced to the Academy of Painting and Belles-Lettres in the year 1753; though M. Bachelier, the author of a treatise "De l'Histoire et du Secret de la Peinture en Cire," had actually painted a picture in wax in 1749; and he was the first who communicated to the public the method of performing the operation of infusion, which is the principal characteristic of the encaustic painting. The count kept his method a secret for some time, contenting himself with exhibiting a picture at the Louvre in 1754, representing the head of Minerva, painted in the manner of the ancients, which excited the curiosity of the public, and was very much admired. In the interval of suspense, several attempts were made to recover the ancient method of painting. The first scheme adopted was that of melting wax and oil of turpentine together, and using this composition as a vehicle for mixing and laying-on the colours. But this method did not explain Pliny's meaning, as the wax is not burnt in this way of managing it. In another attempt, which was much more agreeable to the historian's description of encaustic painting, the wax was melted with strong lixivium of salt of tartar, and with this the colours were ground. When the picture was finished, it was gradually presented to the fire, so as to melt the wax; which was thus diffused through all the particles of the colours, so that they were fixed to the ground, and secured from the access of air or moisture. But the method of count Caylus is much more simple: The cloth or wood which he designed for the basis of his picture, is waxed over, by only rubbing it simply with a piece of bees-wax; the wood, or cloth, stretched on a frame, being held horizontally over, or perpendicularly before, a fire, at such a distance, that the wax might gradually melt, whilst it is rubbed on, diffuse itself, penetrate the body, and fill the interstices of the texture of the cloth, which, when cool, is fit to paint upon; but, as water-colours, or those that are mixed up with common water, will not adhere to wax, the whole picture is to be first rubbed over with Spanish chalk or white, and then the colours are applied to it; when the picture is dry, it is put near the fire, whereby the wax melts, and absorbs all the colours. Phil. Transf. vol. xlix.

Mr. J. H. Muntz, in a treatise on this subject, has proposed several improvements in the art of encaustic painting. When the painting is on cloth, he directs it to be prepared, by stretching it on a frame, and rubbing one side several times over with a piece of bees-wax, or virgin-wax, till it is covered with a coat of wax of considerable thickness. In fine linen, this is the only operation necessary previous to painting; but coarse cloth must be rubbed gently on the unwaxed side with a pumice-stone, to take off all those knots which would prevent the free and accurate working of the pencil. Then the subject is to be painted on the unwaxed side with colours prepared, and tempered with water; and, when the picture is finished, it must be brought near the fire, that the wax may melt and fix the colours. This method, however, can only

only be applied to cloth or paper, through the substance of which the wax may pass; but, in wood, stone, metals, or plaster, the former method of count Caylus must be observed.

Mr. Muntz has also discovered a method of forming grounds for painting with crayons, and fixing these, as well as water-colours, employed with the pencil. On the unwaxed side of a linen cloth, stretched and waxed as before, lay an even and thick coat of the colour proper for the ground; having prepared this colour, by mixing some proper pigment with an equal quantity of chalk, and tempering them with water. When the colour is dry, bring the picture to the fire, that the wax may melt, pass through the cloth, and fix the ground. An additional quantity of wax may be applied to the back of the picture, if that which was first rubbed on should not be sufficient for the body of colour; but, as this must be laid-on without heat, the wax should be dissolved in oil of turpentine, and applied with a brush, and the canvas again exposed to the fire, that the fresh supply of wax may pass through the cloth, and be absorbed by the colour: and thus a firm and good body will be formed for working on with the crayons. If cloth and paper are joined together, the cloth must be first fixed to the straining-frame; and then the paper must be pasted to it with a composition of paste, made with wheaten flour, or starch and water, and about a twelfth part of its weight of common turpentine. The turpentine must be added to the paste when it is almost sufficiently boiled, and the composition well stirred, and left to simmer over the fire for five or six minutes. Let wax be dissolved in oil of turpentine to the consistence of a thin paste; and, when the cloth and paper are dry, let them be held near a fire; and with a brush lay a coat of the wax and turpentine on both sides the joined cloth and paper, in such a degree of thickness, that both surfaces may shine throughout without any appearance of dull spots. Then expose the cloth to the fire or to the sun; by which means the oil will evaporate, and the wax become solid, and be fit to receive any composition of colour for a ground, which is to be laid-on as above directed in the case of cloth without paper.

Almost all the colours that are used in oil-painting may be also applied in the encaustic method. Mr. Muntz objects, indeed, to brown, light pink, and unburnt terra di Sienna; because these, on account of their gummy or stony texture, will not admit such a cohesion with the wax as will properly fix them; but other colours, which cannot be admitted in oil-painting, as red-lead, red orpiment, crystals of verdgris, and red precipitate of mercury, may be used here. The crayons used in encaustic painting are the same with those used in the common way of crayon-painting, excepting those that in their compositions are too tenacious; and the method of using them is the same in both cases.

The encaustic painting has many peculiar advantages: though the colours have not the natural varnish or shining which they require with oil, they have all the strength of paintings in oil, and all the airiness of water-colours, without partaking of the apparent character or defects of either; they may be looked at in any light, and in any situation, without any false glare; the colours are firm, and will bear washing; and a picture, after having been smoked, and then exposed to the dew, becomes as clean as if it had been but just painted. It may also be re-touched at pleasure, without any detriment to the colours; for the new colours will unite with the old ones, without spots, as is the case in common size-painting; nor is it necessary to rub the places to be re-touched with oil, as in oil-pictures; it is not liable to crack, and easily repaired, if it should chance to suffer any injury. The duration of this painting is also a very material advantage; the colours are not liable to fade and change; no damp can affect them, nor any corrosive substance injure them; nor can the colour fall off in shivers from the canvas. However, notwithstanding all these and other advantages enu-

merated by the abbé Mazeas and Mr. Muntz, this art has not yet been much practised. Many of these properties belong to a much higher species of encaustic painting, lately discovered in England, the colours of which are fixed by a very intense heat; nor are the colours, or grounds on which they are laid, liable to be dissolved or corroded by any chemical menstruum, nor, like the glassy colours of enamel, to run out of the drawing on the fire. See on this subject, Phil. Transf. vol. li. and Phil. Mag. vol. i. p. 23, 141, and 406.

The oil-varnishes used by the Egyptians and by Apelles might have brought them to the discovery of oil-painting; but, as it appears, both from mummies and from the works of Pliny, that their colours were not prepared and mixed with that varnish, and as it is plain rather that this varnish was externally laid over the finished pictures; no other conclusion can be drawn, except that they were within sight of the discovery, and that it is a matter of wonder that they should not have laid hold of it.

The oil also, that was used in the coarser wax and wall paintings just mentioned, proves at most that experiments had been tried with oils; but we have no proofs of oil-painting having been understood or used by the Egyptians, Greeks, or Romans; and, however great their skill or ingenuity, they might very well have been within sight and reach of the discovery, and nevertheless have missed it.

Of the COLOURS used by the ANCIENTS.

Sir Humphry Davy, during his residence at Rome in the year 1814 and 15, made a great number of experiments on the colours used in painting by the ancients, an account of which, with observations, he transmitted in the beginning of the year 1815 to the Royal Society. In his introduction to this paper, he observes, that the importance which the Greeks attached to pictures, the estimation in which their great painters were held, the high prices paid for their most celebrated productions, and the emulation existing between different states with regard to the possession of them, prove that painting was one of the arts most cultivated in ancient Greece. The works, indeed, of the great masters of Greece, are unfortunately lost: they disappeared from their native country during the wars waged by the Romans with the successors of Alexander, and the later Greek republics; and were destroyed either by accident, by time, or by barbarian conquerors, at the period of the decline and fall of the Roman empire. The subjects of many of these pictures are described in ancient authors; and some idea of the manner and style of the Greek artists may be gained from the designs on the vases, called, though improperly, Etruscan, which were executed by artists of Magna Grecia, and some faint notion of their execution and colouring may be gained from the paintings in fresco at Rome, Herculaneum, and Pompeii. These paintings, it is true, are not properly Greek; yet, whatever may have been said of the early existence of painting in Italy, as a native art, we are certain that, at the period when Rome was the metropolis of the world, the fine arts were cultivated in that city exclusively by the Greeks, or by artists of the Greek schools. By comparing the descriptions of Vitruvius and Pliny with those of Theophrastus, it is found, that the same materials for colouring were employed at Rome and at Athens; and of thirty great painters mentioned by Pliny, whose works were known to the Romans, two only are expressly mentioned as born in Italy; the rest were Greeks.

Ornamental fresco-painting was indeed generally executed by inferior artists; and the designs on the walls of the houses of Herculaneum and Pompeii, are not to be regarded as fair specimens of excellence, even in this department of the art; but in Rome, in the period of her full glory, and in the ornaments of the imperial palace of the first Cæsars, all the resources of the distinguished artists of that age were probably employed. Pliny mentions Cornelius Pinus, and Accius, as the two artists of the

the greatest merit in his own time; and it is probable that these artists had a share in executing, or directing the execution of, the paintings and ornaments in the baths of Titus; and at this period the works of Zeuxis, Parrhasius, Timanthes, Apelles, and Protagoras, were exhibited in Rome, and must have guided the taste of the artists. The decorations of the baths were intended to be seen by torch-light, so that their colours were brilliant and their contrast strong; yet these are regarded by connoisseurs as performances of considerable excellence. In these, and in other works of the same age, the effect of the ancient models is obvious, and the various copies and imitations that have been made of these remains of antiquity, have transferred their spirit into modern art, and left little to be desired as to those results which the skill of the painter can command.

"There remains, however," says sir H. D. "another use to which they may be applied; that of making us acquainted with the *nature and chemical composition of the colours* used by the Greek and Roman artists. The works of Theophrastus, Dioscorides, Vitruvius, and Pliny, contain descriptions of the substances used by the ancients as pigments; but hitherto, I believe, no experimental attempt has been made to identify them, or to imitate such of them as are peculiar. My experiments have been made upon colours found in the baths of Titus, and the ruins called the baths of Livia, and in the remains of other palaces and baths of ancient Rome, and in the ruins of Pompeii. By the kindness of my friend, the celebrated Canova, I was enabled to select with my own hands specimens of the different pigments that have been found in vases discovered in the excavations lately made beneath the ruins of the palace of Titus, and to compare them with the colours fixed on the walls, or detached in fragments of stucco; and was allowed actually to make experiments upon the colours of the celebrated picture *Nozze Aldobrandine*. But, when the preservation of a work of art was concerned, I made my researches upon mere atoms of the colour, taken from a place where the loss was imperceptible; and, without having injured any of the precious remains of antiquity, I flatter myself I shall be able to give some information, not without interest to scientific men, as well as to artists, and not wholly devoid of practical application."

Of the Red Colours of the Ancients.—Amongst the substances found in a large earthen vase filled with mixtures of different colours with clay and chalk, discovered in the year 1812, in a chamber at that time opened in the baths of Titus, there are three different kinds of red: one bright, and approaching to orange; another dull red; and a third, a purplish red. On exposing the bright red to the flame of alcohol, it became darker red; and, on increasing the heat by a blow-pipe, it fused into a mass, having the appearance of litharge, and which was proved to be this substance by the action of sulphuric and muriatic acids: this colour (says sir H. D.) is consequently minium, or the red oxyd of lead. By other processes, which are particularly described, he found that the dull red colour is an iron ochre, and the purplish red was proved to be an ochre of a different tint.

In examining the fresco-paintings in the baths of Titus, he found that these colours had been all used, the ochres in particular, in the shades of the figures, and the minium in the ornaments on the borders. He found another red on the walls, of a tint different from those in the vase, and much brighter, and which had been employed in various apartments, and formed the basis of the colouring of the niche and other parts of the chamber in which the Laocoon is said to have been found: this proved to be vermillion, or cinnabar; for, on heating it with iron-filings, quicksilver was procured. In the picture already mentioned, the *Nozze Aldobrandine*, the reds are all ochres: on these reds the action of acids, of alkalies, and of chlorine, could discover no traces either of minium or vermillion in the picture.

Minium was known to the Greeks, and was discovered accidentally by means of a fire that took place at the Piræus, at Athens: it was first used as a pigment by Nicias. Cinnabar, or vermillion, was discovered by Collias, and was prepared by washing the ores of quicksilver. It was a colour held in great estimation in Rome at the time of the republic: on great festivals it was used for painting the face of Jupiter Capitolinus, and likewise for colouring the body of the victor in the triumphal processions: the first business of newly-elected censors of the capitol, was to fill the place of vermillion-painter to Jupiter. A second, or inferior sort of vermillion, was formed by calcining the stone found in veins of lead. This substance was the same as our minium, and it was evidently formed from the carbonate of lead.

Of the Yellows.—A large earthen pot, found in one of the chambers of the baths of Titus, contained a quantity of yellow paint, which, when submitted to chemical examination, proved to be a mixture of yellow ochre with chalk. There were three different yellows; two of them proved to be yellow ochres mixed with chalk in different proportions; and the third, a yellow ochre mixed with red oxyd of lead, or minium.

The ancients had two other colours, which were orange or yellow: the auripigmentum, said to approach gold in its colour, which was found native in Pontus, and which is a sulphuret of arsenic; and a pale sandarach, said to have been found in the gold and silver mines, and which was imitated at Rome by the partial calcination of ceruse, and which was evidently massicot, or the yellow oxyd of lead mixed with minium. Sir H. Davy could not detect the use of orpiment in any of the fresco-paintings; but a deep yellow, approaching to orange, which was found in the ruins near the monument of Caius Cestius, proved to be oxyd of lead, and consisted of massicot mixed with minium. The yellows in the Aldobrandine picture are all ochres. Our author examined the colours in a very spirited picture on the wall of one of the houses at Pompeii, of a lion and a man; they all proved to be red and yellow ochres.

Of the Blue Colours.—Different shades of blue are used in the different apartments of the baths of Titus, and several very fine blues exist in the mixtures of their colours. These blues are of different hues, according as they contain larger or smaller quantities of carbonate of lime; but, when this carbonate is dissolved by acids, they present the same body-colour, a very fine blue powder, similar to the best smalt, or ultramarine, rough to the touch, and which does not lose its colour by being heated to redness; but which becomes agglutinated and semi-fused at a white heat.

Among some rubbish that had been collected in one of the chambers of the baths of Titus, were found several large lumps of deep blue frit, which, when mixed with chalk, produced colours exactly the same as those used in the baths, and was found to be of the same composition. The minute quantity of lime found in this substance, was not sufficient to account for its fusibility: it was therefore concluded that it contained a fixed alkali, which, upon examination, was proved to be sulphate of soda. The undiluted colour in its form of frit is used for ornamenting some of the mouldings detached from the ceilings of the chambers in the baths of Titus; and the walls of one chamber between the compartments of red marble bear proofs of having been covered with this frit, and contain a considerable quantity of it. This is probably the colour described by Theophrastus, as discovered by an Egyptian king, and of which the manufactory was anciently established at Alexandria: it is described by Vestroius as having been prepared by heating strongly together sand, flos nitri, and copper-filings. Pliny mentions other blues from the mines of Egypt, Scythia, and Cyprus: these were probably different preparations of lapis lazuli, and of the blue carbonates and arseniates of copper.

Pliny and Vitruvius speak of the *Indian blue*, which was

was evidently a species of indigo: the blues in the Nozze Aldobrandine, from their resisting the action of acids, and from the effects of fire, are supposed to be compounded of the Alexandrian or Puzzuoli blue. Some blue colour was found in a pot taken from an excavation at Pompeii, which proved to be a mixture of carbonate of lime with Alexandrian frit.

Sir H. Davy supposes, that the stained glass of the ancients was tinged with oxyd of cobalt, and that the colours were similar to the modern smalt. "I have not," says he, "found any powdered colour of this kind in the baths of Titus, or in any other Roman ruins; but the blue glass, tinged with cobalt, is very common in those ruins, which, when powdered, forms a pale-coloured smalt. I have examined many pastes and glasses that contain oxyd of copper; they are all bluish-green, or of an opaque watery blue. The transparent blue glass vessels which are found with the vases in the tombs in Magna Græcia, are tinged with cobalt, and are found to contain this mineral." Sir H. examined some Egyptian pastes, which are all tinged blue and green with copper; and, though he made experiments on nine different specimens of ancient Greek and Roman transparent blue glass, he found copper in none, but cobalt in them all. A gentleman at Milan found some time ago oxyd of cobalt in the blue glass collected from the ruins of Hadrian's Villa; and "at this time," says our author, "I had no idea that cobalt was known to the ancients."

Of the ancient Greens.—The deep sea-green colouring matter, taken from the ceiling of the chambers called the baths of Livia, proved to be soluble in acids, with effervescence; and, when precipitated from acids, it was redissolved in solution of ammonia, giving it a bright blue, produced by copper. There are several different shades of green employed in the baths of Titus, and on the fragments found near the monuments of Caius Cestius. Of the three different varieties, one, which approached to olive, was the common green earth of Verona; another, which was a pale grass-green, had the character of carbonate of copper mixed with chalk; and a third, which was a sea-green, was a combination of copper mixed with the blue copper frit.

Vitruvius mentions chrysocola as a native substance found in the copper-mines; and Pliny speaks of an artificial chrysocola made from the clay found in the neighbourhood of metallic veins, which clay was most probably impregnated with copper. The native chrysocola was probably a carbonate of copper; and the artificial was clay impregnated with sulphate of copper, rendered green by a yellow die.

Among the substances found in the baths of Titus, were some parts of a grass-green colour, which proved to be carbonate of copper; but it had formed round longitudinal nuclei of red oxyd of copper, so that probably these substances had been copper nails used in building, converted, by the action of the air during so many centuries, into oxyd and carbonate.

The ancients, according to Theophrastus, were well acquainted with verdegriis, and Vitruvius mentions it among the pigments; and perhaps many of the ancient greens which are now carbonates of copper were originally laid on in the state of acetite. The ancients had beautiful deep-green glasses, which were tinged with oxyd of copper; but it does not appear that they used these glasses in a state of powder as pigments.

Of the Purple of the Ancients.—The πορφύρεα of the Greeks, and the *ostium* of the Romans, was regarded as their most beautiful colour, and was prepared from shell-fish. According to Vitruvius, the colour differed according to the country from which the shell-fish was brought; it afforded a colour deeper and more approaching to violet from the northern countries, and a redder colour from the southern coasts. The finest purple had a tint like that of a deep-coloured rose; and in painting, it was laid on to give the last lustre to the *sandyx*, a com-

position made by calcining together red ochre and sandarach, and which, it is inferred, must have been nearly the same as our crimson.

In the baths of Titus, there is a broken vase of earthenware which contains a pale rose-colour; which, from a number of curious and interesting experiments, appeared to be a compound of either vegetable or animal origin. It agreed with both the vegetable and animal lakes, in being immediately destroyed by a solution of chlorine. The durability of this lake, whether vegetable or animal, is a very curious circumstance, and probably depends, in a great measure, upon the attractive powers of so large a mass of alumina; for, whenever one portion of a substance is combined with many proportions of another substance, it is very difficult to decompose, or detach, the one proportion. After all his experiments, sir H. D. says, it is impossible to form an opinion whether it is of vegetable or animal origin. If of animal origin, it is probably the Tyrian or marine purple. Mr. Chaptal considers the lake which he found among the colours from Pompeii, as of vegetable origin; and he founds his opinion on the circumstance of its not giving-out by decomposition the smell peculiar to animal substances; but, probably, (says sir H.) this smell, even if produced by recent purple colouring-matter of animal origin, would not belong to colouring-matter of 1700 years old; for the smell is most probably owing to albumen, or gelatine, not essential to the colouring particles, and much more rapidly decomposed. "I have seen no colour of the same tint as this ancient lake, in any of the ancient paintings in fresco. The purplish reds in the baths of Titus are mixtures of red ochres, and the blues of copper. In the Aldobrandine picture, there is a purple garment of the Pronuba, but of an inferior hue; and this purple appears to be a compound mineral colour of the nature of these. It was not destroyed by the solution of chlorine; and, when a little of it was exposed to muriatic acid, it rendered the acid yellow, and the remainder yielded a residual blue powder."

Of the Blacks and Browns.—There is one chamber in the baths of Titus of which the ground-work is black; and there are several fragments of stucco painted black in the baths of Titus, and also in some ruins near the Porta del Popolo. These colours were not acted on by acids or alkalies; they deflagrated with nitre, and had all the properties of pure carbonaceous matter.

Sir H. Davy found no blacks, but three different shades of brown, in the vase of mixed colours; one was snuff-colour, one deep red-brown, and the third, a dark olive-brown. The two first proved to be ochres which had been probably partially calcined; the third contained oxyd of manganese, as well as oxyd of iron, and afforded chlorine when acted on by muriatic acid.

All the ancient authors describe the artificial Greek and Roman blacks as carbonaceous, and made either from the powder of charcoal, or the decomposition of resin, (a species of lamp-black,) or from the lees of wine, or from the common soot of wood fires. Pliny mentions the inks of the cuttle-fish, but says, *ex his non fit*. Pliny speaks of ivory-black as invented by Apelles; he says likewise, that there is a natural fossil black, and another black prepared from an earth of the colour of sulphur. Probably both these substances are ores of iron and manganese.

That the ancients were acquainted with the ores of manganese, is evident from the use made of it in colouring glass. "I have examined two specimens of ancient Roman purple glass, both of which were tinged with oxyd of manganese." Pliny speaks of different brown ochres, and particularly of one from Africa, which he names *cicereulum*, which probably contained manganese; and Theophrastus mentions a fossil which inflamed when oil was poured upon it, a property belonging to no other fossil substance now known, but the *black wad*, an ore of manganese, and which is now found in Derbyshire.

The browns in the paintings of the baths of Livia, and in

in the Aldobrandine picture, are all produced by mixtures of ochres with black. Those in the Aldobrandine picture yield oxyd of iron to muriatic acid; but the darker shades were not touched by that acid.

Of the Whites of the Ancients.—The white colours in the Aldobrandine picture are soluble in acids with effervescence, and have the characters of carbonate of lime. The principal white in the vase of mixed colours appears to be a very fine chalk. There is another white, with a tint of cream-colour, which is a fine aluminous clay. The whites from the baths of Titus, and those from other ruins, are all of the same kind.

Ceruse was not met with amongst the ancient colours, though we know from Theophrastus, Vitruvius, and Pliny, that it was a common colour: and Vitruvius describes it as made by the action of lead upon vinegar.

Of the Manner in which the Ancients applied their Colours.

It appears from Vitruvius, that the colours used in fresco-painting were applied moist to the surface of a stucco formed of powdered marble cemented by lime; he states that the wall or ceiling had three distinct coatings of stucco made of this material, of which the first contained coarse powder of marble; the second the finer powder, and the third the finest powder of all; and that after this the wall was polished before the colour was applied. The stuccos that remain in the ruins of the baths of Titus and Livia are of this kind, and so is the ground of the Aldobrandine picture; they are beautifully white, and almost as hard as marble, and the granular marble of different degrees of fineness may be distinguished in them. This circumstance, indeed, offers a test of the antiquity of ruins at Rome. In the houses that have been built in the middle and latter ages, decomposing lava has been mixed with the calcareous cement, instead of granular marble; and the stuccos of these houses are grey or brown, and very coarse in their texture.

Pliny says, that purple, orpiment, ceruse, the natural azure, indigo, and the meline white, were injured by application to wet stucco; which is easily explained in the case of orpiment, carbonate of copper, ceruse, and indigo, from their chemical composition.

Vitruvius states, that in fresco-painting vermilion changed, if exposed to light; and he recommends the encaustic process for fixing the colour under this circumstance, namely, laying over it a coat of punic wax, and liquifying the wax so as to make a varnish for the colour. (See p. 215.) Pliny describes this process as applied in painting ships; and we know from his authority, that several pictures of the great Greek masters were painted in encaustic, and that the different colours were laid on mixed with wax. "I have examined several pieces of the painted stuccos found in the different ruins, and likewise the Aldobrandine picture, with a view of ascertaining if any application had been made to fix the colour; but neither by the test of alcohol, nor by heat, nor by the action of water, could I detect the presence of any wax-varnish, or animal or vegetable gluten.

"The pot of colours to which I have already referred, found at Pompeii, was blackened by smoke, as if it had been recently on a fire of wood. I thought that this might be owing to some process for dissolving gluten or varnish in the preparation of the colour; but I could detect no substance of this kind mixed with the colouring-matter. Pliny states, that gluten (our glue) was used in painting with blacks; and this specific mention of its application would induce the belief that it was not employed with other colours, which adhered without difficulty to, and were imbibed by, a surface so polished and well prepared as the Roman stucco; and the lightness of carbonaceous matter alone probably rendered this application necessary.

General Observations by Sir H. Davy.—It appears from the facts that have been stated, and the authorities quoted, that the Greek and Roman painters had almost all the

same colours as those employed by the great Italian masters, at the period of the revival of the arts in Italy. They had indeed the advantage over them in two colours; the Ægean or Egyptian azure, and the Tyrian or marine purple.

The azure, of which the excellence is proved by its duration for seventeen hundred years, may be easily and cheaply made; I find that fifteen parts by weight of carbonate of soda, twenty parts of powdered opaque flints, and three parts of copper-filings, strongly heated together for two hours, gave a substance of exactly the same tint, and of nearly the same degree of fusibility, and which, when powdered, produced a fine deep sky-blue. The azures, the red-and-yellow ochres, and the blacks, are the colours that seem not to have changed at all in the ancient fresco-paintings. The vermilion is darker than recently-made Dutch cinnabar; and the red-lead is inferior in tint to that sold in the shops. The greens in general are dull.

The principle of the composition of the Alexandrian frit is perfect; namely, that of embodying the colour in a composition resembling stone, so as to prevent the escape of elastic matter from it, or the decomposing action of the elements; this is a species of artificial lapis lazuli, the colouring-matter of which is naturally inherent in a hard siliceous stone. It is probable that other coloured frits may be made, and it is worth trying whether the beautiful purple given by oxyd of gold, cannot be made useful in painting on a densely-tinted glass. Where frits can be employed, metallic combinations, which are insoluble in water, and which are saturated with oxygen, or some acid matter, it is evident from the proof of a duration of seventeen centuries, are the best pigments. In the red ochres, the oxyd of iron is fully combined with oxygen and carbonic acid; and these colours have not changed. The carbonates of copper, which contain an oxyd and an acid, have changed very little. Massicot and orpiment were probably the least permanent amongst the ancient mineral colours.

Of the colours the discovery of which is owing to the improvements in modern chemistry, the patent yellow is much more durable than any ancient yellow of the same brilliancy; and chromate of lead, an insoluble compound of a metallic acid with a metallic oxyd, is a much more beautiful yellow than any possessed by the ancients; and, there is every reason to believe, is quite unalterable.

Scheele's green (the arsenite of copper) and the insoluble muriatic combination of copper, will probably be found more unalterable than the ancient greens; and the sulphate of barytes offers a white superior to any possessed by the Greeks and Romans.

I have tried the effect of light and air upon some of the colours formed by the new substance *iodine*. Its combination with mercury offers a good red; but it is, I think, less beautiful than vermilion, and it appears to change more by the action of light. Its compound with lead gives a beautiful yellow, little inferior to the chromate of lead; and I possess some of this colour which has been exposed to light and air without alteration for several months.

In many of the figures and ornaments in the outer chambers of the baths of Titus, where only outlines or spots remain, or shades of ochre, it is probable that vegetable or animal colours, such as indigo and the different dyed clays, were used. Some excellent pictures have suffered very much in modern times from the same cause the lakes in the frescos of the Vatican have lost much of the brilliancy which they must have possessed originally. The blues in many pictures of Paul Veronese are become muddy.

Pliny speaks of the celebrated Greek painters as employing only four colours; white, yellow, red, and black; but, as far as Apelles and Nicomachus are concerned, this is a mistake; and it is not unlikely that Pliny was misled by an imperfect recollection of a passage in Cicero, who describes

describes the earlier Greek school as using only four colours, but the later Greek painters as perfect masters in all the resources of colouring. Pliny himself describes with enthusiasm the *Venus Anadyomenē* of Apelles; and in this picture the sea was represented, which required azure.

The Greek painters, like the most illustrious artists of the Roman and Venetian school, were probably, however, sparing in the use of the more florid tints in historical and moral painting, and produced their effects rather by the contrasts of colouring in those parts of the picture where a deep and uniform tint might be used, than by brilliant drapery. If, therefore, red and yellow ochres, blacks and whites, were the colours most employed by Protogenes and Apelles, so they are likewise the colours most employed by Raphael and Titian, in their best style. The *St. John* and the *Venus*, in the tribune of the gallery at Florence, offer striking examples of pictures, in which all the deeper tints are evidently produced by red and yellow ochres and carbonaceous substances.

"As far as colours are concerned, these works are prepared for that immortality which they deserve; but, unfortunately, the oil and the canvas are vegetable materials, and liable to decomposition, and the last is less durable than even the wood on which the Greek artists painted their celebrated pictures." Read before the Royal Society, Feb. 23, 1815.

The lovers of painting are much indebted to sir Humphry Davy, for the above elaborate essay respecting the colours of the ancients; and it would be very desirable that this gentleman should continue his researches upon similar subjects, as the exertion of his splendid talents in this way promises to be of the greatest service to the arts in general. The extraordinary discoveries in chemistry which the present age has elicited, cannot fail to assist the artist in a wonderful manner; and it is matter of surprise, that a science in such close connection with the art of painting should be so little cultivated. The Royal Academy has its lecturer on anatomy; why not its professor of chemistry also? If it be necessary for the young student to know the proportions and constituent parts of the human figure, is it not equally important that he should be instructed in the chemical principles of colour-making; and not only to mix his colours with judgment, but be able to explain the causes of the effect produced? It is well known how much time and money sir Joshua Reynolds spent to no purpose in contrivances for mixing colours. What advantages, then, might not be derived from a course of lectures upon this subject illustrated by experiments! Subsequent publication of such lectures would be indispensably requisite, as the young artist might then pursue the theory in the closet, and put it in practice upon the canvas. The proper track once pointed out, we should have improvements multiplied, chemistry and painting more closely united, genius would strike out new beauties; and it is highly probable that the art would arrive at a degree of perfection hardly, in the present situation of things, to be expected.

HISTORY OF MODERN PAINTING.

It was not at once, and by miracle, that painting reappeared. Cherished, amidst the terrors of war and bigotry, by the Greek monks, in their silent seclusions, it was occasionally exhibited; and, for two centuries at least before the acknowledged era of its rise, according to Malvasia, and perhaps more early, had been publicly practised, though humbly, in fresco and in mosaic. He says that from 1115 to 1140, Guido, Ventura, and Orson, were employed as painters in several churches at Bologna; and, doubtless, these practices prevailed in other places; for now the ecclesiastical power of the church of Rome was completely established in Italy, and felt the advantages to be derived from adding splendour to the buildings erected to its honour, and exciting the zeal of its devotees. The character, however, of the art, as exhibited in the works of the Greek agents universally em-

ployed at this time, was but ill calculated to answer the higher views of those who promoted the exercise of it; for it was now at its lowest ebb.

Pisa, Lucca, Florence, and other petty republics into which the territory of Italy was divided, began about this period to shake off the barbarism which had so long abused and controlled them, and to exhibit a taste for improvement. Artists were summoned from Greece to assist in adorning Pisa and Florence; and, amongst other things, to paint the chapel of the Gondi family, at the church of *Sia. Maria Novella*, in the latter place; whilst the Venetians employed Apollonius, and others of the same country, on mosaics, in the church of *St. Mark*.

To the gratification enjoyed by Giovanni Cimabue at seeing the productions of the former of these artists, is Europe indebted, in a great measure, for whatever she has since beheld in the art. He, Andrea Taffi, who learned the art of working in mosaic from Apollonius, and Nicolo Pisano, instructed first in sculpture by Greeks, and afterwards by study from ancient bas-reliefs brought by his countryman from Greece, were the first Italians reported to have entered the lists with their masters; whose taste is allowed to have been hard and poor, and devoid of all spirit of imitation, either of nature or of ancient art: a state of debasement we might deem impossible to have occurred, after the extraordinary display of talents which those countries had witnessed, did we not know the rapidity with which the arts fall into decay, if not upheld by a constant succession of practice; and how slow their growth is in advance. And yet, doubtless, notwithstanding the horrors of destructive war, and the mad superstitious zeal of the iconoclasts of the eighth century, many noble examples of sculpture, and architecture more particularly, must have remained to guide their taste. So it was, however; and Vasari and others speak of the arts at this period as being utterly unworthy of the name. Such was their situation in Italy, when Cimabue, who was born at Florence, of a noble family, in 1240, having been initiated into the miserable practice of the Greek artists, conceived the desire of improving upon it; and succeeded so well in his attempt, that a picture of the Virgin, which he painted as large as life, for the church dedicated to her at Florence, excited enthusiastic delight in his fellow-citizens. They treated the painter with almost divine honours; the picture was carried in procession, with the sound of trumpets, to the place of its destination; and the day was celebrated as a public feast. Encouraged by this applause and admiration, Cimabue pursued the art with ardour; and, though the utmost of his efforts were weak and inefficient, yet he made a very great advance beyond his teachers. Vasari, 200 years afterwards, could not help expressing his surprise, that he had seen his way so far through the obscurity of the age he lived in; yet such was the Gothic barbarity in his picture of Christ Crucified, in the cloister of *St. Francis*, at Pisa, that written labels are employed to convey the sentiments of the Saviour to his mother and *St. John*.

His pupil Giotto, whom from a shepherd he raised to be a painter, relieved the art infinitely more from the fetters of Greek imperfection. The extreme rapidity with which he advanced in design, we can only account for by supposing that he left the trammels of the art, as then practised, and studied attentively the productions of the ancients which were to be found in Florence; and which then, doubtless, began to be in research. Giotto left off the use of labels, aimed at real expression, and obtained it; and, even in his own age, was acknowledged to be the pupil of nature. He may be said to have performed for the Italians what Polygnotus had done for the Grecians, by marking the line in which the art ought to be pursued; and, though in both it was accompanied with great deficiencies, yet it was just in its object and direction. To Giotto the world was indebted for the portraits of Dante, Brunetti, and others, amongst those who at that time shone conspicuous in literature, and

with whom he lived on terms of intimacy and friendship. His abilities procured him the patronage of pope Benedict IX. according to Vafari, (though Baldinucci says that it was Boniface VIII.) who employed him in St. Peter's, and highly honoured and remunerated him. Henceforth the art of painting became attached to the papal dignity, and few succeeding pontiffs disregarded the use of it.

The skill of this ingenious artist excited the emulation of many among his contemporaries throughout Italy; and the arts, having now acquired an earnest employment and reputation, of emolument and of honour, no longer wanted skilful professors, or illustrious patrons. A grand epoch of their establishment took place at Florence in 1350, fourteen years after the death of Giotto; when a disciple of his, Jacopo Cassentino, and nine other artists, founded the Academy of St. Luke in that city; an institution from whence arose a large display of talent, increasing in worth, till at length, near 150 years after its foundation, it gave to the world three of the greatest luminaries in art which it has ever known; Leonardo da Vinci, Michael Angelo, and Raphael; besides Masaccio, and others of great repute.

From this time, then, we may date the establishment of what are called

SCHOOLS OF PAINTING.

By a *school*, we understand, as connected with the present subject, a class of artists who have learned their art from a certain master, either by receiving his instructions, or by studying his works; and who of consequence discover more or less of his *manner*, from the desire of imitation, or from the habit of adopting his principles.

All the painters which Europe has produced since the renovation of the arts are classed under the following schools: the School of Florence, the School of Rome, the School of Venice, the Lombard School, the French School, the German School, the Flemish School, the Dutch School, and the English School.

SCHOOL OF FLORENCE.—This school is remarkable for greatness; for a boldness of expression which is unparalleled by any of the others, and a sublimity of composition which has excited the surprise and astonishment of all ages; though it is inferior in grace and beauty to the Roman school, and in liveliness and éclat of colouring to the Venetian school.

This school has an indisputable title to the veneration of all the lovers of the arts, as the first in Italy which cultivated them. Cimabue may be considered as the founder of it; but we have already seen that it was not till the year 1350 that the Florentine painters became so numerous and so respectable as to form themselves into a school or society under the protection of St. Luke.

After a lapse of near a hundred years from the death of Giotto, Tomaso da San Giovanni, better known by the name of Masaccio, (from his total neglect of personal appearance,) exhibited a more exalted taste, and a grander style of execution, than his contemporaries. The art, under his hands, may be said to have advanced from the weakness of infancy to the station of youth, verging towards the vigour of perfect manhood. He first composed with an eye to the whole; managed his groups and single figures upon the principles of perspective, which had been taught him by the sculptor Brunelleschi; and, by understanding the effect of those principles, first laid the feet of upright figures flat upon the ground, and foreshortened his heads and figures with truth and effect. In fact, it was to him that future artists were indebted for a more sure and fixed direction of the line in which the art ought to be pursued. He studied nature with the greatest attention, gave breadth and simplicity to his draperies, and most admirable action, character, and expression, to his figures; which are justly and appropriately employed, and wrought with admirable execution. Even Raphael did not scruple, eighty years afterwards, to study, and

sometimes to adopt, his actions; of which there is an extraordinary instance in the figure of St. Paul preaching at Athens. His principal works in the chapel of the Brancacci, in the church del Carmine at Florence, became the school of study for all those excellent artists who succeeded him; till, at length, Leonardo da Vinci, born near that city in 1445, two years after the death of Masaccio, came forth with superior lustre, and eclipsed all that had preceded. Endowed with uncommon genius, all arts and sciences seemed scarcely to offer a sufficient field for the exertion of his talents. He grasped at all, and succeeded in whatever he undertook; but, by his versatility, wasted much of his time in experiment. Had he persevered with steadiness in pursuit of the art of painting, he probably would have carried it to the utmost perfection. As it was, whatever he painted came from his hand elevated and adorned, and presented a complete originality of effect and manner. To truth and precision of character, and whatever had been well done by Masaccio, Leonardo added new and most valuable qualities, by introducing the principles of *chiaro-scuro*, and depth of tone in colour. By the former of these, pictures were relieved from the tameness of mere imitation, and acquired an increase of power, in boldness and strength of relief, and force of effect. He may be said to have given more than hints of improvement in all the various branches of the art; and to have left some examples, whence others, enjoying more steadiness, and less impetuosity of character, subsequently imbibed such instruction, as directed their course, and aided them in a nearer view of ideal perfection. Michael Angelo in design, Corregio in finish and *chiaro-scuro*, and Rubens in composition, are surely indebted to Da Vinci for the foundation of much of their perfections.

The general increase of mental civilization, of literature, and of science; the same causes which operated in the establishment of the first grand era of the arts among the Greeks; now again began to prevail in the world; and the country where they were found, by natural progress, in its turn became the nurse of art; and in time was remunerated, in the honour and renown of supporting them, till they established a second epoch, scarcely less illustrious than the former. The existence of Leonardo da Vinci was the immediate precursor of that exaltation; and the examples he left, and the lessons he inculcated in his writings, had no small share in producing it. In him, as we have seen in Pamphilus, the master of Apelles, the art enjoyed the advantage of an union with science and general cultivation; and the effect of that combination is evident in the history of both. It enabled Leonardo to embellish and diversify the general impression of character drawn by Masaccio; and to exhibit, with more variety and fulness, the latent feelings of the human heart. Of this, his picture of the Last Supper, at Milan, is a sufficient proof. And that this perfection was the result of deep reflection, is evident, by his having refrained from painting the head of the Saviour, till he could completely satisfy his mind with what features and expression he ought to compose a representation of his divine character. We are told the same story of Haydon, in his picture of Christ's Entry into Jerusalem, now exhibiting in London.

About the beginning of the century in which Leonardo was born, the use of *oil* was adopted as a vehicle for painting; and afforded the means of most extensive improvement, particularly in colour and effect. Distemper, or colours mixed with size and water, appears to have been the first adopted practice; and afterwards, fresco, as more durable, and better adapted to larger purposes. But both of these modes are limited in the execution, more particularly the latter, in which, no means being given to change or retouch the colours without evident disparagement to the work, the artist was obliged to adopt as simple a plan of conduct as possible in the management of his designs. But, when a vehicle was discovered,

vered, or applied, the use of which permitted frequent changes in effect, and in arrangement of colours, with the assurance of perfect union at the conclusion, no means were wanting which he could desire for the indulgence of the utmost stretch of his imagination.

The event which gave rise to the exercise of *painting with colours ground and mixed with oil*, is supposed, with great reason, to have been varnishing-over pictures painted with water-colours; which, as they were wrought up to the full resemblance of natural objects when the colours were dry, were rendered by the varnish as deep in hue as when the materials were wetted to be employed: and thus a tone of effect was superadded to the natural and ordinary one, purely artificial, but very engaging; and the more so, when placed in opposition to the comparatively dull and tame effect of the former modes; which of necessity lacked lustre, as they always dried with a deadened surface.

The discovery of this very essential advantage to the art of painting, which so readily enabled it to outstep whatever had been previously done, has been, by most authors who have written upon the subject, attributed to John Van Eyck, in 1410. Though many doubt concerning the accuracy of this opinion, (see EYCK, vol vii. p. 142.) yet one thing remains clear, that, till after the time in which he lived, oil, as a vehicle for colour, was not in general use. No doubt can remain, that, if he did not actually first apply it to the purpose of his art, at least he first used it essentially and effectually. His application of it would not otherwise have made, as Vanmader says, "as much noise in the world as the discovery of gunpowder by Bertoldo Schwartz had done near a century before;" nor would a native of Italy have taken the trouble of journeying to Flanders, and soliciting the friendship and instructions of Van Eyck, as, Vafari says, Antonella da Messina did, could he have obtained the knowledge he sought at the cost of less trouble and time.

Painting, according to Vanmader, the historian of the Flemish artists, had been carried into Flanders about the time of Giotto, by some Flemings, who went for the express purpose of learning it; and he says that "the mode of painting brought from Italy, was with gum and eggs; having been so practised at Florence at its first commencement by Cimabue." It spread in practice among the Germans about the same time; and each of these countries established a mode of art, or style, for themselves. It was in Italy alone, however, that any true perception of what was the proper object of art appears to have been felt, and there it was first exhibited; and even there it dates its principal exertions from one city and its dependencies; viz. Florence. In this place alone it remained pure in its object, the delineation of character and expression, with selection of form, and simplicity, and un-mixed purity of effect. A style of design, which, pursuing the first impulse of the art, viz. the representation of events at their most impressive moments, leaves minor objects out of consideration, and aims solely at fulfilling its purposes in an intuitive manner upon the mind of an observer. That style Giotto had founded; it was improved in effect by Masaccio, strengthened by Bartolomeo della Porta and Leonardo da Vinci, and finally perfected by Raphael and Michael Angelo.

To this most important aim of the art the introduction of oil in painting brought no efficient aid. What has been said of its benefits, applies only to the ornamental, or less important, applications of it. The objects of the grand style, viz. beauty of design, and purity of expression, the weakest materials are capable of presenting to the imagination; and therefore, notwithstanding the brilliancy of colour and effect which was afforded by the use of oil, it was in great measure disregarded by the Florentines; or, if employed by them, they carried into its practice the defective hues of fresco; to the exception of Leonardo da Vinci, and Fra. Bartolomeo della Porta, (born at Florence in 1479,) who followed

closely the line of colouring laid down by the former, his immediate predecessor. To him the art is indebted for the first conception of the union of true grandeur of style in design, with a suitable dignity and depth of colouring. The subjects he chose were generally of a religious kind, which nearly excluded naked figures; but he amply compensated for that, by the mode in which he composed his draperies and arranged his groups. Of him Raphael is supposed to have acquired more information than from any other source, till he had seen the works of M. Angelo in the Sistine chapel. It was Bartolomeo who changed the taste he had imbibed from his master Pietro Perugino, and directed it in the course wherein he afterwards surpassed all that the modern art of painting had effected.

Michael Angelo was contemporary with Leonardo da Vinci; and surpassed him in grandeur, in boldness of conception, and in knowledge of design; but Leonardo was superior to him in all the amiable parts of the art: Leonardo, possessed of a fine imagination, and full of sensibility, devoted himself, in painting, to express the affections of the soul; and if, in this sublime branch of the art, he was afterwards surpassed by Raphael, he had at least the glory not only of exceeding all the painters who went before him, but of pursuing a path which none of them had attempted. Michael Angelo, less formed to experience sweet affections than vehement passions, sought in nature what the strength of man might accomplish, not that which constitutes beauty. He delighted in being great and terrible, more than in graceful and pleasing attitudes. Well acquainted with anatomy, he knew more exactly than any other artist in what manner to express the joining of the bones of the body, and the office and insertion of the muscles: but, too eager to display his knowledge of anatomy, he seems to have forgotten that the muscles are softened by the skin which covers them; and that they are less visible in children, in women, and in young men, than in confirmed and vigorous manhood. "In his figures (says Mengs) the articulations of the muscles are so easy and free, that they appear to be made for the attitude in which he represents them. The fleshy parts are too much rounded, and the muscles are in general too large, and of too equal strength. You never perceive in his figures a muscle at rest; and, although he knew admirably well how to place them, their action is very frequently inconsistent with their situation."

"He did not possess (says sir Joshua Reynolds) so many delightful parts of the art as Raphael; but those which he had acquired were of a more sublime nature. He saw in painting little more than what might be attained in sculpture; and he confined it to exactness of form, and the expression of passions. He never attempted the lesser elegancies and graces in the art. Vafari says, *he never painted but one picture in oil*; and resolved never to paint another, saying it was an employment only fit for women and children. If any man had a right to look down upon the lower accomplishments as beneath his attention, it was certainly Michael Angelo; nor can it be thought strange, that such a mind should have slighted, or have been withheld from paying due attention to, those graces and embellishments of art which have diffused such lustre over the works of other painters."

ROMAN SCHOOL.—Ancient Rome, rich with the works brought from Greece, or finished in its own bosom by Grecian artists, handed down in its ruins the remains of that glory to which it had been elevated. It was by the study of these remains that the modern artists were formed: they derived from them the knowledge of design, the beauty of exquisite forms, greatness of style, and justness of expression, carried to that length only which did not affect the beauty of the figure: from them also they derived the principles of the art of drapery; and they followed these principles even while they made the drapery of modern paintings more large and flowing than what was practised by the ancient sculptors. The Roman school

school was altogether devoted to the principal parts of the art, to those which require genius and vast conceptions; and was no farther occupied with colours, than what was necessary to establish a difference between painting and sculpture, or rather between painting varied with colours and in chiaro-scuro.

Raphael Sanzio, born at Urbino in 1483, and scholar to Pietro Perugino, was the undoubted founder of this school. His first manner was that of Perugino, his master; but he travelled twice to Florence, to study the great artists who flourished in that city.

It was fortunate for Raphael, says Mengs, that he was born in what he terms the infancy of the art, and that he formed himself by copying nature before he had access to see the works of any great master. He began by studying, with great exactness, the simple truth in his figures. He was then ignorant that any choice was necessary; but he saw the works of Leonardo da Vinci, of Massaccio, and of Michael Angelo, which gave his genius a new direction. After this, he perceived that there was something more in the art of painting than a mere imitation of truth. But the works of those masters were not sufficiently perfect to point out the best choice to make; and he continued in uncertainty till he saw at Rome the works of the ancients. Then he perceived that he had found the true models which he wanted; and, in imitating them, he had only to follow the natural impulse of his genius.

Habituated by his first manner to imitate nature with precision, it was not difficult to carry the same exactness into the imitation of the ancients; and it was a great advantage to him, that he flourished in an age wherein the artists had not achieved facility of execution at the expense of rigorous exactness. He never lost sight of nature; but he was instructed by the ancients in what manner she should be studied. He perceived that the Greeks had not entered into minute details, that they had selected what was great or beautiful, and that one of the chief causes of the beauty of their works, was the regularity of their proportions; he began, therefore, by carefully studying this part of the art. He saw also that the joinings of the bones, and the free play of the articulations, are the causes of all graceful movement: he therefore, after the example of the ancients, gave the greatest attention to this part, and was led by these observations not to be contented with the simple imitation of nature.

His design is excellent, but neither so perfect nor so finished as that of the Greeks. He excelled in representing the character of philosophers, apostles, and other figures of that kind; but he did not equal the Greeks in ideal figures, which ought to carry the impression of divinity. His taste for design was more Roman than Greek, because he formed it chiefly on the basso-relievos which he found at Rome. On this account he had the habit of marking strongly the bones and the articulations, and labouring the fleshy parts less; but, as these basso-relievos are very exact with regard to the reciprocal proportions of every member, he excelled in this part, while at the same time he did not give to his figures all the elegance of the Greek artists, nor the flexibility of articulation which is admired in the Laocoon, in the Apollo of Belvedere, and in the Gladiator.

The manners and spirit of his age, and the subjects which he most commonly treated, prevented him from reaching the ideal of the ancients. Having seldom occasion to represent figures altogether ideal, he devoted himself to purity of expression. He knew that the expression of the passions of the soul is absolutely necessary in an art which represents the actions of men, since, from those affections, the actions may be said truly to originate. To make figures act, and yet neglect the interior springs of action, is nothing more than a representation of automata. The attitudes and action are evident; but they appear not to act of themselves, because they are void of those principles from which alone men are supposed to act.

An artist who neglects *expression*, gives no just representation of character, even though he should take nature for his model. Raphael's first care, when he wanted to compose a piece, was to weigh the expression; that is to say, to establish, according to the nature of the subject, the passions which were to animate the characters. All the figures, all the accessories, all the parts of the composition, were moulded to the general expression.

As he had not found examples in the ancient statues of the chiaro-scuro, he was comparatively weak in this part; and, if there was any thing remarkable in his distribution of light and shade, he owed it to the works of the Florentine painters. It cannot be said, however, even with regard to the chiaro-scuro, that he imitated nature without taste. He delighted in what are called *masses* of light; and disposed the great lights in the most conspicuous places of his figures, whether naked or in drapery. If this method did not produce effects highly illusive, it gives his works that distinctness which makes his figures conspicuous at a distance; and this must be allowed to be an essential part of the art of painting. He did not proceed beyond this; and, content with that kind of chiaro-scuro which comprehends imitation, he never attempted that which is ideal.

The *composition* and the *ensemble* of his figures, were the chief excellencies of Raphael. His philosophical mind could not be affected with objects which had not expression. He had too high an idea of painting to consider it as a mute art; he made it speak to the heart and soul; and he could only do this in subjects which required expression. If Raphael did not reach the Greek excellence, if he did not possess the art of embellishing nature in the same high degree, he saw at least, and imitated her in, whatever was expressive and beautiful. "The Greeks failed with majesty (says Mengs) between earth and heaven: Raphael walked with propriety on the earth." "Composition is in general (says the same author) of two kinds: Raphael's is the expressive kind; the other is the theatrical or picturesque, which consists of an agreeable disposition of the figures. Lanfranc was the inventor of this last, and, after him, Pietro da Cortona. I give the preference to Raphael; because reason presides over all his works, or at least the greatest part of them. He never allowed himself in common ideas, and was never allured to give any thing in his accessory figures which might turn the attention from the principal object of the piece."

It has been observed with great propriety as well as truth, that the paintings of the divine Raphael do not, in general, excite a lively emotion at first sight; and that the cartoons, in particular, although they are the best performances of his inimitable pencil, have often been seen and gazed at, by the public who flock to Hampton-court for the purpose of admiring them, without striking the beholders so forcibly as to elicit the least expression of surprise. Several companies have walked leisurely through the *loggie* and the other apartments of the Vatican, heedless of what surrounded them, and have requested, most innocently, the cicerone to show them the marvellous works of Raphael. The fact is, that the transactions of human life, when faithfully represented, are so familiar to our eyes, that we mistake them for the very acts which we are constantly witnesses to; and that, by mechanically identifying them with nature in our mind, art loses the merit of imitation, and becomes for a moment nature herself. Hence the reason why mythological, allegorical, and religious, subjects, have been always better received than mere historical ones. Eager to excite astonishment, the artist soon found that the surest way was to mix fanciful conceptions with real facts, in order to give them an epic turn, and thereby strike the sight and move the soul. The religion and popular traditions of the Greeks and Romans afforded their poets, painters, and sculptors, an immense scope to vary and adorn their themes; and the Christian belief has proved a most agreeable and an inexhaustible

haughty source of beauties of that kind. Angels and seraphs, miraculous apparitions of saints, and the liberty generally allowed to group together personages who lived at the distance of several centuries from each other, unshackled the hands of the painter, enlarged his canvas, and placed his easel above the clouds. Hence that wonderful enthusiasm which fired his mind, taught his pencil to sweep in bold strokes across the pannel, and unveiled to him those heavenly features which are supposed to be enlightened and blessed with the reflection of the ineffable rays which emanate from God himself.

Raphael's last and most beautiful picture is the celebrated *Transfiguration*, which was exposed at the head of his coffin, to give an impressive idea of the loss the world had just experienced by the death of so great a genius. A copy of this chef d'œuvre, drawn under the eye of Raphael, and painted after his death by Julio Romano, is now at Dulwich-college, as an altar-piece; and is the more precious, that the original, transported from Rome to Paris, has materially suffered under the hands of unskilful cleaners.

A history of the schools is nothing more than a history of the painters who founded them. In those two which we have already given, Michael Angelo and Raphael come readily forward to claim our attention. We have already compared the former with Leonardo da Vinci; and we cannot better conclude this account than by contrasting him with Raphael. This we shall do in the words of sir Joshua Reynolds. "If we put those great artists (says he) in a light of comparison with each other, Raphael had more taste and fancy, Michael Angelo more genius and imagination. The one excelled in beauty, the other in energy. Michael Angelo has more of the poetical in operation; his ideas are vast and sublime; his people are a superior order of beings; there is nothing about them, nothing in the air of their actions, or their attitudes, or the style and cast of their limbs or features, that puts one in mind of their belonging to our species. Raphael's imagination is not so elevated; his figures are not so much disjointed from our own diminutive race of beings, though his ideas are chaste, noble, and of great conformity to their subject. Michael Angelo's works have a strong, peculiar, and marked character; they seem to proceed from his own mind entirely; and that mind so rich and abundant, that he never needed, or seemed to disdain, to look abroad for foreign help. Raphael's materials are generally borrowed, though the noble structure is his own. The excellency of this extraordinary man lay in the propriety, beauty, and majesty, of his characters; his judicious contrivance of composition, correctness of drawing, purity of taste, and the skilful accommodation of other men's conceptions to his own purpose."

VENETIAN SCHOOL.—Whilst painting was pursued at Florence in its higher principles, and thence transplanted pure to Rome, to adorn the pontifical palaces, &c. of the imperial city, its more alluring, though less solid, charms, were cultivated at Venice; where colour occupied the attention of the artists, and repaid it with her most engaging fascinations. Among those artists, Giorgione del Castel Franco, born in 1477, has the reputation of having begun that system of *colouring*, which his early death alone prevented him from carrying to perfection. Had the period of his existence been lengthened, it is probable that *Titian*, who adopted his style, would not have stood so completely alone, as he now does, at the head of the Venetian school. In character and in grace, Giorgione, in some of the few works which he has left, has evidently surpassed him. Except in the adaptations of it to exalted subjects, and an admixture of a certain degree of grandeur and purity in design, which was effected by Titian, the Venetian style of art has an equal supporter in Giacomo Robusti, called *il Tintoretto*; who, too free to be correct, and too daring to be chaste, held the pencil with a vigour of colour and execution worthy

of being added to the sublimity of Michael Angelo in design. Unfortunately, to the delights of execution and surface, he sacrificed character, expression, and propriety; and the world ought to regard him as the founder of the ornamental style, rather than Titian; whose best works hold a middle rank between Tintoretto and Michael Angelo, and are of too serious a character to merit that appellation. It was however his process of colouring which guided the hand of Tintoretto, and also that of Paulo Veronese, in establishing the success of the Venetian school. Paduanino, the elder and younger Palma, Pordenone, the Bassans, and many others, upheld the system for a time, but not with equal powers.

The artists in the Florentine and Roman schools painted most commonly in water-colours or in fresco; and, in the exercise of their profession, instead of nature, they finished their works from their first sketches. Titian painted in oil, and finished from the objects in nature; and this practice, joined to his exquisite talents, gave the greatest truth to his colours. His being a portrait-painter was also of advantage to him as a colourist. In this department, he was accustomed to the colours of nature in carnations and draperies. But the colours of his paintings are so mingled together, as to give no idea of the colours on his pallet; which distinguishes him from Rubens, who placed his colours one at the side of another. It is impossible to say, on the narrowest inspection, with what colours he produced his tints. This practice, which enabled him to imitate so exactly the colours of nature, gives a marked distinction to his manner of painting. In the examination of his works, the critics lose an ordinary source of pleasure, which arises from marking the freedom of hand; but they may console themselves with the natural and exquisite touches of this artist. He is of historical painters one of those who have best succeeded in landscape. His situations are well chosen; his trees are varied in their forms, and their foliage well conceived. He had a custom of representing some remarkable appearance in his landscapes to render them more striking.

There is much ingenuity in Goëthe's remarks on the causes of the transparent colouring of the Venetian painters. The eye, he says with truth, is formed by the objects to which it is accustomed; and here every thing is brilliant. When he saw the gondoliers dressed in gay colours, set off by the vivid green surface of the water, and by the clear sky, he perceived in these objects the character of the pictures of the Venetian school. The sunshine brought out the colouring with dazzling brilliancy, and the shadows were illuminated by the light reflected from the water; all was *light in light*.

In the year 1798, Mr. Sheldrake, of the Strand, presented to the Society of Arts a Dissertation on Oil-painting, as practised in the ancient Venetian School. From this we shall make a few extracts.

"The method of painting practised in the Venetian school, I conceive to have been as follows: The cloth was primed with colours in distemper, of a brownish hue, such as would properly enter into the darkest parts of the picture: the most transparent colours are the properest. I believe umber was most generally used, broken with red, yellow, or blue, according to the tint intended to be produced, and diluted with chalk, or whiting, to the proper degree of strength. Upon the ground so prepared, the subject was correctly drawn with umber, pure, or mixed with lake, blue, or black: and with the same colours those shadows that were darker than the ground were then painted in. The artist then painted the lights with *pure white*, in a solid body, where the light was brightest, or where the full effect of colour was to be produced; and, where the demi-tints were afterwards to be, scumbling it thinner by degrees, till it united with the shadows. In this manner, the *chiaro-scuro* was finished as much as possible, and the local colour of every object in the picture glazed over it. All the colours used in this part

of the work were ground in oil, which was absorbed into the ground; the picture remaining flat, something like a picture in water-colours, or crayons: it was then varnished, till saturated with varnish, and the full of every colour brought out. The picture was then complete.

"The demi-tints, which conduce so much to the brilliancy of a picture, which are so difficult to execute, and in which the painter most frequently fails, are, in the ordinary modes of painting, produced by the mixture of black, grey, blue, or brown, (according to the judgment of the artist,) with the local colours of the objects. It is these tints which, from their being made with such colours, it is difficult to get clear, and which never are so clear in any other as in the Venetian pictures, and in some of the Flemish ones painted upon analogous principles. The fact is, that those painters produced all such tints without the admixture of any colour to represent them, and by a method so like that by which they are produced in nature, that this circumstance alone ensures a degree of brightness to their colours, and of harmony to their shadows, that it is perhaps impossible to produce, in an equal degree, by any other mode of painting.

"It is a singular fact, which I have not skill in physics to be able to account for, though, by numerous experiments, I have ascertained it beyond contradiction, that if, upon any degree of brown between the deepest and the lightest brown-yellow, we paint pure white, in gradations, from the solid body to the lightest tint that can be laid on, all the tints between the solid white and the ground will appear to be *grey*, intense in proportion to the depth of the ground, and the thinness of the white laid upon it. But, in every case, all the tints laid upon one ground will harmonize with each other, and form one connected chain, (if I may use the expression,) which will perfectly unite the highest light with the darkest shade.

"If, then, we examine the component substances of a Venetian picture, we shall find the lighter parts consist only of white, to represent the light; and, of the local colours of the objects it represents, the demi-tints are imitated by an *appearance* almost as deceptive as the similar appearances in nature: but, in every other method of painting, these demi-tints are produced by mixing some dusky colour with the local colours and the light. The comparison of these methods will afford a demonstrative reason why the Venetian must be brighter than any other mode of painting.

"Having shewn, as near to a demonstration as the nature of the subject will perhaps admit, why those parts of a Venetian picture that are connected with light and colours are brighter than the corresponding parts of any other pictures, it remains to explain the cause of similar superiority in the darker parts of the same pictures. It has been said, with much confidence, that, as white represents light, so black is the representative of darkness. But, though this may be true in physics, it certainly is not so in painting; for the painter's art is to represent objects as they *appear*, in point of colour, to be, not as they really are. Thus, if I know an object is perfectly black, and am to represent it as it appears to be at the distance of fifty feet, black from the pallet will not produce a good imitation of it, because the interposition of fifty feet of the atmosphere will cause it to appear of a colour different from what it really is; and, *vice versa*, if we go into a cavern, a cellar, or a room so darkened that the colour of no object can be distinctly seen, and if we there hold any solid black substance near to the eye, the difference will be visible at once; the black object will be immediately distinguished, by its solidity and colour, from the surrounding space, and from such remote objects as may be obscurely visible through it. These objects actually possess their individual colours, and only appear indistinctly from the absence of light. The black object may appear solid, and of that colour, from its proximity to the eye; but the circumjacent ones will appear of a colour perfectly distinct from it, more or less transparent in proportion to their distance

from the eye, and shewing a portion of their individual colours, according to the quantity of ill-defined light that may be admitted. Thus we see (if I may venture to mention so notorious a truism) that shadows are nothing real: they only seem to exist in the absence of light, and give to objects an ill-defined appearance, distinct from, though in some instances mixed with, light and colours in different degrees; but, as the painter must represent this *appearance* by something real, he chooses the colours most analogous, *viz. browns*, and the most transparent of their class, to represent this transparent, but imperfectly-defined, appearance in nature.

"It has been supposed that the Venetian painters had some peculiarly rich and transparent *brown colour*, which is seen to pervade all the works of that school, the effect of which no modern artist has been able to imitate, and which, therefore, is supposed to have been lost. It is not very probable, that a colour so common as to pervade the works of the worst as well as of the best artists of that school, should be so unaccountably lost; and, as the effect attributed to it may be easily produced by the mode of painting I have described, it is not unreasonable to conclude, that this much-lamented colour has never existed." For this communication, the greater silver medal of the Society was voted to Mr. Sheldrake.

LOMBARD SCHOOL.—The distinguishing marks of this school are—grace; an agreeable taste for design, without great correctness; a freshness and lightness of colouring; and what the French call *empâtement*, which is a due and proper union of local colours, generally producing what we style *breadth*.

Antonio Allegri, called *Corregio*, was the father and greatest ornament of this school. He began, like the painters of his time, to imitate nature alone; but, as he was chiefly delighted with the graceful, he was careful to purify his design from all short turnings and unnecessary angles. He perceived that largeness contributed to grace; and therefore he not only rejected all small figures, but enlarged as much as possible the outlines, avoided acute angles and straight lines, and by these means gave an easy grandeur to his design.

After painting had arrived at the greatest perfection among the Greeks, by the exertions of Zeuxis and Parrhasius, Apelles found nothing to add to the art except *grace*; in the same manner, among the moderns, after Raphael had appeared, grace was the only thing wanting to the art; and Corregio became the Apelles of Europe. Painting was by him carried to the highest degree among the moderns; the taste of the best critics, and the eye of the vulgar, were equally gratified.

Corregio painted in oil, a kind of painting susceptible of the greatest delicacy and sweetness; and, as his character led him to cultivate the agreeable, he gave a pleasing, captivating, tone to all his pictures. He sought transparent colours to represent shades conformable to nature; and adopted a manner of glazing, which actually rendered his shadows more obscure. Obscurity in painting cannot be fully obtained without transparent colours; for these absorb the rays of light, and of consequence give less reflection. He laid his colours very thick on the brightest parts of his pictures, to make them capable of receiving, by a proper touch, the greatest degree of light. He perceived that the reflections of light correspond with the colour of the body from which they are reflected; and on these principles he founded his theory of colours with respect to light and shade and reflection. But it is chiefly in the colour of his shades that he deserves to be imitated; for his lights are too clear, and somewhat heavy; and his fleshy parts are not sufficiently transparent.

Harmony and grace are connected together; and on this account Corregio excelled also in harmony. As the delicacy of his taste suffered him not to employ strong oppositions, he naturally became a great master in this part, which chiefly consists of easy gradations from one extreme to another. He was harmonious in his design, by making

making the lines which formed the angles of the contour arched and undulated. But, in the lights and shades, he placed always between the two extremes a space which served to unite them, and to form a passage from the one to the other. The delicacy of his organs made him perceive, better than any other artist, what relief was necessary to the eye, after a violent exertion; and he was therefore careful to follow a bold and prevailing colour with a demi-tint, and to conduct the eye of the spectator, by an invisible gradation, to its ordinary state of tension. In the same manner (says Mengs) does agreeable and melting music draw one so gently out of sleep, that the awakening resembles enchantment more than the disturbing of repose. A delicate taste in colours, a perfect knowledge of the *chiaro-scuro*, the art of uniting light to light, and shade to shade, together with that of detaching the objects from the ground, inimitable, grave, and perfect, harmony, were the qualities which distinguished Corregio from all the painters, and placed him near the head of his profession.

About the end of the sixteenth century, the *Caracci*, Louis, Augustin, and Hannibal, formed what is called the *Second Lombard School*, which is frequently distinguished by the name of the *SCHOOL of BOLOGNA*.

Louis was the master of the other two. He had studied the works of Titian and Paul Veronese at Venice, those of Andrea del Sarto at Florence, those of Corregio at Parma, and those of Julio Romano at Mantua; but he chiefly endeavoured to imitate the manner of Corregio. Hannibal fluctuated between Corregio and Titian. Augustin, their rival in painting, had his mind cultivated by learning, and devoted part of his time to poetry and music, to dancing, and to other manly exercises. These three painters often employed their talents on the same piece; and it was admirable that their united labours seemed to be animated with the same spirit.

They established an academy at Bologna, which their zeal for the advancement of their art made them call *l'Accademia degli Desiderosi*; but it was afterwards called the *Academy of the Caracci*, because the reputation which these artists acquired permitted not a more illustrious name to be given to an establishment of which they were the founders. In this school were taught the art of constructing models, perspective, and anatomy; lessons were given on the beautiful proportions of nature, on the best manner of using colours, and on the principles of light and shade. They held frequent conferences, in which not only artists, but men of general knowledge, were permitted to elucidate points relative to the art of painting; but they were separated upon Hannibal's going to Rome to adorn the gallery of the cardinal Farnese.

The works of the Caracci are often, from the resemblance of their manner, confounded together; especially those which were finished previous to the residence of Hannibal at Rome. Meanwhile each of them has a decided character, distinct from the other two. Louis had less fire, but more of gracefulness and grandeur; Augustin had more spirit in his conception, and more pleasantness in his execution; Hannibal is characterised by boldness, by a design more profound, by an expression more lucky, and by an execution more solid.

Sir Joshua Reynolds, who saw the works of Louis at Bologna, holds him out, in his discourses, as the best model for what is called *style* in painting; which is the faculty of disposing colours in such a manner as to express our sentiments and ideas. "Ludovico Caracci," says he, "(I mean in his best works,) appears to me to approach the nearest to perfection. His unaffected breadth of light and shadow, the simplicity of colouring, which, holding its proper rank, does not draw aside the least part of the attention from the subject, and the solemn effect of that twilight which seems diffused over his pictures, appear to me to correspond with grave and dignified subjects better than the more artificial brilliancy of sunshine which enlignens the pictures of Titian."

Hannibal is esteemed by the best judges as a model for beauty and design. Those who blame him for becoming less a colourist at Rome than he was at Bologna, ought to recollect that it is his performances at Rome which have chiefly secured his reputation. Severe critics have maintained that his design is too little varied in his figures; that he excels only in male beauty; that, in imitating ancient statues, he excites some resemblance, but without arriving at the sublimity of ideas and of style which characterize the ancients; or, in other words, that he successfully imitated the exterior of their manner, but that he was incapable of reaching the interior and profound reasonings which determined those admirable artists.

The success of the Caracci, and the reputation which they acquired, have been pernicious to the art. Their successors, deluded by these considerations, have made them the object of their imitation, without ascending to the sources from which they derived their knowledge, but which they never could equal. Thus, amid the various works of Guido Reni, Domenichino, Lanfranco, Albano, and Guercino, may be seen the imperfection of the plan adopted by their master. Each, following the dictates of his inclination, differed from his fellow-student in the objects of imitation, as well as in manner; and yet the *school* attached some in measure to all, inasmuch as the *art*, in preference to nature, was the main object of attention with them generally. In some few instances, indeed, the reverse took place; and Domenichino, in his pictures of the Communion of St. Jerome, and the Cure of the Demoniac, rivalled, in feeling and expression, the fame of Raphael; qualities which had languished, and been neglected, after the death of that renowned artist.

After this period, the art continued to decline in Italy. The great talents of Pietro da Cortona, and Luca Giordano, were abused by the too great facility with which they satisfied the perverted minds of their employers. Nicholas Poussin alone endeavoured to stem the torrent of corruption in taste, which now flowed over the classic ground of former ages; but, though he reverted to the pure source of Grecian art for his models, yet, in severe criticism, he is justly said "rather to have copied its reliques than adopted its spirit." He indeed is by some denied to the Italian school; but, as the chief part of his life was spent in that country, and all the valuable information he possessed derived from his residence there, we have attached him to the history of its art; and with him closes all record concerning it, worthy of particular distinction.

GERMAN SCHOOL.—To Germany the art travelled from Italy: at what period is not exactly to be ascertained; but it is not improbable that it was soon after the time of Giotto. It was not, however, till towards the end of the fifteenth century, that its progress there claims our attention. At that time Albert Durer relieved it from little better than obscurity, by his ingenuity, his fertile invention, and his skilful attention to minute imitation of individual forms. He carefully studied the human figure, but wasted his time in fanciful schemes for regulating proportion; and never attained the art of selection, or a station in the rank of exalted artists. Yet, sometimes his compositions are well worthy to have been treated in the greatest style in design, and the colour with which he executed them often rivals the best among the Venetians. The bane of the style, if it may be called so, is meagreness and poverty of forms, mean expression, and capricious, and often vulgar, invention. Lucas Van Leyden was the best of those who attempted to rival the name of Albert Durer, unless we except Holbein; who, though he never equalled him in composition, infinitely surpassed him in portraiture. The taste of the Germans totally changed after they possessed the knowledge of the works of Michael Angelo; when, with the constant effect of the sudden transition of extremes, the newly-imbibed principles burst all reasonable bound, and were employed only to be abused. Unable to penetrate the depth of its mysteries,

mysteries, its surface was extravagantly imitated by Goltzius, by Spranger, and a host of ambitious contemporaries; but the folly of this misapplication soon acted to its destruction; and in its decay bore down with it the character of the German school of painting.

FLEMISH SCHOOL.—This school is recommended to the lovers of the art by the discovery, or at least the first practice, of oil-painting. John Van Eyck, of whom we have already spoken as the inventor of oil-painting, was a Fleming; and, from his having settled at Bruges, was commonly called *John of Bruges*. He may be considered as the founder of painting as a profession in Flanders; but Peter Paul Rubens was the founder of the art. This extraordinary person produced an immense number of works. He excelled equally in historical, portrait, and landscape, painting; in fruits, in flowers, and in animals. He both invented and executed with the greatest facility; and, to show the extent of his powers, he frequently made a great number of sketches on the same subject, altogether different, without allowing any time to elapse between them. The works of Rubens were destitute of that soft inspiration so conspicuous in the works of Raphael; but he possessed that sprightliness of genius and strength of mind which is ever ready to burst forth in wonderful and astonishing effects. His figures appear to be the exact counterpart of his conceptions, and their creation nothing more than a simple act of the will.

His talent for design has been unjustly censured; for on every occasion his design is noble and easy. He had great knowledge of anatomy, but he was hurried away by the impetuosity of his imagination and his ardour for execution: he preferred splendour to the beauty of forms, and sacrificed correctness of design too often to the magic of colours. In short, his qualities suppose a mind full of fire and vigour, rather than accuracy or profound thought. His chief merit consists in colouring; though in this branch of the art he has not equalled Titian. He is the first among painters eminent for pomp and majesty; the first among those who speak to the eye, and the power of the art is often carried by him almost to enchantment. It is evident, from the works of Rubens, that his method of painting was to lay the colours in their place, one at the side of another, and mix them afterwards by a slight touch of the pencil. Titian mingled his tints as they are in nature, in such a manner as to make it impossible to discover where they began or terminated; the effect is evident, the labour is concealed. Thus Rubens is more dazzling, and Titian more harmonious. In this part, the first excites the attention, the second fixes it. The carnations of Titian resemble the blush of nature; those of Rubens are brilliant and polished like satin, and sometimes his tints are so strong and separated as to appear like spots. "Rubens (says Sir Joshua Reynolds) is a remarkable instance of the same mind being seen in all the various parts of the art. The whole is so much of a piece, that one can scarce be brought to believe but that, if any one of them had been more correct and perfect, his works would not be so complete as they appear. If we should allow a greater purity and correctness of drawing, his want of simplicity in composition, colouring, and drapery, would appear more gross." In his composition his art is too apparent. His figures have expression, and act with energy, but without simplicity or dignity. His colouring, in which he is eminently skilled, is, notwithstanding, too much of what we call *tinted*. Throughout the whole of his works there is a proportionable want of that nicety of distinction and elegance of mind, which is required in the higher walks of painting; and to this want it may be in some degree ascribed, that those qualities which make the excellency of this subordinate style appear in him with their greatest lustre. Indeed, the facility with which he invented, the richness of his composition, the luxuriant harmony and brilliancy of his colouring, so dazzle the eye, that, whilst his works continue

before us, we cannot help thinking that all his deficiencies are fully supplied.

The silver tint, which has so much grace and enticing beauty in the works of some of the Italians, as Carlo Dolce and Paul Veronese, is a characteristic merit of the Flemish school; but, as we have remarked above, correctness of design, faithfulness and elegance of outline, and sublimity of composition, belong exclusively to that city which has been successively, for many centuries, the queen of the world, and has kept up her superiority to this very moment. Rome, through the success of her arms, by the influence of religion, and by the great fame of her artists, seems to have been destined to be forever the mistress of the civilized world.

DUTCH SCHOOL.—To speak in general terms, and without regarding a great number of exceptions, the Dutch school carries none of the above qualities to great perfection, except that of *colouring*. Far from excelling in the beauty of heads and forms, they seem chiefly to delight in the exact imitation of the lowest and most ignoble. Their subjects are derived from the tavern, the smith's shop, and from the vulgar amusements of the rudest peasants. The expressions are sufficiently marked; but it is the expression of passions which debase instead of ennoble human nature. One would think that they practised the art of degrading the bodies and souls of men.

It must be acknowledged, at the same time, that the Dutch painters have succeeded in several branches of the art. If they have chosen low objects of imitation, they have represented them with great exactness; and *truth* must always please. If they have not succeeded in the most difficult parts of the *chiaro-scuro*, they at least excel in the most striking, such as in light confined in a narrow space, night illuminated by the moon or by torches, and the light of a smith's forge. The Dutch understand the gradations of colours; and, by their knowledge of contrast, they have arrived at the art of painting life itself. They have no rivals in landscape-painting, considered as the faithful representation or picture of a particular scene; but they are far from equalling Titian, Poussin, Claude Lorraine, &c. who have carried to the greatest perfection the ideal landscape, and whose pictures, instead of being the topographical representation of certain places, are the combined result of every thing beautiful in their imagination or in nature. The Dutch, however, distinguish themselves by their perspective, by their clouds, sea-scenes, animals, fruits, flowers, and insects; and they excel in miniature-painting. In short, every thing which requires a faithful imitation, colour, and a nice pencil, is well executed by the Dutch painters.

Holland has also produced history-painters, as Octavius Van Been, and Vander Hilst, the rival of Vandyke, and perhaps his superior: but it is not in the works of those artists that we find the character of the Dutch school. Neither is the origin of their style to be derived from the works of Lucas of Leyden, though, from the time he flourished, viz. about the end of the 15th century, he may be considered as the patriarch of the Dutch school. Lucas painted in oil, in water-colours, and on glass; and the kinds of his painting were history, landscape, and portrait. His picture of the Last Judgment is preserved in the hotel-de-ville of Leyden; it possesses vast merit in point of composition, and a great variety of figures.

If miniature-painting be considered as a characteristic of the Dutch school, Cornelius Polembourg may be regarded as the father of it. He possessed the colour, delicacy of touch, and disposition of the *chiaro-scuro* which chiefly distinguish this school; and, if any thing is to be added, it is want of correctness in his design. But, if the choice of low figures is its characteristic, this is to be found in the greatest perfection in the works of the celebrated *Rembrandt*. And it is the more offensive in this artist, as his compositions frequently required an opposite choice of figures. As his father was a miller near

Leyden, his education must altogether have depended on the exertion of great talents and the study of nature. He studied the grotesque figure of a Dutch peasant or the servant of an inn with as much application as the greatest masters of Italy would have studied the Apollo of Belvedere or the Venus de Medicis. This was not the manner of elevating himself to the noble conceptions of Raphael; but it was acquiring the imitation of truth in vulgar painting.

Rembrandt's manner of painting is a kind of magic. No artist knew better the effects of different colours mingled together, nor could better distinguish those which did not agree from those which did. He placed every tone in its place with so much exactness and harmony, that he needed not to mix them, and so destroy what may be called the flower and freshness of the colours. He made the first draught of his pictures with great precision, and with a mixture of colours altogether particular; he proceeded on his first sketch with a vigorous application, and sometimes loaded his lights with so great a quantity of colour, that he seemed to model rather than to paint. Such is the power of genius, that Rembrandt, with all his faults, and they are enormous, is placed among the greatest artists by M. Descamps, who saw his works, and was himself an artist. It is necessary to observe, that if Rembrandt was ignorant of the essential parts of his art, or neglected them, he was yet acquainted with *expression*, which alone was capable of giving animation to his works. His expressions are not noble; but they are just, lively, and excited with great judgment. In him the world possessed another of those men of powerful genius, who created an atmosphere of art for themselves, and moved within it uncontrolled, with a security that sets imitation at defiance. What Corregio had given to the Italians, Rembrandt bestowed upon the Dutch; *chiaro-scuro* concentrated, or expanded, rivalling the purity and brilliancy of nature. That, and colour, were his immediate agents; with which he played at will, in all the varieties which a vivid imagination, and close observation of the more striking effects of nature, could possibly supply him; and not unfrequently, by their means, gave beauty even to deformity, at least, robbed it of disgust, and rendered it engaging to the eye.

John de Laer, a miniature-painter, and who made choice of his subjects from common life, deserves a distinguished place in the Dutch school. He painted hunting-scenes, the attacks of robbers, public festivals, landscapes, and sea-views; and he ornamented his pictures with old ruins, and enriched them with figures of men and animals. He had a correct design, and employed vigorous and lively colouring. Oftade, although born at Lubeck, Gerard Dow, Metz, Miris, Wouvermans, Berghem, and the celebrated painter of flowers Van Huysum, belong to the Dutch school.

The characteristic features of the schools, at the head of which Rubens and Rembrandt are duly placed, are—a perfect skill in combination and arrangement of *chiaro-scuro*; great strength of natural and local character; and a precise truth of imitation, even almost to perfect deception, in form, colour, and effect. These powerful qualities are, however, too constantly degraded by a low and vulgar application of them, particularly among the painters of the Dutch school. Among the Flemings, many of the pupils of Rubens adhered to his class of subjects, and exhibited a brilliancy of imagination, and power of execution, worthy of the source whence they proceeded. Vandyke more especially; who, in point of chastity of design, and purity of colouring, excelled even the power of his master, though he had not his capacious genius, to whom the representation of all things seemed equally facile, and whose abilities seem to have been enlarged according to the sphere he was called to act in, or the canvas he was employed to cover.

The history of the patronage of the art in Holland and Flanders lies within a very short compass; as it rested

almost entirely with the church, who called for altarpieces, (and their chapels were filled with them,) and the munificence and taste of private individuals. Very few indeed of their public establishments were adorned with pictures, notwithstanding the immense fund of abilities the countries possessed; and it was left to find its own interests, by gratifying the taste for portraiture, among the rich merchants and burghers; or the execution of small pictures, within the scale of admission to private rooms, on subjects of ordinary interest, of landscape, or of vulgar amusement. Its practice in those countries failed completely soon after the commencement of the 18th century.

In fact, the greater part of the schools of which we have treated have no longer any existence. Italy alone had four schools, and there only remain at present a very few Italian artists known to foreigners. The school of Rubens is in vain sought for in Flanders. If the Dutch school still exists, it is not known beyond the precincts of Holland. Mengs, a German artist, has made himself famous in our days; but it was in Italy that he chiefly improved his talents and exercised his art. M. Dietrich, another German, has made himself known to strangers; but two solitary artists do not form a school.

FRENCH SCHOOL.—The adoption of Leonardo da Vinci by Francis I. after he had left Italy, (and in whose arms he died,) together with the powerful talents of Primaticcio, of Rosso, and of Nicolo Abbati, employed by the same monarch to paint in fresco the chambers of the royal palace of Fontainebleau, it might have been imagined, would have laid so strong a foundation of exalted taste in the country where it came with all the charms of novelty, that it could not but have been pursued by a people eminent for their ingenuity, with a degree of success rivalling the neighbouring country of Italy; more especially as they had perpetual intercourse with it, and were under the influence of the same system of religion, which had there adopted painting as a portion of itself. Yet, very little arose from these admirable examples; and the only French painters whose names have come down to us of any pretensions to excellence for the next hundred and fifty years, are Jean Cousin and Jacques Blanchard. The former lived towards the end of the sixteenth century, and was a skilful designer, though in a meagre taste. He painted principally on glass. The latter was of somewhat later date; and having, by study at Venice, acquired a taste for Venetian design and colouring, he obtained the name of the French Titian, and his works were much esteemed.

After these, the art did not rise in France, till Poussin, having imbibed a taste for its excellencies in Italy, returned to his native country, but with reluctance, at the invitation of Louis XIII. Although the treatment he received was handsome, and becoming both patron and painter, yet he found the taste of his country not formed to relish the simplicity of his style. The facile mediocrity of Simon Vouet received more admiration; and Poussin, disgusted, returned to his tranquil life at Rome; leaving the field to a competitor, who laid the foundation of that flutter and frivolity which characterised the style of the French school up to the time of the late sweeping and grand revolution. Le Sueur, indeed, felt like a man of a pure and elevated mind; and spurned the trammels imposed by the style of Vouet. The chastity, the feeling, and purity of soul, of Raphael, seem to have been infused into his mind, and exhibited itself in the series of pictures painted for the convent of the Chartreux at Paris, and known as the *Life of St. Bruno*; in the *Burning of the Books of Magic at Ephesus*, &c. But no preparation had been made to receive so pure a taste as Le Sueur's; and in a court where ostentation took place of magnificence, its suavity and gentleness were ill capable of withstanding the brilliant but false glitter, which accompanied the exertions of his fellow-student under Vouet, Charles le Brun. He sunk under the unjust abase-

ment, and fell a victim to mortality at the early age of 37; not without leaving cause for a suspicion of his having been poisoned.

His fortunate competitor Le Brun formed, by the great extent of his ability, an era in the history of the art in France; and stands unrivalled in his style, as the acknowledged head of the French school; the deity of its succeeding artists, and the theme of their eternal adoration, to the utter exclusion of all the real great painters of Italy, of Flanders, or of Spain. And, if a vigorous imagination, and powerful execution of rich combinations in forms and colour, with an eye and a hand which arranged with facility the various parts of extended compositions, and united them as a whole, will effectively weigh against the want of simplicity, natural expression, and purity in design; then he well merited the distinction given him by his countrymen. The splendid arrangement of the gallery of Versailles (now in danger of perishing, by the neglect it experienced during the days of republican France), is a satisfactory proof of the extent of his abilities; and, when his Battles of Alexander are placed in conjunction with it, we can no longer wonder that such a display of talent, so congenial to the mind of that vain ambitious monarch, Louis XIV. completely overpowered all competitors. During his long reign, talent of all kinds shone conspicuous round his throne; and painting was consequently elevated and encouraged; the splendour of the court, and the dignity of the king, being made the principal objects of attention by its professors. An academy of painting, &c. was formed at Paris, under the immediate patronage of his majesty; and another at Rome, for the benefit of French students. Vander Meulen accompanied him in his campaigns, and painted the principal events that occurred, to perpetuate his renown. But a more classical tribute of homage was required of the art in that age of learning. In imitation therefore of Cæsar, who had perverted the pictures of Alexander, painted by Apelles, to his own exaltation, by adopting them as symbolic of that power which he had created for himself; so, by the instrumentality of Le Brun, Louis XIV. contrived to make the victories of that immortal conqueror emblematic of his own restless ambition. The grand monarch, however, in this mistaken application of the art, acknowledged the utility of it, as an agent of glory to himself; and the result has been, another proof added to the testimony of former ages, of the increased renown which may be acquired by a monarch and a country, from a cultivation of the arts which adorn human nature, above that derived from political causes.

If even the firm basis of nature, upon which the style of Michael Angelo was founded, did not preserve it from perversion by his imitators, it was not likely that Le Brun's, built as it was upon the sandy foundation of artifice, should share a happier fate. As it led the way in substituting theatrical for natural taste in gesture and in expression, and had obtained such a commanding influence by its success, those who adopted it appear to have imagined that the former was the best prototype of the two; and accordingly the stage, and its artificial airs and graces, which were ready made to their hands, and prevented the difficulty and trouble of searching and selecting from the coy haunts of nature what was necessary for their works, was made the subject of their imitation. Instead of forming their taste on the beautiful simplicity of nature, their painters studied the gestures and the attitudes of comedians, the fopperies of women of fashion, the affected airs of courtiers, the pageantry of Versailles, and the magnificence of the opera. Mengs says, "The French have formed a national style, of which ingenuity, and what they call *esprit*, are the discriminating qualities; they have ceased to introduce Greek, Egyptian, Roman, or barbarian, personages into their paintings; and they content themselves with figures altogether French, as if it

were their intention to hand down to posterity that such a nation once existed."

No want of ability, however, appears in the men who immediately succeeded Le Brun. The wonder is, that men endowed with so much talent could have submitted their understandings to so false a taste. Sebastian Bourdon, indeed, rushed from it, and with true poetic feeling endeavoured to imitate, and often very successfully did imitate, the purer taste of Poussin; but Pierre Mignard, Jouvenet, Champagne, and Rigaud, gave into the system, till it became reduced to pompous no-meaning flutter; and, in the hands of Van Loo, Bouchet, &c. lost all trace of its masterly origin, and sunk into contempt, even in the country where it originated. In a more minute detail of the progress of the art than our limits will admit, the names of Watteau and of Vernet ought not to be overlooked; the former, particularly, who created a pleasing style of execution and colour, and exhibited it in sportive scenes of imagination, drawn principally from the amusements of the higher circles; and the latter introduced a taste for landscape and views of sea-ports, which had been unknown till his time, but was too artificial in his colouring.

When the terrors of the recent revolution had somewhat subsided, and in measure even during its course, it was thought proper, in France, to revolutionize the taste of its arts. But, whether the fervour of hatred to royalty, the determination to exterminate all remnants of it, or a real feeling of the indirect course which the taste of their school of art had taken, guided them in the choice of their present style of design, and was the cause or not of the change, certain it is that, in its vibration, it has gone almost as far beyond the true line of propriety on the one side, as it had before done on the other. In place of the pompous display of figures in affected attitudes, overloaded with draperies of rich stuffs, flowing in all the parade of unmeaning magnificence, a dry and insipid imitation of Greek sculpture is adopted; and, in spite of the immense mass of perfect exemplars, in the works of Raphael, of Titian, of Domenichino, and almost all the renowned masters of Italy and of Flanders, &c. with which the gallery of the Louvre abounds, and which, with a superior judgment, the government leave free to their study; the present rulers of taste in France have marked a line of conduct for the students, imitative of the condition of painting before those masters were born. Rejecting the efforts of the happy period of its maturity, they prefer resorting to the infancy of the art, with about as much propriety as a man who is desirous of walking, might tie up his legs, and throw himself into the arms of his nurse. Whether the minute attention now given by the French school to drawing, and the peculiar taste in which it is directed, viz. to the adoption, in painting, of the forms which appear to belong exclusively to sculpture, be likely to produce, in any length of time, the end proposed, is extremely problematic. We rather suspect the system must be changed ere they will reach the object of their wishes; and then, perhaps, this preparatory attention to simple forms may really have a beneficial effect.

THE ENGLISH SCHOOL.—So very little is known of what occurred concerning the art of painting in this country previous to the time when Henry VIII. encouraged the abilities of Holbein in portraiture, and invited Titian to come here, that it would be useless to endeavour to trace its history. Enough, however, is known, to satisfy us that it was at a very low standard. It was but little before his time, that the people of England began to throw off the yoke of ignorance and barbarism, and to cultivate literature and science. The ambition of Henry to be renowned, and his spirit of rivalry to his great neighbour Francis I. of France, were quite sufficient motives to stimulate him to the proud aim of becoming a patron of the liberal arts; had not his theological

gical

gical discussions with Luther, and afterwards his more sublimary quarrel with the pope, so powerfully diverted his attention from them, and produced him so active an employment in deciding the course of the reformation in religion which consequently ensued. But, however great be the cause that England has to rejoice in the general fruits of that change in religious principles and government, its effects were fatal to the cultivation of the arts of painting and sculpture. Those arts, particularly the latter, being then so thoroughly interwoven with the system of the church of Rome, were of consequence as thoroughly opposed by that of England, set up in defiance of its authority. Had the arts at this time, when the nation was new-modelling its character, been adopted by the reformed system of religion; and had they accompanied it with progressive steps in its course to our present state of cultivation; we might, together with our just privilege to boast of an exalted rank as a nation in literature and science, have likewise heightened our importance by exhibiting a settled style of historical-painting. But it was nipped in the bud; and to this day has not overcome the effect of the chilling blast of disappointment and neglect.

In the succeeding reigns of Edward VI. Mary, and Elizabeth, a few portrait-painters, natives some, but principally foreigners, exerted themselves to gratify the desires of our nobility, and preserve their features to the admiration of posterity. St. Antonio More, Frederic Zuccheri, Isaac Oliver, Lucas de Heere, and others of less note, supported this branch of the art with varied success. But, during the long and splendid reign of the latter of the three sovereigns, not only was encouragement denied to historical-painting, but the very humble, and even graceful, attempt made by the dean of her majesty's chapel, Dr. Nowell, to afford her pleasure from the sight of prints upon religious subjects, met only with the severity of rebuke. (See vol. xvii. p. 280.) Whether it were natural bigotry, or political necessity, which incited the queen to the use of the repulsive air she assumed, it acted like a command upon the church; and, from that time to the present hour, the prejudice, except in a very few instances, remains in full force. See vol. xiii. p. 407, 8.

In Italy, on the revival of letters, poets and painters appeared at the same time. A Raphael painted, and a Vida sung. In England, from the causes we have mentioned, Spenser and Shakespeare were not accompanied with any painters of eminence. Thus, while the religious enthusiasm which still remained in Italy and other Roman-catholic countries, covered the walls of their churches with pictures, and enriched them with sculpture; while the painter and sculptor were creating forms and representations, before which the knee of the votary was to bend; England was content to boast that her poets struck the true chords, and breathed those strains which rivalled the poets of Greece and Rome, but without carrying her boast any farther. And thus was that channel through which alone the plastic arts had ever been introduced with success into any country, closed upon the efforts of the English; and by that hand, which, if conducted with true and enlightened policy, ought to have fostered it.

Charles I. endeavoured to introduce a feeling for the art, which his father had almost entirely overlooked; but for which he appears to have had a very great affection. He employed Rubens, during his short residence here as envoy from the king of Spain, to paint the ceiling of the Banqueting-room, now the chapel of Whitehall; and procured a treasure of inestimable value to the country, by the countenance and encouragement he afforded to Vandyke; and also to other ingenious foreigners, who have enriched the country with their productions. He formed a very considerable collection of pictures, in addition to those already possessed by the crown; and, at the suggestion of Rubens, bought the cartoons. He employed an artist to copy the works of Titian in Spain; and purchased the cabinet of the duke of Mantua, at the cost of

20,000*l.* (see Walpole's *Anecdotes*, Car. I.) and some were sent him as presents. The whole were sold and dispersed by the parliament in 1643, who gave especial orders, "that all pictures which had the representation of the Saviour or the Virgin Mary in them, should be burnt." After the restoration, many of them were returned to the royal collection, but only to meet utter annihilation by the fire which consumed the palace of Whitehall.

Of the natives of England, few caught the flame of desire to imitate them even in portraiture, not one in history. Of the former, W. Dobson took the lead, and succeeded in painting a head with great skill; but there his abilities rested. His exertions, and those of his contemporaries, were arrested almost entirely by the Gothic barbarity of the puritanical system which followed; and the taste of Charles II. whatever he might have acquired from his father, was only immersed in impurity and frivolity, by his long residence at the French court; where he acquired a taste for that parade and pompous display of magnificence which was the ruin of the French art. Verrio and Benedetto Gennaro were patronised by this monarch. The former was employed by him to decorate the ceilings and walls of the royal palace of Windsor; and received, for the extravagant load of ingenious absurdities with which he covered them, to the amount (according to Walpole) of 5500*l.* and upwards. Of the latter, there are several pictures at Windsor, in a style of dull imitation of Guercino, of whom he was a nephew. In portraiture, sir Peter Lely filled with very great ability the place which Vandyke had held; and, in an original and very agreeable manner, he often rose to a station very nearly approaching that of his great predecessor. In the expression of beauty, he frequently surpassed him; and was a far more agreeable painter to the ladies. Sir Godfrey Kneller, likewise, in this reign, began his long career of portrait-painting: he succeeded to Lely's fame, upon his decease in 1680, and as an artist was utterly ruined by success. Had he been under the necessity of labouring with care to support the great name he enjoyed and abused, he had talents efficient to the purpose. Witness for him, the Converted Chinese at Windsor, the portrait of Newton at Petworth, of Dr. Meade at Oxford, and many others. But he lived and practised painting for five successive reigns, almost without a rival, making gain rather than fame the object of his desire. Dahl, who was a Swede, was the only one who interfered with his practice, to any extent. Wishing, his countryman, threatened, by his carefulness in finishing, to have more effectually counteracted him; but he, unfortunately for Kneller's reputation, died young.

In historical painting, no English artist had appeared to rival the productions of foreigners introduced here, in any degree, till at length sir James Thornhill, born in 1677, arose to contest the honours of the pallet with Laguerre, who had been employed to adorn the halls and staircases of many among our nobility. The style he adopted, like that of his rival, was but a lower imitation than Verrio's of the French school; and by no means served to elevate the taste of the country. However, the state did him the justice to employ him in the decorations of St. Paul's and at Greenwich, in which he was most materially assisted by a German of the name of André; but, such was the humiliating nature of his engagement, that he was paid at the rate of 40*s.* per square yard. With him properly commences the history of English art, though portraiture, as we have noticed, had been practised by Dobson after Vandyke; also by Riley, and by Cooper, who was a very ingenious artist, in miniature. But, after them, it sunk lower and lower, in the hands of Greenhill, Jervas, Richardson, (who, notwithstanding, has so admirably written upon the art, and exhibited, in his essays, a true feeling for those excellencies which he could never exemplify by manner;) and hundreds of others, whose names it would be cruel to rescue from oblivion; for the mania for portraiture did not cease, though the ability

ability of the artists was fast verging to utter decay. What sir James Thornhill had done in historical, or rather decorative, art, found no very successful imitator; so that, to use the words of Horace Walpole, in the commencement of the reign of George I. the arts of England were sunk almost to the lowest ebb;" and, with the still greater authority of sir Joshua Reynolds we may add, "lower they could not well be."

The circumstance apparently most surprising in this matter is, that, when the powers of Vandyke were so long and so widely displayed in England, and portraiture so much encouraged, so few of her artists should have followed in his track, or that taste should have swerved so completely from it. But the fact is, that British students were inclined to pursue it, witness Dobson and Riley; and Jamestone in Scotland; and they succeeded to a very considerable degree. It could not, however, be expected that, when there had been so little food for nourishment offered to artists, they should at once spring to perfection, unless endowed with genius in a higher degree than even the renowned master whom they emulated. No one was immediately found equal to that; and the astonishment created by his exquisite abilities had scarcely subsided into regular study, when Lely appeared, to usurp his station, and spread the peculiar beauties of his own ready pencil in the way; gratifying the court, and, consequently, guiding the taste of the country. Kneller succeeded rapidly to him: the English artists had not time to rise; and imitation of the reigning influence was alone left for him; as no one advanced with sufficient power of mind to steer successfully in a track of his own.

Thus far we have been giving the history of painting in England, rather than of the English *school*; for that school was not yet formed. But the period at length arrived when England, exerting her native energy, advanced in her turn to enjoy a share of renown among the cultivators of the art of painting.

It has been asserted carelessly, unreflectingly, and, we might add, impudently, by the abbé Du Bos, and other superficial writers on the fine arts, that the English nation, from its *character* and *climate*, would never form a school of painting. Other causes may have prevented that branch of art from reaching the eminence it attained in other parts of Europe; but the country that has produced such poets as Shakespeare, Milton, Spenser, Dryden, &c. is certainly not excluded from a proportionate degree of excellence in the sister art. And, if such a *climate* as that of the Netherlands could produce such painters as Rubens, Vandyke, and other great masters, there is no physical cause at least, why England should not have boasted of artists equal in genius to those of the neighbouring countries.

The principal difficulty in the outset, was to rescue the art from the degrading influence of a vicious taste, to retrace the steps of our predecessors, or rather, to burst the bondage in which they had enthralled us, and resort at once to the original principle of imitation; which, when pure and select, is the only sound basis of the art. The first step towards it, was the establishment of a school for drawing from the living figure. This had been begun by sir James Thornhill, in most inexplicable conjunction with sir Godfrey Kneller, who, one would imagine, from his latter works, had left all consideration of the value of such a thing far behind. Thus, however, he assisted in laying the foundation of a remedy for the evil, which he more than any other had occasioned. This school, sir James continued at his own house in the Piazza for some years. His death, in 1734, obliged the artists to procure another situation, which was not effected without some difficulty; for the people were so unprepared to consider the study from the naked figure as necessary to the artists, that their meetings were even suspected to be held for immoral purposes. Another school was at length formed by Michael Moser, a native of Schaffhausen, and a chaser by profession, and six other artists, principally foreigners,

the management resting with Moser. After a while they were visited by Hogarth and others; and a larger body was formed in consequence, who established themselves in Peter's Court, St. Martin's Lane, in the year 1739. Having acquired some property by combined exhibitions of their works, they solicited a charter of incorporation; and, the scheme being sanctioned by the late king at the beginning of his long reign, their charter was granted in 1765. But, dissensions arising in the body, a secession of many of its principal members took place; and the result was the establishment of the Royal Academy in 1768, under the more immediate patronage of his majesty; sir Joshua Reynolds being nominated its first president. From this time we are to date the foundation of an English School of Painting; and sir Joshua must be considered as its founder.

Richardson, who died in 1745, at the advanced age of eighty, unable by his pencil to rival the real beauties of Vandyke, of Raphael, or others, whose names stand on high record, endeavoured to make amends by his pen; and in 1715 published a book, full of high encomiums of the merits of those masters, and of useful observations on the theory of the art of painting; and in 1719 another, on criticism, and the science of a connoisseur; works of which nobody will be inclined to dispute the merit, who knows the value which sir Joshua Reynolds placed upon them; and particularly the former, which he declared confirmed him in his love of the art, and elevated his ideas of its professors. In it, Richardson contended for the propriety of painting portraits in the costume of their time; and Hudson, the son-in-law of Richardson, with the help of Van Alken, (a Fleming,) and in rivalry with Van Loo, (a Frenchman, and brother to Carlo Van Loo,) profited by the suggestion, and ventured to reject the non-sensical draperies in use at the time; and, instead of loose unmeaning pieces of varied stuffs thrown in artificial folds over the shoulders of the gentlemen, and the affectation of grace and grandeur in which the ladies were represented *en chemise*, half exposed and half enveloped in one ill-contrived piece of silk, as if they had carelessly thrown on a mantle when rising from their beds, he dressed them in the formality of the day; and his Flemish assistant painted their silks and laces with great care and exactness. Hayman also, who had succeeded sir James Thornhill as an historical painter, upon the same ground, felt himself at liberty to preserve the uniforms proper to those whom he introduced into his pictures; and no longer, by a senseless magic, converted them into Roman centurions or Grecian heroes.

It were useless to trace the progress of the art in the hands of those who, in minor degree, assisted in this enfranchisement of it in our own country; "or recount the stammering and babbling of its infancy;" for as such its condition at the time of which we are speaking may be regarded. It scarcely enjoyed the period of youth; for, when Reynolds and Wilson returned from Rome, they rushed at once with it to maturity in portraiture and in landscape. And when West, having by his British connections in America imbibed a true taste for its beauties, had also cultivated it in Italy, and came here to devote his life in its service, all that had been done in history, by Hayman, by Pine, by Wale, and others, was instantly sunk in oblivion.

Hogarth, however, demands a rescue from the mass of our earlier artists. With a marked originality of feeling, he pursued the art as his own taste, or rather fortune, guided him; and traced a line for himself totally unknown to any other, though more in the application of the art than in itself. Yet, in his latter pictures, particularly in his *Rakes's Progress*, and the *Marriage-a-la-Mode*, he exhibited a thorough feeling for the beauties of the Dutch school, executed in a broad style of his own; and, proving, that, if his youth had been employed in painting pictures, instead of engraving silver tankards, he might have rivalled the best among them.

In landscape, Lambert had advanced beyond the steps of his contemporaries; and produced, with some talent, a kind of union of the peculiarities of Gaspar Poussin and Claude. But, when *Wilson* expanded his brilliant, chaste, and glowing, tints, in ample masses of light and shade, over the canvas, the art seemed to leap at once ages in advance; far too rapid, indeed, for the taste of the public, or the benefit of its professor.

Whatever had been done here in portraiture, from the time of Vandyke and Lely till 1752, when *Reynolds* returned from Italy, was then utterly annihilated by the display of his splendid talents; the foundation of all which this branch of the art boasts in the English school. Not but that there have been, and are, exhibited various deviations, with original feeling, from his peculiar taste; but his is the acknowledged and undoubted claim of superiority, as of priority. His best portraits are inferior to none, for truth of character and style of treatment: in many points they are superior to those of all the portrait-painters who ever lived.

With respect to the practice of the higher style of historical painting in this country, the rank it merits is so much the almost exclusive privilege of artists now living, that it is not easy to know how to state the sentiments which liberal and candid criticism dictates concerning it. Partiality may blind, or true criticism, if given, may be misconstrued to flattery, or some principle of a meaner kind. It must be left therefore to posterity, to give the due meed of praise to those who have exerted themselves against innumerable difficulties, and endeavoured to uphold the true spirit of the art in this its most arduous application; and persevered, till at length something like an inclination to encourage their efforts appears to arise, where alone it can be effectual. No one can for an instant hesitate to declare their sense of the exalted abilities with which it has been, and is, supported; or cease to see them duly employed and encouraged.

Of those who have practised in this branch of the art, and are departed, Reynolds, Romney, Opie, and Barry, require to be particularly mentioned. The former, with all the splendour of chiaro-scuro and colour, which no one since Rembrandt has wielded with so much authority, exhibited in his pictures of Hercules strangling the serpents, Macbeth, Cardinal Beaufort, and Ugolino, a fund of historic power. Romney also had poetic imagination, feeling, and expression; and, in the little leisure allowed by his general practice of portraiture, indulged in the delights ideal subjects afforded him; while Opie presented "images new and striking, drawn directly from nature;" and "what he wanted of academical or classical information, he compensated for, in great measure, by character, by force, and by a just and bold imitation." But, of the four, Barry was the only one who had regularly educated himself for its practice, and undoubtedly had the highest and most enthusiastic feeling for its best qualities. With a generous zeal worthy of the highest encomium, he broke entirely from all consideration of the ordinary style of subject, or design; and, contemplating his art in the most exalted manner, attempted to embody the elevated ideas he entertained. His most sincere admirers must however regret, that those excellent sentiments which he so ably inculcated by his pen, were not more completely supported by his pencil; yet, his productions of the series of pictures upon the culture of man, in the great room of the society in the Adelphi, notwithstanding their imperfections in the executive part, must ever remain a marked event in the annals of historical painting in England.

Still we cannot refrain from mentioning a few more artists of our own time, both living and dead.—Benjamin West, for whom the arts even yet mourn, was an American, but it was while those states belonged to the English crown; and he arrived early enough in England to be one of the original members of the Royal Academy, of which he was so long the chief ornament, and of which he died president, in March last, at the great age of 82.

VOL. XVIII. No. 1238.

He painted a prodigious number of pictures; which very frequently remind us of the school of Raphael, on account of the correctness of the outlines.—Louthenbourg, though mad with the folly of animal magnetism, was however a great painter. His pencil blazes in battle with Bourguignon, or reposes among cattle and flocks with Berghem and Vandevelde. He died in 1812.—There are yet spared to us Fuseli, who emulates the boldness of Michael Angelo, whose admirably-expressed ideas he has taken for his guide in the enthusiastic regions of fancy; and Northcote, who takes Rubens and Snyders for his models in the delineation of the rational as well as the brute creation.—The loss we have sustained by the demise of Louthenbourg's worthy pupil, sir Francis Bourgeois, in whose lively tints, and correctness of imitation, P. Potter, Berghem, C. du Jardin, and Cuyp, seemed to revive, is somewhat compensated by the talents of Calcott, Constable, Collins, and other successful votaries of the pastoral muse. Hilton makes rapid progress towards the highest summit of the chromatic Parnassus, where Nicolo Poussin seems to direct his efforts and crown his attempts. Cooper, whose pencil blazes in battle with Wouvermans and the Parrocels, stands the rival of Chalons and of Ward. Can we not boast also of Beechey, Lawrence, Shee, Phillips, Dawe, &c. whose correct eye arrests on the canvas the features of fleeting beauty, and who approach so near to those luminaries in the temple of physiognomy, Rubens, Vandyke, and the great Titian?—Death has snatched Bird and Harlowe on the very threshold of the fane; but their name will last long among the worthies in the inside of the chromatic Pantheon. The two Smirkes, Westall, and many others, do honour to the end of the last and the beginning of the present century. Haydon and Hayter stand aloof, and boldly wield the pallet and the brush on the strength of their own originality; and Wilkie seems to be at once the Teniers, the Bruyere, the Ostade, and the Gerard-Dow, of Great Britain.—We have only to regret that modern fashion, that sways over academicians with as much tyranny as over the swarthy rivals Day and Martin, and Turner, for the glofs of their black paint, has paralyzed the hands of modern painters, by preventing their natural talents from being tried in large and important works, such as the decorations of domes, ceilings, and staircases, like what we see at St. Paul's, at Whitehall, and Montague-house; and we doubt not that, if proper opportunity were given, the genius of our English artists would soar to the highest peak of the chromatic Helicon.

Barry was certainly a discontented man; but many have joined in opinion with him, that the arts have wanted encouragement in Great Britain. What they have received has been principally from commerce; and that is of a nature by no means calculated to advance their progress towards perfection. It may give the artist bread, but we fear it will not give him fame. Academies have not always advanced the object of their establishments. Those composed of artists are found to be very subject to errors; especially as it too often happens that the heads of them obtain their advancement by favour and intrigue, rather than by the genius and talent displayed in their works. Vitruvius complained of it in his day; "*Animadverto potius indoctos quam doctos gratia superare.*" And the complaint may be continued to our own day, and our own country. The Royal Academy has given some eclat to the arts, but done them no very great service. Those of its members whose names have given it all the celebrity it possesses, were themselves celebrated before its establishment, or had laid the foundation of the fame they have since obtained, in the good old quiet unpretending school in St. Martin's Lane. We have at length, however, to congratulate our country on an establishment formed on such principles, governed by such regulations, supported by such liberality, and patronized by persons of such high distinction, superior knowledge, and refined taste, that every thing is to be

expected from it, in favour of the fine arts in the United Kingdom. We mean the British Institution; which may be considered in the light of a private school, where pupils may learn at once the art of drawing, composing, and colouring, after the manner of a particular master. For a certain time in the year, the governors and directors contrive to collect in their gallery a set of pictures from the best masters of the different schools; and artists properly qualified have admittance, under particular restrictions, to copy or paint after these chef-d'œuvres. Some of these pictures have been bought, and others are borrowed from noblemen and gentlemen who are the possessors of private collections. This institution has an annual exhibition of original pictures, which are also on sale at the prices marked; and we think that no other nation could fill such a gallery with works of equal merit from the pencil or the chisel of its native professors. For the incitement of young artists, handsome premiums are also given. See further, vol. xi. p. 149, 50.

Descriptive Catalogues accompany many of our exhibitions, as the British Gallery for instance; which are of vast utility to the generality of the public. No man was ever born without a certain share of taste, discrimination, and judgment; yet every one is not always ready or disposed to feel, as they ought to be felt, the beauties contained in the productions of the fine arts. He who stands by mere chance before the famous Laocoon, may admire that expression of agonizing pain so well wrought upon the face and the whole body of the unfortunate priest and upon his two sons; but his pleasure must increase considerably, when he reads the passage, in the second book of the *Æneid* of Virgil, in which the awful accident is so well described. The School of Athens, the cartoons of Raphael, the Luxemburg Gallery, and some other great performances of the best artists, speak loudly for themselves; yet the commentaries of Felibien, Du Piles, Richardson, and others, upon them, have opened the eyes of many. Simple and transitory notice has been raised up to admiration, and admiration fired into well-deserved enthusiasm. We are even authorized to say, that our description of Mr. West's picture, "Christ rejected by the Jews," vol. xiii. p. 572. has conveyed to many spectators the real meaning of the artist, and rendered their feelings congenial with those that directed his hand. A description points out harmonies and contrasts, which, although they produce the intended effect upon the mind, are not immediately guessed at by the most intelligent beholder; it tells us why and how we are pleased; and it is a received axiom, that we double our pleasure by ascertaining the real cause of it.

The English taste appears to be formed on the great masters of the Italian and the Flemish schools. Sir Joshua Reynolds was a great admirer of Michael Angelo, and particularly recommends him to the attention of the academicians. "I feel (says he, in his farewell-lecture) a self-congratulation in knowing myself capable of such sensations as he intended to excite. I reflect, not without vanity, that these discourses bear testimony of my admiration of that truly divine man; and I should desire that the last words which I should pronounce in this academy, and from this place, might be the name of—*Michael Angelo*."

In concluding our remarks upon the English school, it may perhaps be interesting to our readers to see an uninterrupted line of masters and pupils, through which the founder of it was descended from a very ancient Italian master.

Cosimo Roselli, who died 1484, taught
 Mariotto Albertinelli, died 1535.
 Innocenzio da Imola, born 1492.
 Prospero Fontana, born 1512.
 Denis Calvert, died 1619.
 Annibal Caracci, died 1609.
 Giovanni Lanfranco, died 1647.
 François Perrier, died 1650.

Isaac Fuller, died 1676.

John Riley, died 1691.

Jonathan Richardson, died 1745.

Thomas Hudson, died 1779, taught

Sir Joshua Reynolds, who died 1792, 308 years after the death of Cosimo.

Of all the different schools it may in general be observed, that it is easy to trace the reason of the characters which distinguish them. In the Roman school, it is the excellent education of the first artists, and the masterpieces of antique found among the ruins of ancient Rome. In the Venetian school, the magnificence brought to Venice by the commerce of the east, the frequency of fêtes and masquerades, the necessity for artists frequently to paint persons habited in rich stuffs. In the Dutch school, the ordinary lives of their artists, who frequented tippling-houses, and the shops of the lowest artificers; they were witnesses to scenes the most vulgarly grotesque, and were often in the way of observing the effect of a confined or narrow light, natural or artificial, in close places. The *Encyclopédie Methodique*, speaking of the English school, then in its infancy, says, "Beauty must naturally form part of the character of this school, because beauty is so common in England as continually to meet the eye of the artist: if this beauty is not precisely that of the antique, it is perhaps not inferior to it. The English school will be distinguished by truth of expression, because national liberty leaves the passions their own natural play. It will preserve its simplicity, and will not be degraded by theatrical imitation, by quaintness, and false graces, because simplicity is still preserved by the English in their manners. Examine the portrait of a Frenchwoman painted by a Frenchman: you will often find no expression but a forced smile, in which the eyes and forehead have no share, and which mark no affection of the mind. Look at an Englishwoman's portrait, by an English artist: you will most frequently find a naiveté of expression, which acquaints you with the character, the mind, of the person represented." *Ency. Meth. Beaux Arts*, i. 238.

PRINCIPLES OF PAINTING.

The rudiments, or first principles, of the art of painting, are *drawing* and *colouring*. Other component parts of painting are—perspective, symmetry, drapery, composition, disposition, chiaro-scuro, &c. Of all these we shall speak incidentally; but shall reduce them to as few heads as possible.

OF DRAWING.

DRAWING consists in forming the contour, or outline, of the piece. This, of course, is the chief and most important part of the work, since it includes every thing but the filling-up, shading, or *colouring*. We speak of course of the finished drawing, or composition; for some painters, as well as some poets, correct and alter a great deal as they proceed; others, like Shakespeare, little or nothing.

Drawing the outline is an arbitrary mode of conveying ideas of form, which has its foundation altogether in art, and was its first essay towards perfection; and, although the progress of painting has been so great, and it has so nearly approached to complete imitation by the help of chiaro-scuro and colour, yet *outline*, simple and unaided, still remains duly appreciated, as efficient to produce the greatest and most essential purposes of art; viz. the ideas of action and expression in the figures it represents.

There is not, in fact, any such thing as an outline in nature. The effect which natural objects produce upon our vision, is only that of a number of parts, or of distinct masses of form and colour, but no lines. We are obliged to aid invention in design, by resorting to a fiction; and the first and simplest means which presents itself to the mind is, to separate the objects we desire to represent upon a plane surface, by marking the boundary of each, the extreme

extreme extent of its dimensions in every direction; and this we call drawing its outline. We recollect more of a form by its boundary, or its separation from other objects, than by its projecting parts; hence arises the satisfaction we receive from a line which marks that boundary, though no such line in reality exists; our imagination immediately loses sight of the fallacy, and dwells upon the form within it. It is sufficient for this purpose, that the exterior of the form be exhibited correct enough to excite an image of the whole; and perhaps the impression a well-drawn outline makes upon the mind is seldom much increased, if at all, by the more complete imitation of form which light and shade can give it.

Such an outline is in itself a perfect thing. It has no exemplar in nature, but is received as an arbitrary token of a substance. The image it excites is, indeed, more or less perfect, according to the information or force of imagination of the beholder; but, as there is no other means of comparison than with the reasoning powers of his own mind, its impression must be considered as complete. Fill it with colour, give the form within it light and shade; in short, attempt to make it an imitation of the real object, and it becomes subject to comparisons, which, in well-informed minds, must necessarily diminish its force. Its simplicity is the basis of its power. The impression, as far as it goes, being complete, if the other requisites of art were not, when added to it, as perfect in their kind as the simple outline, it would certainly be weakened in its main points; a more full image might indeed be presented to the eye, but that fulness of effect which arises when the mind is simply excited to act for itself, would be disturbed, and withdrawn from the pathos of the design.

The value of outline will be most fully appreciated by those who, with Lavater, have observed the fulness of character displayed in silhouettes, or profile outlines filled up with only one colour; and still more by those who have examined the beautiful works in outline from Homer, Æschylus, and Dante, by Mr. Flaxman. In regarding many of those excellent designs, the mind is so entirely filled with figure, action, and expression, that it almost shrinks with fear at the idea of an attempt at further completion.

If, indeed, the art of painting were considered merely as an instrument of moral instruction, or even as a means of relating a fact, outline would be fully adequate to fulfil its purposes. But, although we are not inclined to depreciate the value of this noble art, we agree with those who regard its practice more in the light of ornament than of utility, generally speaking; and in that view of it, outline becomes merely a passive agent to prepare the way for the more splendid effects which *chiaro-scuro* and colour alone can produce.

It is outline which decides the character of a painting; for, according to the style in which this is drawn must be the one adopted in filling up the void: in other words, a figure must have complete union in its character, in the parts which appear to come forwards, and are produced within the outline, as well as in those which recede and form it.

As outline is thus essentially important in the art, it becomes necessarily an object worthy the most serious attention of the professor; and we cannot recommend to a young practitioner a more useful lesson than that he endeavour to attain, as early as possible, the power of drawing an outline free and characteristic; as that power can never be unaccompanied with a certain degree of freedom in the execution of a finished picture: but, if not attained while the hand is free, and the mind most alive to impression, the task is rendered proportionably difficult.

The revivers of painting in the thirteenth century followed the meagre taste in drawing of the Greek artists, their immediate predecessors, and appear to have selected for their models the most emaciated objects in nature. Donatello and Luca Signorelli broke through this in a

great degree; and its overthrow was completed by Michael Angelo. It required, however, two centuries to get entirely the better of this strange poverty of style. Michael Angelo himself, when he designed his celebrated Cartoon of Pisa, if we may judge from the Holkham copy, (which has every appearance of being an accurate transcript,) had not then adopted that fulness of form which characterises his subsequent works, and which he probably derived from some fine fragments of antiquity discovered in his time, particularly the *torso*. The sight of the Sistine chapel produced in Raphael an immediate change from the Gothic taste of his master Pietro Perugino, in which he commenced; and he seems to have been so pleased with this new style, as sometimes to carry it to excess: he usually surpassed his rival in grace, though he never equalled him in energy or grandeur.

Drawing degenerated rapidly with the successors of these two great men. After Giulio and Polidoro, the Roman school fell into insipidity; and the Florentine, endeavouring to imitate Michael Angelo, became tumid and extravagant. Correggio and Parmegiano, seduced by beauty of line, too often sacrificed correctness to elegance. The Caracci at Bologna composed a sort of middle style, in which they attempted to obviate all these defects; but it was heavy, and possessed little sentiment or character, though it has become the common-place historical manner of almost all their successors, and, we may add, of most academies in other parts of Europe. Ludovico Caracci, and Domenichino, are the best of this school, in regard to purity of taste. Poussin adopted another style, founded on a close imitation of the antique statues, but acquired too much of the hardness of the material in which they were wrought, without attaining, in general, their grace or symmetry. The present French school have pushed this still further, and fill their pictures with frigid copies of all the ideal forms of the ancients.

The *antique*, however, must always be considered the great source of true taste in drawing. It is here the artist may learn to separate the essential and generic from the accidental and individual; the great principle of the superiority of the ancients over the moderns. How much of this, which is properly called *style*, may be adopted in painting, is a question of some nicety: Rubens has expressed his admiration of the ancient statues, and given his opinion how far they may be studied with advantage by a painter, in a treatise quoted by Du Piles, but seems to have wholly neglected them in his practice. In this country, as it was formerly in the Venetian school, drawing is considered as the least important part of painting; fine tones and imposing effects compensate for all omissions of this kind. The pre-eminent talents of the late sir Joshua Reynolds have probably not a little contributed to give this direction to the taste of the English school; his successful example, though utterly at variance with his precepts, added to the natural fascination of colour and *chiaro-scuro*, has made the sensual triumph over the intellectual part of the art; and it is the more to be regretted, as he has merely left his followers to labour in a mine which he himself had almost exhausted. But, in spite of fashion or indolence, it may be safely affirmed, that drawing is the soul of beauty, character, and expression, and that its neglect will inevitably be followed by the extinction of all the higher styles of painting.

OF COLOURING.

COLOURING, one of the great component and essential parts of painting, is the art of giving to every object in a picture its true and proper hue, as it appears under all the various circumstances or combinations of light, middle-tint, and shadow; and of so blending and contrasting the colours, as to make each appear with the greatest advantage and beauty, at the same time that it contributes to the richness, the brilliancy, and the harmony, of the whole.

Colouring, like *chiaro-scuro*, may be divided into kinds, that

that which is *necessary* for rendering the imitation just and intelligible; and that which is *expedient*, or *ornamental*, as contributing to make the work at once more impressive to the imagination, and more harmonious and delightful to the eye. Truth in the local tints is alone required in the first kind; the second demands choice in their selection and distribution. For illustration, let us suppose the principal figure in a piece to be dressed in sky-blue, and another figure near it, of less consequence in the story, to be represented in scarlet, with an under-vestment of bright yellow; and let the light be made to strike equally on both: in such a case, it would be utterly impossible to give an effect agreeable or harmonious to the picture, although each of these objects should be painted with the utmost exactness and truth; nay, the combination, though found in nature itself, would excite feelings of disgust and aversion; whereas, if the principal figure were dressed in scarlet and white draperies, and the figure next it in blue of not too light or bold a tint, the effect would be harmonious and pleasing; and another point of great importance would be gained, as the eye would then be attracted by the principal figure, which could not have been the case in the former instance, where the gaudy combinations of yellow and red must infallibly, as is natural with all warm colours, have first obtruded itself into notice. However, as the eye has the same intuitive abhorrence of unharmonious combinations of colours that the ear has of discordant sounds, it is therefore not surprising if we so seldom meet with enormities like the one above supposed, even in the works of those artists who least of all can lay claim to the scientific arrangement of colours: to produce effects not unharmonious or disagreeable, requires no great exertion of talent; but, to perform all that can be done by the most skilful application of the various powers of the art, is the lot of few.

For the practice of the art of colouring, it is very difficult to give efficient rules. The principal objects which require attention, are, to let the preparatory colours be lighter and clearer (that is, rather more gay) than those with which it is intended to finish, and to take care that the full form be made out with the under-colour, before any proceeding is made with the finishing ones; which ought not to be disturbed in their hues; and to be employed only to strengthen those prepared, and give lightness and delicacy of execution. It is also desirable that the colours be disturbed as little as possible with the brush; and not be too much blended, or softened; but rather laid on with touches, beside each other, as that tends to keep them pure, whilst too much fretting causes them to become muddy, and to change in drying. The first part of the process of a picture, after the artist has fixed in his own mind a full idea of his composition in all its material parts, is, for him to draw correctly the general forms, and then begin to paint in his *chiaro-scuro*, with as simple a scale of colour as possible; and fully to satisfy himself on that head before he proceeds with his positive colours. This is the readiest mode of avoiding confusion, and the necessity of frequent repetition; but there are almost as many modes of process as there are painters; each varying in some respect from the other, and every man's practice, either by accident or principle, furnishing him with varieties. Too great an adherence to system, is certainly not favourable to advancement; yet, without a system, much time is necessarily lost; and it seems most reasonable, that every artist should commence with one, however he may find it necessary to vary from it in his progress.

But, after all, the pictures of the best colourists are, it is universally allowed, the books in which a young painter must chiefly look for the rules of colouring; that is, of that branch of painting which contributes so much to express the beauty of objects, and is so requisite to represent them as what they really are. Giorgione and Titian seem to have discovered circumstances in nature which others have entirely overlooked; and the last in

particular has been happy enough to express them with a pencil as delicate as his eye was quick and piercing. In his works we behold that sweetness of colouring which is produced by union, that beauty which is consistent with truth; and all the insensible transmutations, all the soft transitions, in a word, all the pleasing modulations, of tints and colours. When a young painter has, by close application, acquired from Titian, whom he can never sufficiently dwell upon, that art which, of all painters, he has best contrived to hide, he would do well to turn to Bassano and Paolo Veronese, on account of the beauty, boldness, and elegance, of their touches. That richness, softness, and freshness, of colouring, for which the Lombard school is so justly celebrated, may likewise be of great service to him. Nor will he reap less benefit by studying the principles and practice of the Flemish school; which, chiefly by means of her varnishes, has contrived to give a most enchanting lustre and transparency to her colours.

As soon, however, as a young painter has laid a proper foundation for good colouring, by studying the best masters, he should turn all his thoughts to truth and nature. And it would perhaps be well worth while to have, in the academies of painting, models for colouring as well as designing; that, as from the one the pupils learn to give their due proportion to the several members and muscles, they may learn from the other to make their carnations rich and warm, and faithfully copy the different local hues which appear quite distinct in the different parts of a fine body. To illustrate still farther the use of such a model, let us suppose it placed in different lights; now in that of the sun, now in that of the sky, and now again in that of a lamp or candle; one time placed in the shade, and another in a reflected light. Hence the pupil may learn all the different effects of the complexion in different circumstances, whether the livid, the lucid, or transparent; and, above all, that variety of tints and half-tints, occasioned in the colour of the skin by the epidermis having the bones immediately under it in some places, and in others a greater or less number of blood-vessels or quantity of fat. An artist, who had long studied such a model, would run no risk of degrading the beauties of nature by any particularity of style, or of giving into any preposterous fulness and floridness of colour: he would not "feed his figures with roses," as an ancient painter of Greece shrewdly expressed it, but with good beef; a difference which the learned eye of a modern writer could perceive between the colouring of Barocci and that of Titian. *Webb's Dialogues.*

What statues are in design, nature is in colouring; the fountain-head of that perfection to which every artist, ambitious to excel, should constantly aspire; and accordingly the Flemish painters, in consequence of their aiming solely to copy nature, are in colouring as excellent as they are wont to be awkward in designing.

Amongst the Flemish painters, Rubens undoubtedly holds the first place; and his works, as sir Joshua Reynolds observes, "have that peculiar property always attendant on genius, to attract attention, and enforce admiration, in spite of all their faults." His colouring evinces that exuberance and boldness of genius, which in every other part of the art peculiarly characterises him. It possesses neither the sober richness of Titian nor the delicate harmony of Corregio; but seems frequently, by the gorgeous assemblage of tints, to vie with the gaiety of the chaplet or nosegay. It is perhaps, however, a matter worthy of investigation, whether the great variety of colours introduced by Rubens in the draperies and other parts of his pictures, has not, by the too-great equality of their distribution, upon some occasions proved detrimental, rather than advantageous, to the richness and splendour of effect, which at all times seems to have been his principal object; and whether that object would not have been more effectually attained, had he followed the practice of the early Venetians, in giving to two or three colours a more decided pre-eminence. The style

of Vandyke is more pure and chaste. The modest tenderness of his tints gently, but irresistibly, persuade; and his numerous portraits, by their delicacy and truth of expression, still captivate and interest the beholder, even where the personages they represent have been long forgotten.

Rembrandt is, as Mr. Fuseli observes, a genius of the first class in every thing which relates not to form; but, though as a colourist he certainly holds a pre-eminent rank, the effect of his pictures is perhaps, as we have said of Guercino, more the consequence of his astonishing *chiaro-scuro* than of the freshness and vigour of his tints. His works present not the gorgeous combinations of colour found in those of Rubens, or that humid mellowness of tint in the flesh so much admired in the pictures of Titian and Giorgione; nevertheless, they evince a most powerful conception of harmony, a beautiful gradation of tint, and great solemnity of tone. His lights have a brilliancy peculiarly his own; scarcely more owing to the powerful opposition of his *chiaro-scuro*, than to the extraordinary method which he used of painting the luminous parts of his pictures with a very great body of colour in almost a dry state; whilst his broad masses of shadow possess a magic transparency, making, as it were, darkness visible.

It would be endless to enumerate the many admirable colourists of Flanders and Holland, who successively trod the footsteps of the great artists above-mentioned; indeed, there are few painters of those schools whose works may not be studied with advantage as to this part of the art; the richness and harmony of their tints, the beauty and strength of their *chiaro-scuro*, and the delicacy of their pencilling, comprising their chief excellence. Sir Joshua Reynolds, the great colourist of the last century, fully appreciated their merits; and, by combining somewhat of their principle with the different styles of Titian and Corregio, has succeeded in producing, in not a few instances, a richness and brilliancy of colour, inferior perhaps to neither, and at the same time different from all. Happy for his reputation, if, from an insatiable desire of surpassing, he had not, in so many of his pictures, indulged himself in the use of colours and varnishes, which, like the more delicate blossoms of nature, are the earliest subject to decay.

It has already been observed, that *chiaro-scuro* may exist in the greatest perfection, independently of colours; but colouring, without the aid of lights and shadows, would present us nothing more than the geographical chart, or the harlequin's coat; and the study of it must therefore necessarily imply some previous knowledge of *chiaro-scuro*.

That species or division of colouring which we have termed the *expedient*, or *ornamental*, is of a very extended range, and may be compared to rhetoric, which gives additional lustre to truth, and enables the orator, even where proof is wanting, to support his argument upon specious, though fallacious, grounds. By a judicious opposition of one colour to another, the skilful painter is enabled to give to each an increased delicacy or an additional splendour; and by the same means a colour may be made to appear different from that which it really is; and thus a semblance of truth in the local tint may be frequently attained, even where that truth is in reality very far from existing. If the tint of the flesh be of too warm a hue, a yellow drapery placed next it restores it to harmony; if too red, a crimson or a scarlet mantle takes away, or diminishes, the imperfection; if it appear cold, blue or purple opposed to it, gives it a proportionable degree of warmth; and thus, by contrasting one colour with another, the painter is enabled to give to each the degree of value he desires, according as his subject and the general effect of his work requires. It was the custom of Rubens, when he wished to give brilliancy to the principal figures in his picture, to oppose to the flesh a map of scarlet drapery, and another of pure white; by these means the tints of the naked parts acquired a won-

derful air of truth, at the same time that a splendid and harmonious effect was produced.

The balance of cold and warm colours in a picture seems to bear a strong affinity to the gradation or contrast of the *chiaro-scuro*, and demands equal attention. "A certain quantity of cold colours," says Sir Joshua Reynolds, "is necessary to give value and lustre to the warm colours;" he adds, "that the masses of light in a picture be always of a warm mellow colour, yellow, red, or a yellowish-white; and that the blue, the grey, or the green, colours, be kept almost entirely out of these masses, and be used only to support and set off these warm colours; and for this purpose a small proportion of cold colours will be sufficient." "Let this conduct be reversed," continues this excellent writer; "let the light be cold, and the surrounding colours warm, as we often see in the works of the Roman and Florentine painters, and it will be out of the power of art, even in the hands of Rubens or Titian, to make a picture splendid and harmonious. The illuminated parts of objects are in nature of a warmer tint than those that are in the shade; what I have recommended therefore is no more than that the same conduct be observed in the whole, which is acknowledged to be necessary in every individual part. It is presenting to the eye the same effect as that which it has been accustomed to feel, which in this case, as in every other, will always produce beauty; no principle therefore in our art can be more certain, or is derived from a higher source."

It is proper, in this place, to observe, that the body which receives a reflected light, receives, together with that light, somewhat of the colour of the object which gives the reflection; and this in proportion to the strength of light on the body reflecting, and the vicinity of such body to that receiving the reflection. The skilful management of *reflections* is so indispensable a part of colouring, that it cannot employ too great a share of the student's attention: an excellent insight into the principles of it will be afforded him by the works of Rubens and Jordaens; not perhaps the less so from these masters having marked the reflections in their pictures with a precision and distinctness, perhaps even beyond what is warranted by the appearances of Nature herself.

With respect to the application of colouring, it should always be remembered, that, like the other parts of the art, it is of a nature powerfully to contribute to the sentiment and expression of a picture; when the style adopted is in strict conformity with the character of the subject represented. This conformity is therefore the first thing to be considered. If the subject is awful or melancholy, a grave sombre tone of colour will be appropriate; if gay or magnificent, the most brilliant and gorgeous tints may be freely used. The dark hue given by Michael Angelo to his celebrated group in the boat, in the Last Judgment, with the cold light behind it, renders it perhaps not less a masterpiece of colour, than the Venus and Adonis of Titian, or the Sleeping Nymphs of Rubens.

There are more reasons than one why our colouring cannot equal that of the ancients.

The ancients (says Longerue) were not in possession of the art of painting in oil, invented by John of Bruges; yet their colours were more glowing and durable than ours. Our colours are considerably diminished, even since the last age: compare the colouring of Le Brun and Mignard, with that of their predecessors. This is said to proceed from the avarice of the Dutch, and others, who corrupt the drugs used in painting; perhaps, too, they have induced the natives themselves to corrupt them. The colouring of the two great painters above mentioned fades every day. It is the same in Italy; and this great evil has become general. Those who have inspected the paintings on vellum, or illuminated manuscripts, of which many fine specimens are preserved in the British Museum, will confess, that not only the artists of those times excelled us in the elaborate finishings of their pieces; or, in the language of Pope, "The patient touches of unwearied

unwearied art;" but that the brilliancy of their colours is such, that no just conception can be formed of their beauty but by inspection. They preserve all their vivid tints, though they are so ancient. We might perhaps hope to emulate them, if something could be effected to preserve the drugs from adulteration.

It is certain that, in Italy, France, Holland, and Flanders, they obtained much better oil than we do at this moment; nut-oil, drawn without the assistance, or rather violence, of fire, and bleached in the sun, in white glass bottles, at the bottom of which a few shot or thin pieces of lead are deposited, in order to attract and combine with the adipose part of the oil, was what they generally employed; and we doubt not that it is in a great measure owing to the simplicity and purity of this process, that the colouring of Titian and Rubens, of Veronese and of Teniers, is still the deserved object of our admiration, and baffles still the imitative powers of our contemporaries.

Another powerful, though imperceptible, agent, which contributes materially to create a difference between a copy and its prototype, is Time. Among the instructive and interesting dreams, allegories, and visions, with which Addison has interspersed his immortal *Spectator*, we read (N^o 83.) that, having been led into an immense gallery, full of masterpieces of all kinds of pictures, he remarked in one of the apartments a little old man, with a long beard, and much emaciated both by study and age, who seemed working slowly, but with undisturbed attention, upon some of the *tableaux* which composed the valuable collection. Turning to the cicerone who attended, he whispered him, "Pray, who is that old picture-cleaner, so busy upon those pieces?" "'Tis TIME," answered the man; "to him, to his minute touches, to his softening the glare, and deepening the shadows, we owe that undescribable harmony and inimitable mellowness which enhances so much the merit of pictures." This allegory, besides its lively ingenuity, contains an evident share of truth. It is obvious to any man who is acquainted with the principles and practice of the art, that time, by slow degrees, improves, generally, the value of a picture; not because the hand which has produced it lies cold in the grave, and can paint no more; but on account of that admirable varnish of softness which age, and the improving hands of passing centuries, spread upon the works of painters, as well as upon the metal of ancient medals and coins. Can a copy, fresh from the pallet and the brush, boast of such a quality? and, when the copier compares, impartially, his work with the beautiful exemplar which stands in judgment against him and his labours, is he not ready to despond? But, if he consider that, although there is a family-likeness between them, yet, as it happens among brothers, the youngest must naturally differ in proportion from the eldest, he will soon reconcile himself with his art, and be more pleased with his seemingly-unsuccessful exertions. Hence we must infer, that a copy never can entirely be a *fac-simile* of the original; or that, if it appear so at the moment it is done, it will, in a few years, lose more of its native sweetness and brilliancy than the type, which has boldly stood the test of years, will ever do in the same space of time. Lanfranc, a celebrated French painter, used to say, *Je fais tout ce que je peux; l'air fait le reste*; "I do all I can, the air (or time) performs the rest."

OF DRAPERY.

The DRAPERY contributes to the life, character, and expression, of the figure. The naked form should chiefly be considered; the drapery is only accessory to it, and should therefore seem to cover the limbs only, not to hide them. The garment must not be too tight, so as to seem to confine the limbs; nor too loose and large, so as to be troublesome. Many good artists draw their figures first naked, and lay on the drapery afterwards; an excellent method for avoiding absurdities. The colours and materials of the drapery should concur with the general ex-

pression. Gay and shining garments must not be introduced in melancholy or terrible subjects. Thyestes should not be arrayed in gay colours, when the flesh of his own son seems to agitate his bowels; nor Portia, when feeding upon ashes. But, where the subject is cheerful, let all the drapery be gay and light. The drapery should also agree with the age and character of the figures they cover: gay colours, and light stuffs, floating in the air, mark the young; darker colours, and heavier materials, the aged. A grave and austere person is not to be dressed like a light and voluptuous man; a majestic prince, a prudent mother, is not to be confounded with a courtesan.

If the artist represents a figure flying in the air, let him show by the drapery whether it is rising or descending. If mounting, a column of air from above weighs upon the drapery, and keeps it down; if descending, the under-current of air raises the garment accordingly.

Silk stuffs must be sparingly employed in subjects of ancient history, because among the ancients the fabrication of silk was but very partially known. Equal care should be taken to avoid that poverty which makes some masters look as if, through mere penury, they grudged clothes to their figures; and that profusion which Albani imputed to Guido, saying, that he was rather a tailor than a painter. The ornaments of dress should be used with great sobriety; and it will not be amiss to remember what was once said to an ancient painter: "I pity you greatly; unable to make Helen handsome, you have taken care to make her fine."

Drapery, also, comprehends all hangings, curtains, and other adjustments, made by means of stuffs or cloths of any kind, in the scenery of a picture; but it must be recollected, that it is not the name nor substance, but the *disposition* of those materials, that brings them under the denomination of *drapery*. Cloths of any kind may be made to fill whatever portion of his composition the painter may find suitable to his purpose; but, unless they be disposed in folds, they are still cloths only, and not drapery.

Drapery then, strictly regarded, consists in the disposition of folds; and the skillful disposition of folds; whether for clothing or other use, constitutes the *art* of drapery. In the general composition of a picture, drapery is connected with *costume* and character; as an object of study in a single figure, the beauty of drapery stands deservedly next in rank to beauty of form, as it not only powerfully co-operates with the latter, but is even found to be at times capable of enhancing its value, by artful management and partial concealment; and it is also capable of assisting *expression*, as far as it is displayed by the action of the figure.

To drape a figure well, it is necessary that the folds be large and few in number; because large folds produce great masses of light and shadow, while small ones multiply the objects of view and distract the attention. But, if the character of the drapery or kind of stuff requires small folds, they should at least be distributed in groups, in such a manner that a great number of small folds shall be subordinate to an equal mass formed by a principal fold.

It is also proper to observe, that the *colour* of the drapery contributes to the harmony of the whole, and produces effects which the *chiaro-scuro* cannot do alone. At the same time, the principles of the *chiaro-scuro* should preside over, or at least regulate, the art of drapery. If the folds of the stuff which cover the members exposed to the light are too strongly shaded, they will appear to enter into the members, and cut them.

The Greek and Roman artists understood so well the proportions of the human body, and the flowing elegance of drapery, that it was said of their statues and pictures, *Induitur, formosa est; exuitur, ipsa forma est*: "Covered, she is beautiful; naked, she is beauty itself."

Raphael is the model for drapery among the moderns. At first, says Mengs, he imitated his master Pietro Perugino's manner of drapery; and he brought this manner

to perfection, by studying the works of Massaccio and of Bartholomew; but he departed entirely from the taste of the school in which he was educated when he had seen the works of the ancients. It was the bas-reliefs of antiquity which pointed out to him the true flowing of drapery, and he was not backward to introduce it. He made his ample draperies without useless folds, and with bendings at the articulations. It was the form of the naked figure which pointed out to him the form of his folds, and on the great muscles he formed great masses. When any part required to be fore-shortened, he covered it with the same number of folds as if it had been straight; but then he crowded them in proportion to the fore-shortening. He frequently discovered the border of his drapery, to show that his figures were not dressed in a simple sack. The form of the principal parts, and the specific weight of the air, were always the causes of his folds. It was easy to discover in his works, by the folds of his drapery, the attitude of the figure previous to the one in which it was placed; and whether, for example, the arm was extended or otherwise, immediately before the action. This was an expression which he had carefully studied on all occasions, because he found it in nature. When the drapery was to cover the leg or arm but half, or in an imperfect manner, he made it cut obliquely the member which was partly to be covered. His folds were of a triangular form. The reason of this form is in nature; for all drapery has a tendency to enlarge itself and be extended; and, as at the same time its own weight obliges it to fall back on itself, it is naturally formed into triangles. He knew perfectly that the movements of the body and of its members are the causes of the actual situation of drapery, and of the formation of its folds. All his practice is nothing else but the unfolding and demonstrating of this theory; and drapery executed in any other manner must be in a false and vicious taste.

There can be no drapery more faulty in painting or sculpture, than that which, in either art, affects to resemble the productions of the other. It is not to be denied, that in the highest of all examples of sculpture, the works of Phidias, such drapery is to be found, as from its softness and breadth (founded on a knowledge of principles possessed only by himself) may safely be transferred to painting. Such, for instance, is the drapery of the two females sitting together, in the collection brought from Athens by the earl of Elgin, in which every quality of beauty of form and character is combined. But, without this consummate knowledge, the experiment, whenever it has been made, has been generally unsuccessful. Painting, imitating the drapery of sculpture, has produced garments of ropes; and sculpture, imitating that of painting, has left it doubtful if it designed to represent cloths or rocks. The requisite distinction between the proper management of drapery in painting and in sculpture, is most instructively exemplified in the practice of that great master of both arts, Michael Angelo. Du Fresnoy has justly pointed out this distinction: the large folds, he remarks, and massy garments, with which the Prophets, in the Sistine chapel, are invested, are confessedly such as correspond with the powers of painting, and are peculiarly adapted to the awful character of the persons who wear them; but, in the Monument of Julius II. in the church of San Pietro in Vincoli, the statue of Moses, although, by the character of the person represented, it evidently takes the same class as the figures of the Prophets, has nothing of the same kind of drapery. The dress is cast closer round the limbs, the folds are thinner, narrower, and, in every respect, such as the properties of sculpture render necessary for the just expression of the forms of the figure.

In the latter period of the Italian school, two great masters of the art of drapery, Guido and Carlo Maratti, have arisen to eclipse the fame of all preceding painters, except Raphael. Guido, in his picture of the "Doctors of the

Church revolving the Question of the immaculate Conception," and in his still more celebrated "Aurora," has left examples of the most perfect beauty, propriety, and character of drapery. In the former work, the light folds of unfulfilled whiteness of the drapery of the Virgin, mildly and generally illuminated by aerial splendours, and the larger foldings and graver hues of the garments of the doctors, are equally deserving our admiration. In the latter, he has exemplified all that is light, airy, elegant, and graceful, in female drapery, cast or falling into folds by the force of motion, or air. In the picture of the Doctors of the Church it is to be remarked, that Guido has entirely laid aside all reference to costume, although he did not want precedents for the dresses of the principal persons represented; and that the draperies are as purely ideal in that picture as in his other work of poetical imagination, the Aurora.

It is remarkable, in the progress of the Italian school, that, in proportion as the style of art deteriorated, attention to drapery continued to gain an ascendancy. In Guido, from the varied beauties which he gave to his drapery, from the union of lightness, softness, and breadth, in his folds, drapery first became a predominant feature of historical design. Pietro da Cortona, who corrupted art, clothed his female figures in the most seductive variety of attire. Andrea Sacchi's great work, in the church of St. Romualdo, the fourth wonder of Roman painting, derived the greater portion of its praise from the powerful management of the drapery in the dresses of the religious characters introduced in it; and, in the time of his scholar, Carlo Maratti, the whole study of painting consisted scarcely in any thing besides drapery. Indeed, Carlo Maratti was of opinion, that the disposition of drapery was a more difficult art than even that of drawing the human figure; that a student might be more easily taught the latter than the former; as the rules of drapery, he said, could not be so well ascertained as those for delineating a correct form. But this is only a proof how willingly we favour our own peculiar excellence. Carlo Maratti valued himself particularly upon his skill in this part of his art; yet, in him, the disposition appears so artificial, that he is inferior to Raphael, even in that which gave him his best claim to reputation.

Paul Veronese also gained much applause for his draperies; but it is smartly said by a French writer, "that Raphael is the best painter of *drapery*; Veronese the best painter of *stuffs*."

OF COSTUME.

Closely connected with the subject of drapery is that of *COSTUME*, or giving to the figures the proper dresses of the country and age they belong to. But *costume* has a much larger sense, and a much wider range: it may be said to correspond with the unities of time, place, and action, in tragedy and in epic poetry. It is chiefly confined to history-painting; and regards the *customs* and manners of different periods, as well as the *dresses* of different nations. Great exactness in the costume is scarcely practicable; but too sensible a departure from it denotes unpardonable negligence. The road of the painter is between these two extremes; not to despise beauty on the one hand, nor probability on the other. We mean that it is not necessary for the painter to cramp himself by an observance too minute. He should steer a middle course: let him give to a nation, the Romans for instance, the dress which they wore in the most flourishing times of the republic, without a tedious and minute enquiry into the various shades of fashion which luxury introduced among that famous people.

On the other hand, a departure from costume has rendered many a fine picture ridiculous. These offences are like grammatical solecisms in a beautiful composition. Several blunders of this kind are pointed out by Chevreau; and some connoisseurs will recollect the very pictures.

tures which are alluded to. "Those artists who paint Isaac on his knees before an altar, with Abraham behind him, who raises a knife in the act of striking at him, describe Isaac imperfectly. Before Abraham lifted his arm, Isaac was not prostrate at the altar, but lay on it, as clearly appears in the book of Genesis, where it is said, that Abraham, after having built an altar, *bound Isaac, laid him on the wood, and then took the knife to slay him.* Gen. xxii. 9, 10. In several pictures, Jesus is seen on the cross, with a perspective view of the city of Jerusalem behind him, in which place are represented pyramids, domes, cupolas, and obelisks. This is a gross blunder; because at Jerusalem, and all eastern cities, the tops of the houses were flat and open; there company walked, held assemblies, and celebrated the feast of tabernacles. The Virgin should not be painted with a book on the table, when the angel Gabriel salutes her; nor should St. John the Evangelist, when he wrote his Revelation, be represented young; nor Jesus be made to recline his head on the table, as if asleep, at the supper with his apostles. St. James is ridiculously represented by several, with a pilgrim's staff in his hand, and shells hung about him, because catholics go in pilgrimage to St. James of Compostella in Galicia. In the collection of the French king there is a celebrated picture, in which Jesus is represented at table, in the castle of Emmaus, with two of his disciples; one with a slouched hat, with broad brims hanging over his back, and a huge chaplet round his waist; the other has a scarf or shoulder-belt on his coat. They are served by a man, who wears a kind of handkerchief which only covers half his head; his arms naked to the elbows, like a cook; and by him stands a page, who has a little hat with a feather in it, according to the present Venetian fashion."

Perhaps the blunder of painters most susceptible of raillery, is that of representing Moses with *horns* on his head, when he descends from Mount Sinai with the tables in his hands. This is copied in many engravings, which are very common. Chevreau explains this blunder: it is owing to one in the Vulgate, which, however, was not detected by St. Jerome. The noun *keren*, in Hebrew, signifies "horns;" and the verb *karan* "to emit rays," or to glitter. When the Jews (observes Chevreau) come into our churches, they laugh at us for representing Moses like Satan. Our version renders the passage, not that Moses came down "with horns on his head," but that *the skin of his face shone.* Exod. xxxiv. 29, 30.

An ancient painter called Galaton gave likewise a fine proof of his genius in this line, by representing a great number of poets greedily quenching their thirst in the waters gushing from the mouth of Homer. And to this allegory, according to Guigni, Pliny has an eye, when he calls that prince of poets the *fountain of wits.*

The mythological taste of the learned Poussin is well known; but Rubens seems to claim the merit of having presented to the world a still greater number of supreme absurdities in this learned style: nor is it easy to conceive a more heterogeneous mixture of circumstances, real and imaginary, sacred and profane, than the Luxembourg Gallery, and the other works of that great master, perpetually exhibit. Thus he has united the queen-mother in council with two cardinals and Mercury. Nor is there less impropriety in his making Tritons and Nereids, in another piece of the same gallery, swim to the queen's vessel through the galleys of the knights of St. Stephen. Such freedoms are equally disgusting with the prophecies of Sannazaro's Proteus concerning the mystery of the incarnation, or the Indian kings of Camoens reasoning with the Portuguese on the adventures of Ulysses.

Mr. Strutt has detected some singular improprieties of our Saxon painters. He writes, "They were far from having the least idea of any thing more ancient than the manners and customs of their own particular times. They put Noah, Abraham, Christ, and king Edgar, all in the same habit; that is, the habit worn by themselves at that time; and in some manuscripts illuminated in the reign

of Henry VI. are exhibited the figures of Meleager, Hercules, Jason, &c. in the full dress of the great lords of that prince's court." In one of these manuscripts, the erudite artist having heard something about Hercules and his lion's skin, he has covered the shoulders of his athletic beau with a hide of that noble animal, but it is made to hang upon a splendid load of silk and gold embroidery!

In the third volume of the Transactions of the Manchester Society, we have an enumeration of some very curious violations of costume, and of common sense.

"When Raphael, in his cartoons, introduces monks and Swiss guards; when he puts into a boat more figures than it is evident the boat could actually contain; when, in the chastisement of Heliodorus, who attempted to despoil the temple of Jerusalem, pope Julius II. is depicted as being present; when, in the Donation of Constantine in the Vatican, a naked boy is placed conspicuous in the fore-ground, astride upon a dog, in the immediate presence of the pope and the emperor; when Venetian senators are introduced while pope Alexander excommunicates Barbarossa; when Aristotle, Plato, Dante, and Petrarch, are brought together in the School of Athens, to omit the minor improprieties of shoeless apostles, &c. every person must acknowledge that such offences as these against truths so obvious, if they do not arise from a defect of understanding, are instances of inexcusable carelessness. In like manner, when the same great master paints the dreams of Joseph and his fellow-prisoner in circles over their heads; when similar contrivances to express future events are used by Albani, Parmegiano and Fuseli; is it not evident that no possibility can make the fiction true, and that real and feigned existences are unnaturally introduced in one narration?"

"When Polydore chooses to represent the death of Cato, and exposes to the spectator the hero of the piece with his bowels gushing out; when Paul Veronese, at a banquet painted with his usual magnificence, places before us a dog gnawing a bone, and a boy making water: however such disgusting circumstances may be forgiven in the *chef d'œuvre* of a Michael Angelo, had he represented these instead of the horrible figures of his Day of Judgment, the performance of an inferior artist cannot atone for them. So also, when Paul Veronese introduces Benedictine monks at the Marriage of Cana; when, in a picture of the Crucifixion, he puts the Roman soldiers in the jerkins of the 16th century, and adorns their heads with turbans; when Guido, in a painting of Jesus appearing to his mother after his resurrection, places St. Charles Borromeo in a kind of desk in the back-ground as witness to the interview; when Tintoret, at the miraculous fall of manna, arms the Israelites with fusils; and Corregio appoints St. Jerome as the instructor of the child Jesus; common sense revolts at the impropriety, and we are compelled to exclaim, *Quicquid offends mihi sic, incredululis odi!*

"When so great an authority as sir Joshua Reynolds contends for the rejection of common sense in favour of somewhat which he terms a *higher sense*; when he laments, indirectly, that art is not in such high estimation with us, as to induce the generals, lawgivers, and kings, of modern times, to suffer themselves to be represented naked, as in the days of ancient Greece; when he defends even the ridiculous aberrations from possibility, which the extravagant pencil of Rubens has so plentifully produced; it is not surprising that the artists of the present day should be led to reject the company of common sense, or that sir Joshua's performances should furnish examples of his own precepts. For instance, Mrs. Siddons is represented by sir Joshua in the character (as it is said) of the Tragic Muse; she is placed in an old-fashioned arm-chair; this arm-chair is supported by clouds, suspended in the air; on each side of her head is a figure not unapt to suggest the idea of the attendant imps of an enchantress: of these figures one is supposed to represent Comedy, and the

the other Tragedy: Mrs. Siddons herself is decently attired in the fashionable habiliments of the year 1785. Now, if this be a picture of the Tragic Muse, she ought not to appear in a modern dress, nor ought she to be seated in an old arm-chair. If this be a portraiture of Mrs. Siddons, she has no business in the clouds, nor has she any thing to do with aerial attendants. If this be Mrs. Siddons in the character of the Tragic Muse, the first set of objections apply; for she is placed in a situation where Mrs. Siddons could never be.

"In the Death of Dido, sir Joshua Reynolds introduces her sister lamenting over the corpse of the unfortunate queen. This is possible: but he has also introduced Atropos cutting Dido's hair with a pair of scissors, as a being equally real and apparent in the painting with Dido or her sister. This is a gross offence against mythological probability; nor is it the only offence against the costume with which that picture is chargeable."

There is one other breach of costume, however common among painters, more gross and offensive than any of the instances hitherto alleged; we mean the perpetual and unnecessary display of the naked figure. We shall not stay to enquire whether more skill can be shown in painting the human body clothed or unclothed. If the personages introduced in any picture are more naked in the representation than can be justified by the probability of the times, persons, places, or circumstances, it is a breach of the costume proportionate to the deviation. This fault, however, is so common as hardly to be noticed; so slight indeed, when compared with that general taste for voluptuous imagery and obscene representation which has disgraced the art of painting in every stage of its progress, that science and morality are callous to the slight offence.

It is impossible to express how much a picture suffers by such looseness of fancy, and sinks as a bastard of the art in the esteem of good judges. Some people, indeed, are of opinion, that so scrupulous an observance of the costume is apt to hurt pictures, by depriving them of a certain air of truth, arising, they think, from those features and habits to which we are accustomed; and which are therefore apt to make a greater impression than can be expected from things drawn from the remote sources of antiquity: adding withal, that a certain degree of license has ever been allowed those artists who in their works must make fancy their chief guide. "See," say they, "the Greeks;" that is, the masters of Raphael and Poussin themselves; "do they ever trouble their heads about such niceties? The Rhodian statuary, for example, have not scrupled to represent Laocoon naked; that is, the priest of Apollo naked in the very act of sacrificing to the gods, and that too in presence of a whole people, of the virgins and matrons of Ilium. Now, (continue they,) if it was allowable in the ancient statuary to neglect probability and decency to such a degree, to have a better opportunity of displaying their skill in the anatomy of the human body; why may it not be allowable in modern painters, the better to attain the end of their art, which is deception, to depart now-and-then a little from the ancient manners and the too-rigorous laws of the costume? But these reasons, we beg leave to observe, are more absurd than they are ingenious. What! are we to draw conclusions from an example which, far from deciding the dispute, gives occasion to another? The learned are of opinion, that those Rhodian masters would have done much better, had they looked out for a subject in which, without offending so much against truth, and even probability, they might have had an equal opportunity of displaying their knowledge of the naked. And certainly no authority or example whatever should tempt us to do any thing contrary to what both decency and the reason of things require, unless we intend, like Carpi, to represent *Sogni d'inferni, e fole di romanzi*; "The dreams of sick men, and the tales of fools."

VOL. XVIII. No. 1239,

OF COPYING AND OF IMITATION.

The art of COPYING requires the assistance of two mental qualities—judgment and discretion. The first will direct as to the choice, the other as to the application. Supported on either side by these two columns of strength, the artist must stand before his model and consider, till, out of the chaos excited at first in his mind by the confused influx of simultaneous ideas, judgment strikes a light, and discretion assigns their proper forms to the component elements of the whole. In his most instructive and constantly amusing "Entretiens," Felibien tells us, that, when Dominechino was on the point of beginning a picture, he never took hold of the chalk, struck a single line, or handled the brush, until he had long, silently and motionless, with his eyes fixed on the canvas, (the future field of action,) maturely meditated upon his subject, whether it were his own conceptions he had to embody, or another master's performance to imitate. One would have suspected, at first sight, that he was deprived of imagination, or courage; that timidity or sterility fettered his hand, or that he really did not know what he was about; but, when that inward tumult which nobody could witness but himself, when this turbid ebullition of the ideal elements, had subsided, his pencil darted with the rapidity of lightning across the canvas; and, as if bursting into a storm, his execution produced wonders. Some physicians are of opinion, that no man should eat until he feels the sharpness of hunger and a call for food. We may apply this principle to the student who copies, or to the master who meditates an original. If you stand in sight of your subject, contemplating the external or internal archetype, till you feel the impulse and the desire of inception; then your ideas will flow in emulative facility with the colours of your pallet; then you may expect your hand to keep equal pace with your imagination; a circumstance which seldom happens, but which, when it occurs, produces, at once, pleasure in the mind of the painter and pleasing effects on his canvas; for it has been properly remarked, that the corporeal agent is not always as ready as the mental director; *dislat ab ingenio manus*; and that the vivacity of our conceptions wanes and cools considerably during the time of execution.

Another circumstance, which is most worthy of attention, relates to the comparative size of the copy and the original. The art of reducing is simple as to geometrical rules; yet, although you may be correct as far as lineal imitation requires, it will often happen that the whole harmony of the one will not be translated upon the other. We will take as an instance that large picture by Paul Veronese of the "Vocation of St. Charles Borromeo to the See of Milan." Now a small copy of this picture may certainly have its merits, and a good effect, but will not work upon the feelings of the beholders the same impression which is excited by the original; and, besides the truth of the well-known axiom, that the sublime implies magnitude, this unavoidable difference will arise from two distinct causes, which it is proper to explain. In the first place, the element in which we move, the air, is a diaphanous body; but it carries with it, as other substances, its own share of density; hence the magic of aerial perspective in nature, and in the copies which we make of natural objects, either aggregate or single. The mass of air, circulating between the eye of the beholder and a performance of the size of Veronese's picture now under our consideration, is of much greater magnitude than what would intermediately exist between the sight and a highly-finished jewel of Mieris or Gerard Dow. This is, indeed, so far applicable to the original and the reduced copy, that, if the imitator were to work with the same freedom and the identical pigments which the master used, he certainly could not attain his object. The canvas, for instance, upon which the picture of Paolo is executed, is purposely of a very coarse nature, and pro-

duces a striking effect of clearness and brightness everywhere, and especially on the green vestment of St. Charles, (which, however, should have been red, as he had been made a cardinal some time before.) Indeed, the very cloth becomes the garment itself, and identifies its own woof with that of the painted dress. Can this be obtained when copied on a small primed cloth, or a well-pumiced pannel? Certainly not; for this very coarseness is softened by the intermediate air in a way which is entirely denied to the nearly-inspected copy. Lumps of colour issuing out of the scumbling-brush, when driven with enthusiasm and velocity over the pictorial field, have shadows of their own and their own points of reflected light, which, in combined exertions, produce a sensible effect from a cause imperceptible at a distance: again, the air harmonises all this, when profusely interposed; but not so, when the diminutive imitation is offered to the close inspection of the eye. Let us, therefore, take these hints into our consideration, and be persuaded, that a good copy of a good picture, when reduced in size, cannot be made, without allowing a great deal for the absence of that benevolent element which does so much for the artist, by dropping its gauze-like veil between the object and the eye, and thus creating a really perfect *tout ensemble* out of a heap of apparent imperfections. See also the section on COLOURING, p. 233.

Whatever a young painter's natural disposition may be, whether to paint boldly and freely like Tintoret and Rubens, or to labour his works like Titian or da Vinci, let him follow it. This kind of imitation is very commendable. It is thus that Dante, at the same time that he carefully avoided adopting the particular expressions of Virgil, endeavoured to seize his bold and free manner, and at last caught from him that elegance of style which has done him so much honour.

As to the rest, nothing should hinder an able master from making use now-and-then of any antique, or even modern figure, which he may find his account in employing. Raphael, in a St. Paul at Lystra, scrupled not to avail himself of an ancient sacrifice in basso-relievo; nor did Michael Angelo himself disdain to use in his paintings the figures upon the famous cornelian which tradition tells us he wore on his finger, and which was in the possession of the late king of France. Men like these avail themselves of the productions of others in such a manner as to make us apply to them what La Bruyere said of Despréaux, that one would imagine the thoughts of other men had been of his own creation.

In general, a painter should have his eye constantly fixed on Nature, that inexhaustible and varied source of every kind of beauty; and should study to imitate her in her most singular effects. As beauty, scattered over the whole universe, shines brighter in some objects than in others, he should never be without his little book and crayon, in order to make drawings of every beautiful or uncommon object that may happen to present itself; and take sketches of every fine building, every situation, every effect of light, every flight of clouds, every flow of drapery, every attitude, every expression of the passions, that may happen to strike him. He may afterwards employ these things as occasions offer; and in the mean time will have the advantage of acquiring a grand taste.

It is by carefully studying the best masters, and imitating nature, that a painter arrives at the style of perfection which the Italians call *gusto grande*, the French *le beau idéal*, and the English *the great style*.

When we speak of the habitual imitation and continued study of masters, it is not to be understood that we advise any endeavour to copy the exact peculiar colour and complexion of another man's mind; the success of such an attempt must always be like his who imitates exactly the air, manner, and gestures, of him whom he admires. His model may be excellent, but he himself will be ridiculous; and this ridicule arises, not from his hav-

ing imitated, but from his not having chosen the right mode of imitation.

It is a necessary warrantable pride to disdain to walk servilely behind any individual, however elevated his rank. The true and liberal ground of imitation is an open field, where, though he who precedes has had the advantage of starting before you, yet it is enough to pursue his course; you need not tread in his footsteps; and you certainly have a right to outstrip him if you can.

The great use of studying our predecessors is to open the mind, to shorten our labour, and to give us the result of the selection made by those great minds of what is grand or beautiful in nature: her rich stores are all spread out before us; but it is an art, and no easy art, to know how or what to choose, and how to attain and secure the object of our choice. Thus the highest beauty of form must be taken from Nature; but it is an art of long deduction and great experience to know how to find it.

To judge if a Painting be an Original or a Copy.

We shall not speak of indifferent copies, which the curious will find out at first sight; much less of bad ones, which are known to be so by all the world. We must suppose a copy made by a good master, which calls for serious reflection, and makes one doubt, for some time at least, whether it is a copy or an original. Of such copies there are three sorts. The first is done faithfully, but servilely; the second is light, easy, but not faithful; the third is both faithful and easy.

The first, which is servile and faithful, includes the design, the colouring, and the touches of the original; but the fear of passing beyond the bounds of this exactness, and to err against fidelity, makes the hand of the copyist stiff, and thus betrays it to a good judge.

The second is more likely to impose on the spectator, because of the lightness of the pencil; but the unfaithfulness of the contours or outlines will undeceive the best critics.

But the third, which is faithful and easy, made by a learned and skilful hand, and, above all, in the time of the original, may sometimes puzzle the greatest critics.

There is still another difficulty, greater perhaps than any of the foregoing; namely, the repetition of a picture. There is scarcely a painter but has re-created some of his own works: there are two Madonnas of Raphael, which, being placed side by side, it would hardly be possible to say which is the original, and which the repetition or copy. Titian has repeated the same picture seven or eight times; and we see several pictures of the best masters of Italy repeated, which divide the merits of their other pieces, and pass for originals in different places.

Luca Signorelli, of Cortona, was a disciple of Pietro della Francesca; and imitated his manner so exactly, that their works are often taken the one for the other.

There have indeed been copies that have deceived the most skilful painters. Among many examples of this kind, we shall relate one, which is the more remarkable, as it is of an artist who was deceived relative to his own performance.

Frederic II. duke of Mantua, being at Florence, in his way to Rome, to pay a visit to pope Clement VII. observed, in the palace of Medici, over one of the doors, the picture of Leo X. between the cardinal of Medici and cardinal di Rossi; the heads were by Raphael, the drapery by Julio Romano. The duke looked upon it earnestly, and became so enamoured of it, that he could not forbear begging it of the pope when he came to Rome. His holiness very graciously gave it him; and ordered his secretary to write to Octavian de Medici at Florence, to put the picture up in a case and send it to Mantua. Octavian, who was a great lover of painting, and loath to deprive Florence of such a rarity, invented an excuse to defer sending it, pretending that the frame was not rich enough, and that he would get one fitted-up for it. This

delay gave Octavian time to have it copied, which was done by Andrea del Sarto, who imitated even the little spots that were upon the canvas. This piece was so like the original, that Octavian himself could hardly distinguish the one from the other; and, that he might not be deceived, he put a private mark upon the copy, and in a few days after sent it to Mantua. The duke received it with all possible satisfaction, not doubting but it was the work of Raphael and Julio Romano: the latter, who was then in the service of that prince, had no suspicion that his part of the picture was not done by himself; and he would have remained in this error as long as he lived, if Vafari, who had seen the copy while it was drawing, had not undeceived him; for this Vafari, coming to Mantua, was well entertained by Julio Romano, who showed him all the duke's rarities, and, among the rest, this picture of Leo X. which, he informed him was done by Raphael. Vafari said, "It is a very good picture, but it is not Raphael's." Julio Romano, looking on it more attentively, replied, "How! is it not Raphael's! and do I not know my own work in it? do not I see the strokes of my pencil, and remember the striking them?" Vafari answered, "You do not observe it closely enough; I assure you I saw Andrea del Sarto draw this very picture; behind the canvas you will see a mark which was put upon it to distinguish it from the original." Julio Romano, turning the picture, and perceiving it was matter of fact, held up his hands with astonishment, saying, "I value it as much as if it were Raphael's, and even more; for it is very surprising to see so excellent a master so well imitated as to deceive one who is likewise a professor." Now, since Julio Romano, with all his skill, after having had notice given him, still persisted in the deceit of his judgment as to his own work, we must not think it strange that painters less skilful should sometimes be mistaken about the works of others.

An anecdote of Peter Mignard is not less curious. This great man painted a Magdalen on a canvas fabricated at Rome. A broker, in concert with Mignard, went to the chevalier de Clairville, and told him as a secret, that he was to receive from Italy a Magdalen of Guido, and his masterpiece. The chevalier caught the bait, begged the preference, and purchased the picture at a very high price. Some time afterwards he was informed he had been imposed upon, for that the Magdalen was painted by Mignard. Although Mignard himself caused the alarm to be given, the amateur would not believe it; all the connoisseurs agreed it was a Guido, and the famous Le Brun corroborated this opinion.

The chevalier came to Mignard: "There are (he says) some persons who assure me that my Magdalen is your work." "Mine! they do me great honour; I am sure that Le Brun is not of that opinion." "No: Le Brun swears it can be no other than a Guido. You shall dine with me, and meet several of the first connoisseurs." On the day of meeting, the picture was more closely inspected than ever. Mignard hinted his doubts whether the piece was the work of that great master; he insinuated that it was possible to be deceived; and added, that, if it was Guido's, he did not think it in his best manner. It is a Guido, sir, and in his very best manner, replied Le Brun with warmth; I am perfectly convinced. And all the critics unanimously agreed with him. Mignard then spoke in a firm tone of voice; "And I, gentlemen, will wager three hundred louis that it is not a Guido." The dispute now became violent: Le Brun was desirous of accepting the wager. In a word, the affair became such as could add nothing more to the glory of Mignard. "No, sir, (replied the latter,) I am too honest to bet when I am certain to win. Monsieur le Chevalier, this piece cost you 2000 crowns; the money must be returned; the painting is mine." Le Brun would not believe it. "The proof," Mignard continued, "is easy: on this canvas, which is a Roman one, was the portrait of a cardinal; I will show you his cap." The chevalier did not

know which of the rival artists to believe: the proposition alarmed him. "He who painted the picture shall mend it," said Mignard. He took a pencil dipped in oil; and, rubbing the hair of the Magdalen, discovered the cap of the cardinal. The honour of the ingenious painter could no longer be disputed.

We need not, then, wonder at the following mistake, which happened when the French were in Modena as conquerors, and were selecting the pictures they were to carry away. There was a very fine Crucifixion, the single figure of Our Saviour on the cross, by Guido; and an excellent copy of it hung not far distant. The French officer, commissioner, or whatever might be his title, who was entrusted to select those pictures which were to be presented to Parisian admiration, after much puzzling, fixed at length on the copy, which was accordingly carried off, and hung in the Louvre, where it passed for an undoubted original, to the great delight of the Modenese, who, besides keeping the picture itself, enjoyed the pleasure of knowing their oppressors to be thus notably deceived. *Sketches of Italy*; Lond. 1820.

It remains to say something of those pictures that are neither originals nor copies, which the Italians call *pasticci*, from *pasty*; because, as the several things which season a *pasty* are reduced to one taste, so counterfeiters that compose a *pasticci* tend only to effect one design. A painter that would deceive in this way ought to be well imbued with the manner and principles of the master of whom he would give an idea, whether he take any part of a picture which that master has made, and puts it in his own work, or whether the invention is his own, and he imitates only the *manner* of that particular master. It often happens that painters who thus propose to counterfeit another's manner, and aim at imitating such as are more skilful than themselves, really make better pictures of this kind than if they were to do something entirely of their own. Among those who took delight in counterfeiting the manner of other painters, we shall content ourselves with naming David Teniers, who has deceived, and ever will deceive, the curious, who are not aware of his dexterity in transforming himself into Bassano and Paolo Veronese. There are some of his *pasticci* made with so much art, that the most judicious are deceived by them at first sight; and it requires a very close inspection, and great judgment, to find out the trick that is played them.

QUALIFICATIONS OF A PAINTER.

The well-known aphorism of Hippocrates, that "Art is long, and life is short," applies to no peculiar art so well as to painting; since not only has no single man unaided been able to carry it to perfection, but, in the progressive accumulation of knowledge through the lapse of ages, succeeding ones benefiting by the experience and examples of the former, no man has yet arrived at that degree of excellence in the practice of it, which a perfect union of all its principles and qualities would produce.

The power of exercising this useful and delightful art has at all times been slow of acquirement, as the history we have given of its progress evidently shows. It has this diversity in its growth from that of poetry; which has shone with conspicuous lustre at very early periods of human culture, whilst painting has never flourished but in gradual advance with the general improvement of mankind; and has been truly conspicuous only at those times when the arts of civilization have risen to their highest pitch of excellence in the countries where it has been practised.

In no art has the professor greater or more numerous difficulties to encounter than in painting; since he not only is under a necessity, equally imposing as is the historian or the poet, of obtaining accurate ideas of the events he records, or the scenes he displays; but he has also to invent and perfect himself in the medium, or language, in which he communicates his ideas; before he proceeds to the

the use of it. This medium is utterly out of the ordinary way of human culture; and, whatever may be the aids derived from the advantages we now possess, in having the experience of our predecessors as our guide, there must have been infinite difficulty in bringing it so near to perfection as the great masters have done; and it has been only effected by an extremely gradual progress, and the union of successive exertions operating in one continued line of action. Even now, with the works of preceding painters in our hands, the language of the art (the value and use of its materials) is necessarily, in a very great degree, new to every professor who attains any tolerable degree of eminence. And though it must, no doubt, appear very extraordinary to those who have never made the practice of painting their study, that, when such exemplars of art remain to us, men possessed of good sense should hesitate in producing the like; or that, when they are become capable of making copies, perfect almost to deception, they should not be also capable of employing the means they have acquired, in a systematic mode, in works of original invention;—yet the reverse, in many instances, is a fact of universal notoriety; and proves incontrovertibly, that the art of painting, particularly when employed upon original matter, is more dependant upon mental exertion than manual dexterity in its execution, as well as in its object and effect; and well worthy of the rank assigned it by the Greeks among those arts which they denominated liberal.

Notwithstanding the high degree of perfection to which this art has been carried, no scientific or complete systematic arrangement has yet been adopted for the perfect guidance of the painter; nor does it appear probable that any one ever can be formed, that will effectually apply to the practice of an art which is capable of such an infinite diversity of character and effect. A man of enlarged mind, carefully consulting the pictures of preceding artists, cannot avoid acquiring information which may assist him in his labour; and it is by this means, more than by regular systematic instruction, that painters have arrived at eminence. Thus, then, as in other arts and sciences, something is ready done to the hands of the painter: he builds upon a foundation laid by his predecessors; but the benefit is derived principally from seeing what may be done, rather than in being informed how to do it. He has yet to discover what colours or materials will most effectively combine to attain his end, even in copying pictures; and, when he ventures to attempt the imitation of nature, to trace her varieties and intricacies through the numberless paths of light and shade, and colour, and in all the diversities of view in which objects present themselves, then the whole value of the information obtained by the study of the works of former masters in the practical part of the art, falls still lower in the scale of utility, from the extreme difficulty of applying it. Perhaps there cannot be a greater proof of the originality of thought required in the practice of this art, than the great diversity of the works produced in competition with old pictures, by those who have at different periods admired and studied them enthusiastically. No man of genius, or good sense, will, however, slight the advantages which the study of them may afford him. He may not, at first, obtain the full and actual information he seeks; but the attempt will lead him in a right way to the discovery of the true principles of art; and time may be saved for their application, which, without such helps, must have been lost in experiment.

No vulgar or uninformed man, no one who has not taken pains to cultivate and improve his mental faculties, can be a painter, in the exalted sense in which we view it. Whatever is requisite for the poet or the historian, in cultivation and information, ought not to be disregarded by the painter, whose desire is to exercise his art in an honourable or useful manner, as the great masters among the ancient Greeks, and in the more modern Italian schools, have done. If it be not required of him to be-

come as learned in natural philosophy as Newton, he ought not to be unacquainted with its principles; his business is not merely with the surface of things, if he wishes to represent their appearances in a sensible and characteristic manner. A knowledge in the sciences, sufficient to inform him of the principles which direct and govern the actions of animals, and cause the various appearances of natural unanimated objects, cannot or ought not to be uninteresting to him whose whole life is employed in contemplating and representing their forms or their effects. If he knows the natural structure of an animal, its modes and habits of life and action, he at once, and without hesitation, directs his attention to the parts most materially necessary to its delineation; and does not lose his time, as an ignorant person would do, in representing those parts which, though they may, from accidental causes, strike the eye, yet are, in effect, prejudicial to true character; and, if marked too strongly, even with the hand of ability, counteract the effect of those more efficient in general representation, which always ought to be the sole object of him who wishes to be a great painter. In the representation of objects of unanimated nature, a just comprehension of their causes and effects will in great measure operate in the same way. We do not mean to say, that if a man happens, for example, to know the cause of a rainbow, or can form a pleasing theory upon it, he will therefore be able to select and blend, in a proper manner, the colouring substances necessary to paint one with truth and taste: we have already said that this is a matter utterly unconnected with all other species of information; but, if he add to his technical and practical acquirements the scientific one alluded to, he will most undoubtedly set about the task with less confusion of mind than the most ingenious among those who are ignorant of it.

To this knowledge of the principles of nature, an unremitting attention to her productions is absolutely required of the painter. To him whose mind is devoted to the art, no scene can be vacant or uninteresting; every place affords him matter of observation and investigation. All appearances of natural objects, from the simplest to the most awful; all the actions of man, the varied expressions of his countenance when under the influence of his passions; the characters of health, of age, of beauty, and even deformity, are entitled to his regard, indeed demand his closest enquiry into their most characteristic lines and effects. All the varieties of country, the peculiar forms of animals, trees, rocks, &c. ought necessarily to be known to him; in fact, there is no object the observation of which may not, either immediately or collaterally, be useful to him. The trouble which attends this constant application of the mind, is in the end most highly rewarded. His sphere of vision is enlarged, almost to the creation of another sense, unknown to those who are uninitiated in the art, which finds continual nourishment in scenes even of apparent dulness and insipidity: imagination is strengthened by it, as the power of creating new images increases in proportion to the store of ideas he acquires; and the power of invention or combination, with whatsoever degree nature may have blessed him, is rendered so much the more effective, as he is careful and active in observation; whereas it would be utterly useless, or worse, if not thus supplied by a well-digested mass of materials, raised by continual study of nature; particularly of the beautiful, the grand, the interesting, and the characteristic.

This union of general knowledge with practical ability, may be regarded as the material, or the body, of the art, the servant of its more exalted and spiritual essence, the power of invention and expression, by which alone the charm of the art is acquired and imparted. In vain may the most skilful operator combine his colours, and arrange his lines; or the most scientific composer determine his groups, and perfect his forms, in exact imitation of nature; if a vivid and correct invention, amply supplied with

with the stores of nature and of art, has not formed the basis of the work; and if an enthusiastic feeling of expression does not pervade every part, and add, with its glowing energy, the true and forcible impression of life, of motive, and of motion.

The best mode of acquiring the practical part of painting, is certainly, in the first instance, to copy the works of good painters, under the guidance of an able instructor. Slight, however, in comparison with the object, is all that tuition can afford in this matter. The arrangement of the pallet, the preparation of colours, the general principles of their union or opposition, and consequently the order of their most agreeable arrangements and most powerful effects, together with the best or readiest mode of exercising the implements of the art, may of course be communicated and learnt. The mind may be directed to seek for refinement in taste of form and colour, and to select and combine them; but will be taught in vain, unless nature has implanted the seeds of discrimination, of judgment, and of taste, itself. And, even if somewhat of this should be imbibed, vain is every effort to impart imagination, invention, or the feeling of expression: these are qualities, improvable, when possessed, by exercise and study; but not to be created by the power of man. To those who, possessing them, feel the inclination to study the art of painting, we would say, The true mode of learning to rival the successful efforts of the great masters, is not by copying servilely the surfaces of their works; but, when the power of execution is in part obtained, endeavour, while copying, to search into the principles by which compositions are arranged, and upon which their execution is effected; what are the peculiar features of colour, or of handling, that give the character of grace and taste expressed in them; and what peculiar traits of imagination most beautifully and most justly develop their subjects. In investigating pictures with views dictated by such desires, it will frequently be found, that what appears to superficial observers mere freaks of fancy, mere recreation or indulgence of the pencil, is the result of the most deeply inventive faculty, and admitted, not for pleasure only, but for the most important purposes. Such, to instance in a work open every season to the inspection of artists by the liberality of the marquis of Stafford, is the little vase in the middle of Titian's picture of the Bath of Diana. To the common observer it presents, as intended, a proper accompaniment to the toilet of the goddess, perhaps a vessel containing perfume, no matter whether disposed of here or there, provided it were introduced; yet more an ornament than a necessary adjunct in the composition: in the eyes of the artist, it is beheld as an instrument of inestimable value, in preserving the brilliancy and richness of flesh in full yet just character, by its own superior power of reflection; and producing a brilliant focus to the light of the picture, without attracting the eye too powerfully to itself; not to speak of its interrupting, by its beautiful form, the too great regularity of the mass of stone-work on which it stands.

It should never be forgotten, that there is no mode of obtaining excellence in painting but by a regular and steady pursuit. Let the original foundation of genius and talent be as good as it may, nothing short of persevering industry can raise the superstructure. "There is no royal road to geometry," said an Egyptian philosopher to his sovereign. "I know of no easy way to become a good painter," was the frequent remark of sir Joshua Reynolds to his pupils. There is indeed no short cut whereby the painter may arrive at the end of his course, and escape the labours of study and exercise; and of this the practice of the very greatest artists are satisfactory proofs. Apelles, it is said, never allowed a day to pass without exercising his art in a greater or less degree. The industrious exertions of the most able of the Italian artists are on record; and our own great example, sir Joshua Reynolds, is a host in himself: the immense quantity of

his works amply testifying his industry, as well as his attachment to the art. Indeed, without that entire devotedness which supercedes, though it does not exclude, all attention to other objects, it is impossible to obtain that facility of hand, or intelligence of mind, which resorts to the proper sources for a supply of materials to fill the canvas, to improve or embellish a composition, to supply deficiencies or correct defects, by a prompt and happy recollection of the most appropriate objects in form or colour.

The power of *execution* in painting being secured, the next step is to *invent* compositions, and execute the parts from nature; combining them with the principles of the art. Then comes the proof, whether the student has felt in his previous studies like an artist, or only as a man possessing no higher qualifications, than those with which his fellow-mortals in general are endowed.

When we consider the general extent of the gratification and information afforded by painting, it is extraordinary that a due attention to its principles is not yet admitted as a portion of polite education; since the knowledge of them so evidently increases the pleasure the art is capable of producing: the more particularly when, among the higher classes of mankind, it forms so very constant and material a source of their delights, and is so constantly also a subject of discussion, although arising from, and pretty generally decided by, sensation, rather than reason; and necessarily so indeed! "What can we reason, but from what we know?" Pope has justly said; and how can they decide with reason upon the merits of a work, who are ignorant of the principles upon which it is constructed? Yet so much of it is felt to be desirable, that every gentleman and lady conceives it necessary to learn to draw, regarding the art as worthy of a partial devotion of time; but this is generally effected in so inferior a degree, as to leave the polished learner utterly uninformed of its higher claims, its worthier objects, and its real utility.

To be truly a connoisseur or a judge of the qualities of painting when exercised in its highest style, requires, notwithstanding the impertinent slippancy of thousands of pretenders, a peculiar cultivation of mind; quite as much so as any other art or science requires an initiation into its principles, to be a judge of its effects. Our art, however, appealing to the sense of sight more than to reason, and producing its effects from the representation of well-known objects, has a great advantage over others, in that its end is more easily comprehended, although the principles which govern its practice are not less abstruse and difficult of application. Most men, therefore, of good mental capacities, are capable of understanding and feeling the grand and general points; such as of colour, whether it be like that of natural objects under peculiar circumstances; of expression; and if the story be fully and clearly exhibited; and of the general effect of the *chiaro-scuro*, whether it present an agreeable surface to the eye, &c. but of the subtleties of arrangement and execution, whereby difficulties arising from the nature and disunion of the materials and parts are overcome; of the delicate hues, which are covertly introduced to produce harmony; and of the art which attaches light to light, and dark to dark; to produce masses, without violating the principles of nature; of these things, hidden as they are in the mystery of the art, none but an artist can well judge.

This valuable art has, in the course of the world, been generally regarded as worthy of the greatest honours, and its eminent professors of a proportional share of estimation and rewards. Some of the greatest among men have, at different periods, upheld this opinion of its excellence, as its history testifies; but Pericles, at the head of the Athenian republic, was the first who duly estimated its value as a national political instrument; and encouraging it, in conjunction with sculpture and architecture, laid, in part, the basis of the long-continued fame of the city.

He satisfied the people, who murmured at the expense he indulged in in the public works, that, by advancing the interests of the arts, he was promoting their own glory. The love of fame was the first object of the Greeks, and their leaders therefore very wisely employed every means to maintain so useful a spirit. In compliance with this, Panæus and Polygnotus were employed by Pericles to adorn the public buildings with paintings, the subjects of which were the heroic actions of the most renowned among their countrymen; thus perpetuating a record of those deeds which excited to emulation, which, appealing to the natural and instinctive pride of man in a becoming manner, necessarily leads, wherever it is strongly felt, to great and useful conduct. There is no denying that painting is peculiarly adapted to this species of excitement, its effect being full and instantaneous; as the impression made upon the mind by witnessing the exhibition of a scene of heroism, of distress, or of delight, is greater than any which can arise from a detail of it in description. The interest in the relation is the weaker, as impression succeeds to impression; whereas in the fact, or the representation of it, the whole rushes upon the sight at once.

It is scarcely credible that, in direct opposition to this sentiment of the Greeks, any one should assert, in this enlightened period, that no inculcation of moral or religious truth can be effected by painting; the more so, when the works of Hogarth, the most instructive of painters, are in our hands, and no one who ever thinks of art at all can plead ignorance of them. An assertion to that effect has, however, been made by a very learned and ingenious author, in a critique on the *Life and Works of J. Barry, Esq.* (see *Edinb. Review*, Aug. 1810.) and he has gone the length of saying, "that, as to conveying moral, religious, or political, instruction in pictures, it is the most absurd of all absurd notions." If the ingenious gentleman means, by the word *instruction*, that kind only which properly belongs to painting, and to which, when speaking of the art, he ought to confine himself, viz. that sudden and unavoidable impression of truth, which most men, not utterly destitute of sense, receive upon the first sight of a well-regulated moral or poetical composition; more particularly such as, being drawn from common nature, applies common objects to its purpose; surely every day's experience is against him. We would appeal to himself, if he has never received the impression of disgust at pride; abhorrence of avarice and of sensuality; disdain of vanity and idle waste of time, a prudential hint of the folly of extravagance, and of trusting to gay dissipation for the enjoyment of happiness; from the series of pictures called *The Marriage-a-la-Mode* by Hogarth. What moral lectures in rhetoric would, or could, more completely illustrate, in a more universally-intelligible manner, the fatal effects of vice, or the beneficial ones attendant upon virtue, than that ingenious painter has done in this and others of his productions; as the *Industrious and Idle Apprentices*, the *Rake's* and the *Harlot's Progress*, &c. and yet, with these designs in his hand, has he risked so unjust and ungenerous a sentiment as his assertion conveys. Ungenerous, because, if true, it can be productive of no good to extend such an opinion, and it tends to diminish the regard which painting has deservedly received from the world, wherever its highest powers have been engaged; and unjust, because it is contrary to the acknowledgment of ages, and is upheld by no reasoning at all applicable to the case.

The appeal of the pencil is not so much to the understanding as to the heart and mind; by that the first excitement is produced, and thence necessarily follow reflections, attached to the nature of the images presented to the eye. Do we not fearfully acknowledge its power to corrupt young minds, and take constant care to keep improper drawings from their view? What mode of information does it pursue in this case, but that of presenting images of agreeable vices in an engaging manner? And is it allowed to be so sufficiently potent for the produc-

tion of evil, that all our care is requisite to counteract or prevent its influence in that respect; and shall it be denied any influence in the promotion of good! Forbid it reason, sense, and justice! If the objection to its utility be just, how shall we estimate the wisdom of those whom the learned author alluded to sufficiently honours on other occasions; of those who employed sculpture and painting as political and religious agents, to stimulate the ardent minds of the Greeks to heroism or devotion. The opinions of almost all ancient authors who have noticed it, are most decidedly in favour of the utility of the pencil; and those of the wisest politicians among the moderns have been amply illustrated by the use they have made of its powers.

The STUDENT in his PAINTING ROOM.

We do not intend to give a minute description of the instruments and tools generally used by painters; but will just observe, that oil-painting may be executed on primed canvas, prepared pannel, copper, or any other smooth substance. The canvas is sold at the oil and colour shops in London, many of which keep canvas and colours, with tools, ready prepared for artists. The canvas is either sold at so much a yard, or strained on a frame of deal wood of a certain size. The common sizes are 9 inches by 10, 10 by 12, and 17 by 21. Then three-quarters, kit-cat, half-length, and whole-length, for portraits.

Pannels of all sorts of wood may be used in oil-painting; but mahogany, wainscot, beech, and deal, should never be made use of unless they are well seasoned and dry. Old coach-pannels are preferable to any, and prove most useful, cheap, and pleasant to the brush of the young artist. They are easily procured at the coach-makers.

The old painters, chiefly in Flanders and Holland, where the high-finish style was so much in vogue, made use of plates of copper. The metal, by its smoothness and steadiness, meets pleasingly the point of the brush; and, if you think proper to smooth down the ridges of your painting, you may more easily do it on this substance than upon any other. We are told that rotten-stone, cuttle-fish, and pumice-stone, were often used for this purpose; and that it is to this simple process that we owe the astonishing smoothness of the works of Vanderwerf, Mieris, Gerard Dow, &c.

Having chosen the substance you intend to paint upon, you must set it steady and safe on an *easel*. This machine you will be provided with it at the colour-shops.

The next part of the indispensable apparatus, is the *pallet*, which is a flat piece of wood, with a hole to receive the thumb that holds it, on the fore-arm. The resting-stick, which is held in the left hand, is a proper fulcrum for the right, when employed. The brushes are what is generally called small or fine tools, and made of bristles; the camel's-hair and fable pencils are used for the minutest parts of the piece.

Now that the young artist is armed, and ready to proceed to business, we must advise him to delineate carefully on the canvas, pannel, &c. what he intends to paint, with a colour that contrasts with the ground of the pannel or canvas.

The most celebrated of ancient painters, chiefly those whose landscapes are still admired for their clearness and glow, did always paint their ground of a reddish colour, composed of red ochre and a little umber.

Disposition of the Colours on the Pallet.—To begin from the thumb of the hand that holds the pallet: flake white; Naples-yellow; yellow ochre; unburnt terra di Sienna; burnt ditto; vermilion; light-red; Indian-red; lake; Antwerp blue; Prussian blue; Vandyke-brown; Bolonian earth; blue-black; ivory-black. You may also make use of many other colours, but they will be only required on particular occasions; of which the young artist ought to judge for himself, and use his own discretion.

Composition of Tints to colour a Face.—The best tint to sketch-out is made of a little ivory-black and Indian-red.

red. This is reckoned by the moderns, and seems to have been adopted by the ancients, as the best general shadow-tint. The best tint for human flesh is composed of red ochre and white: it works pleasantly, and ought to be compared with the complexion of the person whom you are going to paint. A celebrated painter at Paris used to lay-on a coat of Naples-yellow and white as a ground before he began to paint a female face, persuaded that it was a process generally adopted by Corregio and Guido.

Local Colours or Tints.—1. Light-red tint. Ochre and white, with a little vermilion, as occasion may require.

2. Vermilion tint. Vermilion and white.

3. Carmine tint, generally used in finishing the cheeks and lips. Carmine and white.

4. Rose tint. Red shade (see N^o 10.) and white mixed to a middle tint.

5. Yellow tint. Yellow Naples or light ochre and white. It follows the lighter tints, and ought to be laid before the blues.

6. Blue tint. Ultramarine and white. It follows the yellows, and with them makes that beautiful greenish hue which a discerning eye finds in the colouring of the best masters; mixing with the red tints, it produces the tender, purple, reflected, shadows.

7. A lead-tint is made of ivory-black and white, mixed to a middle degree: it is a retiring colour; and is used in the gradations and in the eyes.

8. Green tint. Prussian blue, light ochre, and white, are used in the red shadows when they are too strong. We often meet with that tint in the works of the Venetian school, as well as in the paintings of the best Dutch and Flemish artists.

9. A general ground for shadows is made of Indian red, lake, and black, brought, by mixing flake-white, to a murrey colour of a middle tint. It is a pleasant clean colour, a little inclined to reddish pearl.

10. Red shade; composed of lake and a little Indian-red.

11. The warm shade is made of lake and brown pink, to strengthen the shade-tint (N^o 9.) *Asphaltum* and lake answer the same purpose.

12. Dark shade. Ivory-black and a little Indian-red. A proper glazing for the eye-brows and dark shadows. It works delightfully.

The brown and black ought to be worked with drying oil; and, if you wish to have it sooner ready to paint over and finish, grind with your knife on the pallet a little saccharum saturni, with the least quantity possible of white-lead. You must observe, that, when you use turpentine with your colours, you must mix more dryers with them, except with the whites.

The brown colours, worked with drying oil, are very apt to run, which would spoil the delicacy of your touches, and muddle all the tints. To avoid this, you may employ what is called *megellip*. The etymology of this word is not known; but I shall give my opinion upon it. It is made of about half and half of good drying-oil and mastic-varnish, beat up in a small pot kept for that purpose: it is curious to see these two fluid substances make a body which has the solidity of a *jelly*; therefore, as it is made ready before you begin to paint, I suppose it was called originally *made jelly*, and by corruption *megellip*.

Detached Observations, of Importance to the young Artist.

1. The best heads, which time has spared from the wreck of ancient sculpture, are Niobe and her daughter, Ariadne, Nero when young, Silence, and the Nile.

2. In the whole body, the colouring ought to follow the same system. The colour of the hair should be a rule to decide the tone of that tint which, like the key-note in music, ought to pervade all the masses either of light or shade. As we perceive a very material difference between the complexion of a fair and a black haired person,

it is the same in a landscape, where all objects, and their shadows and light, ought to partake more or less of the warmth of the skies. The works of Claude Lorraine and Gaspar Poussin, of Horizonti and Zuccharelli, ought to be studied attentively for this last kind of painting, and those of Titian and Vandyke for the former.

3. Transitions from light to shade are beautifully expressed by Ovid, in the sixth book of his *Metamorphoses*, and will please the young artist, who ought to be aware that the study of the poets and other writers of antiquity is of great use to direct the mind, warm the fancy, and purify the taste, of a painter:

In quo diversimode niteant cum mille colores

Transitus ipse tamen spectantia lumine fallit,
Usque adeo quod tangit idem est, tamen ultima distant.

4. The study of the *antique* is next to the study of nature; and indeed the great men, known by the denomination of *the ancients*, had studied her so closely, and with so much discernment and taste, that, seen through their works, she seems to have improved herself.

5. Polycletus made a statue, which the artists of his time used to call *the rule*, and which they copied as the best specimen of proportions. Pliny says that "he had established the certainty of the art by the art itself;" *artem ipse fuisse artis opera judicatur*.

6. In some painters dark colours predominate, as in Caravaggio, Spagnoletto, Manfredi, Valentino, and sometimes Guercino and Salvator Rosa; in some a paleness, as in Vouet and Nicolo Poussin; the purple, in Bassano and Lingelback; and grey, in Teniers. This last tint seems to have originated in the works of Teniers from the Haerlem or Antwerp blue he freely used. We have to lament that those beautiful masterpieces which came from the hand of sir Joshua Reynolds have already lost their freshness and beauty of colouring; the paintings of that original genius, George Morland, are also losing every day the vanishing sweetness of their magic tints.

7. The young artist, who by dint of application to the art, and careful study of the best examples, is at the point of producing something worthy of himself, and honourable to his country, should endeavour to select those pigments which are likely to stand for ages. Too often does the painter labour for the pressing necessities of the moment, heedless of lasting fame: but the encouragement and powerful protection which the arts in general, and this especially, receive from the wealthy class of society, will enable him to have a greater meed in view than a pecuniary and momentaneous reward; therefore he ought to avoid, as much as possible, those pleasing glazings produced by lakes and pinks, which evaporate so quickly; the mineral pigments, well managed, are able to supply the place of the vegetable ones, and secure to the artist a more lasting reputation. Burnt terra di Sienna, well chosen and well ground, mixed with a little blue, will answer the purpose of brown pink; and unburnt Sienna, of the same nature, has a transparency nearly equal to Dutch pink and yellow lake. *Asphaltum* has been much in vogue of late years on the English pallet, and *mummy* had also a long run in France; but their use is very precarious, as they give a dingy tint, unless they are constantly employed by themselves. However, it is a very good colour in glazing, and produces in the shadows a depth seldom to be equalled by any other process.

8. It is with sorrow that we are obliged repeatedly to confess, that our modern performances do not keep their brightness as ancient pictures have done to this moment. To what is this change to be attributed? Some good judges are of opinion, that our oil is not so pure, or that we use it too freely; they add, that we are too impatient, and that the addition of dryers alters the colours. It is certain that the old masters used as little oil as possible, working their pigments with spirit of turpentine, and never admitting the help of saccharum saturni or drying-

oil

oil but when they painted pieces on which they built no part of their fame.

9. Let the student place his easel in such a way as to make the light pass over his head; one single light, of course, is necessary to paint by. Some artists, in their hurry of business, have painted small subjects by candle-light, and with great effect; but this supposes in them a great knowledge of the power of their pigments, as it is evident that all yellows lose a great deal of their intensity when seen by artificial light.

10. The question, whether it is better to paint with few or with many colours, has been long agitated, but has never been decided; every artist following and indulging, in this as in many other points of the art, his own ideas and fancy. As it is placed beyond doubt that *there are but three elemental colours in nature*, the mixture and composition of which produce those innumerable tints which delight the sight of man, and constitute the beauty of the universe, it seems natural to think that three pigments, yielding these three colours, viz. red, yellow, and blue, would be sufficient to transport from the pallet to the canvas all hues imaginable; white, however, being the result of these three colours mixed, and the black the absence of light, ought to be represented by pigments particular to themselves. According to this principle, no more than five pigments are required to paint any subject; this is true in theory; but, when we sit down to practise, we find that our colours, *as they are*, soon become very insufficient. We have no true red nor true yellow; the blue is the best; as the colour called Prussian blue approaches nearer to perfection, uniting the two most essential qualities, depth and transparency. Carmine and lake partake of these qualities, it is true; but their red implies blue, and therefore is not a perfect red. Vermilion blazes with great brightness, but inclines to yellow, and has no transparency. Terra di Sienna, well chosen, well ground, and unburnt, offers a good yellow, but not unmixed with red; and yellow ochre, so useful in local tints, a colour that works so pleasantly, and has so strong a body, wants both transparency and depth. After these observations, which might be exemplified to a great length, but are sufficient to make the student understand easily and perfectly the point we argue upon, it appears clear, that we must have recourse to other earths and minerals, or other preparations, to arrive at the several tints which nature offers to our ingenuity as models to copy after. There is, for instance, in *burnt sienna*, a certain kind of yellow and of red, which, if they could be separated and worked by themselves, would be of great use; but they are so united in the natural state, that man's industry is unable to part them; yet we may imitate their hue, by mixing a little lake with raw or unburnt sienna. But, what will be the result? In a few years the lake will lose half of its intensity, while, on the contrary, the sienna earth will keep steady, if not increase in strength, and then produce a discord where you had brought-in harmony. We may say the same of *Cologne earth*, of *Indian-red*, and, in fact, of all compound colours, whose genuine complex tints may be imitated by the union of two pigments. The reason of this we conceive to be that, in the first instance, viz. in burnt sienna the red and yellow are homogeneous elements of that kind of earth, both endowed with the same strength; whereas, in the latter case, *raw sienna* and *lake* are two heterogeneous principles, of unequal vigour and different tendency.

11. The room in which your easel stands, and supports the canvas ready to receive your thoughts embodied by the help of pigments; in one word, your *painting-room*, ought to be pervious to one ray of light only, that is, to have only one window; or else you will lose yourself in a maze of half-lights and half-shadows, out of which you will never be able to extricate your pencil. Louis the XIVth of France (who understood much better the art of war than the art of painting), having determined to fit

for his portrait to M. le Brun, one of the best artists of his realms, commanded his attendance in a well-known apartment of Versailles called *L'œil de Bœuf*, the Bull's Eye, a room surrounded with windows. The painter felt uneasy, but the awe excited by his sovereign forced him for some time to an involuntary silence: he sketched and rubbed out, drew again, and wiped off what he had done; till the king asked him what could be the cause of his uneasiness. The polite artist, in the true French style, answered, "The rays of glory which play around the head of your majesty are too strong for mortal sight; therefore I shall humbly crave the honour of painting my sovereign in a darker room." The king understood him; and ordered the easel to be removed to a single-windowed apartment.

OF THE DIFFERENT KINDS OF PAINTING.

As all the objects in nature are susceptible of imitation by the pencil, the masters of this art have applied themselves to different subjects, each one as his talents, his taste, or inclination, may have led him. From whence have arisen very minute divisions: the Encyclopædia Britannica enumerates no fewer than eighteen different classes of painting. The principal branches of the art are, however, History, Portrait, and Landscape. What has been said throughout the course of this article applies chiefly to the most important branch, history-painting; it remains therefore to insert some rules and observations upon the two other branches: and we shall then conclude with some remarks upon what may be called the *trade* of painting; namely Economical or House Painting.

It is of great importance that an artist should consult his own genius and ability before he engages in a particular line of art:

HISTORICAL PAINTING.	'Ere on the waiting ground his ready hand
	Sketches new forms, and bids his groups to stand;
	First let the painter pause, reflect, and find
	What subjects best may suit his pregnant mind.
	For various subjects various talents claim;
	And lofty souls at lofty laurels aim,
	While modest merit courts an humbler fame.
	Of <i>History</i> some boldly search the store;
	And dip their pencils in the reeking gore
	Of hard-contending hosts. The bloody fight,
LANDSCAPE.	And towns in flames, become their sole delight.
	They show the pallid virgin, struck with fear,
	And mothers weeping on their children's bier.
	Whilst others, fond of calm and rural schemes,
	Will seek the shades, and trace the winding streams;
	Place on their banks the shepherds and the flocks,
	And goats that seem to hang from shelving rocks.
	There Dryads meet with Satyrs in the dance;
	Here Phyllis treads with wonted elegance;
	And from the neighb'ring market brings with ease
PORTRAIT.	The lighter baskets of her barter'd cheese.
	Prometheus-like, fraught with celestial ray,
	Our dearer friends from nature these pourtray,
	And on the lasting canvas bid them live.
	A mother's face to orphans they revive;
	Or to the widow's mind, by magic art,
	Retrace the faithful partner of her heart,
	Whom death has doom'd to rest in calm repose:
	And thus, by fictitious joys, soothe real woes.
	Fresco.
Or porticoes, with rapid pencil roams;	
And boldly sweeps his giant figures o'er	
A work immense! Here swells the distant shore,	
With bright'ning rocks, beneath the azure sky.	
Here palaces allure the wond'ring eye	
In perspective; and, whilst our minds admire,	
Deceive the sight, and gradually retire.	

Others

MINIATURE. Others will choose, their talents to display,
A smaller field; and their inventions lay
On skin prepar'd, on vellum fine and smooth,
Or on thin plates of elephantine tooth;
Reduce all figures to a dwarfish size,
And bid, within a ring, abridged worlds arise!

OF PORTRAIT-PAINTING.

If painting be an imitation of nature, it is doubly so in a portrait; which not only represents a man in general, but such a one as may be distinguished from all others.

If any thing can be definitely ascertained concerning the significance of features, and the expression of the physiognomy, it must be effected by the diligent comparison of faces of which the history is accessible, and the character can be investigated; and, if a standard of beauty, binding on all nations, can ever be obtained, it must be accomplished through the selection of those traits from individual nature which indicate compatible excellences. Conscious that histories of the invisible are like biographies of the anonymous, Suetonius is careful to sketch in words the figure of every eminent emperor: but how weak a substitute is language for the pencil! when a correct personal idea is wanted of the active who are at a distance, or of the celebrated who are no more, it is only the portrait-painter who can overcome the impediments of space and time, and give ubiquity to the living, or immortality to the dead.

The connection between biography and portrait-painting is intimate indeed; "for as, in contemplating the portrait of an eminent person, we long to be instructed in his history, so, in reading of his actions, we long to behold his countenance."

The impression of a striking portrait or statue is great and lasting, and rivals that of the person whom it represents. When Antipater was accused of extortion, his young son Cassander was sent before Alexander to attempt the father's defence: but the king, frowning on the youth, exclaimed, "You shall pay for this, if what the people say be true." Twenty years afterward, Cassander went to visit Delphi, where stood a statue of Alexander; the sight of which so powerfully renewed the remembrance of this mortification, that he was seized with a violent trembling, and could not for a long time resume his self-command.

Most of the renowned painters, both of ancient and modern times, have blended the peculiar practice of portraiture with their other studies; and some have devoted their time to it as a principal object of attention. Among those whose talents assiduously to embalm the memory of ancient Greece, by the cultivation of this delightful art, the names of Panæus, Polygnotus, Apelles, Aristides, and some few others, have escaped oblivion: but, unfortunately, we enjoy only their renown; and must be content to form a judgment of their merits through the feelings and language of others. By the authors who mention their works, we are led to believe that they carried portraiture to the utmost degree of perfection; particularly Apelles, in honour of whose transcendent abilities the whole vocabulary of eulogium has been exhausted.

On the revival of the art of painting in the thirteenth century, portraiture soon became an object of attention, since we find that Giotto, who died in 1336, practised it with very considerable success; and to him we are indebted for the portraits of many of the most conspicuous characters of his time. His historical pictures, as well as those of Masaccio, and all the older artists, are full of figures which bear every appearance of portraits, and some are known to be such. Most probably they painted from those heads of their friends which suited the character they wished to introduce; and certainly that is a means of obtaining a greater degree of natural expression than mere fancy can supply. Raphael, in his greatest work, the labours of the Vatican, employed the same

means. Engaged by Julius II. and Leo X. to adorn the pontifical palace by the exercise of his extraordinary talents, and to celebrate the principles and triumphs of the Christian church, he did not lose sight of the renown due to such munificent patrons; and, by introducing their portraits in the series of pictures he there painted, secured to them a portion of his own immortal fame. Many portraits of the cardinals and nobility of Rome, who were either immediate friends of the artist or promoters of the work, were also admitted; but it must be acknowledged, that the anachronisms created by it are frequently offensive to the judgment, since it is scarcely possible to separate the ideas associated with the figure of one man whose history we are acquainted with, and imagine it to be the image of another of prior date, and character totally distinct. When portraiture is attached to an historical subject, and the real actors of the scene are introduced, it then adds a tenfold interest to the work.

It was not in historical pictures alone that Raphael practised portraiture; he has also left us several superior examples of portraits specifically such, of which those of Leo X. and of Julius II. in the gallery of the Louvre, demand the warmest praise for their individuality, dignity, and character. His works of this kind, however, were but few, compared with those of his great contemporary Titian, who is generally regarded as the father and head of this peculiar branch of the art, having executed it with a greater mixture of truth, simplicity, and grandeur, than any other. Giorgione died so young, that his productions in portraiture are necessarily few; but some of those are exquisitely beautiful; witness the small picture he painted of Gaston de Foix, and a servant putting on his armour; formerly in the Orleans gallery, but now in possession of the earl of Carlisle.

Leonardo da Vinci, Sebastian del Piombo, and most of those who obtained celebrity at the period when the art of painting flourished in Italy, attended to portraiture, and there are very few of whom some examples do not remain; but the number of those who attached themselves to it entirely was small. In Spain, Velasquez attained a degree of perfection nearly rivaling Titian; but we have very few of his works in England: more rich in the labours of Vandyke, we are better enabled to appreciate his powerful taste and talents, and may well boast of the treasures we possess, wrought by his inestimable skill. Next to him, Holbein, Janfen, More, Lely, and Kneller, are the names of those most estimable for their portraits, among the number of artists with which this country has abounded from the days of the former, till the sun of our pictorial hemisphere arose in Reynolds, the father of British art; of whom it may be doubted whether the art he displayed, in uniting taste and truth with style and effect in portraiture, in a degree far surpassing any other painter, added to a just feeling of character, does not more than counterbalance acknowledged deficiencies in drawing, and sometimes in execution, and decidedly place him at the head of this branch of the art.

The following remarks on producing likenesses are extracted chiefly from a work by Sig. Rubeys, of the Academies of Painting at Bologna and Venice, but printed at Paris, in Italian and French, in 1809.

As the face is the focus of expression with respect to the whole body, so that part of the face which may be covered by an oval patch, including both eyes and reaching half way down the nose, is the focus of expression with regard to the whole face. If a friend, a servant, or any other inmate, be wrapped up in a domino, so as to hide all the countenance except this focus of expression, we should know him instantly, any-where, in unexpected circumstances; but, place a patch, a mask, or goggle-spectacles, over this focus of expression, and a slight change of dress will deceive us as to the person.

The Dutch painter Ten Kate, in the preface to his translation of our Richardson, observes, that the artist should always make his outline with the object at a great

distance; but that, at every step in the progress of his portrait, he should approach nearer and nearer to his model, so that all the details may in the first instance escape his attention, and afterward attract it in the order of their conspicuousness. This rule, of which so many Dutch painters avail themselves, and which is the grand cause of their portraits uniting the merit of distant and that of contiguous effect, has escaped most of our modern portrait-painters, because their attention is principally occupied with the drawing of the figure.

Sig. Rubeys justly remarks, that improbable lights, *accidens de lumiere*, should always be avoided: they excite, by association, the idea that something extraordinary is about to be undertaken or undergone by the personage; an idea which excites the mind to conjecture, and which banishes the supposition of repose, so essential to a form of which the expression is tranquil. *Catching lights*, as our artists call them, are too common in English portraits. M. Rubeys is particularly averse to lights from above, which excite the idea of imprisonment in a dungeon, and darken the expressive concavity of the orbit of the eye. He prefers a level, or gently-slanting, light; a front or gentle side-light; a full to a faint, a diffuse to a concentrated, light. In this opinion he has Titian's sanction, who had no objection to paint in the open air, and who imitated without caricature the shadowings of nature. Rembrandt carried to excess the opposite method of representation.

Models commonly assume, during the slow process of delineation, an expression of *ennui* which painters rightly endeavour to avoid in the drawing; yet the attempt at a counter-expression, as of intense thought if the model be grave, or of hilarity if the model be gay, may not always be hazarded without the introduction of some appropriate and emblematic object. The scholar may be painted with his book, the soldier with his weapon, the voluptuary with his wine, or with the portrait of his mistress; but repose is the natural, and ought usually to be the prevailing, character of the portrait; and accidental expression, whenever it does not indicate the leading feature of the character, should be avoided. Great portrait-painters, such as Raphael and Titian, have occasionally bestowed much labour on the dress and the accompaniments: but these minutiae ought never to indicate a period of time, or a line of rank, in which the dress and appendages could not occur. In general, the method of Vandyke, who singles out for attention the physiognomy, and throws into obscurity the distracting but explanatory language of the paraphernalia, is most advisable. The French painter Rigaud erred in the opposite direction, and studiously rendered his draperies and appendages picturesquely but ostentatiously, attractively but glaringly, conspicuous.

The portrait-painter ought also to accommodate his pallet to the complexion of his model. A fair person requires, in the sketch as well as in the finishing, colours different from a dark-haired one; and, if the young artist does not at once mix a tint which ought to be the keynote of the whole performance, he is sure to wander in perplexing mazes, and will never produce any thing pleasing to himself or to others. Some painters have taken a different way to come to the same point: the author of these familiar observations remembers to have seen a foreigner of great note in the art of painting, cover the outlines of a face with patches of colours according to the tint which they were to produce in appearing through the colours used afterwards. The forehead was painted white, the temple blue, the cheeks and mouth with pure vermilion, the shadow of the neck brown, and the breast was divided into several pieces, according to its position and shape. He was astonished at this proceeding, but could not help admiring the result. The artist pretended to have inherited this manner of colouring from the first masters in Italy, Corregio, Guido, Guercino, and most of those whose talents have immortalized the name of the

school of Bologna. Another painter of great merit used to lay a coat of Naples-yellow on the canvas where he intended to paint the face of a young woman, and obtained from this process a general tint in his dead-colouring, which tended considerably to produce harmony.

Portrait-painting, when justly considered and executed, is not, as may be imagined, a tame business of imitation, a mere laborious exactness in copying the precise form which is placed before the artist. Mere likeness is a matter produced, as we see every day, by the dullest of the dull; or by men who will copy to deception the turn of a hair, or the folds of drapery. But, while such artists make the features of exact form, they leave them void of animation, of just colour, or of any degree of sense or sentiment; in short, it is merely a picture stuck against a wall. Unless the mind and character can be infused into the likeness, you certainly have not a man before you, but a picture. If the first sketch could be taken while the party was engaged in some interesting action or conversation, and unconscious of what was doing, then we might expect to have something fit to remain *upon record*. Hogarth sketched many (indeed most) of his portraits in this manner; and, in other cases, he was well acquainted with the *character* of those he had to delineate. But it is not always, perhaps not often, that a portrait-painter enjoys the opportunity of knowing enough of his subject, or sees enough of him, to avail himself decidedly of his natural propensities. In many cases, on the very first introduction, a sitting takes place; and then the only means of studying the character is by making *unnoticed* observations on the general manner of carriage, or of expression, by prolonging discourse before the sitting, by making occasional interruptions, and by throwing objects of attention in the way, which may in some measure elicit an unconfined freedom of action. But it is only by doing this *unobservedly*, that actual character can be discovered. The instant a person is aware that he is noticed, farewell to nature: restraint immediately usurps dominion, and baffles the most quick and intuitive perception. It will happen, however, very frequently in this portrait-painting age and country, that those who, by the calls of affection or of vanity, become subjects for the painter, have "no character at all" to distinguish them from their fellow-mortals; and, in these cases, the painter is entirely at liberty to choose his own action, and indulge his fancy, according to the sex, the age, and quality, of his employer.

Then naturally arises the question, "Whether it is proper, in portraiture, to correct the defects of nature?" Likeness being the essence of portraiture, it would seem that we ought to imitate defects as well as beauties, since, by this means, the imitation will be the more complete. It would be even hard to prove the contrary, to one who would undertake the defence of this position. But ladies and gentlemen do not much approve of those painters who entertain such sentiments, and put them in practice. It is certain that some complaisance in this respect is due to them; and there is little doubt but their pictures may be made to resemble, without displeasing, them; for the effectual likeness is a just agreement of the parts that are painted with those of nature; so that we may be at no loss to know the air of the face, and the temper of the person, whose picture is before us. All deformities, therefore, when the air and temper may be discovered without them, ought to be either corrected or omitted in women's and young men's portraits. A nose somewhat awry may be helped, or a shrivelled neck or high shoulders adapted to a good air, without going from one extreme to another. But this must be done with great discretion: for, by endeavouring to correct nature too much, we insensibly fall into a method of giving a general air to all our portraits; just as, by confining ourselves too much to the defects and littleness of nature, we are in danger of falling into the low and tasteless manner.

But, in the faces of heroes and men of rank, distinguished either

either by dignities, virtues, or great qualities, we cannot be too exact, whether the parts be beautiful or not: for portraits of such persons are to be standing monuments to posterity; in which case, every thing in a picture is precious that is faithful.

OF LANDSCAPE AND ARCHITECTURE.

We are now come to that peculiar application of the art of painting, which represents extended views of whatever is attached to the surface of the earth; as mountains, rocks, woods, buildings, &c. It is also applied to views of the sea, particularly when any portion of the land is seen.

When our young painter has made a sufficient progress in those principal branches of his art, the designing, perspective, colouring, and drapery, of human figures, he should turn his thoughts to landscape and architecture: for, by studying them, he will render himself universal, and qualified to undertake any subject.

The great points which the artist ought to aim at who practises landscape-painting, are, to mark just proportion and true perspective; to obtain a free and varying touch, which may fully characterize the various objects he must of necessity be called upon to imitate; and to produce the effect of space, or what is technically termed *distance*.

There are two kinds of proportion which require attention in order to produce a pleasing landscape. One is, between the quantum of the surface of the picture appropriated to the sky, and that allotted to the earth, or the figures intended to be introduced, be they mountains, houses, rocks, or trees; and the other is that of the various parts of the picture, reciprocally, according to their various distances in the scene. Of the latter, after the size of the objects on the fore-ground is determined, *perspective* is the sole regulator: therefore, a knowledge of the principal rules of that science is here absolutely requisite. With regard to the former of these proportions, the subject of the picture will undoubtedly furnish the best means of deciding justly. If the scene be mountainous, viewed from below, and at a short distance, the space allotted to the sky must be small, and near the top of the picture. If, on the contrary, the view be of an open champaign country, the reverse will be the just characteristic of the picture; and the sky will occupy by far the larger part. In general, much more grandeur is acquired by a low horizon, and an ample space of sky, than by any other proportion; and, next in effect to that, is the direct reverse.

Though landscape-painting has not the same powerful means to work with as historic painting, which enjoys the great advantage of animation and expression in its subjects, and likewise presents the greatest difficulty to overcome; yet, no true and enthusiastic lover and observer of nature can avoid acknowledging that it possesses the power of exciting great interest in the mind. A storm represented by the pencil of Gaspar Poussin, or a calm by that of Claude, will not fail to impress the observer with ideas of terror, or of gentleness. The one, who skilfully traced the paths of the wind in its ravages, and the deformity produced by the falling shower; and the other, who loved to dwell upon the beauties of the earth in moments of undisturbed tranquillity; equally interest our feelings, and excite those emotions which such varied circumstances in nature are calculated to inspire.

Compared with such views of the higher objects and aims of art, the practitioner in *landscape portrait-painting*, or one who paints views of particular spots, sinks into about the same ratio as the portrait-painter of mankind holds to him who engages his talents in the representations of history. Yet still his task is not devoid either of pleasure or interest. The same principles are required for practice, but they are unfortunately often obliged to yield to peculiarities which destroy their simplicity and prevent their effect; unless the artist has obtained that extraordinary talent of introducing casual circumstances, as ideal

shadows, accidental reflections, and agreeable figures, in such a manner as to unite or improve imperfect forms, and guide or attract the eye from disagreeable parts. As is the aim of the improver of grounds, or, as he is now termed, the landscape-gardener, such ought to be that of the landscape-painter. Wherever blemishes in form occur, they should be hidden, and, where natural beauties are bestowed, they should be exhibited to view; and adorned with the proper adjuncts of trees, water, clouds, or figures. A person not conversant with the powers of combination and contrast in design, can have no conception of their extraordinary power to heighten the effect of the dullest scenes, and the meanest objects. It should therefore be the principal task of the artist to observe those which are constantly occurring among natural objects, their effects, and the different sentiments they excite; so that he may possess a store to recur to, in time of need.

It is a wrong idea that has been often inculcated by ingenious writers on the art, that a landscape ought to exhibit Nature truly and exactly as it is represented on the retina of the eye. There are parts which ought to be hyperbolized, if we may use the expression, and others that are better kept down. The medium of the air between the object and the eye, throws harmony on the whole, which is not attainable on canvas but by a severe attention to the effect of light and shadow; observing at the same time, that allowance must also be made for the difference of size in the objects, and the disadvantage of being seen in an apartment; whereas the original landscape is unbounded, and animated by torrents of unimpeded light poured incessantly upon all its parts. It is curious to observe, that the mechanism of the eye is equally affected by a well-painted landscape as by the natural one; that is to say, that we experience a sensible motion in the orb of the eye to swell or flatten the crystalline, as we pass from a near to a distant object: this effect is less perceptible in looking at a print.

It is obvious that, in a landscape, the trees of the foreground cannot be introduced in the first drawing, or sketch, unless they are of so prominent a feature that the sky becomes subordinate to them.

The general tone of your *dead-colouring* must be determined in a landscape from the hour of the day, and the season of the year; from the state of the sky, whether clear and illuminated with a bright sunshine, or cloudy and overcast with misty vapours. The grey and tranquil tints of morn reject the brilliant pride of cinnabar and vermilion, of burnt sienna, and other warm pigments; the gentle warmth of Naples-yellow, the natural demitint of Cologne-earth, are here mostly required; but yield their province to the above-mentioned, when the dispenser of light rides up to his meridian station; and when, insensibly verging to the arms of his beloved Thetis, Apollo inclines his purple car to the west, then carmine, lake, Indian-red, mixed sometimes to the golden hue of ochre, or the azure brightness of ultramarine and Prussian blue, ought to assist the art in her way to give a good imitation of Nature. Even those parts of day ought to be modified by the season of the year; the finest morning in December ought not to be painted like a summer day; and the showery, yet pleasant, evenings of April and May, bear little resemblance to the sunset of autumn. No landscape-painter ought to expect any attention from the public, if he does not forcibly feel the justice of these observations, and put them in practice.

The Greeks were not at all addicted to landscape-painting. Pliny, who reckons as Greeks all those artists who practised in Sicily, at Alexandria, or on the Asian coast, mentions a hundred and thirty-three Greek painters; but, although he abounds with anecdotes of the figure or person painters, neither he nor Pausanias notice any one celebrated picture, or painter, of landscape.

Among the Romans there were painters of landscape. Pliny says, that Ludius, in the time of Augustus, first introduced that agreeable way of painting, on the walls of apartments

apartments and galleries, "towns, porticoes, shrubberies, groves, hills, pools, cascades, rivers, and pleasant shores." Here are all the elements of landscape. The same artist, he continues, also painted in alcoves, at a small expense, views of seaport-towns, pleasingly executed. Landscape-painting, then, began with the decoration of walls of rooms, as if man were born to live abroad, and can only banish from his home the idea of its being a prison, by giving to its boundaries a semblance of the horizon of Nature.

Vitruvius names Apaturius as a good painter of architectural scenery; and another prospect-painter of the Romans is characterised by Pliny, one Serapion, who painted scenes well, but could not paint a human figure. In those remains of ancient painting which occur in the baths of Vespasian, and the apartments at Pompeii, the pannels, which include landscape, exhibit a most imperfect perspective.

The following remarks on the rise and progress of landscape-painting, are extracted from a Discourse on Prospect Painting, delivered at Norwich, by W. Taylor, jun.

"The earlier writers on art, by which I mean those who flourished before the age of Trajan and the Antonines, constantly entitle their books *On zoographers*, *On zoography*; this was their only usual denomination for painting, as if still-life did not merit the name; but the later writers on art, (see the list in Junius De Picturâ Veterum, p. 57.) such as Hypsicrates, Protogenes, &c. treat *περί γραφικῆς*, which substitution of the word *design* to the word *life-drawing*, announces that art was got to include in its range other than living nature; and of these writers so great a number flourished at Constantinople, that one may infer that city to have become, instead of Rome, the seat of the fine arts, and to have cultivated a branch of it which never attained much rank at Rome. Indeed, no circumstance seems so adapted to give a fashion to prospect-painting as the transfer of a seat of empire. The personal reminiscences of the migrated, the historic curiosity of their descendants, must have given, at Constantinople, a high value to every representation of what was dear to personal affection, or beautiful, or celebrated, in the old country.

"These notices of the state of prospect-painting, among the ancients, are very scanty; yet I have not omitted to consult Junius De Picturâ Veterum, Winkelmann's *Geschichte der Kunst*, the *Antiquités de Caylus*, and the *Memoires de l'Académie des Inscriptions*; to say nothing of the domestic sources of information. No inferences can satisfactorily be drawn from them as to the natural progress of art, and the means most conducive to its perfection. The general law of progress must be sought in the history of modern painting.

"In order to form some idea of the probable course of practice, let us single-out an individual artist, who had regular opportunities of study, and habits of industry; one who is alike connected with the Italian and the Flemish schools. Paul Brill was born at Antwerp, in 1554. Formed under Volterman, his first delineations were of rustic objects, imitations of the ordinary nature which surrounded him. Invited by his brother Matthew, who was employed at the Vatican, into Italy, he there attached himself to Apennine scenery, to views of mountainous and woody expanse, whose natural sublimity and effect he heightened by the strength of his light and shadow. In a third stage of his progress, he was remarked as a painter of gardens the most green, of paradisaical groves, where nymphs were seeking sequestered baths in shaded rivulets. I still recollect in the gallery at Florence a painting of his on alabaster, which represents Christ healing the blind Bartimeus. The figures stand on an elevated foreground; in the distance are purple mountains peering above forests of palm; hills clad with the olive and the vine; the brook Kedron, shining as it winds, and bordered with dwellings of a beautiful architecture; a remote view of the majestic holy city; all together forming one of the richest land-

scapes on which the eye of man can rest; and all contributing to enhance the value of the miracle, and to inspire gratitude to the giver of sight. Few subjects are so well adapted for the prospect-painter, as this, to sink the figures in the scene serving to impress the topic. Finally, Paul Brill chose to delineate temples, columns, triumphal arches, classical ruins, and edifices, a taste which he bequeathed to his friend Nieuland, who completed his last productions."

Among the Italians, the earliest landscape-painters were, Bernazzano of Milan, and Muziano of Brescia. Both were remarkable for the rusticity of their scenery; inasmuch that the latter got the nick-name of *The Country Boy*, *Il Giovane dei Paesi*. Fabrizio Parmegiano and Giorgione Barbarelli have also left something of a name for imitating ordinary objects, and making trees distinguishable from one another.

Titian, by the accidental use of his pencil in the delineation of mountain-scenery, became the founder of heroic landscape. Fiorillo enumerates Viola and Angioli among those who first profited by the nobleness of his manner, and who carried aerial perspective, or the art of bedimming distances, to a new perfection. But Salvator Rosa, born in 1614, was in this line of art to attain the highest rank. Simplicity of design and sublimity of impression mark his every composition. In his landscapes he aims at exciting a shudder, a sort of panic fear, by the wild horrors of the scene. His forests have a gloom which announces to the passenger a homeless and inextricable labyrinth full of abysses. His mountains look like decaying pillars of the world. The approach of night is his darling hour, banditti his favourite company.

A Dutch artist, named Peter Molyn, attempted to compete with Salvator Rosa, and acquired among the Italians the nick-name of *Il Cavalier e Tempesta*, from his rage for painting storms, and violent accidents of life.

In the time of Salvator Rosa, two other artists acquired a rival celebrity. Gaspar Dughet, called also *Poussin*, after his relation and master, was born at Rome in 1613. He studied the bolder phenomena of nature, and imitated them successfully; but quitted this romantic scenery for a softer character of landscape, acquired by taking views at Tivoli, Albano, Fregcati, and in such enchanted grounds. His verdure is too uniform and diffuse; the shapes of his leaves he varies more than the moderns, who study gross effect; but the dingy colouring, especially of his foregrounds, delays the effect of his beautiful compositions. His figures are commonly heroic or mythologic, and operate, like a poetic inscription at the bottom of an engraving, in attuning the fancy to the scene. He made written descriptions of the pictures he exposed for sale; and his price, though moderate, was inexorable. The third man of this illustrious triumvirate, and now the most admired of the three, was Claude Gelée, called *de Lorraine*, from the province in which he was born, about the year 1600. He has all the grace and classical taste of Dughet, with a brighter and more various colouring; and he especially excels in the effects of sunshine. He may have been surpassed by Titian in wild and romantic scenery, and grandeur of style in design; but neither he nor any other has ever equalled Claude's truth and purity of colour and effect. Hitherto the perfection with which he has represented the effect of the atmosphere is unrivalled. Even Cuypp (his cotemporary) and our own Wilton, who have arrived the nearest to him, still lack his completion of effect. Their art is more apparent than his in his best works; and great chastity and sweetness of taste appear generally to have governed his choice of scene and of parts. Nicolo Poussin has left a great number of highly-interesting landscapes, in a style peculiarly his own. He appears to have delighted in the hues of the earth and trees after wet, and without sun; and in the tones of twilight; which admirably coincide with his choice of scenery and the classic objects he introduced into it. By Wilton, the taste and talent of Claude for producing the air-

air-teint (as that which produces the effect of the atmosphere is technically termed) has been most powerfully revived; and of him it may truly be said, that, had his patience in completing his pictures been equal to his taste in colour, composition, and effect, the ancient master might have fallen under the modern one; and we should have had to boast, that the greatest painter of landscapes the world ever produced was an Englishman.

Paolo Veronese is in *architecture* what Titian is in landscape. To excel in landscape, we must, above all things, study nature. To excel in architecture, we must chiefly regard the finest works of art; such as the fronts of ancient edifices, and the fabrics of those moderns who have best studied and best copied antiquity. Next to Brunelleschi and Alberti, who were the first revivers of architecture, came Bramante, Giulio Romano, Sanfivino, Sanmicheli, and, lastly, Palladio, whose works the young painter should, above all the rest, diligently study and imprint deeply on his mind. Nor is Vignola to be forgotten; for some think he was a more scrupulous copier of antiquity, and more exact, than Palladio himself, inasmuch that most people consider him as the first architect among the moderns. Amongst that great variety of proportions to be met with in ancient ruins, Palladio has been extremely happy in choosing the best. His profiles are well contrasted, yet easy. All the parts of his buildings hang well together. Grandeur, elegance, and beauty, walk hand in hand in them. In short, the very blemishes of Palladio, who was no slave to convenience, and sometimes perhaps was too profuse in his decorations, are picturesque. And we may reasonably believe, that it was by following so great a master, whose works he had continually before his eyes, that Paolo Veronese formed that fine and masterly taste which enabled him to embellish his compositions with such beautiful structures.

In this difficult path of the art, perspective rules every line, and yet begs the help of the eye to avoid dryness. Le Barbier l'Ainé, who long held a distinguished place among the members of the Academy of Painting at Paris, used to leave on his canvas all his lines drawn according to the strict rules of perspective, and then go out to study Nature on some building whose style was analogous to the back-ground of his picture. He was justly persuaded that the medium, the air, through which we perceive the objects, alters always, in some degree, the general rules of perspective; and that a painting, which is to represent Nature, would look like a mere architectural drawing, if the eye was not to be consulted, and Nature allowed to soften the rigidity of Art.

The study of architecture cannot fail, in another respect, of being very useful to the young painter, inasmuch as it will bring him acquainted with the form of the temples, theatres, basilics, theatres, and other buildings, of the Greeks and Romans. Besides, from the basso-relievos with which it was customary to adorn these buildings, he may gather, with equal delight and profit, the nature of their sacrifices, arms, military ensigns, and dresses.

OF ECONOMICAL PAINTING.

ECONOMICAL PAINTING is that application of artificial colours, compounded either with water or oil, which is employed in preserving or embellishing houses, ships, furniture, &c. The term *economical* applies more immediately to the power which oil and varnishes possess, of preventing the action of the atmosphere upon wood, iron, and stucco, by interposing an artificial surface.

Among the utensils of the painter, it is needless, but for rendering the article complete, to mention brushes and pencils of all sizes as absolutely necessary. The brushes are made of hog's bristles, or of hair with a mixture of bristles; they ought to be straight, very smooth, and of a round form. Half an hour before they are used, it is proper to soak them in water, in order to swell the wood of the handle, and prevent the hairs from

falling off; after this they may be applied to all purposes, either in water-colours or in oil; but it may be observed, that for the former they require less softening. The pencils are made of badger's-hair, or any fine hairs enshased in the pipes of quills of all sizes.

The pallet is made of the wood of the pear or apple tree, of an oval or square shape, very slender, but somewhat thicker at the centre than at the extremities. A hole is made in one of its sides sufficiently large to admit the thumb of the workman. When the pallet is new, it is covered with oil of walnuts; and, as often as it dries, the operation is repeated, till it is fully impregnated; it is afterwards polished, and finally rubbed with a piece of linen dipped in oil of common nuts.

The painter's knife is a thin flexible plate, equally slender on both sides, rounded at one extremity, and the other fixed into a handle of wood.

All the vessels employed to hold the colours should be varnished; a precaution necessary to prevent their drying too quickly.

To *grind*, is to reduce to powder the substances which give colours on a piece of marble or any hard stone by means of water, oil, or essence.

To *dilute*, is to impregnate a liquid with a tint in such a manner as to make it capable of being applied by a brush.

When the materials are ground in water, it is proper to dilute them in size made from parchment. If they are diluted in spirit of wine, there must be no more diluted than what serves the immediate occasion, as colours prepared in this manner dry very rapidly. Colours ground in oil are sometimes diluted with pure oil, more frequently with oil mixed with essence, and commonly with the pure essence of turpentine; the essence makes the colours easy to work. Those prepared in this manner are more solid, but they require more time to dry. When colours are ground with the essence of turpentine, and diluted in varnish, as they require to be immediately applied, it is necessary to prepare a small quantity at a time. This preparation of colours gives greater brilliancy, and dries more speedily, than those prepared in oil; but they require more art to manage them.

In every case, prepare only the quantity of colours necessary for the work you undertake, because they do not keep long; and those which are newly mixed are more vivid and beautiful. Hold the brush straight before you, and allow only the surface to be applied to the subject: if you hold it inclined in any other direction, you will run the hazard of painting unequally. Yet it is necessary to lay on the colours boldly, and with great strokes; taking care at the same time to spread them equally over the surface, and not to fill up the moulding and carved work. If this accident should happen, you must have a little brush to clean out the colours.

Stir the colours frequently in the vessel, that they may preserve always the same tint, and that no sediment may remain at the bottom. Never apply a second layer till the first or preceding one be perfectly dry; which it is easily known to be when, in bearing the hand gently over it, it does not adhere. In order to render this drying more speedy and uniform, make always the layers as thin as possible.

Before painting, it is necessary to *prime* the subject; that is, to give it a layer of size, or of white colouring-oil, to fill up the pores, and render the surface smooth; by this means fewer layers of colour or of varnish are afterwards necessary. Every subject to be painted or gilded ought to have first a white ground; this preserves the colours fresh and vivid, and repairs the damage which they occasionally receive from the air.

OF HOUSE-PAINTING IN WATER-COLOURS.

Works which require no great care or preparation, as ceilings and staircases, are generally painted in common

water-colours; that is, with earths infused in water and diluted in size.

For a common white kind of this painting, steep Spanish-white moderately pounded in water for two hours. Infuse a proper quantity of the black of charcoal in water for the same space of time; mix the black and white in the proportion that the tint requires; afterwards mix them up with a pretty strong size sufficiently thick and warm, and apply them to the subject in as many layers as may be thought necessary. It requires about two pounds of white in a pint of water, and a quantity of black in proportion to the tint, together with a part of size, to cover a square fathom. If this be employed on old walls, they must be well scraped, the dust brushed off with a hair becom, and washed carefully with lime-water. If on new plaster, the colours require more size.

All kinds of colours may be ground in water only when the tint is made; and, when they have been infused in water, they must be mixed up with size. In general, it requires about a pound of colours to paint a square fathom (six feet square) in water-colours. In making-up this quantity, take three-fourths of colours ground in water, and one-fourth of a pound, or six ounces, of size to dilute it.

Of Varnished Water-Colours.—The advantages of this kind of painting are, that the colours do not fade; that they reflect the light; that they give no offensive smell, but permit the places to be inhabited as soon as finished; and that the varnish preserves the wood from insects and moisture.

To make a fine varnish on water-colours, seven operations are necessary; namely, to size the wood, to prepare the white, to soften and rub the subject, to clean the moulding, to paint, to size, and to varnish.

1. To size the wood, is to give one or two layers of size to the subject which you intend to paint. Take three heads of garlic and a handful of wormwood-leaves; boil them in three pints of water till they are reduced to one; pass the juice through a linen cloth, and mix it with a pint of parchment-size; add half a handful of salt and half a pint of vinegar; and boil the whole on the fire. Size the wood with this boiling liquor; allow it to penetrate into the carved and smooth places of the wood, but take care at the same time to take it as clean off the work as possible, or at least to leave it at no place thicker than another. This first sizing serves to fill up the pores of the wood, and to prevent the materials afterwards from collecting in a body, which would cause the work to fall off in scales.

2. To prepare the white, take a quantity of strong parchment-size; and sprinkle lightly over it, with the hand, Spanish-white, till the size is covered with it about half an inch in thickness; allow it to soak for half an hour as near the fire as to keep it milk-warm; and then stir it with the brush till the lumps are broken, and it is sufficiently mixed. Give seven, eight, or ten, layers of this white, or as many as the nature of the work or the defects in the wood shall render necessary, giving more white to the parts which require to be softened; but, in general, the layers must be equal both with regard to the quantity of the white and the strength of the size. The last layer of the white ought to be clearer than the rest, which is made by adding water. It must be applied more slightly, taking care with small brushes to cover all the uneven places in the mouldings and carved work. It is necessary also, between the drying of the different layers, to fill up all the defects with white mastic and size.

3. To soften, is to give to the subject, after the whitening, a smooth and equal surface, and to rub it over with a pumice-stone. The wood being dry, take little pieces of white wood and of pumice-stone, ground for the purpose into all necessary forms, either for the pannels or the moulding. Take cold water, heat being destructive of this kind of work; in summer, it is common to add a little ice. Soften the wall with a brush, but only as much at a
